Divisions.—When the Domesday Survey was made, this county, exclusive of the lands between the Ribbles and the Mersey, now a part of Lancashire, though then considered a part of Cheshire, was divided into twelve hundreds. The modern hundreds are: Wirral on the north-west of the county; Baulake and Macclesfield, on the north and north-east; Northwich and Haslebury, in the centre; Nantwich and Broxton, on the south.

There are 14 market-towns besides Chester:—namely, ALFRINGHAM, BIRKENHEAD, CONGLTON, Frodham, KNUTSFORD, MACCLESFIELD, MALPAS, MIDDLEWICH, NANTWICH, NORTWICH, RUNCORN, SANDRACH, STOCKPORT, and Tarporley. Frodham, Malpas, and Tarporley, with the more recently founded town of Hyde, may be noticed here: the other towns will be found under their several names.

Frodham, formerly a market-town, 10 miles N.E. from Chester, population of the town 2099, is still a place of some local importance, although the market has been long given up. Salt constitutes the chief article of trade, but there are flour-mills, and timber, coals, and slates are dealt in. A sandstone quarry is worked. The church is partly of Norman date. There is a chapel for Wesleyan Methodists. The Free Grammar school has an income of £51. a year, and had 120 scholars in 1852; there is also a National school.

Hyde, population 10,051, a manufacturing town, recently a village, forming part of the parish of Stockport. The extension of the cotton manufacture has considerably augmented the importance of this place. Coal abounds in the township, and means of conveyance are furnished by the Peak Forest Canal and by railway. There are here a new church, a chapel of ease, dedicated to St. Thomas, and chapels for Independents and Wesleyan Methodists; National schools for boys and girls; a public library, and a mechanics institute. Extensive cotton-mills, iron-works, and water-works are in operation. A county court is held in Hyde.

Malpas, situated on an elevation near the river Dee, is 15 miles S. by E. from Chester: the population of the parish, which is partly in Flintshire, was 5710 in 1851. The parish contains two rectories, one held with the curacy of St. Chad, and the other with the curacy of Whitwell. The church was formerly the chapel of a religious house for monks of the Cluniac order; it is built of unhewn stone, and consists of a nave and chancel, without either aisle or steeple; it is partly of Norman date. There are also two chapels of ease, and places of worship for Independents and Wesleyan Methodists; an Endowed Grammar school which has an income from endowment of £251. a year, and had 6 scholars in 1851; National and Infant schools, and many charitable institutions. The town is irregularly built. The market is held on Wednesday; there are fairs on April 5th, July 26th, and December 8th for cattle and pedlery. Malpas is the birthplace of Matthew Henry, the commentator on the Bible.

Tarporley, 10 miles E.S.E. from Chester, is a small market-town near Beeston Castle, on the great road from London to Chester. The population of the parish of Tarporley in 1851 was 2632. It was anciently governed by a mayor, but is now governed by a constable. In 1642 a battle was fought at this place between Sir William Brereton's forces and the Royalists from Chester, who on this occasion were victorious. Tarporley is pleasantly situated, clean, and neatly built. It is now chiefly known as the scene of an annual fox-hunt in November. The church is an ancient structure of red-sandstone: its interior contains several interesting monuments. The Wesleyan Methodists and Baptists have places of worship. The town possesses a National school, some almshouses, and parochial charities. The inhabitants are employed in the manufacture of stockings and leather breeches. The market-hall is a commodious building. The market is on Thursday. There are fairs in May, August, and December.

The following are some of the more important villages, with the population in 1851, and a few other particulars. Except where specially mentioned the population given is that of the parish:—

Acton, population 3165, about 1 mile W. by N. from Nantwich, has an ancient church. The Free Grammar school, founded in 1662, has an income from endowment of £121. a year; the number of scholars in 1852 was 8; there is also a National school. *Ashton-upon-Mersey*, 31 miles N.E. from Chester, population 2894, is a large scattered village, of which Cross-street forms a part. The church is a substantial edifice; there is a Wesleyan chapel. *Audlem*, population 2870, about 7 miles S. from Nantwich, has a small market on Thursday and a fair in the month of July, both recently revived. Besides the parish church, there are chapels for Baptists and Wesleyan and Primitive Methodists. The Free Grammar school, founded in 1655, has an income from endowment of £401. and had 12 scholars in 1851. There is also a National school for girls. *Bebington*, 12 miles N.N.W. from Chester and 4 miles S. from Birkenhead, consists of two villages, Higher and Lower Bebbington: the population of the parish in 1841 was 5008, in 1851 it was 10,016, having doubled itself in the ten years. Both villages are on the line of the Chester and Birkenhead railway. The parish church is partly of Norman and partly of early English

date. *Bosden*, 18 miles E.S.E. from Chester, population of the township 397, is celebrated for its castle, which has been already noticed. The ruins have a picturesque appearance, and a very extensive view is obtained from them. *Bosley* is an extensive village and chapelry in the parish of Frodsham, 40 miles E. by N. from Chester and 8 miles N. from Macclesfield: population of the township 555. The inhabitants are employed in cotton factories and mills; there are also some distilleries. The Macclesfield Canal runs by the village. There is a chapel of ease, erected at the expense of the late Mr. Turner. The Wesleyan and Primitive Methodist churches are places of worship. *Bosworth*, 20 miles N.E. from Chester, population of township 1164, is pleasantly situated on an elevation about 1 mile S. from Altringham. From the church tower there is a very extensive and pleasing prospect. The church is in part of Norman date. In it are some good monuments. There is an Endowed Grammar school. *New Brighton*, population included with that of Wallasey parish, 24 miles N.N.W. from Chester, is situated at the mouth of the Mersey. The village has increased rapidly in population within the last few years. Several large hotels have been constructed, and numerous good villa residences. The beach is well adapted for bathing, and the sea views are very fine. By the steamer it is only 4 or 5 miles from Liverpool. *Bromborough*, 11 miles N.N.W. from Chester, population 638, was formerly a market-town, but is now a place of little consequence. A station of the Chester and Birkenhead railway is at Bromborough. There was formerly an abbey here. The church is small but ancient. *Great Budworth*, population of the township 643, of the parish 17,990, is pleasantly situated near Pickmere Mere and Budworth Mere, about 2 miles N. from Northwich. The parish comprises an area of 35,920 acres. Besides the parish church there are a chapel for Wesleyan Methodists, and Parochial and Infant schools. The Wilton Free Grammar school, founded in 1556, has an income from endowment which amounted in 1837 to 269*l.* a year. It is now conducted as a National school, the schoolmaster receiving only 75*l.* a year from the endowment. *Buglawton*, 34 miles E. from Chester, population of the township 2052, is a short distance from Congleton, with which town it is pretty closely connected. The inhabitants are chiefly employed in the manufacture of cotton and silk. A new church was erected here in 1829. *Bunbury*, 12 miles S.E. from Chester: population of the township 931. The church is a very fine one of the perpendicular style. In the interior are several interesting monuments. The Wesleyan Methodists have a place of worship. The Free Grammar school, founded in 1594, is free to children of the parish. The number of scholars in 1852 was 72. There is also a National school. *Burton*, population 467, on the right bank of the Dee estuary, 9 miles N.W. from Chester, possesses a Free school with an income from endowment of 87*l.* a year. *Cheadle Bulkeley*, population of the township 5489, and *Cheadle Moseley*, population of the township 2319, are two contiguous villages, about 3 miles W.S.W. from Stockport. The inhabitants are occupied in calico-printing and silk-weaving. On the Mersey are some corn-mills. The parish church, which is ancient, contains some good monuments. *Compstall Bridge*, 5 miles E.S.E. from Stockport, in the parish of Stockport, is a busy and populous village. The inhabitants are chiefly employed in cotton-spinning and calico-printing. Besides the church, there are places of worship for Wesleyan and Primitive Methodists. *Darnhall*, population of township 186, about 8 miles W.S.W. from Middlewich, possesses an Endowed Grammar school, founded in 1681, which is free to 26 boys in Darnhall and Swanlow; the income from endowment is 70*l.* a year; the number of scholars in 1852 was 94. *Disley*, or *Disley Stanley*, about 6 miles S.E. from Stockport, on the eastern border of the county: population of the township 2225. Cotton factories and print works give employment to the inhabitants; there is also a large whiting factory. The chapel is of the perpendicular date and style. The Wesleyan Methodists have a place of worship. *Eastham*, 9½ miles N. by W. from Chester: population of the township 419. The village, which is pleasantly situated on the Mersey, is much resorted to by the inhabitants of Liverpool during the summer. A steamer plies regularly to Liverpool throughout the season. *Ellesmere Port*, in Eastham parish, 8 miles N. from Chester, has risen into some consequence since the construction of a capacious dock and extensive warehouses by the Ellesmere and Chester Canal Company. Many good villa residences have been erected by the Marquis of Westminster. Besides a chapel belonging to the Establishment, there are a chapel for Wesleyan Methodists, and a National school. *Gea Cross*, about 4 miles E.N.E. from Stockport, is a populous village: the population is returned with the parish of Stockport. There are extensive cotton-mills here. Besides a chapel of the Establishment, there are chapels for Wesleyan Methodists and Unitarians. *Godley*, 45 miles N.E. from Chester: population of the township, 1353. There are several cotton-mills. *Halton*, 14 miles N.E. by N. from Chester: population of the township 1570. A castle was erected here soon after the Norman conquest; John of Gaunt, duke of Lancaster, possessed the castle, and resided much in it. A portion of the remains is now fitted up as an inn. Halton is in much favour as a summer residence. The village contains a Grammar school, also almshouses for six poor persons. *Hazel Grove*, 4 miles S. from Stockport, of which parish it is a hamlet. Till 1836 this place was

called Bullock Smithy. Wesleyan and Association Methodists and Independents have places of worship. There are National and Infant schools, and a dispensary. The chief occupation is the weaving of silk and cotton. *Holmes Chapel*, or *Church Holmes*, 2½ miles E. from Chester: population of the township 555. The church consists of a nave, chancel, and aisles, and has an embattled tower with pinnacles. In the village are a Wesleyan Methodist chapel, and an endowed Free Coat school. Fairs for cattle and horses are held in April, October, and November. *West Kirby*, population of township 435, about 7 miles W. from Birkenhead, is situated on the shore of the Dee estuary, near its outfall. There is here a Grammar school, founded in 1636, which is free to sons of parishioners; the income from endowment is 58*l.* a year. The number of scholars in 1852 was 30. *Leftwich*, 13 miles E. by N. from Chester: population of the township 2528. A Wesleyan chapel and an Infant school are in the township; salt-works and a tannery are carried on. *Liscard*, situated at the mouth of the Mersey, 4 miles N. by W. from Birkenhead, population of Liscard township, 4100; has a rather handsome church. *Lymm*, population 3156, about 8 miles W.S.W. from Altringham. The church is ancient; the tower was rebuilt in 1521; from the tower is obtained an extended view of picturesque scenery. There is here a Wesleyan Methodist chapel. The Grammar school, established in 1698, has an endowment of about 120*l.* a year, and had 100 scholars in 1851. There is also a National school. Lymm Hall, and other excellent mansions, are in the neighbourhood. A cross, the lower steps of which are cut in the rock, stands opposite the gates of Lymm Hall. *Marple*, population of the township 3558, is on the eastern border of the county, 5 miles E.S.E. from Stockport. All Saints church has been rebuilt; in the tower are placed the old bells of Stockport church. There are chapels for Wesleyan and Primitive Methodists, a Grammar school, and a National school. Cotton-spinning, bleaching, and calico printing are extensively carried on; there is also some boat building. On the river Goyt are corn-mills. A branch of the Peak Forest Canal from Marple joins the Mersey Canal at Lawton. Marple Hall, an interesting old mansion, is in the possession of a descendant of John Bradshaw, who presided at the trial of Charles I. *Mottram-in-Longdendale*, population 3199, is situated near the north-east extremity of the county, about 7 miles N.E. from Stockport, surrounded by rugged and picturesque scenery. In the vicinity are Mottram hill and the Car Tor. The Car Tor is a singular eminence rising abruptly from the plain to a height of about 80 feet. It is composed of regularly arranged strata of rock, freestone, and a kind of slate or coal. Besides the parish church, there are chapels for New Connexion Methodists and Moravians. The Free Grammar school, founded in 1610, had an income in 1837 of 65*l.* a year from endowment. Its affairs have been the subject of proceedings in Chancery. Iron foundries, and collieries, with cotton-spinning, calico-printing, and other establishments, give employment to the inhabitants. *Great Neston*, on the right bank of the estuary of the Dee, 10½ miles N.W. from Chester, population of the township 1524, is chiefly dependent on visitants during the summer. The parish church, dedicated to St. Mary, is ancient; the tower was repaired in 1697. There are here a Wesleyan chapel, a National and an Infant school. *Northen*, population of the township 679, is pleasantly situated on the left bank of the Mersey and north border of the county, about 6 miles W. from Stockport. The church, dedicated to St. Wilfrid, has a nave, chancel, side aisle, and a tower. There is here an Infant school. *Over*, population of the township 2926, is situated near the left bank of the Weaver, about 4 miles W. from Middlewich. This town, though small, claims to be a borough by prescription, and is governed by a mayor. In the principal street, which forms a part of the high road, are remains of several crosses. The parish church, an old building, has some good specimens of stained glass. There is a chapel for Independents. A small weekly market is held. The annual fair continues for three days. A brewery, and brick and tile-works, afford some employment. *Parkgate*, a small bathing town on the right bank of the Dee; adjoins Great Neston, with which township the population is included. The houses, which are neatly and regularly built, command a fine prospect of the opposite Welsh coast. Communication with Flint and Bagillt on the Welsh side is maintained by ferry boats. A sand-bank off the town prevents vessels of heavy burden coming up to the quay. The Independents and Wesleyan Methodists have places of worship here. *Preston Brook*, or *Preston-on-the-Hill*, 14 miles N.E. from Chester, population 594, situated on the line of the Liverpool and Birmingham railway, has extensive warehouses for the accommodation of the traffic by the different canals in the district. The carrying trade is here of considerable magnitude. *Rosthern*, population of the township 388, is pleasantly situated about 4 miles S. by W. from Altringham. By Rosthern Mere, a beautiful sheet of water, is the ancient church, dedicated to St. Mary; it is partly of Norman date, and has a stone tower, built in 1538. At Hoo Green, a place much resorted to by the neighbouring gentry, a bowling-club is established. *Seacombe*, population of the joint township of Poulton-cum-Seacombe 3044, is on the left bank of the Mersey, opposite Liverpool, with which there is constant communication by ferry. There are here large copper-mills, an iron foundry, smelt-works, and a varnish manufactory. The Wesleyan Methodists have a chapel. *Tarvin*, 6 miles E. from Chester, popula-

tion of the township 1181, had formerly a market, but it has long been discontinued. Fairs are held in April and December. In 1752 the village was nearly destroyed by fire. Besides the parish church, there are Dissenting meeting-houses and a National school. Hargrave Free Grammar school, founded in 1627, is free to all children paying 1s. a quarter: it possesses an endowment of 40*l.* a year with a house, and had 118 scholars in 1852. *Tiverton*, 11 miles E.S.E. from Chester: population of the township 747. The Baptists have a place of worship here. The Chester and Nantwich Canal passes by Tiverton. A corn market, at which extensive transactions in grain take place, is held on Monday at Fern Lane Ends in this township. *Wallasey*, population of the township 1195, situated near the shore of Liverpool Bay, about 4 miles N.N.W. from Birkenhead, has much increased during the last few years in consequence of increased communication with Liverpool. The parish church, which stands on a considerably elevated site, was rebuilt about a century ago, with the exception of the tower, which dates from 1560. The Free Grammar school, founded in 1654, has an income from endowment of 114*l.* a year; the number of scholars in 1852 was 58. A question as to the right of patronage of this school is under consideration in Chancery. *Weaverham*, population of the lordship and township together 1529, is 16 miles W.N.W. from Chester. The parish church, dedicated to St. Mary, has a fine tower. There are chapels for Wesleyan and Association Methodists; also a National school for boys and girls. The Free Grammar school, which has an endowment of 46*l.* a year, had 55 scholars in 1852. *Weston*, population of the township 933, including 234 in barges, is situated near the confluence of the Mersey and the Weaver, about 13 miles N.N.E. from Chester. The Wesleyan Methodists have a place of worship in the village; at Weston Point, two miles distant, is a church, with National schools for boys and girls. A lighthouse was erected at Weston Point a few years back. There is a considerable carrying trade in barges on the estuary of the Mersey. The village is much resorted to in summer for bathing. *Wilmslow*, population 4952, is situated on the left bank of the river Bollin, 37 miles E.N.E. from Chester. The parish church is a fine building of different styles. The interior contains several interesting monuments. The Wesleyan, Methodists and Independents have places of worship, and there is a National school. Extensive cotton and silk factories are established here. Wilmslow, being within 12 miles of Manchester by railway, is a place of residence for many of the Manchester merchants. *Winsford*, population included with that of Over township, is situated on the high road, 17 miles E. from Chester. Winsford church, parsonage, and school were built by the trustees for the navigation of the river Weaver, the church being for the use of the watermen on the river. The Wesleyan and Wesleyan Association Methodists have places of worship. The Weaver is here crossed by a bridge. There are extensive brine pits on both sides of the river, and large quantities of salt are produced, for the conveyance of which the Weaver affords the required accommodation. At Winsford is a station of the London and North-Western railway.

Ecclesiastical and Legal Jurisdiction.—Of the 87 parishes 46 are rectories, 23 vicarages, and 18 donatives, or perpetual curacies; many are of great extent. The parish of Prestbury extends over an area of 63,125 acres, and comprises 32 townships and 14 chapelries. The county is in the diocese of Chester, and province of York: it forms an archdeaconry, and comprises seven deaneries. A few parishes are in the archdeaconry of Liverpool and deanery of Wirrall. According to the 'Census of Religious Worship,' taken in 1851, it appears that there were then in the county 833 places of worship, of which 252 belonged to the Church of England, 188 to Wesleyan Methodists, 135 to Primitive Methodists, 66 to Independents, 50 to Wesleyan Association Methodists, 29 to New Connexion Methodists, 17 to Roman Catholics, 14 to Particular Baptists, 14 to Unitarians, and 68 to other bodies. The number of sittings amounted in all to 235,593. The county is divided by the Poor-Law Commissioners into 10 Unions: Altringham, Great Boughton, Chester, Congleton, Macclesfield, Nantwich, Northwich, Runcorn, Stockport, and Wirrall. The Unions include 458 parishes and townships, with an area of 550,257 acres, and a population in 1851 of 410,247; but the boundaries of the Unions are not strictly co-extensive with those of the county. Cheshire is in the South Wales circuit. The Lent and summer assizes and the quarter sessions for the county are held at Chester, where also is the county jail. The city of Chester has a separate jurisdiction, and tries by its own recorder. County courts are held at Altringham, Birkenhead, Chester, Knutsford, Nantwich, Northwich, and Runcorn.

Cheshire before the Reform Act of 1832 sent four members to the Imperial Parliament: it was then formed into a north and a south division, each of which sends two members. The boroughs of Chester, Macclesfield, and Stockport return two members each to Parliament.

Manufactures.—The cotton and silk manufactures are extensively carried on in and around Stockport, Macclesfield, Marple, Congleton, and Sandbach. At Knutsford there is a large manufactory of thread. At Nantwich, and the places just named, are manufactories of hats for exportation. Shoes are extensively made at Sandbach. Some woollen cloths are also made in the same district. Tanning is very extensively carried on throughout the county. There is a large manufacture of gloves, ribands, and buttons. The copper, lead, and iron of the Alderley Edge and Stockport Hills are manufactured in

the county, and constitute a small item in the export trade. But cheese is the principal product, which is not only well known and highly esteemed in every part of England, where the consumption is immense, but also in most parts of Europe. The whole annual produce of this article in Cheshire is about 11,500 tons, of which 4000 tons are exported. (Holland's 'Agricultural Survey.') The prime cheese is made chiefly in the districts where the salt abounds; that is, along the banks of the Weaver. Potatoes are raised in very large quantities, especially in the western portion of the county, including the peninsula of Wirrall. Besides a very large home consumption, they are exported in great quantity by the Mersey to Liverpool and Manchester.

Civil History and Antiquities.—At the time of the Roman invasion this county formed part of the territory occupied by the Carnabii. In the first division of Britain by the Romans it was included in Britannia Superior; and in their subsequent subdivision it became part of Flavia Caesariensis. From inscriptions which have been found, the twentieth legion appears to have continued at Chester as late as the 3rd century.

On the departure of the Romans, the Britons continued to hold Cheshire until about the year 607, when it was wrested from Brochmael, king of Powys, by the successful arms of Ethelfrid, the Saxon king of Bernicia. Prior to the battle, the Saxon troops are said to have massacred the monks of Bangor. [BANGOR-ISOED.] Several of the British princes however having collected an army and marched to Chester, Ethelfrid was defeated in turn, and this district was not again subjected to the Anglo-Saxon power until about the year 828, when it was taken by King Egbert, and made a part of the kingdom of Mercia. According to Peter Langtoft, Athelwolf held his parliament at Chester after the death of Egbert, and there received the homage of his tributary kings, 'from Berwick unto Kent.' About the close of 894, an army of Danes advancing from Northumberland took possession of Chester, and seized the fortress: the Saxons under Alfred however having arrived in the vicinity, by destroying the cattle and corn, and intercepting the provisions of the Danes, drove them to such extremities of famine, that they quitted the city and retreated to North Wales. Upon the division of England into three districts by Alfred, Cheshire was included in the Mercian jurisdiction. Cheshire acquired the privileges of a county palatine in the reign of William the Conqueror, who granted it to his nephew, Hugh d'Avranches, commonly called Hugh Lupus, to hold it as freely by the sword as he himself held the kingdom of England by the crown. Until the final subjugation of the Welsh, the city of Chester was the usual place of rendezvous for the English army, and the county was exposed to all the evils of a border warfare.

In 1237, on the death of John Scott, the seventh earl of Chester of the Norman line, without male issue, Henry III. gave the daughters of the late earl other lands in lieu of the earldom, being unwilling, as he said, to 'parcel out' so great an inheritance 'among distaffs': the county he bestowed on his son Edward, who did not assume the title, but conferred it on his son Edward of Caernarvon, since which time the eldest sons of the sovereigns of England have held the title of earls of Chester. The inhabitants of Cheshire took a part in the rebellion of the Percys, and the greater part of the knights and esquires of the whole county, to the number of 200, with many of their retainers, fell in the battle of Shrewsbury, on the 22nd of July 1403. From the time of Henry III. to the reign of Henry VIII., the palatinate was governed as independently as it had been by the Norman earls. Henry VIII. however made it subordinate to the crown of England, but reserving several privileges in favour of the county. The county being solely under a distinct jurisdiction, and to a certain extent like a separate kingdom, never sent representatives to the English Parliament, either for city or shire, until the reign of Edward VI., when in the year 1549, on the petition of the inhabitants, two members were summoned from each. On the out-breaking of the civil war the Parliament sent Sir William Brereton with a troop of horse, who took possession of Nantwich, which he fortified and made his head-quarters; while Sir Nicholas Byron, being appointed colonel-general of Shropshire and Cheshire, and governor of Chester by the king, made it the head-quarters of the Royalists. Lord Byron, the nephew of the governor, defeated the parliamentary forces under Sir William Brereton at Middlewich, in December 1643. Nantwich was besieged in January 1644, but was relieved by the united forces of Sir Thomas Fairfax and Sir William Brereton, who defeated Lord Byron and compelled him to retreat with the remains of his forces to Chester. Prince Rupert took Stockport without resistance on the 25th of May; but the Royalists were defeated after a severe battle at Castleheath, near Malpas, on the 25th of August. Next year, on the advance of the king to Chester with a large force, the Parliament abandoned all their garrisons, except Tarvin and Nantwich, and on the 27th of September the battle of Rowton and Hoolesheath was fought near Chester, in which the Royalists were defeated; an event which led to the surrender of the garrison of Chester, in February 1646, and the subjugation of the whole county to the Parliament.

In August 1659, Sir George Booth appeared in Cheshire at the head of an army of upwards of 8000 men. The army of the Parliament, under General Lambert, met them at Winnington Bridge, near North-

wich, on the 16th of August, and soon defeated them. Booth himself was taken at Newport Pagnell, and sent to the Tower; and Chester, which had been held by Colonel Croxton, surrendered immediately on the approach of the victorious army.

The Roman roads in the county are found in detached parts: one road, called the Watling-street, was probably more ancient than the Roman times. This road enters Cheshire from the north by the ford over the Mersey at Stratford: in this part the marks of the elevated crest, peculiar to the military roads of the Romans, are still visible. A little south-west of Bucklow Hill the roads seem to have divided, the Roman road continuing towards Kinderton, and the British road pursuing its old direction by Northwich over Delamere Forest, and by Chester to the coast of Caernarvonshire. The Roman road from Manchester to Kinderton crosses the ford of the Mersey, and proceeds to the village of Cross-street. In crossing the adjoining moss it is known by the name of Upcast, whence it runs by Dunham Park to a field called the Harbour-field, in the parish of Kinderton, which is the supposed station of Condate. Part of the Via Devana crossed the county from the south-east to Chester.

The castle at Chester was built by William the Conqueror. Rooston Castle, built in 1220, by Randle Blundeville, earl of Chester, is upon the slope and summit of a sandstone rock, which forms on one side an almost perpendicular precipice of great height. The outer court is irregular in form, inclosing an area of about five acres. The walls are prodigiously thick, and have several round towers. A deep ditch, sunk in the solid rock, surrounds the keep, which was entered by a drawbridge, opposite two circular watch-towers, still remaining. The approach within the great gateway between these towers is by rugged steps cut in the natural rock. This castle has been in ruins since the civil war of Charles I., when it was dismantled. Of Halton Castle few traces now remain; of Aldford Castle the foundations only are traceable; Shocklach Castle has left only some earthworks and a high mound now visible; Shotwick Castle appears from the sketch of it in the British Museum to have had a pentagonal wall, with several circular towers inclosing a lofty square tower. There are numerous ancient mansions. Smith, in his 'Treatise on Cheshire,' calls this county "the mother and the nurse of the gentility of England." Little Morton Hall, in the parish of Astbury, is the most remarkable ancient mansion in the county. It has large and handsome bay windows. The materials of the house are timber and plaster. Bramhall Hall, the ancient seat of the Davenports, about 2 miles south-west from Stockport, resembles Little Morton. Saughton Grange, near Chester, was one of the castellated residences of the Abbot of St. Werburg. Doddington Hall, the ancient seat of the Delves family, is near the road from Nantwich to London. The modern, large, and sumptuous fabric was erected in 1780 by Samuel Wyatt. It stands in a spacious park, and overlooks a fine sheet of water. Poole Hall, in the parish of Eastham, was built in the middle of the 16th century, and is one of the most venerable specimens of domestic architecture in this county. The style of the architecture is similar to that of all the ancient Cheshire mansions, rising into pointed gables, with numerous large bay windows, and having the approach through a line of stables and cow-houses. Brereton Hall, which is in the style of Esher Place in Surrey, was built by Sir William Brereton, and the foundation stone is said to have been laid by Queen Elizabeth herself. The site is on a rising ground near the river Croke. Among the rich decorations of the interior is a curious painting of Queen Elizabeth in full costume, with chains of jewels hanging down to her waist, and with hair extremely red. Dutton Hall stands on the ridge of a steep declivity overlooking the Weaver. It is surrounded by a broad and deep moat. The great hall is 40 feet by 20 feet, and the whole edifice is a very sumptuous specimen of the domestic architecture of the 16th century. Crewe Hall, the seat of Lord Crewe, is an equally fine specimen of the 17th century, having been completed in 1636. It is a quadrangular building of red brick, with battlements and large projecting bay windows. The sculptured oak ornaments of the interior are curious, as well as the painted glass window of the chapel. There are many portraits by Lely and others of that time. The seat of Lord Combermere was an ancient Cistercian abbey; it is beautifully situated on the margin of the large mere so called. The original edifice has been almost wholly renewed in the pointed gothic style. Dunham Massey, the seat of the Earl of Stamford and Warrington, was rebuilt in 1780. It is a very spacious quadrangular building of brick, surrounded with a fine park of lofty old oaks, and is interesting for a curious gallery of paintings by Holbein, Vandyke, Lely, and other old masters. Cholmondeley Castle, the seat of the Marquis of Cholmondeley, is in the township of Cholmondeley, in Broxton hundred. The present magnificent edifice was built in 1804, on the site of the ancient castle. The architecture is gothic; and in approaching the eminence on which it stands, it has the appearance of a Norman fortress. The apartments are adorned with some rare and beautiful paintings. Eaton Hall, the seat of the Marquis of Westminster, possesses great architectural grandeur, and resembles Cholmondeley Castle, being in the pointed gothic style. The surrounding park and pleasure-grounds are laid out with much picturesque effect. Ancient crosses occur at the boundary of Lyme Park, at Sandbach, at Oulton, and at Lymm. The crosses at Sandbach are referred by Lysons to a period not long subsequent to the introduction of Christianity into England. The sword of Hugh Lupus, the first Norman earl of Chester, is preserved in the British Museum.

tianity into England. The sword of Hugh Lupus, the first Norman earl of Chester, is preserved in the British Museum.

Cheshire is both a manufacturing and an agricultural county. But it has for many years been steadily becoming more strictly a manufacturing county. In 1851 the county possessed 12 savings banks, at Bowdon and Altringham, Chester, Congleton, Frodsham, Knutsford, Macclesfield, Nantwich, Northwich, Runcorn, Sandbach, Stockport, and Wallasey. The total amount owing to depositors on the 20th of November 1851 was 683,120*l.* 8*s.*

CESHUNT. [HERTFORDSHIRE.]

CHESTER, the capital of Cheshire, an episcopal city, municipal and parliamentary borough and port, and the seat of a Poor-Law Union, is situated on the river Dee, in 53° 11' N. lat., 2° 54' W. long.; distant 183 miles N.W. from London by road, and 178½ miles by the North Western railway via Trent Valley. The population of the city of Chester was 27,756 in 1851. The city is governed by 10 aldermen, and 30 councillors, of whom one is mayor; and returns two members to the Imperial Parliament. The livings are in the archdeaconry and diocese of Chester. Chester Poor-Law Union, which is co-extensive with the city, contains an area of 3010 acres.

Chester was unquestionably an important Roman station. It appears to have been the Deva of the 'Itinerary' of Antoninus. The plan of the city and the arrangement of the streets, as well as its name, bear testimony to its Roman origin. The fortifications of the city appear to be on a Roman basis. A hypocaust which was found in a tolerably perfect state, is still preserved in the city. Remains of Roman masonry have been discovered; and Chester has produced innumerable coins, fibulae, inscribed tiles, inscribed stones, and altars, the usual vestiges of the Romans. In 1653 a votive altar to Jupiter Tanarus was dug up, which had been raised by an officer of the 20th Legion called the Victorious. According to the 'Itinerary' of Antoninus, the 20th Legion, the 'Legio vicesima valens victrix,' had its station somewhere on the Deva or Dee, and there can be little doubt that Chester was the place. The Welsh name of Chester, Caer Leon Gawr, signifies the city of the 'Great Legion.' Chester was evidently the most considerable place in a large tract of country in the Roman times, and so continued when the Romans had withdrawn their forces. The possession of it was an object of importance to the Saxons and to the remains of the Britons. The two nations seem to have possessed it by turns, and it was certainly one of the last places which yielded to the Saxon power. It was taken by Egbert in 830. From that period to the Conquest, 1066, Chester is often mentioned in the annals of the Saxon sovereignty. Edgar the Saxon monarch is related by the Chroniclers to have received the homage of six kings at Chester in 972: William of Malmesbury says that sitting at the prow of a boat in triumph he was rowed by them on the Dee. They were no doubt the petty kings or chiefs which were so numerous in Saxon times. The situation of Chester as a frontier fortress against Wales necessarily gave it importance; but it was also of consequence as a place of security when the coast was menaced with invasion by the Danes and Northmen. In 875 when a descent by the Danes was apprehended, the body of St. Werburgh, a Saxon saint, daughter of Wulphero king of Mercia, which had been preserved as a sacred relic, was removed for security to Chester. From this time St. Werburgh became the tutelary saint of Chester; a religious community was founded, in whose church her relics were sumptuously enshrined. For six centuries and a half the house was one of the wealthiest of the monastic establishments of England. At the dissolution its annual revenues exceeded 1000*l.*

Chester had in the Saxon times a peculiar local government, and peculiar municipal customs. It had its trade by sea and its home trade, it had also associations of members of particular trades, which trade associations have flourished longer at Chester than in most other places. The Bishop of Lichfield was in remote times sometimes called Bishop of Chester.

William created his nephew, Hugh surnamed Lupus, Earl of Chester, granting him at the same time sovereign jurisdiction over the county. Cheshire thus became what is called a county Palatine, having courts peculiar to itself and the custody of its own records. The earls of Chester resided in the castle at Chester, and held therein their courts and parliaments, in which sat the superiors of the religious houses of the county, together with the eight great subinfeudatories, among whom Earl Hugh had distributed the greater portion of his territory. The succeeding earls of his family, of whom there were six, maintained the same state. The series terminated in the reign of Henry III., and from that time the earldom of Chester has been in the crown, or in the hands of members of the royal house. The title is now possessed by the eldest son of the sovereign. Most of the large tenures created by the Conqueror reverted sooner or later to the crown by forfeiture or marriage. Chester has often received visits from the sovereign, and has been occasionally the scene of interesting public events. It has had a series of charters, by which valuable privileges were granted or confirmed, from the earls of Chester, and from the kings Edward I. and III., Richard II., and Henry VII. As early as 1242 there was a mayor, who presided over a guild merchant or mercatorial. Chester was in those times a place of considerable trade.

Besides the monastery of St. Werburgh, there was here a religious

community of women; the Black, the White, and the Gray friars had each an establishment in Chester: a college of the Holy Cross is mentioned, and hospitals of St. Anne and of St. John the Baptist, of which the latter escaped suppression at the Reformation, and continues to this day. Chester had, during this period, among its inhabitants, some whose names are connected with the early literature of England; Higden, the most celebrated of them, who lived in the reign of Edward III., is supposed to be the author of a set of mysteries, or religious dramas, which were exhibited by the several trades in Chester from time to time, and of which copies have descended to the present day.

In the 34th of Henry VIII., writs were first issued to Chester to send members to Parliament. The church of St. Werburgh was suppressed along with the other monasteries; but its revenues were not, as in most other cases, wholly confiscated. Chester was erected into an episcopal see, and the revenues of the monastery were appropriated to the support of the chapter. The church became the cathedral of the new see. The diocese assigned to the bishop was the whole county of Chester, which had previously been under the superintendence of the Bishop of Lichfield, and the county of Lancaster, with the archdeaconry of Richmond, part of the ancient diocese of York. From the period of the Reformation, the only striking event in the history of Chester is the protracted siege it endured in the civil war. Charles I. was for a time in the city, and is said to have witnessed the defeat of his army on Rowton Heath from one of the towers on the walls. The history of the commerce of Chester is a history of its steady decline coincident with the rise of that of Liverpool.

Chester is in many respects one of the most interesting cities in England, especially to the antiquary. It consists of two great streets intersecting at right angles, with others diverging regularly from them, very much it is thought according to the plan of a Roman camp. The city is one of the very few places in England which have maintained in a tolerable state of completeness the walls which were erected for their defence in remote ages; at no other place are they so entire as at Chester. Though no longer useful for defence, they afford an agreeable promenade, with pleasant views, at various points, of the surrounding country; they are nearly two miles in circuit. To a stranger the most striking objects in Chester are the walls and the rows. The rows are a species of wide footpath, raised above the level of the street, at the height of the first story of a house, and covered over head by the second story of the house; as though, in fact, the front and partition walls of the first stories were taken away, and the rooms converted into connected walks with shops at the back. The two great intersecting streets are, for the most part, constructed on this plan. A large number of the houses are the quaint half-timbered houses with ornamented gables of the 16th century: and they, with the rows, render the streets of Chester perhaps the most picturesque of any English city.

Chester cathedral does not rank among the finer of the cathedrals of this country. The church of the abbey of St. Werburgh was altered to fit it for the cathedral of the new see, but the Reformation is believed to have put a stop to the works before they were fully completed. It is in the perpendicular style. It is constructed of the soft red-sandstone of the district, and has become externally much weather-worn. Some parts have been repaired and partly restored of late years. The cathedral consists of a nave with side aisles; a choir and lady-chapel at the east end; and on the north a cloister, chapter-house, and school-room. The extreme length of the edifice is 375 feet, the breadth 200 feet. The nave is 120 feet long and 41 feet broad. The tower is 127 feet high. The chapter-house, which is rectangular, is much older than the cathedral, being in the early English style of the early part of the 13th century. The interior is very beautiful. There are nine parish churches in Chester. Of these St. John's, partly in ruins, is the most interesting for its architecture. It is Norman, and was formerly collegiate. St. Peter's has been recently enlarged and the older parts restored. Christ church was erected about fifteen years back. The Wesleyan, Primitive, and New Connexion Methodists, Presbyterians, Independents, Baptists, Quakers, and Roman Catholics have places of worship. The Grammar school of Chester, founded in the time of Henry VIII., and called the King's School, is attached to the cathedral, and is under the direction of the dean and chapter; it is free to 24 foundation boys, and has an income from endowment of 62l. a year, with 5 exhibitions. The number of scholars in 1852 was 48. There are also the Marquis of Westminster's school for 400 or 450 boys and girls, a Diocesan school, and several National and Infant schools. A Diocesan Training college for educating teachers for National schools provides accommodation for 70 students to be trained as schoolmasters, and for 50 in the Commercial, Mechanical, and Agricultural school attached to the college; the number of students in residence in July 1852 was 44. In 1700 a Blue-Coat school was founded for boys, and in 1750 another for girls.

Chester has numerous charities and benevolent institutions. Among others an infirmary, founded in 1761, supported by subscriptions and the interest of about 20,000l. in the funds; a house of industry; a house of refuge; public baths and washhouses; a mechanics institute, with a museum, which is kept in one of the towers on the walls; a public library; and a savings bank.

Of the castle built by Hugh Lupus scarcely a vestige remains. The

present castle is modern; it was erected from the designs of Mr. T. Harrison. It is used as the shire-hall, the county jail, and military barracks. It is of great extent, and presents an imposing appearance. The shire-hall is a noble room. The county lunatic asylum is situated in the Bath-road. Near the castle the Dee is crossed by a very handsome bridge of a single arch. The span of the arch is 200 feet, being the largest stone arch which has been constructed. The architect was Mr. Harrison. The Chester and Holyhead railway crosses the Dee at Chester by an iron-girder bridge of rather peculiar construction.

The number and tonnage of vessels registered as belonging to the port of Chester on December 31st, 1852, were as follows:—Sailing vessels, under 50 tons, 57, tonnage 2092; above 50 tons, 60, tonnage 3899; steam vessels, under 50 tons, 5, tonnage 167; above 50 tons, 2, tonnage 342. The number and tonnage of vessels which entered and cleared at the port of Chester during the year 1852 were as follows:—Coasting trade, inwards, 1182 vessels, 56,297 tons; outwards, 2110 vessels, 94,450 tons: colonial trade, inwards, 9 vessels, 2328 tons; foreign trade, inwards, 10 vessels, 1045 tons; outwards, 11 vessels, 1143 tons.

Ship-building is carried on in Chester to some extent; also rope and sail making. Chemical-works, soap-works, a shot manufactory, and several extensive tanyards, afford considerable employment. Fringe, whips, thread, and tobacco are manufactured. In the neighbourhood stone-quarries are successfully worked. The obstructions to the navigation of the Dee form the chief hindrance to the commerce of Chester. The Ellesmere Canal affords ready water communication with Liverpool and the towns in its course, and in the course of its connected canals. Chester has become the centre of an extensive railway system, which affords facilities of communication with all parts of the kingdom. The railway station at Chester is a very fine one. Markets are held at Chester on Wednesday and Saturday; fairs on the last Thursday in February, July 5th, and October 10th. The July and October fairs continue for about a fortnight for the sale of goods of every kind. Fairs for the sale of cheese are held monthly.

Chester has always been the residence of many wealthy families, and has at all times been celebrated for its amusements. In early times the Chester mysteries and processions rivalled those of Coventry. It was one of the first places noted for its horse-racing. The Roo-doo is the oldest and also the most convenient race-course belonging to any English city. It lies just beneath the wall, in a spot where the whole running-ground is under the eye of the spectator. The Chester races retain their ancient fame. Chester has also its theatre, assembly-rooms, and other places of amusement. In the vicinity are many good mansions. Eaton Hall, the seat of the Marquis of Westminster, is the most famous; it lies within a rich park about three miles from Chester on the Shrewsbury road.

The diocese of Chester is in the province of York. The diocese extends over the whole of Cheshire and parts of Lancashire, Cumberland, and Westmoreland, and comprises 436 benefices. It is divided into two archdeaconries, Chester and Liverpool: part of the archdeaconry of Richmond is in the diocese of Chester, but it is to be transferred to that of Carlisle. The chapter consists of the dean, the archdeacons, 4 canons, 4 honorary and 4 minor canons, and a chancellor. The income of the bishop is fixed at 4500l. a year.

(Ormerod, *Cheshire*; King, *Vale Royal*; Lysons, *Magna Britannia*; *Chester Guides*; *Parliamentary Papers*; *Communication from Chester*.)

CHESTER-LE-STREET, Durham, a village and the seat of a Poor-Law Union, in the parish of Chester-le-Street and chiefly in the middle division of Chester ward, is situated on the high north road, in 54° 51' N. lat., 1° 34' W. long., 6 miles N. from Durham, and 264 miles N. by W. from London. Fence Houses station of the York and Newcastle railway, which is 8 miles from Chester-le-Street, is 249½ miles from London via York. The population of the township of Chester-le-Street in 1851 was 2580. The living is a perpetual curacy in the archdeaconry and diocese of Durham. Chester-le-Street Poor-Law Union contains 20 parishes and townships, with an area of 81,066 acres, and a population in 1851 of 18,336.

By the Saxons Chester-le-Street was called Coneceastre or Cuneceastre, from the name of the brook Cone which flows past the village. In the year 882 it was made the seat of a bishopric, which was removed hither from Lindisfarne; it retained its episcopal rank till 995, when the Danes, invading the country, drove away the bishop and his clergy. The bishop afterwards fixed his seat at Durham. The village is lighted with gas. The principal street extends about a mile along the north road; another more irregular line of houses runs along the brook at right angles to the main street. The parish church, dedicated to St. Mary and St. Cuthbert, is a fine old gothic structure, consisting of a nave with side aisles, a chancel, and a tower at the western end, surmounted with an elegant spire. The north aisle contains a continuous series of monuments of the Lumley family. There are places of worship for Primitive Methodists and Independents; National and Infant schools; a mechanics institution; a parochial library; and a savings bank.

The neighbouring coal-mines, an extensive iron and brass foundry, a steam-engine factory, iron-works, fire-brick manufactories, and corn and paper mills, afford employment to many of the inhabitants. Numerous wealthy families reside in the vicinity.

Lumley Castle, the baronial seat of the Earl of Scarborough, a noble building which retains much of its ancient magnificence, is situated on an elevated spot near the bank of the Wear, about three-quarters of a mile from Chester. Lambton Hall, the seat of the Earl of Durham, about two miles north by east from Chester-le-Street, was built in 1797; the grounds are pleasant. Many incongruities. Ravensworth Castle, the seat of Lord Ravensworth, is a modern castellated edifice.

(Communication from Chester-le-Street.)

CHESTERFIELD, Derbyshire, a municipal borough, market-town, and the seat of a Poor-Law Union, in the parish of Chesterfield and hundred of Scarsdale, is situated near two rivulets, the Hyper and the Rother, in 53° 18' N. lat., 1° 25' W. long., 182 miles N.W. by W. from London by road, and 156 miles by the North-Western and Midland railways. The population of the borough in 1851 was 7101. The borough is governed by 4 aldermen and 12 councillors, one of whom is mayor. The living is a vicarage in the archdeaconry of Derby and diocese of Lichfield. Chesterfield Poor-Law Union contains 34 parishes and townships, with an area of 85,732 acres, and a population in 1851 of 45,803.

Chesterfield is conjectured, from its name, to have been a Roman station. The town received various privileges from King John, but was not incorporated till the reign of Elizabeth. The town is moderately well lighted and paved. In addition to the old town-hall there is a municipal-hall of recent erection. The parish church, erected during the 13th century, is a beautiful and spacious edifice. The spire is remarkable from being crooked. The bulging out of a portion of the middle of the spire causes the ball on the summit to deviate from the perpendicular 6 feet towards the south, and 4 feet 4 inches towards the west. The spire is 230 feet high. The interior has been restored. Trinity church is a neat structure built in 1838. There are chapels for Independents, Baptists, and Methodists. A Free Grammar school, founded in the reign of Elizabeth, but closed for many years, was re-opened and a handsome new school-house built in 1846; it has an income from endowment of 140*l.* a year, and had 85 scholars in 1851. The Victoria school is mainly supported by the vicar. There are almshouses, a savings bank, a mechanics institute, and a dispensary. A county court is held in the town. The district around Chesterfield is rich in coal and iron, and a considerable number of persons are employed in the mines. Potter's-clay, brick-clay, building-stone, and roofing-stone are also met with. The manufacture of cotton-wicks, ginghams, checks, cotton and worsted hosiery, and bobbin-net is carried on. The Chesterfield Canal extends from this town to the tideway of the Trent, a distance of 46 miles.

(Woodhead, *Account of the Borough of Chesterfield; Communications from Chesterfield.*)

CHESTERTON, Cambridgeshire, a village and the seat of a Poor-Law Union, in the parish and hundred of Chesterton, is situated on the left bank of the river Cam, in 52° 13' N. lat., 0° 9' E. long.; distant one mile N. by E. from Cambridge, 52 miles N. by E. from London by road, and 59 miles by the Eastern Counties railway. The population of the parish of Chesterton in 1851 was 2816. The living is a vicarage in the archdeaconry and diocese of Ely. Chesterton Poor-Law Union contains 38 parishes and townships, with an area of 72,422 acres, and a population in 1851 of 25,165. The manor of Chesterton was given by Henry I. to the prior and canon of Barnwell. In the village a nunnery formerly existed; the remains of the chapel are now converted into a dairy. The parish church of Chesterton, dedicated to St. Andrew, is a spacious edifice in the perpendicular style. In the village are a Baptist chapel, and National and British schools. The Cambridge county jail, and the Victoria Benefit Societies Asylum are in the parish. During the interval between the Censuses of 1841 and 1851 the number of houses in Chesterton parish rose from 331 to 577, and the number of inhabitants from 1617 to 2816. This has been owing chiefly to the low rents and light taxation which have attracted to it as a place of residence persons engaged in business in Cambridge, of which town indeed Chesterton village is in some respects a suburb. At Arbury in Chesterton parish are the remains of a circular camp of British origin.

CHEVAGNES. [ALLIER.]

CHEW MAGNA. [SOMERSETSHIRE.]

CHIANA, VAL DI, a valley in Tuscany, in the province of Arezzo, running north and south 30 miles in length, from Arezzo to Chiusi, and between two chains of hills, of which the western divides it from the valley of the Ombrone, and the eastern from the Lake Trasymene and the valley of the Tiber. Chiana is the modern name of the ancient *Clanis*, a feeder of the Tiber. The Val di Chiana was formerly a vast marsh, and its air was pestilential; it was drained under the Grand Duke Leopold I., and his son Ferdinand. By this operation above 36 square miles of ground are become now one of the most fertile districts of Tuscany. The waters of the northern and larger part of the valley now run north into the Arno by a stream called *Chiana Toscana*, the drainage of the southern part is collected into another arm called *Chiana Romana*, which flows into the Paglia about five miles above its confluence with the Tiber. Indeed the valley is so nearly a perfect flat, that the waters which flow into it from the hills on each side would flow indifferently in either direction. In ancient times they all flowed south to Clusium (Chiusi), where

the river formed and still forms a lake (Lago di Chiusi), and thence about 30 miles farther to the Tiber. [ARNO; AREZZO.]

CHICACOLE. [CIRCARS, NORTHERN.]

CHICHESTER, Sussex, an episcopal city, a municipal and parliamentary borough and market-town, and the seat of a Poor-Law Union, in the rape of Chichester, and western division of the county, is situated in 50° 50' N. lat., 0° 46' W. long., distant 62 miles S.W. by S. from London by road, and 79 miles by the Portsmouth branch of the South Coast railway. The livings are in the archdeaconry and diocese of Chichester. The city is governed by 6 aldermen and 18 councillors, one of whom is mayor; and returns two members to the Imperial Parliament. The population of Chichester in 1851 was 8662. Chichester Poor-Law Union comprises the city and suburbs, with an area of 1680 acres, and a population in 1851 of 15,000.

Chichester stands at the termination of a gentle descent from the South Down hills. The plain in which it is situated extends from the west side of Brighton to Portsmouth harbour, between the South Downs and the sea, and attains at Chichester its greatest width. The city within the walls is divided by two principal streets running north and south, and east and west, which intersect each other near the centre of the town. Beyond the walls the suburbs are prolonged in the direction of the principal streets. A small rivulet called the Lavant, which is occasionally dry in summer, bounds the city on the east and south sides.

Chichester occupies the site of the Roman station *Regnum*. The walls, which are nearly a mile and a half in circuit, were probably first erected by the Romans. The present walls are supposed to have been re-constructed with the materials of the Roman walls.

The word Chichester appears to be a contraction of 'Cissancester,' the city or castle of Cissa, an Anglo-Saxon chief, who according to the Chroniclers repaired and partly rebuilt it, after it had been destroyed in a siege. At the Norman survey Chichester had 238 houses, which were given to Roger de Montgomery, who was created the first Earl of Chichester. This nobleman is believed to have succeeded in removing the seat of the bishopric of Sussex from Selsea to Chichester, which was one cause of the early prosperity of the place. The earliest charter extant is one by Stephen. In the beginning of the reign of King John, there were three Mints established in Chichester, two belonging to the king, and one to the bishop. In December 1642 the Royalists who held the city surrendered to the parliamentary forces. The fortifications were demolished by order of the Parliament in 1648.

A cathedral, built mostly of wood, was founded here in 1108. The present cathedral, a cruciform edifice erected during the 13th century, exhibits some specimens of Norman design, and also some examples of the first pointed style, when the Petworth or Sussex marble came into fashion. The spire, which is about a century later in date than the body of the building, is finely proportioned. The extreme length of the cathedral from east to west is 407 feet; from north to south 150 feet; the transept is 129 feet long, and 34 feet wide; the nave and aisles are 97 feet wide; and the tower and spire 300 feet high. The building is remarkable for having double side aisles. In the cathedral are nine monuments by Flaxman, one of them to the memory of William Collins, the poet, who was a native of Chichester. It also contains several ancient monuments. One of the modern monuments is a statue by Carow of the late Mr. Huskisson, who was for some time member for this city. Near the north-west angle of the cathedral is a bell-tower 120 feet high; with massive walls, called Ryman's Tower. The palace of the bishop of Chichester is within the city. There is a neat antique chapel attached to the palace, which was repaired by Bishop Malby. Something has been done during the last 20 years in the way of restoring various portions of the cathedral buildings.

The parochial churches in Chichester are generally small, and some of them are poor in appearance. In 1836 the sub-deanery was divided, and a handsome gothic church, dedicated to St. Paul, and capable of accommodating 1000 persons, was erected without the walls. Before this was built, St. John's proprietary chapel furnished the chief accommodation for public worship in connection with the Established Church. The Independents, Wesleyan and Primitive Methodists, Baptists, Quakers, Unitarians, and other bodies have places of worship. There are in the city National, British, and Infant schools. There is a Blue-Coat school, founded in 1702, in which 28 boys are boarded and educated; and such of the boys as conduct themselves well receive on leaving the school a sum of money to enable them to set up in business, or otherwise to promote their interests. The revenue of this foundation is above 1800*l.* per annum. The Prebendal Grammar school was re-founded by Bishop Story about the close of the 15th century, but the school is believed to be coeval with the cathedral. It has an income of 20*l.* a year, and had 18 scholars in 1852. A Diocesan Theological college, founded by Bishop Otter in 1839, is under the care of a Principal and a Vice-Principal. Bishop Otter's Training college was originally founded by the bishop about 1841; in 1850 a new and handsome building was erected as a memorial of the founder, and bearing his name. Provision is made

for 24 students. The number in residence in July 1852 was 16. A model school is attached to the Training college.

The guildhall, which is appropriated to the transaction of town and county business, was formerly a chapel belonging to an ancient monastery of Gray friars. The council chamber or town-house contains, besides the required business-rooms, a commodious and elegant assembly-room. The market-house is neat and commodious. The market-cross, an octagonal building in the centre of the city, was erected by Bishop Story, who held the see between 1478-1502. It is of large size and pleasing proportions, and is one of the very finest and most elaborately ornamented market-crosses remaining in England. The infirmary, opened in 1827, is a fine building to the north of the city, surrounded with grounds for the use of the patients. Its erection is to be ascribed to the exertions of Dr. Forbes. A wing was recently added for fever wards at the expense of Charles Dixon, Esq., of Stansted Park. St. Mary's hospital is an ancient foundation for the support of old and infirm persons who have been reduced to poverty. Chichester possesses a literary and scientific institute, with a museum. There is also a savings bank. Quarter sessions and a county court are held in the city.

Chichester is well built, lighted, watered, and drained; the principal streets are wide, and contain many good houses. There is communication with the sea at Chichester harbour by means of a short canal, which joins the Arundel Canal as it passes to the south of the city. This canal is chiefly used for the conveyance of coals. The number and tonnage of vessels registered as belonging to the port of Chichester on 31st December 1852 were—Under 50 tons 27, tonnage 584; above 50 tons 11, tonnage 1222. The entries and clearances at the port during 1852 were as follows:—Coasting trade, inwards 294, tonnage 17,584; outwards 151, tonnage 5139; foreign trade, inwards 4, tonnage 210; outwards 1, tonnage 47. Chichester possesses no manufactures. The market held on alternate Wednesdays for cattle, sheep, horses, and pigs, is one of the largest held within the precincts of any town in England. The weekly market on Saturday is chiefly for corn. Fairs are held on St. George's day, Whit-Monday, St. James's day, Michaelmas day, and October 21st. Large quantities of corn are sent from Chichester to London and the west of England. There are several extensive malting establishments in the city. Tanning and brewing are carried on.

The see of Chichester was originally founded at Selsea, in the 7th century, and removed to Chichester in 1071. The diocese includes the entire county of Sussex, and comprises 311 benefices: there are two archdeaconries, Chichester and Lewes. The chapter consists of the dean, four canons, the archdeacons, precentor, chancellor, with non-resident and minor canons. The income of the bishop is 4200*l.* a year.

(Horsfield, *Sussex*; Dallaway, *Sussex*; Hay, *Chichester*; *Communication from Chichester*.)

CHIEVELY. [BERKSHIRE.]

CHIGWELL. [ESSEX.]

CHIHUAHUA. [MEXICO.]

CHILI, or CHILE (Republic of), South America, lies along the shores of the Pacific, between 25° and 42° S. lat.; but the archipelago of Chiloe, which also belongs to it, extends about two degrees farther south. The republic of Chili claims the whole coast to the Strait of Magalhaens, and the islands as far as Cape Horn, together with a portion of Patagonia, as belonging to its territories; but as no settlements have been formed in these countries, we shall limit our description to the tract between 25° and 42° S. lat., which extends from the chain of the Andes, forming its eastern boundary (between 69° and 71° W. long.), to the shores of the Pacific Ocean (between 70° and 74° W. long.) and the island of Chiloe.

Chili within the above limits is bounded E. by the Argentine Confederation, from which it is divided by the Andes; N. by the desert of Atacama, which belongs to Bolivia; W. by the Pacific Ocean; and S. it is separated from the island of Chiloe by the Strait of Chacao, and bounded by the Bay of Ancud.

Area, Coast-line, &c.—The republic of Chili extends from north to south about 1175 miles; its breadth varies between 100 and 200 miles; its area, including Chiloe, is about 180,000 square miles. The area of the country, as claimed by the republic, is of course very much larger—probably not less than twice as large. According to the last official census (1843), the population was 1,080,000. By very recent estimates the population, including that of the new province of Arauco, amounts to 1,133,802, thus distributed among the several provinces:—

Atacama	25,165
Coquimbo	85,349
Aconcagua	91,674
Santiago	207,434
Colchagua	173,073
Valparaiso	75,962
Talca	71,381
Maule	118,309
Nuble	89,955
Concepcion	109,526
Valdivia	23,098
Arauco	14,000
Chiloe	48,876
Total	1,133,802

The coast from its southern extremity by the island of Chiloe, bears generally north-north-east, and more or less parallel with the Andes, to the northern termination of the republic at Point Taltal. The archipelago of Chiloe consists of a number of wild rocky islands and islets, of which only one, Chiloe, is of any importance; many of the smaller islands however afford supplies of water and provisions to vessels navigating this coast. Chiloe possesses three or four good harbours; San Carlos, the principal, is said by Captain Fitzroy to be an excellent harbour, while Castro appears to be little inferior. Several dangerous islets and sandy shoals lie between the northern termination of Chiloe and the broad but shallow and wild Maullin Inlet, rendering this a place to which it is advisable that seamen should give a wide berth. About Godry Point, at the mouth of the inlet, the shore is low. From this point a bold and rocky coast trends north-north-west for 34 miles to Cape Quedal, a lofty and bold promontory, which, like most of the headlands on this part of the coast of South America, has many detached rocks lying close to it. From Cape Quedal to Point Galera the coast bears north-north-east. Behind this point rise the Valdivia Hills (1550 feet), their three peaks forming a conspicuous landmark; they terminate seaward in Point Falsa. Here the shore sweeps round north-east to Gonzales Head, a bluff wooded cliff, behind which is Port Valdivia, the first harbour which offers north from San Carlos. Port Valdivia is a secure and apparently spacious harbour, but the part which affords sheltered anchorage for large ships is somewhat confined.

Eight miles from Gonzales Head is Bonifacio Head, whence the coast bears away north-east to Chancan Cove, the mouth of the river Mehuin; beyond which it bears northward to Cauten Head, being generally low and sandy, with occasional bluff headlands. Off Cape Tirua is Mocha Island, which is about 7 miles long by 3 miles broad; its surface is hilly, the highest point attaining an elevation of 1250 feet, and it appears to be very fertile. The passage between it and the mainland is open, and perfectly free from danger. From Cape Tirua to Tucapel Point, about 40 miles, the coast is wild, unsheltered, and very dangerous; a short distance south of Tucapel Point is Molguilla Point, on which her Majesty's ship Challenger was wrecked in 1835. Beyond Tucapel Point is Tucapel Head, which, with Millon Point, protects the cove into which the Leibu River opens, and which affords shelter for small vessels. Carnero Bay is merely an open bight, unfit for shipping. Off Arauco Bay lies the low and dangerous island of Santa Maria. The wide bay of Arauco affords one or two sheltered spots, as Luco Bay, where shipping finds tolerably secure anchorage in all seasons, and there is good though exposed anchorage throughout the bay itself. At the northern extremity of Arauco Bay is the river Biobio, which is inaccessible to shipping on account of sandbanks and of the south-west swell. The modern town of Concepcion is a short distance up this river. Old Concepcion, or Penco, lies at the southern extremity of Concepcion Bay, some miles farther north. This bay is said by Captain Fitzroy to be "the finest port on this coast, being 6 miles long and 4 miles wide, with anchorage ground everywhere, abundant space, and all well sheltered." Farther north is Coluimbo Bay, which affords safe anchorage for coasting vessels, and "has always been the scene of smuggling transactions." Beyond this the coast continues in the same generally north-east direction for 40 miles to Cape Carranza. A few miles farther north is Cape Humas, which marks the mouth of the river Maule, about a mile above which, on the left bank, is the little town of Constitution, which would perhaps rise into some commercial importance, being near the outlet, and the natural port of a remarkably rich and fertile country, did not a bar at the mouth of the river render it inaccessible to vessels of any size. Thence the coast continues still nearly north, and occasionally broken by a projecting headland, as Points Topocalina, Toro, &c., and affording a few sheltered coves, as San Antonio, Quintay, &c., to Point Curaumarilla, from which the land bears north-east for seven miles to Los Angeles Point, the southern extremity of Valparaiso Bay, at the southern end of which lies the town of Valparaiso, at the base of hills from 1200 to 1400 feet high. [VALPARAISO.]

About 360 miles W. from the coast at Valparaiso, lies the island of Juan Fernandez, or Masatierra ('more landward'), as it is called by the Spaniards: it is about 18 miles long by 6 miles wide. Its northern half is an elevated mass of trap and basalt rocks furrowed with pleasant valleys, and mostly covered with wood; the southern half, which is only slightly raised above the sea, is rocky and barren. On its northern shore, and about three miles from its eastern extremity, is Cumberland Bay, which affords safe anchorage for vessels of any size. Goats in a wild state are found here; on the rocky shores are seals and sea-lions; fish, especially cod, are plentiful along the coast. The island is very subject to earthquakes. In 1848 there were only eight inhabitants on the island. It was on this island that Alexander Selkirk was left and lived alone for more than four years. His adventures are commonly though incorrectly said to have supplied De Foe with materials for his 'Robinson Crusoe.' About 92 miles W. from Juan Fernandez is the smaller island of Masafuera ('more seaward'), a mass of precipitous rocks rising to the height of 3000 feet. It is generally covered with trees, has no convenient landing-place, and no inhabitants. Both these islands belong to Chili.

Returning to the coast of Chili and continuing our course north-

ward, we soon reach Quintero Bay, another spacious and tolerably sheltered harbour. A little farther north are the dangerous Quintero Rocks, east of which is Horcon Head, the southern headland of Horcon Bay, off which during nine months in the year there is secure anchorage in from 10 to 15 fathoms. The coast now bears slightly to the west for about 25 miles, to a low rocky point called Lengua de Vaca, which forms the southern side of Tongoy Bay, once frequented by American whalers. About 14 miles farther is the much-frequented Coquimbo Bay, and immediately south of it is the small land-locked harbour called Herradura Coquimbo. Proceeding northward, the coast continues to be broken into numerous coves and small bays, among others are Tortoralillo, Chungunga, Huasco, and Herradura de Carrisal ports, while many small rocky islands and reefs lie off the shore. From Cape Leones the trend of the coast is north-north-east. The spacious bay of Salado is rendered dangerous for shipping by the presence of numerous rocks, some sunken and others visible. Copiapó, the next harbour of any magnitude, is also unsafe, owing to dangerous shoals and want of shelter. Off it lies the singular island, Isla Graude. Port Ynglis affords anchorage for small vessels, but Port Caldera to the north of it is a much finer harbour. A pier was erected here two or three years back, and a railway formed in connection with it several miles inland, and it appears probable that this port will concentrate in itself much of the traffic of the rich agricultural and mining district of Atacama, which has hitherto been carried to Copiapó. Several of the small ports recently named, and others not noticed, are used occasionally for the shipment of a cargo of copper ore. A few miles farther north is another very good harbour, Port Flamenco, as yet however very little used except by the native fishermen. No other harbour of any consequence occurs before Point Taltal, the boundary between Chili and Bolivia, is reached. The rise and fall of the tide along the coast of Chili is about five or six feet. ('Admiralty Charts' and 'Sailing Directions for South America.')

Surface, Hydrography, &c.—The Andes, which from the Strait of Magalhaens as far north as the Bay of Ancud press close on the shores of the Pacific, appear to turn east at the northern extremity of that bay, but soon resume their northern direction, in which with some slight bends to the east and west, they continue along the boundary-line of Chili. The Chilean Andes, as they are here termed, will be found sufficiently described under ANDES and ARGENTINE CONFEDERATION. Several of the peaks of the Chilean Andes rise above the line of perpetual snow, which in these latitudes is found at about 14,000 feet above the sea. The summits which are covered with perpetual snow are the Peak of Aconcagua (south of 32°), the highest volcano in the world, being 23,200 feet above the sea, the Peak of Tupungato (south of 33°), the Volcano Penqueñes (near 34°), the Peak of Descabezado (north of 36°), and the Volcano of Antuco (north of 37°). The mean height of the whole range seems to be lower south of 35° than north of it, though the summits in the whole range seem to attain nearly the same elevation. This portion of the Andes contains many volcanoes. They are extremely numerous to the south of 35°, where about twenty are known to exist, and it is supposed that many are still unknown. Between 35° and 30° only a few occur, and at great distances from one another. Still farther north no volcano is known to exist in the Andes between that of Coquimbo (south of 30°), and that of Atacama (south of 21°).

Several mountain passes traverse this range. The most frequented is that of Uspallata, which passes over the range between the peaks of Aconcagua and Tupungato, traverses the valley of Uspallata, and unites Santiago de Chili with Mendoza in La Plata. Its highest point, called La Cumbre, is 12,454 feet above the sea. The Pass of the Portillo traverses the Andes south of the Peak of Tupungato, passing through the northern part of the valley of Tunyan. Its highest point is on the eastern range, where it rises to 14,365 feet above the sea. The Pass del Planchon traverses the range between the Volcano of Peteroa and the Peak of Descabezado, and is less elevated than the others, reaching only about 11,000 feet: vegetation extends to its summit. The Pass of Antuco, which crosses the range near the foot of the volcano of that name, probably does not rise above 12,000 feet. As it traverses the country of the independent Indians, who occupy the Pampas of La Plata, it is not much used. Besides these passes there are others over the Andes, but all of them are nearly if not quite impracticable for mules in winter (from June to September).

The districts of Chili north of the Rio Chuapa (31° 30' S. lat.) resemble the coast of Peru, and the whole of that country may be considered as the western declivity of the Andes. Near the high range the country is still between 6000 and 8000 feet above the sea, and it lowers gradually to the west, till it terminates near the sea in an extensive plain, about twenty miles in breadth, and from 60 to 80 feet above the sea. The country between this plain and the chain of the Andes is very uneven, exhibiting numerous ridges of low hills, which in some parts, especially near the Andes, and near the plain along the shores, run parallel to the great chain and the Pacific; but in the intermediate country they continually change their direction. The surface presents either bare rocks, or is covered with sand, and nearly without vegetation, except a few stunted shrubs, which generally occur in the narrow glens and ravines, with which it is sparingly intersected. A few rivers rising in the Andes run in deep beds

through this country, but most of them have only water in the spring (September till December), when the snow is melting in the upper region of the Andes, and they are dry during eight or nine months of the year. Only three rivers, the Copiapó, Guasco, and Chuapa, have water all the year round. On their banks are the few cultivated spots, which are irrigated by water drawn from the rivers. But the greater part of the small level tracts along the watercourses are unfit for cultivation, being covered with incrustations of salt, which in some places are five or six inches thick, and occupy the whole surface, covering even the low grasses. The few spots which are cultivated produce only maize, potatoes, a small quantity of wheat, and considerable quantities of fruits. Few countries of equal extent possess greater metallic wealth, especially gold, silver, and copper, but the extreme sterility of the country prevents the working of these mines, except when they are very rich. In climate these districts resemble Peru. It never rains, but sometimes a pretty strong dew falls in the morning, which refreshes the plants. This extreme dryness of the air is accompanied with a very inordinate degree of heat, the thermometer in summer rarely attaining more than 70°; and in winter the temperature is sometimes so low that the morning dew is changed into snow. This general description applies only to the country north of 30°, south of which the cultivable spots are more extensive and more numerous, and the country is annually refreshed by a few showers of rain.

From the snow-capped peak of Aconcagua a mountain ridge runs directly west, and terminates at a short distance from the sea. It is called Cuesta (ridge) de los Angeles, and attains a considerable height, which however greatly decreases as it proceeds westward. Another ridge, branching off from the Andes at the Peak of Tupungato, runs first north-west, and is called Cuesta de la Damesa: it then turns west, and may be said to terminate at the Campana de Quillota, a mountain which rises to about 2500 feet above the sea, from which it is about 12 miles distant. A much lower ridge extends farther west, terminating not far from the shore and the mouth of the Rio de Aconcagua. The country inclosed by the Cuesta de los Angeles, and those of La Damesa and Chacabuco, is drained by the *Rio de Aconcagua*, which rises on the north-west declivity of the Peak of Tupungato, and runs more than one-third of its course in a narrow and elevated glen, nearly parallel to the chain of the Andes in a north-north-west direction. It then gradually turns west, but the valley through which it flows is still narrow, till it has terminated another third of its course, when it enters the valley or plain of Aconcagua, a beautiful level tract, extending from east-south-east to west-north-west 15 miles, with a breadth of 13 miles where widest. This plain is about 2600 feet above the sea, but as the river has water enough to irrigate the whole, it is well cultivated, and perhaps the most populous portion of Chili. At its western extremity it lies nearly contiguous to the valley of Putuendo, which is smaller, but also fertile and well cultivated, and extends northward to the Cuesta de los Angeles. After the junction of the Rio de Aconcagua with the Rio Putuendo, the mountains again approach its bank, but soon retreat a little farther; and hence to the mouth of the river extends the valley of Quillota, which is not much inferior in fertility to the others, and is about three or four miles wide.

South of the Cuesta de Chacabuco the level country begins to occupy a much larger portion of the surface. The plain of Santiago, beginning at the foot of the range, extends south to the banks of the Rio Maypú. Towards the north it is from 6 to 8 miles wide, but farther south it grows wider, and on the bank of the Maypú, from east to west, it is about 20 miles. Its soil is stony and dry, and it can only be cultivated where it is irrigated. Cultivation accordingly exists only in the neighbourhood of the rivers, and of the canal by which the water of the Maypú has been brought upon it. The country between the plain and the Andes is filled by mountains of various heights, with steep declivities, and nearly without vegetation: the valleys intersecting them are narrow, and covered with an immense number of greater or smaller stones, which have fallen down from the adjacent mountains. The country between the plain of Santiago and the Pacific is traversed by some ranges of hills, which rise to no great height above the adjacent plains, and are southern offsets from the Cuesta de Chacabuco. The plains between them are pretty level, and of moderate extent: the soil is dry and stony, without water and trees.

The *Rio Maypú* has its sources in the Andes, between the Peak of Tupungato and that of Cauquenes, and one-third of its course lies between the high offsets of the Andes in narrow valleys. Towards the plain of Santiago its valley widens. When the river has entered the plain, the canal of Maypú conducts a portion of its waters to the centre of the plain, while the river, continuing its western course, traverses its southern portion. After its junction with the Rio de Colina, which traverses the plain of Santiago, but has water only in the rainy season, the Maypú enters the valley of Melipilli, from 4 to 6 miles wide, which contains large tracts of well cultivated land. The whole course of the Maypú is about 160 miles. It has a sand-bar at its mouth.

The country south of the Rio Maypú has a different character. Towards the Andes it is covered with the high lateral branches of that range, which inclose narrow and elevated valleys. But about

two-thirds of the country rise in gentle undulations, and contain comparatively few steep and high hills. Here also the rains are by no means abundant, nor do they last for any length of time: agriculture therefore cannot be carried on without irrigation, and the tracts of ground under cultivation are not extensive. No trees of large size are found in Chili north of the Rio Cachapual, but their number increases farther south, till on the banks of the Rio Maule the forests of high timber-trees become very extensive. The *Rio Maule* rises in the Andes at the foot of the Peak of Descabesado, near 36° S., and runs ~~first~~ nearly due west. When it has arrived at the more level country it turns north-west, and flowing in a diagonal line, falls into the sea about $34^{\circ} 40'$. It is the most northern of the navigable rivers of Chili. At high tides vessels, not drawing more than 6 feet water, may enter its mouth, and proceed some small distance up it. Flat river-barges may ascend at any season for 20 miles and upwards. The country along its banks is remarkably fertile, and there are extensive forests of timber-trees. The country between the Rio Maule and the Rio Biobio is even better adapted to agriculture; but since the expulsion of the Spaniards it has been nearly deserted, on account of the frequent incursions of the neighbouring Indian tribes. This tract contains much more level ground than any other portion of Chili. The Andes here terminate by a steep descent, and without offsets; and at their foot begins, in the northern districts, an undulating country, intersected with small plains. In the southern districts the level country begins immediately at the foot of the range, and extends to a considerable distance from it. The Travesia (heath) of Yumbel, a plain 60 miles long, and nearly as wide, between the towns of Yumbel and Tucapel, is covered with sand and small pieces of volcanic matter; it is without trees, water, and vegetation, except at a few spots. Püppig thinks it probable that it was once covered with water, and formed a lake. A chain of low hills divides it on the south from the plain of the Isla de Laja, which is nearly as large, and contains only a few low hills. This plain, which is covered with grass, is of great fertility. The country between this plain and the sea is covered with high but gently-sloping hills, which are partly clothed with wood and partly bare and sterile. Along the rivers, especially the Biobio, the soil is very fertile. The *Rio Biobio* rises in the Andes near 38° , and runs in a west-north-west direction to the Pacific, which it enters north of 37° S. lat., after a course of about 150 miles. In its upper course it is deep and rapid. It becomes navigable for canoes and rafts at Nacimiento, 40 miles from its mouth, which Captain B. Hall found to be 2 miles wide, though too shallow for large vessels.

The country south of the Biobio, though included in the territories of the republic, is for the most part in possession of the independent tribes called Araucanos. [ARAUCANA.] This country, so far as it is known, is nearly covered with high trees, which frequently form impenetrable forests. The surface seems to be nearly a level up to the foot of the Andes, with the exception of a range of hills running north and south, and the soil very fertile, as may be inferred from the great number of warriors whom the Indians can send into the field. The *Rio Callucalla* (also named Rio de Valdivia) is by far the deepest of the rivers of Chili: 60-gun ships can enter its mouth without great danger; but it is not known how far it is navigable.

Geology, Mineralogy, &c.—The geological character of Chili has already been noticed under ANDES. The higher parts of the Chilean mountains appear to consist mostly of schistose rocks, while the lower chains are granitic. Everywhere are traces of igneous agency. Sienites, basaltic and felspathic porphyrites, of rich red and brown tints, trachytes, and other plutonic rocks abound. Hornblende and mica-schists, clay-slates, and other metamorphic rocks occur everywhere. Quartz occurs very generally in connection with metallic veins. The carboniferous strata are richest in the district around Concepcion. Limestone rocks of various qualities occur in numerous places; excellent statuary marble is obtained in Copiapó. Gypsum abounds. Lava, tufa, obsidian, &c., are found in beds of considerable thickness on the slopes of the volcanoes.

Probably no country is more subject to earthquakes than Chili; they occur however much more frequently along the coast than in the interior. In the northern districts slight shocks are felt almost every day, and occasionally several times in a day. Sometimes they destroy the towns and lay waste a great extent of country. In 1819 the town of Copiapó was levelled to the ground, and in 1822 the damage done in Valparaiso and the country about it was not much less. In 1835 the town of Concepcion was entirely destroyed; and in 1837 Valdivia was ruined. In the earthquake of 1822 the rocks inclosing the harbour of Quintero, which is some miles north of the mouth of the Rio Aconcagua, were raised 4 or 5 feet above their former level. In that of 1835 the coast about Concepcion and elsewhere was in like manner raised several feet, but it appears to have subsequently gradually subsided nearly to its former level.

Gold dust is found in the sand of nearly all the rivers which come down from the Andes, as in the Rio de Aconcagua, Rio Maule, and Biobio. Some gold mines occur in the northern districts, where they are worked, but the produce is inconsiderable. Others are said to exist in the southern provinces. The total quantity of gold annually obtained is about 25,000 ounces. Silver is more abundant, but the ore is not generally very rich. The average quantity of silver obtained annually is about 182,000 ounces. The richest mines are in the vicinity

of Copiapó. The copper mines are very numerous in the northern districts, especially about Illapel, Coquimbo, Copiapó, and Guasco; copper is also found farther south in the Andes, but is not worked. The copper of Copiapó is most valued. The quantity of copper exported has of late years been about 100,000 cwt. A small portion comes to Europe, but by far the larger part goes to India and the United States. Ores of lead, tin, zinc, iron, antimony, manganese, arsenic, &c., are said to exist. Sulphur is obtained of remarkable purity.

The coal formation extends under a considerable part of the southern provinces. The coal obtained about Concepcion is the best: it forms an article of some importance in the trade of Valparaiso. Salt does not exist in sufficient quantity. A good deal is collected in the lakes of Bucalemu, south of the mouth of the Rio Maypú, in which the salt-water of the sea is subjected to evaporation. A great quantity of salt is imported from Peru and Patagonia.

Climate, &c.—The climate of Chili varies much in the different districts; but it appears to be almost everywhere healthy. The climate of the central portion of Chili may be compared in some degree with that of Italy. The greatest heat occurs in the months of January and February, at which time the thermometer on the coast frequently rises to 85° during the day, and 70° to 75° during the night. The hottest part of the day is before ten o'clock in the morning, about which time wind rises in the south, which often blows with great violence. In the interior, even in the elevated valley of Aconcagua, the thermometer frequently rises to 90° and 95° in the shade; and as the southern wind is not strong here, the days are sultry, but at sunset a delightful breeze springs up, which cools the air. The months of March and April are much more temperate, especially in the interior; and at the end of April the rains generally set in, and occur up to August, and then the Andes are covered with snow, which generally lies for four or five months on the higher parts of the range. Snow and also some ice occur in the elevated valleys, but it soon melts, and the atmosphere is only chilly while the rain is falling. Snow never occurs along the sea. The number of rainy days in the northern districts is commonly fourteen, and seldom more than twenty throughout the year. This rain, which is very heavy, seldom falls for more than three days continuously. In the southern districts, where the number of rainy days is much greater, being on an average forty, the rain sometimes continues ten days without intermission. After the rainy season, in September, the spring begins, which is frequently more chilly than the winter itself, and ice is sometimes observed even on the coast. Summer begins towards the commencement of November, and then the sky, which during the spring is covered with clouds, is entirely free from them. The heat gradually increases, and in the northern districts vegetation begins to die away in December, but in the southern districts the country is always clothed with verdure, as the plants are occasionally refreshed by rain, and the dews are frequent and heavy. The mean temperature at the mouth of the Rio Aconcagua in July and August is 70° , and at Talcahuana, near Concepcion, one or two degrees less.

Chili is subject to strong periodical gales. In the beginning of the rainy season (May and June) the north and north-western winds prevail, and frequently blow with great violence. As all the harbours of this coast are open to that quarter, vessels abandon them, and weather the storm in the open sea. Between 25° and 35° S. the wind during eight or nine months blows from the south or south-east, from a little before noon till about sunset, but occasionally till midnight, and frequently with great force, especially in summer and autumn. At the same time a current, of about half a mile an hour, usually runs along the coast to the north, both which circumstances favour navigation northward, but the return to the south is rendered tedious and difficult. Easterly winds are rare, except in September, when they suddenly lower the thermometer, and in February and March. They often blow with such force as to throw down the strongest trees.

Agriculture, &c.—Although much improvement has taken place of late years the cultivation of the soil is in a very backward state. The stimulus which has been given by the great demands made by the Californian and Australian markets has done much to bring about a better state of things; and the government has anxiously encouraged the immigration of European, and especially of German, agriculturists, many of whom have settled here. The soil is in many parts very fertile, and some spots are now well cultivated. Very large quantities of grain, flour, and vegetables are exported, principally to California and Australia, but also to the harbours along the western coast of South America.

Agriculture is almost limited to the productions of Europe. Maize is grown everywhere, but not to a great amount. Wheat is the staple; it is raised all over the country, and gives in many places very abundant crops, especially south of the Rio Maule. Barley is grown in the southern provinces to some extent, but very little north of the Rio Maule: oats only on a few estates. Leguminous vegetables are grown abundantly, especially different kinds of beans, and supply an article of exportation. Hemp is raised in the country north of the Rio Maypú; it grows to an extraordinary height and of superior quality. Hemp is grown in no other country on the west coast of South America. Intertropical plants do not succeed; for though the heat in the northern district is great the extreme dryness of the air

is unfavourable to the growth of plants which require a long time in coming to maturity. The sugar-cane was tried some years ago, but it has been abandoned.

Vegetables are now largely cultivated. Potatoes are grown in great abundance in the northern districts. Capsicum is raised in the valley of Aconcagua, and forms a considerable article in the internal commerce of the country. The quinoa (*Chenopodium Quinoa*) is peculiar to Chili. In the southern provinces it is raised in abundance: it somewhat resembles millet, and a pleasant beverage is made of it. Melons and water-melons, as well as pumpkins, succeed very well in the northern provinces, where they are raised in great quantities and attain a surprising size.

Figs, grapes, pomegranates, oranges, and peaches succeed best in the most northern districts, whence they are exported to the other parts of the state. Wine is made at different places, but not with any great success. The best is made near Concepcion. The olive-tree succeeds well, but the oil is bad for want of a proper method of preparing it. Extensive forests of wild apple and pear-trees occur along the foot of the Andes in the southern provinces. The fruits are hardly eatable, but cider is made of them. The forests, which cover so considerable a portion of the southern provinces, contain many fine timber-trees, which form one of the more important articles of export. In the Andes south of the Volcano of Antuco many valleys are covered with forests of the *Araucaria*, whose fruits contain a great number of nuts twice as large as an almond, which are very palatable, and constitute the principal food of the Indian tribe of the Pehuenches.

Cattle are very abundant north of the Rio Maule, the declivities of the mountains and high hills affording copious pasture for four or five months, and some low tracts which are sown with lucerne, for the remainder of the year. Single proprietors sometimes possess from 10,000 to 20,000 head of cattle. Live stock, jerked beef, tallow, and hides are large articles of export. Cheese is made on the banks of the Rio Maule and sent to Peru: butter is made in the neighbourhood of the larger towns. Horses, though less numerous than formerly, are still bred in considerable numbers: they are of a middling size and strong, and are in much request for exportation. Mules and asses are also largely bred; they are said to be superior to any other for carrying burdens over the passes of the Andes. Sheep are not numerous, and their wool is bad. Goats are more plentiful. Swine are found in abundance in the archipelago of Chiloe, whence hams are exported: on the continent they are less numerous, and their flesh is not of good flavour. Pork is salted in the harbours as provisions for ships. The island of Mocha, between Concepcion and Valdivia, is overrun with wild horses and pigs, both of which are used as fresh stock by the whaling and sealing ships in the Pacific.

Commerce, &c.—Chili is probably the only American state formerly subject to Spain whose commerce has increased since the separation from the mother country. The importations, according to a rough estimate, have averaged during the last five or six years about 2,000,000*l.*, and the exportations, including the transit commerce, about 2,500,000*l.* The foreign trade is mostly carried on through VALPARAISO, under which title it will be further noticed. The larger part of the imports are from Great Britain: they consist chiefly of cotton and woollen goods, iron, hardware, earthenware, &c. The United States have the next largest share in the import trade; the goods sent consist chiefly of tobacco, sugar, oil, soap, candles, and rough manufactured articles, besides tea from China, and silks &c. from the East Indies. France sends a large quantity of wine, brandy, silks, paper, perfumery, and fancy goods. Germany sends linens, iron-ware, glass, &c. Coffee, cotton, rice, salt, maté, spirits, sugar, dyes, &c. are imported from various ports in Central and South America.

The articles of export, besides the bullion sent to Europe and the United States, are grain and vegetables to California and Australia, and various parts of South America; hides and copper to England and the United States; hides to France, Germany, and Belgium; copper to China and the East Indies; and the various European and Indian goods received at Valparaiso and sent to the principal ports of South America—this transit-trade constituting in fact a most important part of the commerce of the republic.

The manufactures of Chili are chiefly of the ordinary articles of domestic consumption, as hempen cloths, hats, ponchos, earthenware, cordage, leather, soap, tallow, spirits, &c., and coarse iron and copper utensils.

The coins, weights, and measures used in Chili are the same as those of Spain.

Divisions, Towns, &c.—Chili is divided into 13 provinces, which are subdivided into 52 departments. These provinces, beginning from the north, are as follows:—

1. Atacama comprehends the most northern and sterile portion of the republic. It exports gold, silver, copper, and dried fruits. The principal town and port is Copiapó; but Port Caldera is attracting to itself much of the export trade of this rich mining district. The population of the province is 25,165.

2. Coquimbo extends southward from Atacama to the Rio Chuapa. In general character it much resembles Atacama, but is somewhat more fertile and populous. The copper-mines of this province are the

richest in Chili; there are also gold- and silver-mines. The exports are the same as from Atacama, with the addition of some chinilla skins. Coquimbo town, near the bay of the same name, is the capital and port. The population of the province is 85,349.

3. Aconcagua contains the valley of the Rio Aconcagua and the countries north of it to the Rio Chuapa. It exports cattle, grain, and fruits, and has some rich mines of gold and copper. The capital is S. Felipe, or Villa Vieja de Aconcagua. This province has been already fully described. [Aconcagua.] The population is 91,074.

4. Santiago comprehends the plains along the foot of the Andes on both sides of the Rio Maypú, and part of the hilly and in some places mountainous country between the plains and the Pacific. It contains few mines, and their produce is small. Its wealth consists in wheat and cattle. It contains Santiago, the capital of the republic. The population is 207,494.

5. Valparaiso is a small province comprehending the country around the harbour of the same name, and is surrounded by the provinces of Santiago and Colchagua. Large quantities of grain and vegetables are raised for exportation. The capital, VALPARAISO, is the most frequented harbour in the republic. The population of the province is 75,962.

6. Colchagua extends between the rivers Cachapoal and Maule, and comprehends a country partly level and partly hilly. It is of great fertility, and produces corn in abundance; cattle are also very numerous. In this province the immense forests begin which cover so considerable a portion of the south; farther north there are no forests. The capital, San Fernando, is a considerable town, and is situated in a very fertile country. The population of the province is 173,078.

7. Talca is an inland province, which has been formed out of the provinces of Colchagua and Maule. It is for the most part mountainous, and is covered with vast forests. Cattle are raised largely. A good deal of copper is found. The population of the province is 71,381.

8. Maule extends from the Rio Maule to the Rio Itata. It produces corn, wine, and tobacco. It is perhaps the most fertile part of Chili, and consists mostly of an undulating country and some small plains. Cattle constitutes the principal wealth of the inhabitants. The chief town is Villa de Cauquenes, a small place situated in a well-cultivated plain. The population of the province is 118,809.

9. Nuble lies to the east of Maule, and comprehends the mountainous country between the Andes and that province. A large part of it is covered with lofty forest-trees. Copper abounds in some places. The inhabitants are however chiefly dependent on grazing. The population is 89,955.

10. Concepcion lies between the rivers Itata and Biobio, and comprehends the sandy plain of Yumbel and the fertile plain of Isla de Laxa, and in part the hilly country extending between the plains and the sea. It is less fertile than Maule, a great part of its surface being occupied by the Travesia de Yumbel and the sandy hills between it and the sea; but the remainder is very fertile, especially the plain of Laxa. Corn and timber are the principal exports. Coal of good quality is obtained, and carried for sale and export to Valparaiso. The capital is Concepcion. The population of the province is 109,526.

11. Valdivia comprehends the countries between the Rio Biobio and the newly-formed province of Arauco; but by far the greater part of this tract is occupied by Indian tribes. Except the town of Valdivia the European settlements are for the most part limited to a small number of fortifications along the banks of the Biobio, among which Nacimiento is the most important. Timber and a little corn are exported. The capital is Valdivia. The population of the province is 23,098.

12. Arauco is a new province, comprehending the southern part of the old province of Valdivia. Nearly the whole of this country is still in the possession of the Araucanians, the most warlike and perhaps the most civilised of the Indian tribes. [ARAUCANA.] The population of the province is estimated at about 14,000. Fort Arauco, on Arauco Bay, one of the most important of the Chilean stations, is described by Captain Fitzroy as merely a small square fort. Maullin Fort, near the western entrance of the Strait of Chacao, is the most southern European settlement on the mainland of America.

13. Chiloe (pronounced Chilō-e) comprehends the island of Chiloe and the smaller islands in the Gulf of Ancud, which together constitute the *Archipelago of Chiloe*. The island of Chiloe is the most northern of that series of larger and smaller islands which skirt the western coast of South America from Cape Horn northward. It is divided from the continent by a wide strait called the Gulf of Ancud, and at its northern extremity by the much narrower strait termed by mariners the Chacao Narrows. It extends from north to south about 120 miles, and from east to west 60 miles, where widest; but its eastern coast being deeply indented the average width probably does not exceed 40 miles. The whole island is a mass of rock, which in no part rises to a greater height than 2600 feet, and is covered with earth and clothed with wood, chiefly consisting of a species of bastard cedar, very durable, and affording excellent timber, which is largely exported. In the island itself it is used for building vessels. The eastern coast, which is much indented, has many excellent harbours, among which the best are San Carlos, Chacao, Dalcabue, and Castro, in all of which

vessels of any size may anchor with the greatest safety. San Carlos is said by Captain Fitzroy to be an excellent harbour. On the west coast is the Lagoon of Cucao, which is upwards of 20 miles in length, and connected with the sea. Though frost and snow are hardly known the climate of the island is chilly. The air is so damp that fogs occur almost daily during the rainy season, which lasts ten months; yet the island is considered to be healthy. The domestic animals are cattle, horses, sheep, and swine. Some hides are exported, and about 10,000 hams annually, of excellent quality. These, with about 250,000 planks, and occasionally grain and potatoes, constitute the exports. The soil being of excellent quality produces rich crops of wheat and barley and great quantities of potatoes. A good deal of butter is made. Fish, as well as oysters and other shell-fish, are very abundant, and in some parts are the chief food of the inhabitants. The interior of the country is little known, the inhabitants all living along the sea-shore, or only at a little distance from it. The northern and eastern coasts are settled by Europeans, but at the southern extremity only Indians in small numbers are found. The people are in appearance more like northern Europeans than Spaniards, being athletic and robust, and having a fair complexion and light flaxen hair. The principal towns are *San Carlos*, on the Strait of Chacao, a small town with about 2000 inhabitants, and *Castro*, which contains two dilapidated churches, and a small and poor population. The most remarkable of the numerous smaller islands of the archipelago are Quinchao, Lemuy, Calbuco, and Llaicha. On Lemuy very good ponchos are made from the wool of the country. The population of the province is 48,876.

The capital of Chili is SANTIAGO; the chief port and centre of commerce is VALPARAISO; both of these will be described under their respective titles. The few other towns of any size or consequence have mostly been enumerated in speaking of the provinces; what further notice seems necessary we add here. Most of the towns of Chili, as mentioned under ACONCAGUA (vol. i. col. 56), are built on a regular plan, and are similar in their general appearance: the churches and other public buildings, and the principal shops, occupy the sides of a central plaza, the area of which serves by day as a market-place, and in the evening as the public promenade; while the main streets diverge from the plaza at regular intervals, and are of uniform width. The houses are generally of a single story.

Concepcion, the capital of the province of the same name, and the seat of a bishopric, stands on the right bank of the Biobio, about 8 miles from the Bay of Concepcion: population about 7000. The town was built after the destruction of the old city of Ponce by an earthquake in 1763. Concepcion itself, after enduring many shocks of more or less violence, was entirely overthrown by a similar visitation in 1835. It was a well-built town, and contained many fine buildings, among others a massive cathedral, which, like the more fragile structures, was reduced to a mere ruin. The city has not yet recovered from the effects of so serious a calamity, but it appears to be making steady progress. It has little trade and no manufactures. Ships generally lie off the *Port of Talcahuano*, at the head of Concepcion Bay, a poor town of about 1000 inhabitants. Concepcion Bay is 6 miles long and 4 miles wide, affords ample secure and well-sheltered anchorage, and is said to be the finest port on this coast. *Constitution* is a small town on the left bank of the Rio Maule, about a mile from its embouchure. As the port of an exceedingly rich agricultural and mining district, and on the line of the best pass across the Andes, Constitution appears destined to rise into considerable importance. At present a sand-bar prevents vessels of much burden ascending to the town; but there appears to be no insuperable engineering difficulty in the way of its removal, if the inhabitants possessed sufficient capital and enterprise. *Copiapó*, population about 4000, on the right bank of the river of the same name, is the principal port of the mining district of Atacama, but appears likely to give place to the superior facilities of the neighbouring harbour of Caldera. The town suffered very severely from an earthquake in 1819 and again in 1822, and on some subsequent occasions. Copper smelting is carried on in the vicinity. *Coquimbo*, population about 8000, the capital of the province of Coquimbo, was founded in 1544 by Valdivia, who named it *Serena*; it stands near the mouth of the Chuapa, about 7 miles from Coquimbo Bay. The town is regularly laid out with houses of one story, having gardens attached, but has few public buildings of any mark. The district abounds in mines of gold, silver, copper, and iron. There is no import trade. A good deal of copper and copper-ore is exported. The port is a mere collection of hovels. *Huasco*, is the small port-town of a mining district in the province of Coquimbo, of some local consequence, but not requiring further notice here; it stands at the mouth of the Huasco River. *Osorno* (40° 20' S. lat.) is one of the most southern towns in the republic. *Petorca*. [ACONCAGUA.] *Rancagua*, near the southern boundary of Santiago, is a place of some importance. *San Felipe de Aconcagua*. [ACONCAGUA.] *San Fernando*, the capital of Colchagua, stands near the base of the Andes, and is a tolerably large and flourishing town, and the centre of a rich and fertile district. *Talca*, the capital of the province of the same name, stands near the right bank of the Rio Maule in the upper part of its course, and is also a town of considerable note. The district abounds in forests of fine timber. *Valdivia*, the capital of the province of the same name,

stands on the left bank and at the estuary of the Calacalla, at the head of the Port of Valdivia (39° 49' S. lat., 73° 18' W. long.): population about 2000. Owing to a bar at the mouth of the Calacalla, only vessels of light burden can ascend to the town. Although the district is extremely fertile the town has little trade. The exports are chiefly of planks and staves. The town, which consists of a number of scattered wooden houses, surrounded by a forest of apple-trees, bears a poor and neglected aspect; the many costly fortifications, erected by the Spaniards with a view to rendering the harbour impregnable, have been suffered to fall into decay.

Inhabitants.—The population of Chili, north of the Rio Biobio, is almost entirely composed of descendants of Europeans. There are no Indians north of the Biobio, except in the valleys of the Andes south of 34° S. lat. Negroes are few in number. The Indians who inhabit the country south of the Biobio are known by the name of Araucanians, and have obtained some celebrity by the high degree of civilisation attributed to them by Molina. [ARAUCANA.] They appear to consist of several tribes, who speak different dialects of the same language, and are divided by the Chilenos into 'Indios Costinos,' or Indians inhabiting the coast, and into 'Moluchos,' who inhabit the extensive wooded plains stretching along the foot of the Andes, and have resisted all attempts to conquer them. These nations derive their principal subsistence from agriculture, cultivating maize, potatoes, beans, and some other articles. In the valleys of the Andes between 34° and 37° S. lat., are the Pehuenches, who seem rather to be addicted to a wandering life. All these tribes still enjoy virtual independence.

History, Government, Finances, &c.—When Francisco Pizarro had overthrown the empire of the Incas in Peru, he sent Almagro to subjugate Chili. With great loss of men, Almagro passed over the Andes and through the desert of Atacama, and entered the northern provinces without resistance, these districts having previously been dependent on the Peruvian empire. But farther south he met the more warlike tribes, and made no great progress. His successor, Valdivia, advanced to the Biobio, and founded the town of Santiago in 1541. For more than 200 years the Spaniards tried to establish their authority in the south, but without permanent success; and in 1771 they were obliged to abandon that country, with the exception of Valdivia, Osorno, and a few small fortresses on the banks of the Biobio.

The first disturbances tending to a separation from the Spanish dominion occurred in 1810. Chili declared itself independent Sept. 18, 1810, but the strife so far from being ended went on increasing till the Chilenos were defeated in 1814 at Rancagua, by the Spanish general Osorio. In 1817 San Martin entered Chili with an army from La Plata, and liberated the country by the battles of Chacabuco (12th February, 1817) and Maypú (5th April, 1818). Since the establishment of the constitution, which was proclaimed in 1830, there have been frequent conflicts between political parties, but the country has on the whole been more peaceable than most of the other South American states, and not less successful.

By the constitution the government received a republican form, with a central legislature and executive. The executive power is in the hands of a president, elected every five years; and a council of state consisting of the ministry, two members of the court of justice, an ecclesiastical dignitary, a general, two ex-ministers, &c. The legislature consists of a Congress composed of a senate of 20 members retaining their functions for nine years, and a House of Representatives elected triennially, to which a deputy is sent for every 20,000 of the population. The judiciary consists of a supreme court of appeal, three other courts of appeal, and inferior courts.

The army consisted in 1852 of 2661 men, besides the militia, which numbered 66,241. The navy consisted of 7 vessels carrying 88 guns.

The revenue of the republic from 1825 to 1832 averaged about 1,700,000 Spanish dollars, and the expenditure exceeded the receipts. In 1851, according to the report presented to Congress 20th August, 1852, the revenue amounted to 4,427,906 dollars (968,604*l.*), the expenditure in 1851 was 4,712,147 dollars (1,030,782*l.*); but this excess of expenditure was covered by the excess of revenue in the preceding year. The amount of foreign debt (chiefly English) was 1,493,000*l.*; of home debt 467,835*l.*

(Molina; Miers; Meyen; Pöppig; Schmidtmeier; Sutcliffe; Gerstaecker; Fitzroy and King; Darwin, &c.)

CHILKEAH. [BAREILLY.]

CHILÔE ISLAND. [CHILL.]

CHIMAY. [HAINAULT.]

CHIMBORAZO. [ANDES, vol. i. col. 355.]

CHINA is an extensive country in Eastern Asia, constituting the principal portion of the Chinese empire. It is situated on the borders of the Pacific, and extends from 20° N. lat. (or, if the island of Hainan is included, from 18°) to 41° N. lat., and if the tract of land projecting on the north-west towards the centre of Asia be added, to 46° N. lat. Its eastern extremity, where it borders on Corea, is out by 124° E. long., and its western, where it borders on the Birman empire, by 98° E. long.; but if the projecting tract be added, it reaches to 85° E. long. Its greatest length, from the harbour of Amoy, opposite the island of Formosa, taken in a north-western

direction to the farthest extremity of the projecting tract, can hardly fall short of 2000 miles. If however this latter tract is excluded, the length of China from the peninsula opposite the island of Hainan to the Great Wall due north of Peking is about 1400 miles; its breadth varies between 900 and 1300 miles. The area of China is about 1,300,000 square miles, or more than eleven times as large as that of the British Islands. The north-western projecting tract is not included in the calculation. According to a state census made in 1812, the population was then 360,279,897, but it would not be safe to regard this as anything like an accurate enumeration; by a state census taken in 1825, the population was only 352,866,012, and this, though not to be regarded in the same light as a European census, is perhaps not greatly in excess.

China is surrounded by countries dependent upon it, except at its south-western and southern side, where it borders on the Birman empire, the kingdom of Siam, and that of Cochin China. On the west of it extend Tibet and the country of Kho-kho-nor, or Ching-hai. The projecting tract is mostly surrounded by Eastern Turkistan, lately called Grand Tartaria, and by Mongolia. Mongolia occupies also the greatest part of its northern boundary, except in the extreme east, where it is bounded by Manchuria, or Ching-king, and by Corea. Its eastern side is washed by the Pacific, which forms a deep gulf between China and Corea, called the Hoang-hai, or Yellow Sea; it assumes the name of Tung-hai, or Eastern Sea, between Corea and the island of Formosa, and that of Nan-hai, or Southern Sea, or more generally China Sea, between Formosa and Hainan, while the strait between Formosa and the mainland is known as Formosa Channel.

Coast-line, Surface.—The coast of China being about 2500 miles, there is only one mile of coast for every 520 square miles. Where China borders on Corea its coast is high and bold, and full of rocky islets. This coast continues on both sides of the peninsula of Leao-tung, or about 240 miles. It is followed by a sandy coast, which in most places is so low that it cannot be seen at a short distance from the shore: this coast extends from the innermost corner of the Bay of Leao-tung for about 360 miles to the neighbourhood of the Straits of Meno-toa, which form the entrance of the Bay of Pe-tche-li. The coast of the peninsula of Chan-tung is rocky, and commonly bold, but not high, except in a few places. It extends from the Straits of Meno-ton to Cape Macartney, and hence to 35° N. lat., about 350 miles. The shores, as far as the Chusan Islands (30° 30' N. lat.), are low and sandy, indeed in many places very swampy, and extend from 420 to 450 miles. From the Chusan Islands to the Bay of Canton the coast is rocky, bold, and high, except in the recesses of the numerous bays and harbours. At some places it rises to a considerable height, and is besides lined with numerous cliffs and rocky islets, in all its extent of about 800 miles. The western shores of the Bay of Canton, for about 30 miles, are formed by a great number of low sandy islands. From the Bay of Canton to the peninsula of Lui-tcheou, about 120 miles, the coast is again rocky and bold, but it does not appear to be high. The shores of the peninsula itself are about 100 miles long, sandy, flat, and low; the remainder of the coast of China is washed by the Gulf of Tonkin (about 100 miles), along which are numerous small islands.

The whole surface of China may be divided into the mountainous country, the hilly country, and the great plain. The mountainous country comprehends more than half of the whole, and the meridian of 112° may be considered its eastern boundary, but to the north of the Hoang-ho it extends as far as 114°. All this immense tract of country is covered by mountains and valleys. The mountains are commonly too steep and rugged to admit much cultivation, but a great part of them is covered with high trees. Towards the north they are mostly bare, but contain immense beds of coal. The valleys are often narrow, but being watered by numerous streams, their fertile soil maintains a numerous population. This general description however applies properly, in all its extent, only to the districts north of the Tapa-ling and south of the Nan-ling, for in those between these two ranges the mountains are less steep, and their sides are commonly cultivated to a considerable height. The valleys too are much wider, and the level land sometimes extends to plains of considerable width, as for instance the plain of Tchong-tu-foo, which is perhaps 20 miles in every direction.

The western boundary of China extends to the mountain chains which constitute the eastern edge of the high table-land of Eastern Asia [ASIA; BAYAN KHANA]; but only the most eastern of these ranges lies within the boundary of China. It may be considered as beginning in the most southern bend of the Yang-tse-kiang, between 101° and 103° E. long., and as extending hence in a north-north-east direction, and terminating in the great northern bend of the Hoang-ho between 107° and 111° E. long. This mountain range, which is called Siue-ling (Snow-range), or Yung-ling, contains a considerable number of snow-capped summits. The snowy mountains are numerous between 30° and 36° N. lat., and more especially between 32° and 34°. But even south of the great southern bend of the Yang-tse-kiang, and at a short distance from its banks, are some snow-covered summits, whence Ritter rightly concludes, that the river breaks through the southern portion of the range. The four mountain chains which traverse China from west to east, may be considered as offsets of this range. South of the snowy mountains, which are situated on the

south of the great bend of the Yang-tse-kiang, is the hilly table-land of Yun-nan. It is of considerable extent, and at a great elevation above the sea. From the eastern edge of this table-land two mountain ranges branch off, the Yu-ling and the Nan-ling. The Yu-ling, the most southern of these ranges, branches off from the table-land in 24° N. lat., and 102° E. long., and runs nearly east to the neighbourhood of the Bay of Canton, dividing the river Ta-si-kiang from the sea. It does not seem to approach the shores of the sea in any point, nor to rise to a great height. The Nan-ling (or Southern Range), which constitutes the most extensive mountain system in China, branches off from the northern edge of the table-land of Yun-nan, where the snowy mountains are situated (26° N. lat. and 103° E. long.), and runs eastward, passing about 150 miles to the north of Canton as far as 116° E. long.; it then inclines to the north-east, in which direction it continues with a slight bend to the west to its termination at the sea near the harbour of Ning-po, opposite the islands of Chusan. Several summits of this range rise above the snow-line, west of 110° E. long., where also it extends to a great width. An aboriginal nation, the Miao-see, have maintained their independence in its fastnesses. A lateral range, which separates the Yang-tse-kiang from its tributary the Yuen-kiang, and extends north-east to the centre of China, is also said to contain some summits which rise above the snow-line. East of 110° no snow-capped mountains occur, though some rise to a great elevation; but even here the range preserves its steep and rugged character. Its numerous branches, running towards the Formosa Strait and the Tung-hai, are also steep and craggy, but those extending northward are of inconsiderable elevation. Three mountain passes are known to traverse the Nan-ling. The most frequented is to the north of Canton, where the range is called Mei-ling (the Chain of the wild Plum-trees, according to Klaproth), and hence the pass is called Mei-ling pass. By this pass goods are transported from Canton into the interior of China. Goods are brought in boats on the river Pe-kiang to the town of Nan-yong-foo. Between this town and that of Nan-gan-foo is the pass where goods are carried on the backs of men, for about 24 miles over rocky mountains. This is the only place, between Canton and Peking, where no water communication exists; for at Nan-gan-foo the goods are again shipped and descend the Kan-kiang and afterwards the Yang-tse-kiang till they come to the Great Canal. The elevation of the Mei-ling mountain-pass is estimated by Staunton to be 8000 feet above the sea. The second pass which is known occurs near 28° N. lat., and 118° E. long., between Kien ning-foo on the east and Kian-tchang-foo on the west of the range, and though the mountains are very steep and rugged it is much frequented; 18,000 porters are said to be continually employed for the transport of goods. The third road, which is a little farther north, connects the town of Kien-ning-foo with the town of Kintcheou-foo, which lies on the west of the range. Though difficult to pass it is much used.

The two other mountain ranges, the Tapa-ling and the Pe-ling, are immediately connected with the Yun-ling, the Tapa-ling branching off south of 33° N. lat. and Pe-ling about 35°. The Tapa-ling runs south of east nearly in a straight line, and terminates near 112° E. long. north-east of the town of Koei-tcheou-foo. It divides the valley of the Han-kiang from that of the Yang-tse-kiang, and rises to a great height; several of its summits exceed the snow-line, as for instance the Kianku-shan, with which it terminates. The Pe-ling, which runs nearly parallel to the Tapa-ling, separates the valley of the Han-kiang from that of the Hoi-ho, or Wei-ho, an affluent of the Hoang-ho, and consequently the two great river-systems of China from one another. It continues in its eastern direction to 113° E. long., and this portion of the range is high, rugged, and steep. At 113° it declines to the south-east, diminishing considerably in elevation and ruggedness. Having attained 32° N. lat. it turns again to the east, and soon subsides into a chain of hills, which terminates on the western shores of the lake Tsiao-hoo, a considerable distance east of Nanking. The western part of this range contains several snowy mountains, though fewer than the Tapa-ling. The obstacles opposed by these two chains to the communication between the provinces which they traverse have been overcome by an artificial road said to be 420 lis, or nearly 150 miles long, and which, through the mountain district, is conducted over deep clefts by long bridges, and often by deep cuttings through high mountains.

These ranges traverse that part of China which lies south of the Hoang-ho. But even the western, and greater, portion of the countries north of that river is almost entirely covered with high and rugged mountains. These mountains belong partly to the northern portion of the Yun-ling, which joins the Hoang-ho at its great bend, and partly are ramifications of the Inshan, a range which extends round the bend of the river on the west and north, and whose offsets enter China between that bend and the town of Peking in several ridges.

Among the mountainous districts must be included the tract of land which lies between the Nan-ling and the sea; but with the exception of the immediate neighbourhood of the range it rather resembles the countries between the Nan-ling and Tapa-ling than those farther north, its valleys being generally wide and sometimes expanding into plains, as for instance the plain of Canton. A considerable portion of the sides of the mountains is also fit for cultivation. If this tract is added to the other mountainous country, it may be said that

rather more than two-thirds of the surface of China are of this character.

The hilly country lies to the east of 112° E. long., and between this meridian and the eastern part of the Nan-ling, and extends north to the banks of the Yang-tse-kiang. The hills, though in many places steep, generally rise with a gentle ascent; and as they do not attain a great elevation, their sides are cultivated and planted with rice on the terrace system. Their tops are covered with forest-trees, generally of the pine kind, which are carefully planted. The levels between the hills are sometimes narrowed into valleys; in other places they expand into plains. They have generally abundance of water in their rivers, and there are some lakes, of which the largest are the Tungting near the confluence of the Yuen-kiang with the Yang-tse-kiang, and the Po-yang, not far from the mouth of the Kan-kiang. The greatest portion of the surface is in a very high state of cultivation.

The great plain occupies the north-eastern part of China. It extends in length 700 miles from the Great Wall, north of Peking, to the confluence of the rivers Yang-tse-kiang and Kan-kiang (30° N. lat.). The Yang-tse-kiang may be considered as its southern boundary as far down as Ngan-king, whence to the sea it is formed by a line drawn from Ngan-king to the sea through Hang-tcheou-foo. The western boundary-line may be marked by a line drawn from King-tcheou-foo, a town situated on the Yang-tse-kiang, to Hoai-king-foo on the Hoang-ho, and hence to the Great Wall, about 50 miles north-west of Peking. The breadth of the plain is various. North of 35° N. lat., where it partly extends to the shores of the Hoang-lai and partly borders on the western side of the mountain range of Chang-tung, which occupies the peninsula of that name, its width varies between 150 and 250 miles. This portion of the plain probably covers an area of 70,000 square miles. Between 35° and 34° N. lat. the plain enlarges, and in the parallel of the Hoang-ho it extends more than 300 miles east and west. It grows still wider to the south, and reaches nearly 500 miles inland in the parallel of the embouchure of the Yang-tse-kiang. The whole plain, containing 210,000 square miles, is seven times as large as that of Lombardy, with which it may in many respects be compared.

The northern part of the plain has a dry sandy soil, impregnated in many parts with saline matter and destitute of trees, but it produces millet and wheat in abundance. South of 35° N. lat. the whole tract along the coast is very low and swampy, being partly covered with numerous lakes and lagunes, and intersected by numerous water-courses both artificial and natural. It produces a great quantity of rice. Further inland the soil is more firm and dry and of great fertility, which is increased by the abundance of water drawn from the rivers and small lakes. It produces rice, cotton, wheat, and tobacco. The southern districts bordering on the banks of the Yang-tse-kiang differ from the other in not being a flat level, but having a surface slightly undulating, on which even a range of hills rises, as the eastern prolongation of the Pe-ling. It is not however less fertile than the other districts. Among its most valuable branches of agriculture is tea, which is extensively cultivated on these low hills (between 30° and 32° N. lat.).

The eastern portion of this plain is traversed by the Great or Imperial Canal, which begins on the south at the town of Hang-tcheou-foo (30° N. lat.), and extends to the town of Lin-tchin-tcheou, where it falls into the river Eu-ho, or Ou-i-ho. Its length exceeds 500 miles in a straight line, but its actual length is nearly 700 miles. Some portions of it have been made merely for the purpose of internal navigation, but in others the design of draining and irrigating the adjacent country has been connected with it; hence it differs widely from all the canals made in Europe. Its breadth is considerably greater, and its waters are in few places altogether without a current. At a few points it is cut through rocks; it often traverses lakes and swamps of considerable extent, running on an artificial elevation sometimes twenty feet above the surface of the country. Its flood-gates, bridges, the vessels which navigate it, and the number of towns and villages lining its banks, excite the admiration of all travellers. By this canal, and the navigable rivers Yang-tse-kiang and Kan-kiang on the south, and the rivers Eu-ho and Pei-ho in the north, goods may be transported by water from the foot of the Mei-king Pass to the town of Tong-tcheou-foo, a few miles distant from Peking. That portion of the canal which lies south of the Hoang-ho was made in the 7th century, or soon after; but the more northern part in the 13th century by Kublai Khan and his successors, when the Tartar dynasty had removed the imperial residence from Nanking to Peking.

The fertility of its soil and the advantages resulting from the internal navigation afforded by the Great Canal and its numerous branches, have rendered this plain the most populous spot on the earth: its inhabitants, according to the native census, amount to 170 millions, or about two-thirds of the whole population of Europe. To protect this rich plain the Great Wall was erected, which incloses China on the northern boundary, and extends over mountains and through valleys, and is continued by bridges across rivers for about 1400 miles. This great work was constructed rather more than 2000 years since, or about 200 years before the Christian era, by the first universal monarch of China as a defence against the nomadic tribes of Tartars, who have never ceased to infest the country to the south as long as it has been subject to a separate dominion. The main sub-

stance of the wall is earth or rubbish, retained on each side by a thick casing of stone and brick, and terraced by a platform of square tiles. It bounds the whole north of China, extending along the frontiers of three provinces, a distance of nearly 19 degrees of longitude. From its eastern extremity there is an extensive stockade of wooden piles inclosing the country of Mougden, and which in some European maps has been erroneously represented as a continuation of the solid barrier. The total height of the wall varies from 15 to 30 feet, on a basis of stone projecting 2 feet under the brickwork, and about the same in height. The thickness of the whole wall at the base is 25 feet, diminishing to 20 and in places to 15 feet at the platform. The towers are 40 feet square at the base, diminishing to 30 feet at the top, and about 37 feet in height. The thinness of the parapet of the wall, being only 18 inches, justifies the conclusion that it was not intended to resist cannon; and it appears certain that the use of fire-arms is comparatively modern in China, however ancient the invention of gunpowder.

Numerous rivers drain and water China, but by far the greater number flow into the HOANG-HO and YANG-TSE-KIANG, which are among the greatest rivers of the globe. Among the rivers which do not belong to the systems of those two great rivers two require notice here, the Pei-ho and the Ta-si-kiang. The *Pei-ho*, or White River, rises on the mountains north-west of Peking, near the Great Wall, and flows in a south-eastern direction to the town of Tong-tcheou-foo, a few miles east of Peking, where it becomes navigable for large river-boats. Continuing in the same direction, it unites with the *Eu-ho*, a much larger river than the *Pei-ho* itself, which rises near the banks of the Hoang-ho, and running in a north-east direction is connected with the Great Canal at the town of Lin-tchin-tcheou: the remainder of its course may be considered as the continuation of the canal. The tides come up nearly to the place where the *Eu-ho* meets the *Pei-ho*, a distance of more than 80 miles. Hence to the sea the *Pei-ho* runs nearly due east, and at its mouth has a bar which at low tides has only two or three feet of water upon it; but at high tides, which here rise five or six feet, the bar does not prevent the flat-bottomed Chinese junks from entering the river. There is perhaps hardly another river in the world which is navigated by so many vessels as the *Pei-ho*. The *Ta-si-kiang*, or the River of Canton, rises east of the town of Yun-nán (103° E. long.), and runs the first half of its course in a narrow valley between high mountains, and the other half in a wide, fertile, and well-cultivated one; towards its mouth it drains the plain of Canton, and receives the *Pe-kiang*. The general direction of its course is from west to east, and it is navigated to a considerable distance.

In the interior are numerous lakes, of which the largest is the *Touting-hou* (113° E. long.), which is above 200 miles in circuit; it receives the waters of a vast number of small rivers, and discharges itself into the Yang-tse-kiang. The *Pho-yang-hou* (116° E. long.) is also of very large dimensions, and is much admired for the beauty of the surrounding scenery; it also discharges its superfluous waters into the Yang-tse-kiang. The *Tay-hou* (120° E. long.), the *Kan-yew-hou* (119° E. long.), the *Hong-tse-hou*, near the junction of the Grand Canal with the Hoang-ho, are also large and celebrated lakes. All the lakes are well stored with fish.

Mineralogy, &c.—Of the geological character of a country of such vast extent, and of which so small a portion has been explored by men of science as China, it would be manifestly useless to pretend to give any account. It is however certain that the range of rocks embraces most of the primitive and metamorphic series, and yields a valuable variety of building stones and slates. The porcelain clays are of great excellence.

The variety of surface through the wide extent of the empire affords a rich fund of minerals and metals. There can exist no doubt of the abundant supply of coal throughout China, nor of its general use, which we find from Marco Polo was known to the Chinese before its adoption in Europe. Lime they possess in all its combinations. Limestone of good quality is abundant, and lime-kilns are very numerous. The dark gray marble used at Canton is coarse, and unsuited to a fine polish; the shops contain large quantities of striated gypsum or alabaster. At the head of minerals the Chinese place their famous *yu-stone*, which is nephrite, or jade. As the country abounds in the primitive rocks, it is consequently rich in metals. Gold is obtained in the native state from the sands of the rivers in Yun-nán, near the frontiers of the Birmanese country, well known for its richness in that metal; in Yun-nán also silver-mines are worked. Iron is obtained in many parts of the empire. Ordinary copper comes from Yun-nán and Kuei-chow, and an abundance of malachite, or green copper-ore is obtained near the great lake in Hoo-kuang. The famous *pé-tung*, or white copper, which takes a polish not unlike silver, comes from Yun-nán: a considerable quantity of quicksilver is obtained in Kuei-chow; and there is a rich mine of tutanag, or zinc, in Hoo-pé. Arsenic, orpiment, cobalt, &c. are found. Rock-salt and salt obtained by the evaporation of sea-water are articles of great traffic. Rubies, amethysts, sapphires, beryls, topazes, crystals, and lapis-lazuli are met with in some parts.

Climate.—In regard to the climate of China, a distinguishing feature is the unusual excess in which heat and cold prevail in some parts of the empire at opposite seasons of the year; as well as the low average of the thermometer in comparison with the latitude.

Although Peking is nearly a degree to the south of Naples, the latitude of the former place being $39^{\circ} 54'$, of the latter $40^{\circ} 50'$, the mean temperature of Peking is only 54° of Fahrenheit, while that of Naples is 63° . But as the thermometer at the Chinese capital sinks much lower during the winter than at Naples, so in summer it rises somewhat higher. The rivers are said to be frozen for three or four months together, from December to March; while, during the embassy in September 1816, a heat of between 90° and 100° was experienced in the shade. It is well known that Naples and other countries in the extreme south of Europe are strangers to such a degree of long-continued cold, and are not often visited by such heats. Europe, observes Humboldt, may be considered altogether as the western part of a great continent, and therefore subject to all the influence which causes the western sides of continents to be warmer than the eastern; and at the same time more temperate, or less subject to excesses of both heat and cold, but principally the latter. The mean annual temperature of Canton and Macao, which lie nearly under the tropic, is what commonly prevails in the 30th parallel; and it is surprising to contrast their meteorological averages with those of Calcutta, which stands very nearly in the same latitude. The total fall of rain varies greatly from one year to another; the average annual quantity is about 70 inches, but it has been known to reach 90 inches and upwards. Vegetation is checked in the interval from November to February, not less by the dryness than by the coldness of the atmosphere: the three winter months being known sometimes to elapse with scarcely a drop of rain. The north-east monsoon, which commences at Canton and in the adjacent seas to the southward and eastward in September, blows strongest from December to February, and begins to yield to the opposite monsoon in March or April. About that period the southerly winds come charged with the moisture which they have acquired in their passage over the sea through warm latitudes; and this moisture is suddenly condensed into thick fogs as it comes in contact with the coast of China, which has been cooled down to a low temperature by the long-continued northerly winds. The latent heat given out by the rapid distillation of this steam into fluid, produces the sudden advance of temperature which takes place about March; and its effect is immediately perceptible in the stimulus given, by this union of warmth with moisture, to vegetation of all kinds. With the progressive increase of heat and evaporation commence those rains which tend so greatly to mitigate the effects of the sun's rays in tropical climates. In the month of May the fall of rain has been known to exceed 20 inches, being more than one-fourth of all the year, and this keeps down the temperature to the moderate average of about 75° , while in Calcutta there is no portion of the year more dreaded than May. At length the increasing altitude of the sun, which becomes just vertical at Canton about the solstice, and the accumulated heat of the earth, bring on the burning months of July, August, and September, which are the most oppressive and exhausting of the whole year. The extreme rarefaction of the atmosphere now begins to operate as one of the causes tending to the production of those terrible hurricanes, or rushes of wind, called typhoons, which are justly dreaded by the inhabitants of the south of China; but which chiefly devastate the coasts of Hainan, and do not extend much to the north of Canton. They seldom last 48 hours, and their usual duration is less than 24 hours.

Botany, Agriculture, &c.—At the head of Chinese botany may properly be placed the tea-plant. The specimens from the black and green tea countries differ slightly in the leaf, the northern variety, *Thea viridis*, from which the finer green tea is usually made, being a thinner leaf, rather lighter in colour, and longer in shape than the other; but Mr. Fortune has shown, what indeed the Chinese themselves acknowledge, that either black or green tea may be prepared from any tea-plant. At Canton green and black teas are made from the *Thea Bohea*, at the pleasure of the manufacturer. The *Camellia* bears the same name in China with the tea-shrub, and possesses most of its botanical characters; they in fact constitute two genera very closely allied: great skill is displayed by Chinese gardeners in their culture. The *Laurus Camphora*, one of the most remarkable productions of China as well as Japan, is a fine timber-tree, growing in the southern provinces to the height of 50 feet. The hemp-palm is a very handsome tree, and is peculiarly valuable to the northern Chinese, who use its large, brown, hair-like bracts for making ropes and cables, and numerous other useful articles. But far more valuable is a kind of bamboo, the stems of which are sometimes a foot in circumference, quite straight and smooth, and from 30 to 50 feet in height; every part of which is applied to some useful purpose, while the variety of services it renders is according to Mr. Fortune almost innumerable. One of the handsomest trees which have been found in China is the Funereal cypress, which has a nearly straight stem about 60 feet high, and weeping willow-like branches, with slender and graceful leaves, somewhat resembling those of the arbutus. From the seeds of the *Dryandra cordata* the Chinese extract a varnish for boats, and for the coarser implements of domestic use; the fine japan varnish however is obtained from the tai-shoo, or lacker-shrubs, a species of *Rhus*, from which the varnish distills like gum. The Chinese procure their tallow from the *Croton sebiferum*, the seed of which, as soon as it is ripe, opens and divides into three

parts, discovering as many kernels within the capsule, each attached by a separate foot-stalk, and covered with the vegetable grease of a snowy whiteness. The plant from which the pithy substance vulgarly called 'rice-paper' is prepared, seems to be a leguminous species growing in marshes, and found in some parts of India. The square pieces purchased in China are obtained from the stem, which, not being above an inch or two in diameter, is cut in a circular manner, and the cylinder in this way rolled out and flattened. The *Smilax*, or China root of commerce, commonly known as a sudorific, may be seen growing near Canton. That valuable medicine rhubarb is cultivated to the northward, in the cold and mountainous province of Shen-si. The ginseng is very generally used as a tonic, and is very largely cultivated. The Chinese cassia, an inferior cinnamon, is grown in Quang-si, and largely exported in European ships.

Among the most remarkable fruits of China are three distinct species of orange, as different as one sort of fruit can be from another of the same genus. The first is the 'China orange' of Europe; the second is of a pale yellow colour, but very sweet, and with a highly aromatic rind; the third, and perhaps best sort, has a deep crimson rind when ripe, quite detached from the fruit, the lobes of which are almost loose, and surrounded with a kind of net-work of fibres. Another description of *Citrus*, of the lemon kind, by the exercise of some horticultural ingenuity, is made to run entirely into rind, the whole terminating at the head in long narrow processes like fingers, whence it has obtained the appellation of Fū-show, 'the hand of Fū.' Among the peculiar fruits of China, the lichi has been naturalised in Bengal. Another of the dimocarpus sort, called loong-yen, or 'dragon's-eye,' is much smaller, and has a smoother skin. The loquat is a fine fruit (when well ripened) of the *Mespilus* kind. The wampoe, as it is called at Canton, has been compared to the gooseberry, which it resembles only in size; its fruit, which grows in bunches on a good-sized tree, has a yellow skin, inclosing a rather acid pulp that surrounds two or three seeds of a green colour. At the head of cultivated flowers the Chinese place the *Nelumbium*, in consideration of both its beauty and utility. The seeds, in form and size like an acorn without its cup, resemble nuts in flavour: the roots are sliced and eaten as fruit. Another highly esteemed flower is the *Olea fragrans*, allied to the olive of Europe, and remarkable for the fine scent of its blossoms. The famous mow-tan, or tree-peony, flourishes only in the north of the empire. The chrysanthemum is much and very successfully cultivated, and highly valued for the variety and richness of its colours. The choo-lan (*Chloranthus inconspicuus*) is used in scenting the tea that bears its name. The azalea is also a favourite garden plant. Weigelas, gardenias, roses, viburnums, and a very great number of brilliant flowers are carefully raised in the numerous gardens and nurseries, which are required to supply the universal love of the Chinese for flowers.

Agriculture is pursued with the greatest industry. Everywhere the land is diligently cultivated, but both the implements and the methods of agriculture are in a backward state. Irrigation is however well attended to wherever it is needed, and due attention is given to manuring the land; every substance fit for manure, whether solid or liquid, being carefully husbanded. The farms are generally small. All kinds of grain are cultivated, but rice is the principal crop; and so well is its culture managed that the rice of China is said to be brought to greater perfection than that of any other country. Over a great part of China two crops of rice are obtained annually; and sometimes three crops of rice, or two crops of rice and one of vegetables are obtained. Most of the ordinary vegetables are raised in considerable quantities, the Chinese generally being great eaters of vegetables; potatoes however are only grown largely in Macao. Tobacco, cotton, and sugar are also raised to a considerable extent. In the silk districts vast quantities of mulberry-trees are grown for feeding the silk-worms. Mr. Fortune states that in the Hang-tcheou district alone, "going in a straight direction through the country, during the space of two days, in which time he must have travelled upwards of a hundred miles, he saw little else than mulberry-trees, evidently carefully cultivated, and in the highest state of health, producing fine, large, and glossy leaves." The Chinese plant the culture of which is of most importance to foreigners, and second only to rice with the Chinese themselves, is however undoubtedly the tea-shrub, the growth of which is very widely spread. Mr. Fortune, who under the patronage of the East India Company travelled through the tea-districts, says that he has "met with it in cultivation in China, from Canton in the south up to 31° N. lat.; and Mr. Reeves says it is found in the province of Chang-tung, near the city of Tang-chow-foo, in latitude $36^{\circ} 30'$ N. The principal tea-districts of China however, and those which supply the greater portion of the teas exported to Europe and America, lie between 25° and 31° N. lat., and the best districts are those between 27° and 31° ." ('Tea Districts of China,' p. 272). Nothing can well exceed the patient attention bestowed, both on the cultivation of the shrub and the preparation of the leaf; but for the methods employed we must refer the reader to the work just quoted, to Ball's 'Cultivation and Manufacture of Tea,' and to the article TEA, in ENGLISH CYC., NAT. HIST. DIV. The wonderful quantity of tea annually grown and manufactured may be readily conceived, when it is stated that tea is the universal beverage throughout China, being taken

many times during the day; and that above 100 millions of pounds are annually exported. Mr. Travers indeed estimates ('A few Words on the Tea Duties,' 1854) the total amount of the dried leaf produced annually in China at no less than 2240 millions of pounds weight.

No good land is reserved for pasture in China. Cattle and horses are turned out on waste or unprofitable land. The raising food for cattle is no part of a Chinese farmer's occupation. Agriculturists are exclusively employed in raising food for man. Few cattle are kept. The cows are small and of inferior value. The Chinese generally have an inveterate prejudice against the use of butter and cheese; dairy farming is consequently unknown. The sheep are of the large-tailed kind, but much smaller than English sheep. The goats are all straight-horned. Pigs are perhaps the most valuable of the animals bred for food. The greatest care is taken with them; the breed is small but very excellent, and the flesh is pronounced by Europeans to be of unusual delicacy of flavour: the breed has been freely introduced into our farmyards. Puppies and several other animals unknown to the European kitchen are, as is well known, among the most highly prized of the animals specially reared for the Chinese table.

The Chinese horses are not numerous, and of a poor and stunted breed, being very ill fed and kept. Few things excited more the surprise and admiration of the Chinese, in their visits to Hong Kong after it had become an established English settlement, than the size and strength of the English horses. Asses and mules are employed in carrying loads, buffaloes in drawing the plough, but of neither is the race good or the numbers large. The mules are however better than the horses, and are said to bear a higher price, as being capable of more labour on less food. The demand for beasts of draught or burden is greatly lessened by the circumstance that throughout the empire loads are carried by the very skilful porters called 'coolies,' and the canal boats dragged along by men who are trained to the work, while the price of their labour is so low as to render the competition of animals generally unprofitable.

The wild animals, like the vegetables of China, belong principally to the temperate zone; since the low average of the thermometer (which as far south as Canton is little above 70°) and the cold winters are unfriendly to the existence of numerous tropical tribes which are found in corresponding latitudes of India. The larger and more ferocious descriptions of carnivorous quadrupeds are not common in a country so well peopled and cultivated. In the forests of Yun-nan, to the south-west, the Bengal tiger is said to exist, and the animal is well known to the Chinese; but at Canton, so nearly in the latitude of Calcutta, it is quite a stranger. Lions are almost a fabulous animal with them. The woods of the south abound in a small but fierce description of wild cat, which is fattened in cages for the table. The domestic dog of China is uniformly one variety, about the size of a moderate spaniel, of a pale yellow and occasionally a black colour, and a coarse bristly hair on the back; sharp upright ears, and peaked head, not unlike a fox's, with a tail curled over the rump. Bears are common in the hilly wooded parts of Shan-si, west of Peking. Of the common ruminant animals, the Chinese possess several varieties of deer, particularly a spotted kind kept about their residences. Gerbillon describes a species of antelope abounding on the borders of Mongol Tartary, but called by the Chinese huang-yang, 'yellow goat.' The buffalo used in ploughing is very small, with a skin of slate-colour, thinly covered with hairs. Dromedaries are much used as beasts of burden between Peking and Tartary; but in China proper the reasons which cause human labour to supplant every other have prevented their being adopted. The wild boar may be found in the half-reclaimed countries on the western borders, but not in Central China, nor on the east coast, where tillage and population have reached their present height. Of the other wild pachydermatous tribes, the elephant is not at present an inhabitant of China, unless it be in Yun-nan, nor is he used for purposes of either peace or war. The one-horned rhinoceros is found in the forests of the extreme west and south. Of rodent animals, the common rat attains to an unusual size, and is well known to be eaten by the lowest orders of the Chinese. Dr. Gray has described a glirine animal discovered by Mr. Reeves, being nearly allied to the bamboo rat of Sumatra, as a new genus.

The ornithology of China is distinguished by some splendid varieties of gallinaceous birds, as the gold and silver pheasants and Reeves's pheasant, the longest tail-feathers of which approach the extraordinary dimensions of six feet. Another description is called the medallion pheasant, from a beautiful membrane of resplendent feathers which is displayed or contracted according as the animal is affected. China abounds in wild fowl of all kinds, and particularly in immense flocks of geese, observable during winter near Canton. The yuen-yang, a teal of splendid plumage, has been called the 'mandarin-duck,' and is remarkable for the attachment between the male and female: it may now be considered as naturalised in England. The fishing corvora, employed on the shallow lakes of the country in capturing fish, has been described as a brown pelican with white throat; body whitish beneath, spotted with brown; tail rounded; irides blue, and bill yellow. Among the miscellaneous birds of China may be enumerated quails which are often trained to fight; the

common ringdove, of which great numbers breed in the woods about Canton; and the peculiar crow of the country, marked with white about the neck.

Of reptiles, it is remarkable that the largest kinds of saurians, as the crocodile and alligator, are unknown even as far south as Canton, probably in consequence of the vast population and traffic that exist on the rivers. Great numbers of the small lizard tribes are visible during the hot months, some of them infesting trees and shrubs, while others inhabit holes in rocks or old walls. Several fresh-water tortoises have been sent home, and some new genera of batrachians, or the frog kind, have been described. Notwithstanding its situation under the tropic, Canton is little infested by the venomous kinds of serpents; the species most dreaded is a smallish slender snake, between two and three feet in length, called by the Chinese 'the black and white,' from being surrounded from head to tail with alternate rings of those colours.

Of fishes, a large collection of Chinese specimens has been lodged by Mr. Reeves in the British Museum. The golden carp is one of the most distinguished kinds, and has long been bred in Europe from the original specimens which were carried by the Dutch first to Java and thence to Holland. Of edible sea-fish the best kinds near Canton are a sort of rock-cod and a flat-fish called tsang-yu by the Chinese, and pomfret by Europeans. Soles are good and plentiful, but the fish most valued by native epicures is the sturgeon.

Fishing both by sea and on the rivers is most diligently practised. It is the opinion of Sir J. F. Davis that "in no other country besides is so much food derived from the waters." The fish are mostly salted, and consumed with rice.

Among insects, the locust commits great ravages occasionally in particular districts, and rewards are given for its destruction. Some of the most poisonous tribes, as scorpions, are not met with at Canton; but the centipede, which the Chinese call by exactly the same name of pō-tso (hundred feet) is common. A monstrous spider has been seen inhabiting trees, and attaining to a size and strength that enable it to devour small birds entangled in its webs. Dr. Abel notices the *Scarabæus molossus*, the *Cerambyx farinosus*, and the mole-cricket of a large size. On a mountain lying eastward of Canton, called Lo-fow-shan, there are butterflies of a gigantic size and very brilliant colours, a selection of which is sent annually to Peking. The pē-lā-shoo, or wax-tree, affords nourishment to an insect which is supposed to belong to the *Coccus* tribe.

Political Divisions.—China is now politically divided into eighteen provinces, of which seven extend entirely or partly over the great plain, two comprehend the hilly districts, two others the mountainous country along the sea, and the others the mountainous country in the interior.

1. Pe-tche-li extends over the most northern and less fertile portion of the plain, but is well cultivated, and produces, besides vegetables for the supply of the capital, large quantities of millet and wheat. In it is situated PEKING, the capital of the whole empire; the capital of the province is *Pao-ting-foo*, a very large and populous town, in which the governor resides.

2. Chang-tung comprehends a part of the plain and the peninsula of Chang-tung, on which an isolated mountain range rises to a moderate height. It produces wheat, millet, and cotton. Its capital is *Tsi-nan-foo*, a large and populous town. *Lin-tchin-tcheou*, at the confluence of the canal with the river En-ho, is the depository of the goods which are carried from the southern provinces to Peking, and a very large place.

3. Kiang-su, which with the following province once formed that of Kiang-nan, comprehends the low and swampy country on both sides of the Great Canal. It chiefly produces rice and pulse, and has extensive fisheries. Besides the capital, NANKING, it contains many large towns on the banks of the canal, among which the most remarkable are *Yang-tcheou-foo*, which is at a short distance from the Yang-tse-kiang, and carries on an active trade; and *Su-tcheou-foo*, which to an extensive commerce unites great industry in manufacturing silk and cotton goods. Its principal port is SHANG-HAI, a town apparently destined to rival Canton as an entrepôt of commerce.

4. Ngan-hoei, or An-hoi, on both sides of the Yang-tse-kiang, produces, besides grain and rice, some silk. In its south-eastern districts are extensive plantations of tea, and also some mines of gold, silver, and copper. The capital is *Ngan-king-foo*, on the Yang-tse-kiang.

5. Ho-nan is chiefly in the plain, but its western districts are traversed by the Pe-ling mountain range and its branches. It is rich in grain and cotton, and is supposed to contain some mines. In its south-eastern districts tea is cultivated. The capital, *Khai-fong-foo*, is not far from the banks of the Hoang-ho; but the most populous town appears to be *Ho-nan-foo*, on a river which falls into the Hoang-ho, in a richly-cultivated valley.

6. Hoo-pē comprehends part of the undulating portion of the plain, and the wide valleys of the Han-kiang and Yang-tse-kiang, with some mountainous districts. It lies in the centre of China, and formerly constituted with the more southern province of Hoo-nan one province called Hou-quang. Its fertility is very great: its products are grain, cotton, silk, and tea, which are cultivated on its north-eastern border. Its capital, *Wu-tchang-foo*, situated on the Yang-tse-kiang, opposite its junction with the Han-kiang, is one of the largest

of the inland towns of China, and carries on an extensive commerce. *King-tcheou-foo*, farther to the west, likewise on the banks of the Yang-tse-kiang, has also a very extensive trade.

7. Che-kiang comprehends the south-eastern corner of the plain and the northern portion of the mountainous country extending along the sea. It produces more green tea than other provinces, and also silk, rice, grain, and pulse in great abundance. Its capital is *Hang-tcheou-foo*, on the banks of the Tsien-tong-kiang, at the southern termination of the Great Canal, in a very pleasant situation. The city is surrounded by strong walls said to be 8 miles in circumference, and adjoining it are very extensive suburbs. It is the residence of a great many mandarins of high rank and superior government officers; contains numerous rich temples and public buildings; and its shops are well stored with valuable goods, and "everything," says Mr. Fortune, who passed through the city, "which met the eye stamped Hang-tcheou-foo as a place of wealth and luxury." According to Staunton its population was thought to be not much less than that of Peking, and the missionaries estimated it at one million. None of the houses exceed two stories in height: the streets are well paved. It has extensive manufactures of silk and cotton goods, especially in flowered and embroidered satins, and a very active commerce, as well by means of the canal as by the river, which is navigable for large vessels up to the town. The principal port of this province is *Ning-po*.

8. Kiang-si extends over the eastern portion of the hilly country along the western side of the Nan-ling range, and in its well-cultivated valleys and plain produces grain, rice, silk, cotton, indigo, and sugar. It has some plantations of tea. The capital, *Nan-tchang-foo*, on the Kan-kiang, not far from the place where it falls into the lake Poyang, is a large town, and carries on a great trade. In the hilly country, which begins at some distance from the lake of Poyang on the east, is the borough of *King-te-ching*, which is said to contain 1,000,000 inhabitants, who are occupied exclusively in the fabrication of china-ware, which is here made in the greatest perfection. The number of furnaces is said to amount to 500. *Kan-tcheou-foo*, on the Kan-kiang, not far from its source and the Mei-ling Pass, is a large town, in which Indian ink and varnish are made on an extensive scale.

9. Hoo-nan, or the southern part of the ancient province of Hon-quang, contains the remainder of the hilly country. Its productions are like those of Kiang-si. It is said to be rich in minerals. The capital, *Tchang-cha-foo*, on the Heng-kiang, is a large commercial town. *Yo-tcheou-foo*, on the channel connecting the large lake of Tung-ting with the Yang-tse-kiang, also carries on a very active trade.

10. Fo-kian, or Fochan, extends over the mountainous country on the shores of the sea opposite the island of Formosa. Some of the summits of the Nan-ling range here rise to a great height, but do not attain the perpetual snow-line. The higher parts of some of the mountain ridges are bare, others are covered with trees; but in its extensive and fine valleys all the commercial productions of China are met with except perhaps varnish. Its plantations of tea are extensive, and the greatest quantity of black tea is grown here. The inhabitants of this province are noted for their industry, and still more for their spirit of enterprise and their love of emigration. The capital is *Fu-tcheou-foo*, on the river Ming-ho, over which a bridge is built of 33 arches of fine white stone. The largest Chinese vessels can come up almost to the wall of the city, the maritime commerce of which is very considerable, and its population greater than that of Canton. *Tsuen-tcheou-foo*, between *Fu-tcheou-foo* and Amoy, is likewise a large town. A great number of vessels sail hence to the neighbouring countries. It has a bridge built over an arm of the sea on 300 piers of black stone. Here is also the harbour of Amoy.

11. Quang-tun, Kiang-tong, or Canton, extends over the whole southern coast from 117° E. long. to the very boundary of Cochin China, and is likewise mountainous, but its mountains are not so high as those in Fo-kian. It has a great number of fine and wide valleys, and the plain about Canton is of considerable extent: it produces all the commercial commodities of China except tea and varnish. It has several harbours, some of which may become of importance when China is really opened to Europeans and Americans. The capital of the province is CANTON. *Fochan*, lying about 20 miles south-west from Canton, is said to contain a population of 1,000,000, and to have numerous manufactures of silk, cotton, china-ware, and colours.

12. Quang-si, extending on both sides of the Ta-si-kiang, is covered with mountains; the valleys, which are generally narrow, occupy a small portion of its surface. The mountains belonging to the Nan-ling range, inclosing the northern side of the province, rise to a great height, and some summits above the perpetual snow-line. The forests on the declivities of the hills are extensive. Its productions are rice, silk, and timber, and it is supposed to contain gold and other metals. A mountainous district towards the northern boundary of this province is inhabited by the Tchang-Colas, an aboriginal and independent tribe, differing from the Chinese in language and manners. The capital of the province, *Kuei-ling-foo*, lies in a narrow but fine valley.

13. Kuei-tcheou, to the north of Quang-si, is one of the most mountainous provinces of China, being traversed in all its length by the highest portion of the Nan-ling range, several summits of which are always covered with snow. In these mountains live the Seng Miao-tsee, an aboriginal tribe, who differ in language and manners from the

Chinese, and often make war on them. Many fortresses have been erected in the narrow parts of the valleys to stop their incursions. The productions of the province are timber and metals, gold, silver, &c., but especially copper and quicksilver. The capital is *Kuei-yang-foo*, a comparatively small town, its circuit being little more than two miles.

14. Yun-nan, the most south-western province, bordering on Cochin China, Siam, and the Birman empire, forms an extensive but uneven table-land, studded here and there with high mountains, especially towards the north, where there are several snow-capped summits. The mountains towards the south, on the boundary-line of the Birman empire and Siam, are inhabited by a tribe of mountaineers called Lolos, or Lowas, who are only nominally dependent on the Chinese. Its commercial wealth consists of the produce of its mines, gold, silver, copper, &c.; and of its forests, which contain timber-trees and several kinds of rare wood. The capital, *Yun-nan-foo*, situated on the least mountainous part of the table-land, is a considerable place, and carries on an active trade with the Birman empire. A much-frequented road, running mostly on the banks of the Yang-tse-kiang, connects this town with the interior provinces of China; and another passes hence west to *Yangtchang-foo*, another considerable town perhaps larger than Yun-nan. From this place the road continues to the Irawaddi River, and to Bhamo in the Birman empire. A considerable trade is carried on by this route. [BURMA.]

15. Se-tchu-an, the largest of the provinces, is nearly everywhere inclosed by high mountain chains, and its interior is traversed by lower ranges. Its valleys are commonly wide, and often expand into plains. The soil is rich, and produces every kind of grain as well as rice and sugar in abundance; but its commercial riches consist principally of silk, timber, and different kinds of metals. Its capital, *Tching-too-foo*, situated on an island formed by the Min-kiang in an extensive and richly-cultivated plain, is a place of considerable trade, and very populous. *Koci-tcheou-foo*, on the banks of the Yang-tse-kiang, is one of the most commercial places in the interior of China, and very populous.

16. Shen-si is more covered with rugged mountains than Se-tchu-an, and contains a much smaller portion of cultivable land; yet the wide valleys through which the Hoai-ho and Han-kiang run are very fertile, and produce abundance of wheat, millet, and pulse, but little rice. The capital is *Si-ngan-foo* on the Hoai-ho, once the metropolis of the whole empire, a town so large that it is compared with Peking itself; it is strongly fortified, and carries on a considerable trade.

17. Shan-si is still more mountainous than Shen-si; it has one wide and fertile valley along the banks of the Ken-ho, or Fien-ho, which is well cultivated and studded with villages and towns. It exports wheat, millet, raisins, iron, and coal. The capital is *Tai-yuen-foo*, a large place, with considerable manufactures in silk and carpets, and some trade. *Tai-tong-foo* is one of the principal fortified places near the Great Wall.

18. Kan-si, the most north-western province of China, consists of the western portion of Shen-si, to which has been added a comparatively narrow tract of land which extends far westward to the centre of Asia. This tract has been added with the view of separating the warlike and wandering tribes which inhabit the table-lands to the north and west of China from one another, and of preventing their incursions into China. The eastern part of this province is studded with high and many snow-capped mountains, and the western part extends over the stony and sandy deserts of Central Asia; the whole is a poor country, and thinly inhabited. The capital is *Lan-tcheou*, a small place on the banks of the Hoang-ho, which however carries on a brisk trade with the tribes inhabiting the table-lands to the north and west of it.

To these eighteen provinces may be added the province of Leaotung, or Moungden, which extends along the northern shores of the Hoang-hai, or Yellow Sea. It constituted formerly a part of Manchuria, but after the present dynasty had ascended the throne of China this portion was separated from it, and considered as the domain of the imperial family. It is divided from China by the eastern extremity of the Great Wall, and from Mongolia by a stockade of wooden piles which extends to the mountains which separate it from Corea. This country is covered with high mountains except on the banks of the Leaotung, where there is a plain of considerable extent, and pretty well cultivated. Here is the capital, *Moungden* or *Mukden*, now called *Fung-thian-foo*, a place of moderate extent, in which are the tombs of the Manchow dynasty. Towards the boundary of Corea is *Fon-hoan*, traversed by the only road which connects Corea with China, and on which some trade is carried on.

Inhabitants.—In their physical characteristics, the Chinese have been recognised as superior to many other Asiatics. A finer shaped and more powerful race of men hardly exists than the coolies, or porters, of Canton; and as sailors, they are found stronger and more efficient than natives of India. Though the Chinese are allied to the Mongols in the general cast of their features, the harsher points of the Mongols are in the Chinese softened down considerably: in the thickness of the lips the Chinese in some degree approaches, but by no means equals, the Negro, nor is that feature at all so prominent; the nose is flattened, and the nostril expanded in the Chinese, but not to the same extent as in the African: there is the same lank, black, and shining hair in the case of the Chinese as in that of the North

American Indians; the same obliquity of the eyes and eyebrows, turned upwards at the outer extremities, and a corresponding thinness and tufty growth of beard. The Chinese too are distinguished by a nearly total absence of hair from the surface of the body. In the smallness of the hands and feet, and of the bones of the body, compared with Europeans, they resemble the generality of Asiatics. The features of the people in the South have perhaps less of the harsh angularity of the Tartar countenance than at Peking. Among those who are not exposed to the climate the complexion is fully as fair as that of the Portuguese; but the sun has a powerful effect on their skins. Up to the age of twenty, or a little more, they are often very good looking; but soon after that time the prominent cheek-bones generally give a harshness to the features as the roundness of youth wears off. With the progress of age the old men in most cases become very ugly, and the old women, if possible, still more so.

The moral character of the Chinese people is a compound of bad and good traits, which, as usual, may be traced to the influence of their political and social system. Industry, tranquillity, and content are unusually prevalent in the bulk of the population. Notwithstanding his power is absolute, the emperor himself always endeavours to prove that his conduct is based in reason and benevolence, the truth of the argument being of course a distinct affair. The advantageous features of their character, as mildness, docility, industry, peaceableness, subordination, and respect for the aged, are accompanied by the vices of insincerity and falsehood, with their consequences, mutual distrust and jealousy. Lying and deceit, being generally the refuge of the weak and timid, have always been held among us as disgraceful vices, while the Chinese, at any time, do not attach the same degree of disgrace to deceit, and least of all when it is practised towards a European. It would however be as unreasonable to infer the character of the whole nation from the unfavourable aspect in which it appears at Canton, a trading sea-port, as to form an estimate of our national character in England from an experience equally limited and disadvantageous.

Arts, &c.—Whatever may be the actual antiquity of the Chinese people, no doubt seems now to exist of their having been the authors of what are justly considered in Europe as three of the most important inventions or discoveries of modern times: the art of printing, the composition of gunpowder, and the magnetic compass. To these may be added two very remarkable manufactures, of which they were unquestionably the first inventors, those of silk and of porcelain. There cannot be the least doubt of the art of printing having been practised in China during the 10th century of our era. The precise mode in which they operate is certainly different from ours, but the main principle, that of multiplying and cheapening books, by saving the time and labour of transcription, is altogether the same. The invention of powder, as compounded of 'sulphur, saltpetre, and willow-charcoal,' is carried back by the Chinese to a very remote date; but its particular application to fire-arms seems to have been European. The Chinese name has no reference whatever to guns, and simply implies 'fire-drug,' which seems to show that the composition was applied by them merely to fire-works (in which they excel at present) and other harmless or useful purposes, long before their unwelcome spirit could have suggested the use of guns to themselves, or they could have borrowed the notion from Europe. With regard to the compass, the attractive power of the loadstone had been known to them from remote antiquity, but its property of communicating polarity to iron is for the first time explicitly noticed in a Chinese dictionary finished in A.D. 121. Under the head of 'Loadstone' appears this definition: "A stone with which a direction can be given to the needle." The same word (*chin*) is used by them to express the magnetic and the common working-needle, as among ourselves. Père Gaubil, in his 'History of the T'ang Dynasty,' states that he found, in a work written one hundred years later than the above, the use of the compass distinctly recorded. It is curious to contrast inventions of such high utility and importance with the very small progress which the Chinese have made in the sciences, as astronomy, geography, and mathematics, for which they were not ashamed to be indebted to the European missionaries. With regard to the fine arts, or those which minister rather to the pleasures than to the wants of mankind, it becomes necessary to make some allowances for the peculiarities of national taste. The arts of drawing and painting do not rank so high among the Chinese as among ourselves in Europe, and having therefore met with less encouragement they may be expected to have made less progress. In drawings where perspective is not very strictly required, as in representations of birds, insects, fruits, and flowers, they are eminently successful, and nothing can exceed the splendour and variety of their colours. In regard to the Chinese music, their instruments are mostly tuned in unison, and they have little or no idea of accompaniment. They have certain characters to express the name of every note in their very limited scale, and these they use in writing down their airs. Their instruments are numerous, consisting of different species of lutes and guitars; flutes and other wind-instruments; a harmonicon of wires, touched with two slender slips of bamboo; bells and pieces of sonorous metal; drums, and a sort of clarinet which emits as nearly as possible the tones of the Scottish bagpipe.

Literature and Language.—The antiquity of Chinese literature is

proportionate to that of their language, and has been of course greatly promoted and increased by the early invention of the art of printing, which they have now possessed for 900 years. Specimens of this literature in various departments have been afforded to Europe by the labours of Staunton, Davis, Morrison, Klaproth, and Rémusat, who followed up the earlier investigations of the Jesuits at Peking, and have enabled us to form a judgment regarding the merits of compositions which for a long period were considered to be inaccessible, from the difficulties of the language in which they were written. In legislation we possess a translation of the penal code of the empire; in politics and morals, the sacred books of Confucius and his followers; and in philology and belles-lettres we have a copious and well-executed dictionary of the language; several translations or abstracts of histories; the dramas of the 'Heir in Old Age,' the 'Sorrows of Hân,' 'Le Cercle de Craie'; an elaborate treatise concerning their poetry; and the excellent novel or romance of the 'Fortunate Union.' The mastery which has thus been obtained of the language of China by several Europeans, among whom our own countrymen hold a conspicuous place, seems to prove that the rumoured difficulties attendant on its acquisition, from the alleged number and variety of the characters, are the mere exaggerations of ignorance. We may close this notice with giving some account of so singular and original a language from Davis's work on China.

It appears that the theory of a universal medium for the communication of ideas, as conceived by Bishop Wilkins, has been realised by the Chinese. While the letters of our alphabet are mere symbols of sounds, the Chinese characters or written words are symbols of ideas, and alike intelligible to the people of Cochin China, Japan, Loo-Choo, and Corea, with those of China itself; in the same way as the Arabic numerals are common to all Europe, while the sounds which they represent in one country would convey no meaning to the inhabitants of any other. It is in this manner too that the universality of the Chinese language extends only to the written character, and that the natives of the two extremities of the empire, who read the same books, and understand each other perfectly on paper, are all but mutually unintelligible in speech. The roots, or original characters of the Chinese, are only 214 in number, and might indeed be reduced to a much smaller amount by a little dissection and analysis. These are combined with each other to form other words, or express other ideas, very much in the same way that the individual Arabic numerals are combined to express the infinite varieties of numbers. By a species of analogy they may be called the alphabet of the language; with the difference that exists between an alphabet of ideas and an alphabet of sounds. These roots serve, like our alphabet, for the arrangement of the words in the large Chinese dictionary, a national work compiled by the most learned persons in the empire more than a century since, by order of the enlightened monarch K'ang-hy. Much consideration is attached by the Chinese to the graphic beauty of their written characters. The two most usual forms of their characters are the printed and the written, besides which there are the seal, or engraved form, and one or two others. The printed form (analogous to our Roman type) lays claim only to clearness and accuracy; but the written combines correctness with elegance. It may suffice to observe generally, that the grammar of the language is extremely limited. In the absence of all inflexion, of which their characters are utterly incapable, the relation of words to each other in a sentence can only be marked by their position. The verb, for instance, must always precede its object, and follow its agent. The cases of nouns and pronouns are determined by prepositions, as *tsoung t'ien*, 'from heaven.' The collocation of words in a sentence must of course be a matter of more consequence in Chinese than in those languages where the relations of different words to each other are marked by the distinctions of number, gender, case, and person, as shown by declension and conjugation. The 'Notitia Linguae Sinicae' of the Jesuit Prémare is perhaps the best Chinese grammar ever written. Mr. Meadows's 'Desultory Notes on China' should also be consulted by the student.

Commerce, Manufactures, &c.—The character of the productions and trade of China has been noticed in our account of the several provinces; the foreign trade generally is noticed under CANTON, and will be further noticed under SHANG-HAI; and the English trade under HONG KONG. The principal article of export is tea, with which China supplies almost every part of the world. The total quantity annually exported now considerably exceeds, as already mentioned, 100 millions of pounds. Of this the quantity brought into Great Britain in 1858, was 70,735,532 lbs.; and about 10 millions of pounds went to the British colonies and East Indian presidencies. In the same year above 20 millions of pounds were exported to the United States; 7 millions to Russia, and 3 or 4 millions to all other countries. Raw silk-thread and silk piece-goods are the next most important articles of export. About 20,000 bales of raw silk are annually exported to England. The value of the silk-ware exported is about one-fourth that of the tea. Nankeens are exported somewhat largely to India. Sugar, sugar-candy, cassia, fancy-lacquered goods, articles made in ivory, mother-of-pearl, tortoise-shell &c., are also among the exports. The treasure exported is considerably more in amount than the value of the tea exported.

The imports of manufactured articles are comparatively small. Cotton and woollen goods, hardware, clocks, &c., are among the

leading articles. Raw materials meet with a much readier sale; of these raw cotton is by far the most important, the value of the cotton imported exceeding half the value of the tea exported; but the substance for which the demand has far outstripped that of all others is opium. For this drug all ranks and classes appear to have an engrossing and unappeasable desire, and its supply, notwithstanding the most determined efforts of the government to suppress its use, has become of the first commercial importance. The value of the opium imported into China by the English, exceeds that of the tea exported from the empire. It is to pay for the opium imported that the large amount of bullion is annually sent out of China. In 1852 treasure to the amount of 1,265,592*l.* was remitted through Hong Kong to India by the Peninsular and Oriental Company's steamers alone, to pay for opium brought from India, and sold to the Chinese along the coast. The import of opium, as already intimated, was until lately strictly prohibited, and it was in endeavouring to enforce the prohibition that the disastrous war with England was brought about. Since that war the importation has gone on steadily increasing, and the import was legalised by the emperor of China, for the purpose of the revenue, on the 5th of January, 1853.

Large as is the foreign commerce of China, it is of very inferior importance to its internal trade. Even in tea, the great foreign staple, the home consumption is, if recent estimates are at all to be depended upon, upwards of twenty times that of the foreign market. But the real home staple commodities are rice and salt. Rice is in universal use among the vast population, and its culture, transit, and sale afford the means of support to an immense number of persons. Salt is a government monopoly; its production is on an enormous scale. The kinds used are rock-salt, that obtained from salt-springs, and that prepared in large square fields or salterns in marshes adjacent to the sea. Mr. Barrow counted in the vicinity of Tien-tsing 222 stacks or hills of salt, which he computed to contain 600 millions of pounds, besides which there were numerous other hills incomplete.

In manufactures, while adhering tenaciously to their old methods, the Chinese display remarkable skill and ingenuity. The superiority of their porcelain, a Chinese invention, was maintained for many centuries, and even now it can scarcely be said to be surpassed though it may be equalled in quality, however it may be in design and artistic embellishment, by that of Europe. Paper is another article of Chinese invention, and the fine silky Chinese paper is still preferred for some purposes of art to any European imitations of it. In metal the Chinese are also skilful workmen. Their silks and other textile manufactures are of excellent quality, though unable to compete in the market with the machine-made goods of Europe. In preparing lacquered goods, ivory carvings, and other minutely finished fancy articles for the eastern market, they display the most admirable patience and ingenuity, however grotesque their productions often are as works of art. For almost all the ordinary domestic utensils, agricultural and mechanical implements, articles of wearing apparel, household furniture, and the various matters requisite for comfort or luxury, the Chinese are at present independent of foreign manufacturers. As European goods become better known they will doubtless become more generally adopted; at the same time it is highly probable that the Chinese mechanics, from their remarkable imitative talent and the readiness with which they acquire an insight into new methods of working, will soon be able to produce similar goods at such prices as will enable them to maintain their standing in the home market.

The weights, measures, and money of China are noticed under CANTON.

The history of the intercourse with England belongs essentially to the commerce of China, and not to its general history. We therefore give it here.

The first attempt of the English to open a trade with China was in 1596, when three ships, bearing letters from Queen Elizabeth, were freighted for that purpose, but they were lost on the voyage out; and no further attempt appears to have been made till 1637, when four merchant-ships from England arrived in Macao Roads. In a few days they sailed up to the Bocca Tigris, which is considered the mouth of the Canton River; but in the meantime the Portuguese, already established at Macao and trading with the Chinese, had misrepresented the purposes of the English, who, having communicated with the mandarins, were directed to wait, and told that their wishes should be attended to. A few days afterwards they were, without warning, fired upon from the fort. Incensed by this act of treachery, they sailed up the river as far as Canton, stormed the castle, and carried off the guns. A further communication then took place with the mandarins, who laid the blame on the Portuguese. Cargoes were supplied by the Chinese, and the guns were restored, and the English ships sailed quietly away. Little or no commercial intercourse took place for some years afterwards. The East India Company established by degrees small commercial agencies at Amoy, at Ning-po, and on the islands of Chusan and Formosa; but the trade, owing to the exactions of the mandarins, proved so troublesome and unprofitable, that the Company deemed it expedient to withdraw their agents from those places, and managed to establish a trade at Canton, which continued to advance but slowly and with many interruptions in consequence of the high duties and the

exactions to which it was subjected. Only one ship was sent to Canton in 1734, and during the whole of 1736 the total number of European ships which took in cargoes at Canton was only ten, of which four were English, two French, two Dutch, one Swedish, and one Danish.

The exactions and insulting assumption of superiority on the part of the Chinese authorities, as well as disputes with the French and Portuguese, led occasionally to outrage and tumult; but the trade at Canton continued to advance, till at length the attention of the British government was drawn to its growing importance, and in 1788 Lord Cathcart was appointed ambassador to China; he died however on his passage out, and the frigate in which he had sailed returned to England. In 1792 Lord Macartney sailed from England in a 64-gun ship as ambassador to the Chinese emperor at Peking, accompanied by Dr. Staunton, afterwards Sir George Staunton, as secretary of legation, chiefly in order to obtain leave to trade at Ning-po, Tien-tsing, Chusan, and other places besides Canton. The embassy was unsuccessful, and the emperor, in his communication to the king of England, stated that British commerce was to be limited to the port of Canton.

After the mission of Lord Macartney the general condition of the English at Canton was considerably improved; the conduct of the mandarins became less imperious; the exactions fewer and less annoying; and though some of the heaviest burdens on the trade still continued, the commercial progress of the English was tolerably quiet and rarely interrupted.

Interruptions however of some importance occurred in 1808, and again in 1814. In 1816 Lord Amherst was sent on an embassy, and though his mission was unsuccessful, it was followed by a longer interval of freedom from Chinese annoyance than had ever before been experienced. From 1816 to 1829 only a single stoppage of British trade took place, except a short interruption in 1822, arising out of an unprovoked attack by the Chinese on some of the crew of the *Topaze* frigate, who were taking in water at the island of Lintin.

The exclusive trade of the East India Company with China terminated in April 1834, and several private ships soon afterwards quitted Canton with cargoes of tea for the British Islands. The new Act empowered the British government to appoint three superintendents, with certain powers over the private traders, to reside at Canton, but the Chinese refused to receive them as the official notification did not assume the form of a petition, and Lord Napier, the chief superintendent, was ordered to withdraw from Canton to Macao. The order was not complied with; and in September the British trade was entirely suspended by direction of the viceroy, the residence of Lord Napier surrounded by soldiers, and his supplies of provisions cut off. His lordship then applied for the assistance of two British ships, the *Imogene* and *Andromache*, which sailed through the Bocca Tigris, silencing the batteries as they passed, and anchored at Whampoa. Negotiations were then entered into, but in vain; and in order no longer to interrupt the trade of the port, Lord Napier withdrew to Macao, where, on October 11 of the same year he died.

With the exception of a few disputes arising out of the smuggling transactions in opium, and the constantly-recurring requiry that all applications to the Chinese officials should assume the character of a petition, matters went on much as usual till 1838, when fresh disturbances broke out in consequence of the smuggling of opium. Preparations were made on December 12th to strangle a Chinese opium-smuggler in the square immediately in front of the factories at Canton, which the Europeans resisted, and a riot and contest with the Chinese ensued. Captain Elliot, who had returned to Canton as superintendent, on the 18th published a notice, requiring all British-owned vessels trading in opium to leave the river within three days. The Chinese authorities however were not conciliated; on Feb. 26, 1839, a Chinese opium-smuggler was strangled in front of the factories, in spite of the opposition of the Europeans; in consequence of which all the foreign flags were struck, and remonstrances sent to the viceroy, to which no answer was returned.

On March 10, Lin Tsih Sew arrived at Canton as high commissioner from the Imperial court, and immediately commenced a series of measures which rendered a war between China and Great Britain unavoidable. In consequence of Captain Elliot's order (which in fact he had no authority to make nor any power to enforce) the opium-vessels had left the river, but this was not enough for Commissioner Lin, who issued an order commanding all opium in British ships, whether in the Canton River or on the coast of China, to be given up to his officers that it might be destroyed. On the 19th the foreign residents were forbidden to leave China. Captain Elliot joined his countrymen in the factories, which were now surrounded by Chinese soldiers, and from which the means of subsistence were cut off: passports were refused; and the surrender of all the opium on board the ships was demanded of him. Under these circumstances of intimidation 20,283 chests were delivered to the officers of Commissioner Lin, and the burning and destruction commenced on June 3, and occupied 20 days. In July Captain Elliot having applied for a naval force, gave notice to the British merchants that all trade was to be suspended, and that tea, the produce of China, would not be admitted into the ports of Great Britain or India. In August the *Volage*

arrived, and Canton was declared in a state of blockade. In October the Hyacinth joined the Valer, and the two frigates were attacked by twenty-nine war-junks, which were beaten off with great loss. In January 1840, an imperial edict directed all trade with Great Britain to cease; the fortifications of Canton were repaired and strengthened, and repeated attacks were made on the British ships, which were constantly receiving additions, the command being taken by Rear-Admiral Elliot in the Melville, 74. A small force having been left in the Canton River to maintain the blockade, the fleet sailed northward along the coast of China. On July 2, 1840, a boat sailed into Amoy from the Blonde, 44 guns, and bearing a flag of truce was fired upon. The Blonde having poured in her broadsides with terrific effect on the batteries and war-junks, sailed away and rejoined the fleet. Ting-hai, the capital of the island of Chusan, was taken in July, after a slight resistance; and on July 10, in consequence of the refusal of the authorities at Ning-po to receive a letter from Lord Palmerston to be transmitted to the Emperor of China at Peking, a blockade was announced of the east coast of China, from Ning-po to the mouth of the Yang-tse-kiang, the most commercial part of the whole seaboard of China.

At the end of July 1840, the entire British force, including the squadron which had sailed to the north together with the fleet assembled in the Canton River, comprised three 74-gun ships, two of 44 guns, three of 28 guns, five of 20 guns, two of 18 guns, one of 10 guns, a large troop-ship, four armed steamers, and twenty-seven transports, having on board three regiments of soldiers, a body of Bengal volunteers, and a corps of Madras sappers and miners.

On the 11th of August, 1840, the Madagascar steamer, with Captain Elliot on board, entered the Peiho, which flows past Peking on the south and falls into the Gulf of Pe-tche-li, where the rest of the fleet arrived a few days afterwards. Lord Palmerston's communication was now received, and forwarded to the emperor at Peking, and a conference took place near the town of Tien-tsing between Captain Elliot and Keshen, the governor of the province. Some unavailing negotiations took place, until in consequence of the violation of the truce, the forts of Chuenpee and Tae-cok-tow were stormed and carried. These are the lowest forts in ascending the Canton River. On the same day the Chinese squadron of war-junks collected in Anson's Bay, under Admiral Kwan, was destroyed, and eighty guns taken. On the following morning, a boat bearing a flag of truce was sent off to the flag-ship by Admiral Kwan, with a communication to Captain Elliot. Negotiations again commenced, the fleet retired to Chuenpee, and on the 20th of January 1841, Captain Elliot announced that a treaty of peace had been concluded with Keshen, by which the island of Hong Kong was to be ceded to the British, six millions of dollars were to be paid as indemnity, and trade was to be resumed at Canton within ten days.

The forts at Chuenpee were then given up, and the British took formal possession of Hong Kong on January 26. No proclamation however was issued for opening the trade at Canton, and there were rumours of warlike preparations going on up the river. Captain Elliot waited till February 10; he then went up to Canton, and fresh negotiations commenced; but on the 20th Keshen published an edict which he had received from the emperor, rejecting the treaty concluded with the British, who then made immediate preparations for resuming hostilities. All the Bogue forts were taken, and their defenders killed or dispersed. The fleet proceeded up the river on February 27, and found other defences prepared a little below the island of Whampoa, consisting of mud forts, war-junks, and a great raft across the river, very solid and strongly constructed. All these defences were destroyed, and nothing remained but to attack Canton. Sir Hugh Gough arrived from Madras, and assumed the chief command of all the land forces.

On March 18 the forts and all the other defences of Canton were taken, the war-junks and armed boats all dispersed or destroyed, and the city lay at the mercy of the British. Nothing further was done on the 19th, and on the 20th a suspension of hostilities was agreed upon between Captain Elliot and the new imperial commissioner, Yang-Fang. Again a negotiation was entered into, but while it was carried on, a plot was laid for destroying the fleet. On the night of May 20, the sentries discovered several dark-looking masses dropping down the river; these proved to be fire-rafts, consisting of boats chained together in twos and threes so as to hang across the bows of a ship while the combustibles were burning. They were set on fire by those who had the charge of them, when the Nemesis and boats immediately dashed among them, and towed them out of the way of the ships. Many of them drifted on shore, and set fire to the suburbs of the town, while masses of fire were seen floating down the river on all sides.

On May 25 the heights which command the city of Canton were carried by the British troops, when a flag of truce was displayed, and on the 27th the Chinese authorities agreed to pay six millions of dollars for the ransom of the city. Hostilities were consequently suspended, five millions of dollars were paid, and security given for the other million. The British forces then withdrew from Canton; early in June all the ships of war and transports were again at Hong Kong, and in July the Canton trade was re-opened.

In August 1841, Sir Henry Pottinger arrived in Macao Roads, as

sole plenipotentiary and chief superintendent of trade in China. A large naval force was placed at his disposal, by which the large towns of Amoy, Ting-hai, Chin-lai, Ning-po, Shang-hai, and several other places were taken possession of; and in July 1842, a portion of the fleet ascended the Yang-tse-kiang, in order to attack Nanking. At daylight on August 14 the attack was ordered to be made, which the commissioners were informed nothing could suspend except the production of a document bearing the emperor's signature, and authorising them to treat definitively of peace. After midnight, and just three hours before the attack was to have commenced, the required document was produced, a cessation of hostilities ensued, and on August 29, 1842, the treaty of peace was signed by Sir Henry Pottinger on the part of Great Britain, and by Hsien, Elephoo, and Neukien, on the part of the Emperor of China. The emperor's entire assent to the treaty was received on September 15.

The most important provisions of the treaty of 1842 are as follows:—British subjects are allowed to reside at the ports of Canton, Amoy, Foo-chow, Ning-po, and Shang-hai, and a consul is to be appointed to reside at each of the five ports. The island of Hong Kong is ceded in perpetuity to Great Britain. The Emperor of China agrees to pay twenty-one millions of dollars. The company of Hong merchants are dissolved, and British merchants are permitted to carry on their mercantile transactions with any persons whatever. All British subjects, whether natives of Europe or India, who may be in confinement in any part of China, to be unconditionally released. Tables of tariff to be established at each of the five ports. Correspondence between the officers of both governments to be on terms of equality.

A supplementary treaty was signed at Hoonun-chas, October 8, 1843, to which is attached the tariff of export and import duties which are to be paid at the five ports. The principal articles relate chiefly to commercial arrangements, to the arrest and punishment of offences committed by British and Chinese subjects, and to the stationing of a British cruiser at each of the five ports, for the enforcement of good order among the crews of the merchant vessels, and to support the authority of the British consuls. From this period the intercourse has always been peaceful and uninterrupted.

Government.—The government of China is in principle an absolute despotism, and the succession depends on the will and nomination of the reigning emperor. The authority of a father over his family is well known to be the exemplar or type of political rule in the country. It is the object of the first of the 'Four Books' of Confucius to inculcate that from the knowledge and government of oneself must proceed the proper economy and government of a family; and from the government of a family that of a province and of a kingdom. The emperor is called the father of the empire; the viceroy the father of the province over which he presides; and the mandarin, or magistrate, of the city which he governs; and the father of every family is the absolute ruler of his own household. "There is nothing more remarkable," observes Sir J. F. Davis, "in their ritual and in their criminal code than the exact parallel which is studiously kept up between the relations in which every person stands to his own parent and to the emperor. For similar offences against both he suffers similar punishments; and at the death of both he mourns the same time and goes the same period unshaven; and both possess nearly the same power over his person." The emperor is head of the state religion, and, as high-priest of the empire, can alone, with his immediate representatives, sacrifice in the government temples. No hierarchy is maintained at the public expense, nor any priesthood attached to the Confucian or state religion, as the sovereign and his great officers perform that part. The two separate religious orders of Fo (Buddha) and Taou, which are only tolerated and not maintained by the government, derive support entirely from their own funds, or from voluntary private contributions.

With respect to the machinery of civil government, the emperor's principal ministers form the 'interior council chamber,' and the chief councillors are four in number, two Tartars and two Chinese; the former always taking precedence. Below these are a number of assessors, who form the chief council of state. The body whence these chief ministers are generally selected is the Hsün-lin, a sort of imperial college, or National Institute. The details of government business are distributed among six boards or tribunals, namely, 1. The board of civil appointment, which takes cognisance of the conduct and administration of all civil officers; 2. The board of revenues, which regulates all fiscal matters; 3. The board of rites and ceremonies; 4. The military board; 5. The supreme tribunal of criminal jurisdiction; 6. The board of public works. A very peculiar feature of the government is observable in the Too-chü-yuen, or office of censors, the members of which are generally styled Yushu. There are two presidents, a Tartar and a Chinese, and the members consist, in all of about forty or fifty, several of whom are sent to various parts of the empire as imperial inspectors, or perhaps, more properly speaking, spies. By the ancient custom of the empire they are privileged to present any remonstrance to the sovereign without danger of losing their lives; but they are frequently degraded if their advice is unwelcome. The provinces are placed under the principal charge, either singly, of a Foo-yuen, or governor; or two provinces together are made subject to a Tsoung-to, or general governor, who has a Foo-yuen under him for each single province. Canton and its adjoining

provinces are together subject to the Tsoong-to, commonly called by Europeans the Viceroy.

In each separate province there is a chief criminal judge and a treasurer, the latter having usually cognisance of civil suits, but his special business is the charge of the territorial revenues. With this he first of all defrays the civil and military expenses of his province, and whatever surplus remains is remitted by him to Peking. The subordinate cities and districts of each province in the three ranks of Foo, Chow, and Hien, are under the charge of their respective magistrates, who take their rank and titles from the cities they govern. The total number of civil magistrates throughout China is estimated at 14,000. At Canton the amount and importance of the European trade has given rise to the special appointment of the Hsakuán, or commissioner of customs, called by Europeans Hoppo, who ranks as third in the province, but has no territorial jurisdiction beyond the trade. No individual in China can hold a magistracy in his own province; and each public officer is changed about once in three years, to prevent growing connexions with those under his government. A son, a brother, or any other very near relation, cannot hold office under a corresponding relative. The various degrees of civil and military offices are partly distinguished by the colour of the ball which they wear at the apex or point of their conical caps. These are red, light blue, dark blue, crystal, white-stone, and gilt. Each ball is accompanied by its corresponding badge, which is a piece of silk embroidery, about a foot square, with the representation of a bird, or other device, on the breast and back of the ceremonial habit; together with a collar or necklace of very large beads, down to the waist.

The whole amount of military throughout the empire, including the militia of each district, has been estimated at 700,000, of which the largest portion are fixed to their native districts, and cultivate the land, or follow some other pursuit. The whole are under the direction of the military tribunal, or board, at Peking. The trusty Tartar troops are ranged under the eight standards, each of them comprising 10,000 men, and making a total of 80,000 for a standing army. Very few mounted soldiers were seen by either of our embassies, and whatever may be their actual amount, they are said to be nearly all Tartars. A great difference seems to exist between the pay of Tartars and Chinese. One of the former, being a foot-soldier, receives about fivepence a day, with an allowance of rice; one of the latter only fourpence a day, without the rice. The principal arms of the cavalry are bows and arrows, the bow being of elastic wood and horn combined, with a string of silk. Their swords are generally ill made, and their matchlocks are considered by them as inferior weapons to the bow and arrow. Some are provided with shields, composed of rattans turned spirally round a centre. In the recent war with England it was made very evident that where there was (as often was the case with the Tartar troops) the greatest bravery, they were utterly inefficient against European soldiers.

The residence of the emperor and his court for some hundreds of years past has been removed from Nanking to Peking, a city whose population has been stated at double that of London; but various reasons conduce to render this altogether improbable. Notwithstanding the great extent of the area inclosed within its walls, there are so many open spaces of great extent, that it is difficult, taking the lowness of the one-storied buildings into consideration, to imagine how such an immense number can exist within its precincts. A large portion of the northern or Tartarian city is occupied by the inclosure which contains the palace and pleasure grounds of the emperor; the remainder is studded over at intervals with official or religious buildings, all of them surrounded by large open courts; and the Chinese city to the south has some very extensive spaces occupied by immensely-spreading public buildings, with grounds attached. There are besides large sheets of water, and gardens devoted to the growth of vegetables for the city. The streets of Canton and of most of the cities are extremely narrow, admitting only three or four foot passengers abreast; but the principal thoroughfares of Peking, connecting its different gates, are fully one hundred feet in width.

Revenues.—The revenues of China are derived principally from a land-tax, and the monopoly of salt, to which are to be added something for customs and transit-duties; and a considerable sum from the recently imposed duty on the importation of opium. At the Manchow conquest a capitation or poll-tax was imposed, but this was soon taken off again; and the second emperor of the dynasty ordained that the land-tax, which under the Chinese had been taken from the cultivators, should ever after be taken from the land-owners. The subject of the Chinese revenues seems never before to have been very clearly understood. From the produce of taxation in each province, the treasurer of that province deducts the civil and military expenses, and all outlays, whether for public works or otherwise, remitting the surplus to Peking either in money or kind. This surplus has been the only point clearly ascertained, and it has been very erroneously mistaken for the gross amount of the revenue. The difficulty of ascertaining the real expense that attends the administration of the empire arises from a considerable portion of the taxes being levied in commodities instead of money, as grain, salt, silks, and stores of different sorts. A portion of the allowances of public

servants, especially at Peking, as well as of the stipends of imperial relatives, is paid in the shape of rations and supplies. Sir Hildebrand states the total revenue of the empire, including the provinces, at "about 200 millions of taels (or upwards of 60 millions sterling), of which only 12 millions sterling are transmitted to Peking;" and more recently obtained information appears to confirm his statement.

Laws.—We possess a translation of the Tartar-Chinese penal code from Sir George Staunton, and this specimen of legislation presents a very advantageous comparison with other Asiatic systems. If we estimate Chinese legislation by its result, we shall find it (as Sir George Staunton observes) wholly inconsistent with the hypothesis of a very bad government, or a very vicious state of society. Mr. Ellis, who had long been in Persia and India, pronounced China "superior to the other countries of Asia, both in the art of government and the general aspect of society;" and adds, "that the laws are more generally known, and more equally administered; that those examples of oppression, accompanied with infliction of barbarous punishment, which offend the eye and distress the feelings of the most hurried traveller in other Asiatic countries, are scarcely to be met with in China; that the proportion which the middling orders bear to the other classes of the community appeared to be considerable; that, compared with Turkey, Persia, and other parts of India, an impression was produced highly favourable to the comparative situation of the lower orders." It is a popular maxim with the Chinese, that to violate the law is the same crime in the emperor as in a subject. "This plainly intimates (observes Sir J. F. Davis) that there are certain sanctions which the people in general look upon as superior to the will of the sovereign himself: these are contained in their sacred books, whose principle is literally, 'salus populi suprema lex' and however much this principle may at times be violated under the pressure of a foreign Tartar dominion, it nevertheless continues to be recognised, and must doubtless exercise more or less influence on the conduct of the government."

History.—Without attempting to deny to the historical records of the Chinese empire a very high degree of antiquity, it is now pretty generally admitted, on the testimony of the most respectable native historians, that this point has been considerably exaggerated. The persons styled Fohy, Shin-noong, and their immediate successors, must be ranged rather under the head of mythology than of history; resembling those demi-gods and heroes of Grecian fable who rescued mankind from primeval barbarism. The fabulous part of Chinese history commences with Puan-koo, who is represented in a dress of leaves, and concerning whom everything is wild and obscure. He is said to have been followed by a number of persons with fanciful names, who in the style of the Hindoo chronology reigned for thousands of years until the appearance of Fohy, who is said to have invented the arts of music and numbers, and taught his subjects to live in a civilised state. At length came Yaou and Shun, who are stated to have been the patterns of all Chinese emperors. To the age of Shun they refer their tradition of an extensive flooding of the lands, which by some has been identified with the Mosiac deluge. It was for his merit in draining the country, or drawing off the waters of the great inundation, in which he was employed eight years, that 'Yu the Great' was chosen by Shun for his successor. He commenced the period called Hea, upwards of 2100 years before Christ; and the whole of the long space of time included under Hea and Shang is full of the marvellous, until Woo-wong was called upon to depose a tyrannical emperor, the last of the Shang, about 1100 years before Christ. With him began the period of Chow, which may be considered as the commencement of authentic history, and during which Confucius himself lived. Though it might be going too far to condemn all that precedes that period as absolutely fabulous, it is still so much mixed up with fable as hardly to deserve the name of history.

The race of Chow filled the long period of 800 years, during which China appears to have been divided into a number of petty independent states engaged in perpetual disputes with each other. The king of Tsin had long been growing powerful at the expense of the other states; he fought against six nations, and at length compelled them all to acknowledge his authority. The chief government began now to assume the aspect of an empire which comprehended that half of modern China lying to the north of the great river Kiang, but which was doomed after the lapse of some centuries to be split again into several parts. The first emperor of the Tsin dynasty rendered himself famous by the erection of the Great Wall which has now stood for 2000 years, as well as by ordering all the books of the learned (including the writings of Confucius) to be cast into the flames.

About the year B.C. 201 the race of Tsin was succeeded by that of Han, which filled one of the most celebrated periods of Chinese history. It was now that the Tartars became the cause of endless disquiet to their more civilised and peaceful neighbours, who were frequently obliged to buy them off with tribute. The period of the Jan-kuo, or 'Three States,' into which the country was divided towards the close of Han, about A.D. 184, is a favourite subject of the historical plays and romances of the Chinese. The leader of one of these 'Three States' having at length obtained the sovereignty, established the

capital in his own country Honán, and commenced a new dynasty. In consequence of the distractions which had arisen from women and eunuchs interfering in affairs of government during the period of the 'Three States,' a kind of salique law was passed that "queens should not reign nor assist in public matters;" and accordingly we meet with no female sovereigns in their history.

On the conclusion of this race of monarchs in 416 China became divided into two principal kingdoms, Nanking being the capital of the southern one and Honán of the northern. For about 200 years afterwards five successive races (Woo-tai) rapidly followed each other, and the salutary rule of hereditary succession being constantly violated by the strongest, the whole history of the interval is a mere record of contests and crimes. At length in 585 the north and south of modern China were united for the first time in one empire, the capital of which was fixed at Honán. The last of the five contending races was soon after deposed by Ly-yuen, who in 622 founded the dynasty of Táng. There is reason to believe that certain Christians of the Nestorian Church first came to China about this time. It is recorded that foreigners arrived having fair hair and blue eyes. According to the Jesuits, whom Du Halde has quoted, a stone monument was found by them in Shen-si with the cross, an abstract of the Christian law, and the names of seventy-two preachers in Syriac characters bearing the date of 640. The dynasty of Táng was put an end to by a powerful leader in the year 897, and the whole country was thrown into a state of war and confusion, with several aspirants to the sovereignty. This period, which lasted about fifty-three years, is principally distinguished by the incursions of the Tartar people at the eastern extremity of the Great Wall, who being encouraged by the unsettled and divided state of the country gave great trouble by their inroads. After a succession of civil wars Tse-tsoo, the first emperor of the Soong dynasty, was raised to the throne by the military leaders, 950. The art of printing having been just previously invented (about 500 years before it was known to us), the multiplication of books became a principal cause of the literary character of the age of Soong. The Chinese however being much less warlike than learned, the eastern Tartars advanced apace; they took possession of a part of northern China, and threatened the whole country. They were destined soon to be checked, not by the Chinese, but by the Mongols, who inhabited the countries which extend from the north-western provinces of China to Tibet and Samarcand. They had already conquered India, and being now called in against the Kin or Eastern Tartars, they soon subdued both them and the enervated Chinese, whom they had been invited to protect. The Mongols might be said to be masters of the northern part of modern China from the middle of the 13th century. Kublai Khan, finding himself possessed of the provinces bordering on the Wall with Peking for his capital, sent his army against the last sovereign of the Soong dynasty, then a child. Little or no resistance was offered to the Mongols, who exercised great cruelty on the vanquished. The remains of the Chinese court betook themselves to the sea near Canton, and perished with the emperor, 1281. Notwithstanding the great qualities of Kublai Khan, which were calculated to lay the foundation of a permanent dominion, his successors of the Yuen race, as they are called, by their rapid degeneracy caused the empire to pass out of the hands of the Mongol race in a little more than eighty-years' time. Enervated by the climate and vices of the south they quickly lost the courage and hardihood which had put the country in possession of their ancestors; and Shun-ty, the ninth emperor in succession, was compelled to resign the empire to a Chinese. The new sovereign who commenced the native dynasty of Ming, 1366, selected Nanking as his capital, erecting Peking into a principality for one of his younger sons, Yoong-lo. When this prince succeeded as third emperor of his family the capital was finally transferred (1408) to Peking; a principal reason perhaps being the necessity of keeping in check the Eastern Tartars, who had been joined by some of the refugees among the expelled Mongols. From this union sprang the Manchows, who were destined at length to expel the Chinese dynasty and establish a permanent Tartar dominion. In the year 1618 Wan-li, the thirteenth emperor of the Chinese dynasty, being on the throne, a war commenced with these Manchows; and the empire passed in 1644 to Shunchy, the first of the Ta-tsing race, of whom the seventh emperor is now reigning. Such is the brief summary of the principal revolutions in the history of this ancient empire, which for nearly two centuries past has been governed by a foreign race, who had the sagacity to adopt the political and social system of a nation which so greatly out-numbered themselves.

Within the last few years the long-continued quiet of the empire has been twice rudely disturbed; first by the war with England, of which we have already spoken, and since that by the insurrection which is still raging, and which threatens to overturn the reigning dynasty. Of the real nature of this rebellion we are at present in ignorance. Early in 1851 rumours were spread of a revolutionary movement having broken out in the southern province of Quang-si. It was little heeded; but when month after month passed and it remained unrepessed, its progress attracted great attention. The Imperial government watched the movement with much anxiety. The rebels continued to increase in number and daring; they appeared to offer but a feeble resistance. Town after town fell into their hands, and in March 1852 they took the

important city of Nanking. In May of the following year the port-town of Amoy was taken, which has however been since re-taken. In September 1853 Shang-hai, the next commercial city to Canton, was captured. The insurgents have continued to gain ground, meeting in remarkably few instances with any decided reverse. By the latest intelligence received (in February, 1854) it appears that the main army is within 50 or 60 miles of Peking, and a very large part of China is more or less in the hands of the rebels. As we said before, it is difficult to arrive at any certain knowledge of the real character of the movement beyond that of its being intended to overthrow the reigning Manchow, and as it appears to restore the Ming dynasty. By many it is believed to have a religious origin, and to be mainly or equally directed to the overthrow of the existing state worship. There can be no doubt that a decidedly religious zeal of some kind pervades the camp of the insurgents, and that a good deal of religious mystery is thrown over the proceedings of the leaders. But that it is of a Christian and even Protestant character, as many affirm, it is very difficult to believe. The most probable explanation of the great success of the movement is that it was set a-going by certain secret societies, the existence of which has long been known to Europeans, and the branches and ramifications of which have been for many years past stretching throughout every part of the empire and gaining over members from all grades of Chinese society. This will account both for the slight opposition offered by the Chinese authorities and the ready acquiescence of the general population; while the watchwords and religious solemnities of which so much has been said may be parts of the original system of the secret societies.

As before the arrival of the Europeans China was frequently divided into two or three states, the northern portion of it was called by the adjacent nations of Central Asia 'Cathay,' and under this name it became known to the Russians and Mongols, whilst the inhabitants of India called the southern part 'Chin,' under which name the Portuguese and other Europeans became acquainted with it. In the 17th century, and not before, it was ascertained that Cathay was China, and that the great town of Cambalh was identical with Peking.

CHINCHAS, a group of three islands in the Bay of Pisco, on the coast of Peru, lie between 18° and 14° S. lat., 76° and 77° W. long. They are naturally bare rocks, without a sign of vegetation of any sort, but they have obtained great celebrity for the vast quantities of guano with which they are covered. The islands lie nearly north and south, and are separated by channels from one mile to two miles broad. In their general formation they are all alike. On the eastern side they present a perpendicular wall of rock, from the edge of which the guano slopes towards the centre of each island, where a pinnacle of rock rises above the surface; from this point there is a gentle slope to the western shore, the guano continuing to within a few feet of the water. Each of the islands is about two miles round; and each presents the appearance of a flattened cone, the rocky inequalities of the original surface having been filled up and covered with the guano, the outtings of which vary in depth from a hundred feet to a few inches. Round the base of the islands little rocky peninsulas jut out, in which the washing of the sea has formed many caverns, the resort of sea-lions. Whales also are frequently seen gamboling about the islands. The middle island has been moderately worked, but the greatest quantity of guano has been taken from the north island: the south island is still untouched. The quantity of guano on the three islands has been estimated at 250 millions of tons. Guano is also found on the Battista Islands, and upon San Gallen Island, which lie immediately south of the Chinchas, but only in small quantities. It is also found on the Lobos Islands, off the north-west coast of Peru, and at various points along the coast of South America; but what is obtained from the Chinchas Islands is prized above all other deposits on account of its extreme dryness, as rain never falls upon these islands. The steepness of the cliffs that form the shore and the great depth of water (seven fathoms close in) afford great facilities for loading ships.

Guano was used as a manure in the time of the Incas, and the Spaniards learned its use from the Peruvians. The name is a corruption of the Spanish 'huanu,' itself a corruption of the Peruvian 'huanu,' signifying excrement. The substance has been deposited in the course of ages by countless flocks of sea-birds—pelicans, gannets, mews, mutton-birds, divers, gulls, penguins, and others, which still frequent the islands, but not in such numbers as formerly, the great concourse of ships engaged in the guano traffic having driven many of them away. The guano deposits are regularly stratified, the lower strata are solidified by the weight of the upper, and are of a dark red colour, which becomes gradually lighter towards the surface. Under the sun-baked crust of the surface the birds scratch deep oblique holes, in which they lay their eggs, one or two in each hole, so that the upper layer of guano is completely honey-combed by the birds. In addition to the excrement of birds, guano contains decomposed egg-shells, and the bones and remains of fish brought by the old birds to their young.

A ship having taken in by her boats enough guano to ballast her

approaches to a point of the coast where the remainder of the cargo is shot down the cliff into the hold of the vessel. This is managed as follows:—A deep inclosure capable of containing four or five hundred tons of guano is formed on the top of the cliff with stakes firmly bound together by strong iron chains; it is made wide and open at the upper end, and gradually slopes down to a point on the extreme edge of the precipice, where a small opening is left fitted with a canvas shute or pipe, which extends down the rock to the deck of the ship. Through this shute the guano is poured in a continuous stream at the rate of about 350 tons a-day; three days are generally sufficient for loading the largest ship. The inclosure is filled during the night by Indians, who sleep or smoke all day. On the north island about 200 men, and on the middle about 80, usually reside, the numbers varying with the demand for guano. They are almost all Indians; they live in wretched huts, wear but little clothing, earn plenty of money, and seem happy in their way, though everything about them, food and all, is impregnated with guano.

The chief countries engaged in the guano traffic are Great Britain and the United States. The quantity imported into Great Britain in 1852 was 129,889 tons, which was much less than for some previous years. The privilege of loading vessels is obtained from the Peruvian government at a rate of about 4*l.* sterling per ton. There are frequently nearly 100 vessels waiting to load; and some Peruvian vessels of war are constantly stationed off the islands.

CHINGLEPUT, a tract of country forming part of the grants obtained by the East India Company in 1750 and 1768 from the Nabob of Arcot, and known in the annals of the Indian government as the Company's Jaghira. This tract is bounded N. by Nellore district; W. by the districts of northern and southern Arcot; S. by the southern division of Arcot; and E. by the Bay of Bengal; it therefore forms part of the province of the Carnatic, and is included in the presidency of Madras. The soil of the Chingleput district is generally bad; detached rocks of granite are continually met with in the fields, and interfere with the processes of cultivation. The district was invaded by Hyder Ali in 1768 and 1780; in the latter of these invasions the country was so ravaged that many parts were wholly depopulated. In 1794 the district was formed into a collectorate under Mr. Place, and a gradual improvement was effected. The principal towns in the district, Chingleput and Conjeveram, are described under CARNATIC.

CHIOS (Khio, Scio), an island in the *Ægean* Sea near the west coast of Asia Minor, opposite the peninsula on which Erythra stood, and which now separates the gulfs of Smyrna and Scala Nuova. Chios lies at the entrance of the Gulf of Smyrna, and is separated from the mainland by a channel (the Strait of Scio) about 5 miles wide. Its greatest length from north to south is about 32 miles, and its greatest breadth, which is across its northern part, about 18 miles; but a little south of the central part of the island the breadth is only about 8 miles. The circuit is about 110 miles, and the area 400 square miles. The island is mountainous, especially in the northern part, the principal summit of which, called Mount Pelinæus, consists of a long line of bare rocks. Strabo reckoned 400 stadia from the northern extremity of Chios to the nearest point of Lesbos, but the distance between the nearest points of the two islands does not exceed 30 miles. The point indicated by 38° 30' N. lat., 26° 0' E. long., is in the island of Chios.

The oldest settlers, according to tradition once current in the island, were Pelangi from Thessaly. Chios was afterwards one of the twelve Ionian states; the population that settled there was not pure Ionian, but mixed. (Strab. 633; Herod. i. 142.) The dialect of the inhabitants is said by Herodotus to have been the same as that of the people of Erythra. In the great sea-fight between the Ionian Greeks and the Persians off Miletus (B.C. 494), which resulted in the entire defeat of the Greeks, the people of Chios furnished 100 ships, and fought bravely. After the battle the Persians took possession of the island; the cities and temples were burnt, and all the handsome young females carried off. (Herod. vi. 8, 32.)

After the close of the Persian war, B.C. 480, the island passed successively under the dominions of the Athenians, the Macedonians, the Romans, and the Byzantines. The Genoese took it in 1346, and it was governed for a long time by the Genoese family of Giustiniani. Solyman the Great took it in 1566. In 1694 it was taken by the Venetians, but was soon after retaken by the Turks, by whom it was treated with especial favour, being allotted as a kind of dowry to the Sultana mother, who sent her officers to collect the mastic gum, which is collected in great abundance from the lentiscus in the south of the island, and which constitutes a valuable commodity, being much used at Constantinople, and especially by the ladies of the seraglio, for chewing. Under the protection of the Sultana, the people of Chios were safe from the vexations of the pashas and other arbitrary chiefs; they had their own magistrates, and lived in comparative freedom and security. The island accordingly prospered, and Tournefort and other travellers agree in representing it as a garden inhabited by a happy people. Its inhabitants amounted to more than 100,000, of whom nearly 30,000 lived at Khio (sometimes also called *Kastro*), the capital, a handsome town built in the Italian style, with a castle raised by the Genoese, on the east coast of the island. Khio is at the foot of Pelinæus, and occupies the site of the ancient town of Chios. It

had a college with 14 professors, in which between 400 and 500 youths of the various Greek islands received their education; a printing-office, and a good library. The establishment was supported by contributions of the Chiote merchants, many of whom were wealthy, and carried on an extensive commerce with Italy and other countries.

When the Greek insurrection broke out, the Chiotes, a peaceful race, and far from the theatre of war, remained quiet, until a party of turbulent Samiotes and other Greeks from Candia, half partisans, half pirates, landed upon the island in 1822, and excited or rather obliged the people to join the insurrection. The sequel is well known. The capitan pasha came with a large force, the Samiotes escaped by sea, the poor Chiotes made hardly any resistance, but were slaughtered by thousands, their wives and children were carried away and sold as slaves, and the town of Khio was burnt. In the town and the villages of the island in 1828 there were only about 15,000 Greeks, who had escaped from the slaughter and had returned under the assurance of protection of the new pasha.

The island is recovering from this terrible chastisement. It is naturally one of the most beautiful of the Greek islands; its surface presents varied and charming scenery; and its products are abundant and valuable, comprising besides mastic, wine of excellent quality, silk, wool, figs, lemons, oranges and other fruits, and cheese. The corn grown on the island does not suffice for the consumption. There is a marble quarry near the town of Khio.

The principal towns of the island in ancient times were Chios, Delphinium, Bolissus, Phanse, which had a good port and a temple of Apollo, and Leuconium. Cardamyle, where the Athenians landed to attack the people of Chios (Thucyd. viii. 24), is now Khardamli, on the north-east coast of the island. Ion, the dramatic writer, the historian Theopompus, and the sophist Theocritus, were natives of this island. Chios was one of the places that claimed to be the birth-place of Homer, and the natives still show a spot on the north coast which they call Homer's School.

CHIPPENHAM, Wiltshire, a municipal and parliamentary borough, and the seat of a Poor-Law Union, in the parish and hundred of Chippenham and northern division of the county, is built principally in a valley on the left bank of the Bristol or North Wilts Avon, in 51° 27' N. lat., 2° 6' W. long.; distant 10 miles N.W. by N. from Devizes, 94 miles W. by S. from London by road, and 93½ miles by the Great Western railway. The population of the municipal borough of Chippenham in 1851 was 1707; that of the parliamentary borough was 6283. The borough is governed by four aldermen and twelve councillors, one of whom is mayor; and returns two members to the Imperial Parliament. The living is a vicarage, with the rectory of Tytherton Lucas annexed, in the archdeaconry of Bristol and diocese of Gloucester and Bristol. Chippenham Poor-Law Union contains 29 parishes and townships, with an area of 56,371 acres, and a population in 1851 of 21,407.

Chippenham received its first charter of incorporation from Queen Mary, but there can be little doubt that it was an important town prior to the Conquest. The taking of the town by the Danes about the year 880 is said to have been the cause of the retreat of Alfred the Great to the Isle of Athelney in Somersetshire. The name of the town occurs several times in Anglo-Saxon history, and is thought to have been derived from the Saxon term for market; the market at this place was from a very early period an important one. Chippenham sent representatives to Parliament as early as the time of Edward I. At Chippenham the Avon is crossed by a handsome stone bridge of 21 arches, which has been widened and improved, and is kept in repair and lighted with gas, from the proceeds of landed property given to the borough by Queen Mary on its incorporation. Near the stone bridge is a wooden bridge for foot passengers only. The town consists chiefly of one street, more than half a mile in length, which runs eastward from the bridge, and forms a part of the coach road. The streets are well paved and are lighted with gas. In the High-street the houses are generally built of freestone or of brick. The market-house, in the High-street, erected by Joseph Neeld, Esq., one of the members for the borough, is a spacious and handsome structure; it has been recently greatly enlarged at the expense of Mr. Neeld. In the upper part of it is the new hall, a commodious room used for public meetings. The parish church, a venerable gothic structure, is in the centre of the town; it is partly of the decorated and partly of the perpendicular style. It has been recently repewed. The Wesleyan and Primitive Methodists, Independents, and Baptists have places of worship. The Free school in Chippenham is for the education of twelve poor boys, and is managed by the charity trustees. There are National and British schools, and a literary and scientific institution.

From its position on a leading high road, and the importance of its fairs and markets, Chippenham has generally secured a good share of traffic. The river Avon is not navigable till it reaches the city of Bath, but a branch of the Wilts and Berks Canal is brought to Chippenham, and by it a considerable trade is still carried on, chiefly in coals. A branch line of railway connects Chippenham with the neighbouring towns of Melksham, Trowbridge, and Westbury. Broad cloths and kerseymeres were at one time woven to a great extent at Chippenham, but the general introduction of superior and more

machinery into this branch of manufacture has quite changed the character of the trade throughout the West of England. The quality of the fabric however still maintains its reputation. A small silk manufactory, a tan-yard, a corn-mill, two iron-foundries, and several brick-fields and malt-houses give considerable employment. The weekly market at Chippenham is held on Friday. There is a monthly market for cattle and cheese. There are four hiring markets for servants; several wool fairs; and an annual cattle show in December. The cheese markets and cattle shows are among the most extensive in the west of England. Four annual fairs are held May 17th, June 22nd, October 29th, and December 11th for the sale of cattle, sheep, and horses. Chippenham possesses a savings bank. A county court and petty sessions are held in the town.

Some mineral springs have been found in the vicinity of Chippenham. The ancient abbeys of Stanley and Lacock are within three miles of Chippenham; the former has been converted into a farm-house, but the latter has been preserved, and is now the family seat of the Talbots. The ancient forest of Chippenham and Pewsham has been long disafforested.

(Hoare, *Wiltshire*; Britton, *Wiltshire*; *Correspondent at Chippenham*.)

CHIPPING NORTON, Oxfordshire, a municipal borough, market-town, and the seat of a Poor-Law Union, in the parish of Chipping Norton and hundred of Chadlington, is situated near the head of the river Evenlode, in 51° 56' N. lat., 1° 33' W. long., distant 19½ miles N.W. from Oxford, 73 miles N.W. by W. from London. The population of the borough in 1851 was 2932. The borough is governed by 4 aldermen and 12 councillors, one of whom is mayor. The living is a vicarage with the curacy of Over Norton attached, in the archdeaconry and diocese of Oxford. Chipping Norton Poor-Law Union contains 33 parishes and townships, with an area of 75,071 acres, and a population in 1851 of 17,338.

Chipping Norton is a town of considerable antiquity, but it possesses little historical interest. It is situated on elevated ground. The town is lighted by gas. The principal street, which is in the higher part of the town, is the most modern, and contains the best houses. The parish church, a large and beautiful gothic edifice, consists of a nave, which has an old carved oak roof, side aisles, and a chancel. At the west end is an embattled tower. There are places of worship for Methodists, Baptists, and Quakers. The Free Grammar school, founded in 1547, has an income from endowment of about 17l. a year with a house, and had 49 scholars in 1850, of whom 4 were free. There are National and British schools. A new town-hall has been recently erected. The manufacture of woollen goods is carried on. Druggots, horse-cloths, and a stout cloth for trousers are made. Worsted shawls are woven in large quantities. Chipping Norton market is an important one for agricultural produce. The market-day is Wednesday. There are nine fairs or great markets for cattle in the course of the year. A county court is held. To the north of the church is the elevated site of the keep of the old castle.

(*Communication from Chipping Norton*.)

CHIPPING SODBURY, Gloucestershire, a market-town and the seat of a Poor-Law Union, in the parish of Chipping Sodbury and hundred of Grumbald's Ash, is situated in 51° 32' N. lat., 2° 23' W. long.; distant 27 miles S.S.W. from Gloucester, and 108 miles W. from London by road; Yate station, on the Bristol and Gloucester line, which is one mile and a half from Chipping Sodbury, is 128½ miles from London by the Great Western railway. The population of the parish of Chipping Sodbury in 1851 was 1195. The town is governed by a bailiff and 12 burgesses. The living is a perpetual curacy in the archdeaconry of Bristol and diocese of Gloucester and Bristol. Chipping Sodbury Poor-Law Union contains 23 parishes and townships, with an area of 61,398 acres, and a population in 1851 of 18,523.

The manor of Chipping Sodbury was given by William the Conqueror to one of his relatives. The borough had a charter in the time of Charles I. The town, which is situated at the foot of a hill, consists of several streets; the principal street, which is on the high road, is wide and handsome. It was paved a few years back, the cost being defrayed by the inhabitants. The front of the town-hall has been recently rebuilt by the corporation. The church, an ancient and commodious edifice, has a lofty tower. The Baptists, Quakers, and Roman Catholics have places of worship. The town possesses an Endowed Grammar school and a National school; also some valuable charities. The population is chiefly agricultural. Malting is carried on. In the neighbourhood are lime-kilns, stone-quarries, and coal-pits. The market-day is Thursday. There is a large monthly market for cheese, cattle, corn, &c. Fairs are held on May 28th and June 24th. On a range of hills about three miles from Chipping Sodbury are the remains of a Roman encampment. Immediately contiguous to the camp is Little Sodbury Manor House, distinguished as the place in which Tyndale commenced his translation of the New Testament.

(*Communication from Chipping Sodbury*.)

CHIRK. [DENBIGHSHIRE.]

CHIRNSIDE. [BERWICKSHIRE.]

CHISLEHURST. [KENT.]

CHISWICK. [MIDDLESEX.]

CHITTAGONG, a district in the south-east part of the province of Bengal, bounded N. by Tipperah district, E. by the Birman empire, S. by the province of Aracan, and W. by the Bay of Bengal. This district lies between 21° and 23° N. lat., and between 91° and 93° E. long.; its length from north to south is about 120 miles, and its greatest breadth 50 miles, but the eastern boundary has not been accurately defined, and the average breadth is supposed to be not greater than 25 miles. The country is watered by numerous streams, half of which flow towards the Bay of Bengal, and the rest into the Irawaddi. The most considerable of these streams is the Kamaphuli, or Chittagong River, which at its mouth forms a secure harbour, but so embayed, that during the continuance of the south-west monsoon it is generally difficult for vessels to put to sea. The channel of this river at the capital, Islamabad, is about a mile broad; but a little higher up its width does not exceed 200 yards, although the tide continues to flow strongly up the river. The source of this river is in Ava, whence it flows south-west to the district of Chittagong, which it enters by the Mugh Mountains, where many waterfalls occur. In the valley of the Kamaphuli are some rich tracts of land, cultivated by Bengalese, which yield plantains, ginger, betel-leaf, sugar-cane, cotton, indigo, and tobacco. Between the hills are several well-watered plains and valleys, of small extent, which are cultivated partly by Hindoos of Bengal, and partly by Mughls of Aracan, who migrated into the district upon the conquest of their country by the Birmanes in 1783. The majority of the Mughls who thus settled in Chittagong are traders and mechanics, only a small proportion having become cultivators. Exclusive of the Mugh settlers, the inhabitants of Chittagong do not exceed a million. The Mohammedan inhabitants exceed the Hindoos in number in the proportion of three to two.

CHOAPSES, or KIRKHAH RIVER. [BAGHDAD, PASHALIC OF.]

CHOCZIM, or KHOTIN. [BESSARABIA.]

CHOLLET. [MAINE-ET-LOIRE.]

CHOLULA, a town in Mexico, in the state of Puebla, stands in 19° 2' 6" N. lat., 98° 15' W. long. It is situated on the table-land of Anahuac, at an elevation of 6912 feet above the level of the sea. Cholula is a considerable place, being inhabited by 16,000 souls, but its manufacturing industry is limited to the fabrication of coarse cotton goods. In the country about it are numerous and extensive plantations of maguay, from which plant the natives extract the beverage called pulque. Close to the town stands the largest of the Mexican teocalli, or pyramids. [AMERICA, *Antiquities*, vol. i. col. 309.] The platform on its top has an area of somewhat more than 50,000 square feet, and in the midst of it is built a church, dedicated to Nuestra Señora de los Remedios, in which mass is read every morning by a priest of the Indian race. The prospect from this platform over the adjacent plain, as far as the great mountain masses of Popocatepetl and Pico de Orizaba is very grand and striking. At the time of the invasion of Cortez, Cholula had 20,000 houses, and in the suburbs were as many. Above 400 towers of temples rose above the town.

CHORGES. [ALPES, HAUTES.]

CHORLEY, Lancashire, a market-town and the seat of a Poor-Law Union, in the parish of Chorley and hundred of Leyland, is situated in 53° 39' N. lat., 2° 37' W. long.; distant 32 miles S. by E. from Lancaster, 208 miles N.W. by N. from London by road, and 211 miles by the North-Western railway, and the Manchester and Preston branch of the Lancashire and Yorkshire railway. The population of the town of Chorley in 1851 was 8907. The government of the town is vested in a constable and visiting magistrates. The living is a rectory in the archdeaconry and diocese of Manchester. Chorley Poor-Law Union contains 26 parishes and townships, with an area of 37,908 acres, and a population in 1851 of 37,701.

Chorley is situated on a hill in the centre of the county, on the great west road from London to the North, near the course of a small stream called the Chor. Chorley was erected into an independent parish in 1793. The parish church is an ancient structure, supposed to be of Norman origin. The tower, which is embattled and has pinnacles, is a later erection. St. George's church, an elegant modern structure, built by the parliamentary commissioners, was opened in 1825. The Independents, Wesleyan and Primitive Methodists, Baptists, Unitarians, and Roman Catholics have places of worship. The Grammar school, adjoining to the churchyard, has an income from endowment of 10l. 15s. a year, and had 32 scholars in 1851. There are National and Infant schools, Independent, Methodist, and Roman Catholic day schools; a dispensary, and a savings bank. Six almshouses, built in 1682, are for aged women and widows.

Chorley is a thriving manufacturing town: its streets are tolerably well laid out, lighted with gas, and supplied with water. The chief articles of manufacture are calicoes, muslins, and gingham. Cotton-factories, print-works weaving-sheds, bleaching-works, a paper-mill, coal-mines, stone-quarries, and a patent brick and draining-tile manufactory afford employment to many of the inhabitants. Four miles from Chorley, lead and carbonate of barytes are found. The Leeds and Liverpool Canal, and the Lancashire and Yorkshire railway afford facilities for the carriage of goods. A county court is held in Chorley. The town-hall is a neat stone building, erected in 1802, at the cost of the late John Hollinshed, Esq. The under part of the building

is used as a market-house. The market-day is Tuesday. Fairs are held on March 26th and May 5th for horned cattle; on October 21st for horses, and on September 4th, 5th, and 6th for woollen-cloth, hardware, and pedlery. In the vicinity is a mineral spa, with various descriptions of baths. The grounds are laid out as gardens and public walks.

(Robinson, *Description of the Parish of Chorley; Communication from Chorley.*)

CHORLTON. [MANCHESTER.]

CHOUMLA. [SHUMLA.]

CHOWBENT. [LANCASHIRE.]

CHRISTCHURCH, Hampshire, a market-town, "parliamentary borough, sea-port, and the seat of a Poor-Law Union, in the parish and hundred of Christchurch, and the western division of the county, is situated within the angle formed by the confluence of the rivers Avon and Stour, in 50° 44' N. lat., 1° 45' W. long., distant 24 miles S.W. by W. from Southampton, and 101 miles S.W. from London by road. Christchurch-road station on the Southampton and Dorchester branch of the South-Western railway, which is 7 miles from Christchurch, is 100 miles from London. The population of the old borough of Christchurch in 1851 was 1877, that of the parliamentary borough was 7475. The borough is governed by a mayor and burgesses, but the judicial affairs are in the hands of the county magistrates. Christchurch returns one member to the Imperial Parliament. The living is a vicarage with the curacy of Holdenhurst annexed, in the archdeaconry and diocese of Winchester. Christchurch Poor-Law Union contains three parishes and townships, with an area of 35,988 acres, and a population in 1851 of 8477.

The name of the borough, properly Christchurch Twyneham, is derived from a church and priory founded here by the West Saxons in the reign of Edward the Confessor. The priory was refounded and the church built in the reign of William Rufus, by Flambard, bishop of Durham. Henry VIII. assigned the church of the priory to the inhabitants of Christchurch for their parish church. It is a very spacious and remarkable edifice, having much the character of a cathedral. It consists of a nave with aisles, choir with aisles, and a lady chapel, transepts with chapels attached, a massive square tower at the western end, and a capacious northern porch-house. The extreme length of the church is 311 feet; the nave is 118 feet long, with the aisles 58 feet wide, and to the summit of vaulting 58 feet high; the tower is 120 feet high. The nave is of Norman date and style, with a clere-story of early decorated; the choir is perpendicular. The nave has a double row of massive Norman pillars, which support semicircular arches with the characteristic Norman carvings. In the chancel is a magnificent stone altar-screen, having the genealogy of Christ elaborately sculptured upon it. The most interesting of the mortuary chapels attached to the church is that erected during her life by Margaret Plantagenet, countess of Salisbury, who was beheaded by order of Henry VIII. in 1541. It is an exceedingly good specimen of the florid perpendicular style, with a richly carved roof of fan tracery. Among the many monuments in the church is one to Viscountess Fitzharris, by Flaxman; there is also one by Chantry. At various times during the present century the church has been repaired, and to a great extent restored. Of the other priory buildings the only portion left is the lodge a little to the south of the church. The independent chapel is a spacious building, and has attached to it extensive school-rooms. The Wesleyan Methodists have a new and commodious chapel. In Christchurch are a Free Grammar school, National, British, and Infant schools, and several endowed charities. A county court is held monthly.

The principal manufacture in Christchurch is that of fusee chains for watches and clocks. The making of these chains employs about 500 persons, chiefly women and children; the chains are supplied to the watch and clock-makers of London, Birmingham, and Liverpool. The salmon fishery is prosecuted to some extent in the rivers Avon and Stour. A shifting sand-bar prevents the approach of vessels drawing more than six feet of water, and these can only enter at high tide. At Christchurch harbour high water occurs twice every tide. Good anchorage in six fathoms water is found in the bay, east of the harbour, about two miles from the town. Some fragments of the keep and other parts of the castle are still standing close to the north side of the churchyard. Roman and British remains have been found in and near the town. On the site of the ancient priory is a house which in 1817 was the temporary residence of Louis Philippe, the late king of the French. Near Christchurch is the remarkable promontory of Hengistbury Head.

(Ferrey and Brayley, *Antiquities of the Priory of Christchurch; Communication from Christchurch.*)

CHRISTIANIA, the capital of Norway, is situated in 59° 55' N. lat., 10° 50' E. long., at the northern extremity of the Christiania Fjord [AGGERHUUS], into which the river Agger falls close to the town. In 1810 the population hardly reached 10,000; in 1826 it was 20,581; in 1845 it was 31,703. Except towards the bay the town is inclosed by high hills and mountains, which on the north are about five miles distant, but on the other sides approach much nearer the town. The streets are wide, straight, and well paved; the pavement however inclines from each side to the centre of the street, which is thus converted into a common sewer. The houses have rarely more

than two stories; most of them are built of bricks, and very few of them have any pretensions to architectural beauty. The best street is that leading to the new palace, which is finely situated—its chief merit above the mean-looking old palace in the centre of the town. Christiania has four suburbs, which in parts are not paved. Among the public edifices are the new palace already mentioned, the Storting hall, or legislative palace, the military academy, and the cathedral; but the churches generally have no architectural interest whatever. Norway, by its union with Sweden, obtained an independent legislative government, which has its seat in this town. The university, which was founded in 1811, and for which a new building has been recently erected, is attended by about 800 students. It possesses a library of 130,000 volumes, astronomical and magnetic observatories, a botanic garden, a museum, a picture gallery, and other institutions. The sum of 33,000 dollars is annually allowed for its maintenance. The museum of the university contains collections in zoology, mineralogy, &c., and a variety of northern antiquities, consisting of gold and silver ornaments; rude bronze idols; weapons in flint, bronze, silver, and gold, &c. Like the universities of Germany it is rather a school for public officers than intended to form men of science and learning; some of the lectures are intended as a preparatory course for young men who are designed to be practical miners. There are besides a military academy and several other schools, an art-union, two theatres, a national bank and exchange, military and lunatic asylums, a Freemasons' hall (a large structure in which there is a ball-room capable of containing 1000 persons), and also a society for promoting the prosperity of the country. Manufacturing industry has not made much progress; the chief products are woollen cloth, iron utensils, tobacco, paper, &c.; cotton factories and iron works however are on the increase. There are several distilleries and breweries, and the town has an extensive trade in deals, planks, wood, fish, and other northern produce. In one of its suburbs, called Opslo, alum is made to a considerable extent.

The castle of Aggerhuus is situated on an eminence to the south of the town; its ramparts, which command the town and the entrance to the harbour, are laid out in walks. In the castle are preserved the regalia of Norway and the national archives. On the western side of the keep two brass guns, splendidly decorated with bas-reliefs, are mounted; they were cast in 1620, and are said to have been taken during the Thirty Years' war by the Swedes, from whom they were subsequently captured by the Norwegians. The castle it is said was built in 1302; it was last besieged by Charles XII. in 1716. Part of it is used as a prison for galley-slaves.

In the environs are the botanical gardens, situated about a mile from the town on the Trondhjem road, tastefully laid out, and exceedingly rich in arctic plants, both native and exotic; the cemetery; and near it the Column of Liberty, erected to commemorate the commencement of the Norwegian constitution, April 11, 1814. Splendid views of the town and bay of Christiania from the Frogneraasen, a hill 1500 feet high, and from the opposite hill of Egeberg, which rises about 400 feet above the old town of Opslo.

Opslo was founded in 1058 by King Harald Haardrade, and rose to be the third city in Norway. Upon the union of Norway with Denmark, Opslo became the capital of the former. Christopher III. and Christian II. were crowned in Opslo in the cathedral of St. Halvard, which also witnessed the marriage of James I. to Anne of Denmark in 1589. With the exception of the bishop's palace and a few houses, Opslo was entirely destroyed by fire in 1624. The new city then built was named Christiania after Christian IV., who happened at the time to be in Norway.

Steamers ply regularly between Christiania and Copenhagen, Kiel, Christiansand, &c. A railway is in course of construction from Christiania to Lake Mjosen, which will open up some of the most fertile parts of Norway. In the open season the town of Christiania is said to have the healthiest and most equable climate in Europe: the mean summer temperature is 60° Fahr.; in winter the average temperature is 23° Fahr.

(Forbes, *Norway and its Glaciers*: Edinburgh, 1853.)

CHRISTIANSAND, a province of Norway, comprehends the most southern part of that kingdom, and extends from Cape Lindesnaes (the Naze), or from 58° to a little north of 60° N. lat. It is comprised between 5° and 10° E. long. Its length from south to north is 150 miles, and its average breadth is about 100 miles. The area is about 14,100 square miles; the population amounts to about 250,000.

Cape Lindesnaes is considered as the southern extremity of the Norrøka Fjellen mountain chain, which traverses Norway from south to north as far as 62° N. lat., and then turns east-north-east till it joins the Kiölen range at 63° N. lat. This range begins with Cape Lindesnaes, but does not attain the perpetual snow-line south of 59°; so that those parts of it which are called Heek Field and Bygle do not rise 4000 feet above the sea, which in this parallel is the line of perpetual congelation. But north of 59°, the Iocle Field, Hougle Field, Gute Field, and Hardanger Field rise somewhat above it. The highest summit of the Hougle Field is 4668 feet. The highest mountain however, the Gousta Fell, is not in the principal range, but east of it: the elevation of this mountain is 5535 feet above the sea. From these mountain masses, which occupy more than half its surface, the province slopes gradually towards the sea, forming everywhere a rocky,

bold, and frequently a high shore, which on the east and south is slightly indented, but on the west forms a bay of considerable extent, the Bukke Fiord. Two of its branches run many miles into the mountains, and terminate at the foot of the high range. The northern and larger is called Nærstrand Fiord, and the southern Lyse Fiord. The latter may be considered as separating the mountains from the hilly country which extends southward to Cape Lindesnaes.

The north-eastern part of Christiansand, about the Gousta Fell, is a very high country, called Tallemarken, and inhabited by a poor but hardy and enterprising race of men. The numerous clefts are filled with water, which rushes down in rapids and cataracts with incredible velocity. The waterfall of the Rinkan Foss is 450 feet high. These waters unite in three streams, which fall into the lake of Nord Soën, from which issues a powerful and rapid stream, the Skeen-Elf, or Brevig-Elf. The southern districts of the province are mostly wide and fertile valleys, with a warmer climate than could be expected in such a high latitude. Agriculture is duly attended to in the low grounds, and the hills are covered with forests of oak, pine, fir, and birch. These forests are the principal wealth of the country; they supply materials for the building of the numerous boats employed in fishing, and are also an article of export in the shape of planks and deals. The fishery is not important, except that of lobsters, which are perhaps nowhere found in such immense numbers as along the southern coast between Hellesund (east of Christiansand), and Lister Fiord (north-west of Lindesnaes). The London market is supplied with lobsters principally from these fisheries. The chief rivers are the Nid-Elf, which runs about 80 miles, and the Torridals-Elf, which has a length of about 100 miles; both are too rapid to be navigated. The sea along the south and the south-east coast is dotted with innumerable rocks and islets.

Besides the capital, CHRISTIANSAND, which forms the subject of the next article, the following places may be noticed:—*Arendal*, north-east of Christiansand, is a small but pretty town built on rocks projecting into the channel formed by the Trommø and other islands near the mouth of the Nid-Elf. Its streets are formed partly by wooden bridges and partly by canals. Its harbour, which is safe but not large, is formed by the island of Trommø; ships lie close to the houses, so great is the depth of water. The church is built of wood. A broad quay, facing the south-east, runs along the principal street. Deals and planks are exported, and in its neighbourhood some iron-mines are worked. There are tobacco factories, distilleries, and ship-building yards. The population, which consists chiefly of traders and fishermen, is about 3500. *Plekkeford*, on the west coast near the head of Lal Fiord, has 3000 inhabitants and a considerable trade. The harbour is good, but the channel of the Lal Fiord is narrow. *Mandal*, between Christiansand and Cape Lindesnaes, at the mouth of the Mandals-Elf, has a safe harbour, to which vessels resort when damaged in the dangerous navigation of this sea. It exports salmon, both salt and dried, and has about 3000 inhabitants. *Stavanger*, on an arm of the Bukke Fiord, called the Tunge Fiord, has a spacious and safe harbour, and about 8000 inhabitants, who are chiefly supported by the herring fishery. The annual take of herrings for curing averages 300,000 barrels. The town, which is one of the most ancient in Norway, is built on a large promontory which commands fine views of the fiord with its numerous islands and bays and the mountains on the mainland to eastward. Stavanger gave title to a bishop before the foundation of Christiansand; it still retains its cathedral, which, with the exception of that of Trondhjem, is the finest specimen of gothic architecture in Norway. The harbour of Stavanger is well sheltered by an island in front of the town. Steamers between Christiansand and the north-west coast of Norway put into Stavanger.

The province is divided into the bailiwicks of Nedenais, Mandals, and Stavanger, which respectively comprise the eastern, southern, and western districts.

CHRISTIANSAND, capital of the stift or province of Christiansand in Norway, and the residence of the stift-amtmand (high bailiff of the province) and of a bishop, is situated on the Topdals Fiord on the northern coast of the Skagerack, opposite to the peninsula of Jutland, in 58° 10' N. lat., 8° 20' E. long., and has about 12,000 inhabitants. It stands on an extensive bay, where the Torridals-Elf enters the sea; its harbour is safe, and affords a secure shelter for vessels that navigate the Baltic along this rocky coast. The town, which was founded in 1641 by Christian IV., has long broad streets laid out with the utmost regularity, and covered in the middle with deep sand. The houses, though chiefly of wood, are very neat and pleasant, and separated from one another by gardens. The cathedral is built of gray stone, and in architectural pretensions ranks next to those of Trondhjem and Stavanger. There is a branch national bank and a grammar school in the town. The town and the entrance of the harbour are defended by a fortress erected on the Isle of Odderø. The principal branch of industry is ship-building, this place being situated in the only district of Norway where oak grows, and hence most of the vessels belonging to the merchants of Christiania and Drammen are built here. It exports lobsters, logs, and deals to England. Lobster fishing affords occupation to numbers of the population. Steamers ply regularly to Christiania and Trondhjem. In the graveyard of *Odde's* church, which is a little north of the town, and

is reached by a handsome bridge thrown across the river, are several ancient tombstones; among others one marked with a Runic inscription is supposed to be above 800 years old. About three miles above the town the Torridals-Elf makes a fine fall, called Helfos.

CHRISTIANSTAD, a fortified town in South Sweden, in 56° 1' N. lat., 14° 5' E. long., is the capital of Christianstads Län. [SWEDEN.] It is built on a peninsula in the Helge Lake, which is formed by the river Helge An, and has a population of 4500. The streets are straight and wide, and the houses mostly built of wood. The harbour of the town is *Ahus*, a small place about 10 miles from it at the mouth of the river Helge An in the Baltic. The town was founded by Christian IV. of Denmark. A canal was begun in order to form a convenient water-communication with the harbour, but as its commerce was, and is still, very limited, this work has gone to decay. Some woollen and linen goods are made here, and good gloves. It has been recently proposed to lay down a railway through Christianstad from the Skelder Wik, an inlet of the Kattegat on the west of the Län to *Ahus*, in order to relieve the commerce of South Sweden from the Sound dues.

CHRISTIANSUND. [TRONDHJEM.]

CHRISTOPHER'S, ST., or ST. KITT'S, one of the Caribbean Islands, was discovered in November 1493, by Columbus, who was so delighted with its appearance that he gave it his own Christian name. At this time it was well peopled by the Caribs, by whom it was called *Liamuiga*, or the Fertile Island. It was never colonised by the Spaniards, but was the first of the British settlements in the West Indies. A party under Mr. Thomas Warner took possession of it in 1623, and four years afterwards it was shared with some French settlers. After various severe contentions the island was wholly ceded to the English, in whose possession it remained till 1782, when it was taken by the French, but restored at the peace of 1783. In 1805 it was again ravaged by the French, who however did not retain possession. St. Kitt's contains about 44,000 acres, nearly half of which is unfit for cultivation. The other part is almost entirely occupied with plantations of sugar-cane, leaving only a small portion for cotton, indigo, pasturage, and provisions. The centre of the island is occupied by rugged barren mountains, which contain some hot springs. The highest point, called Mount Misery, 3711 feet above the sea, is an exhausted volcano, the crater of which is still apparent. The soil of the plain is chiefly a dark gray loam. The island is divided into nine parishes, and contains four towns—*Basseterre*, the capital, Sandy Point, Old Road, and Deep Bay. St. Kitt's is governed by a lieutenant-governor, and sends 10 members to the House of Assembly of the Leeward Islands, at Antigua, of which government it forms a part. The revenue in 1851 amounted to 19,665*l.* 5*s.* 2*d.*, the expenditure to 14,672*l.* 7*s.* 6*d.* The year 1851 was considered a very prosperous year in consequence of the abundance of the harvest. The sugar exported in 1851 amounted to 7270 hogsheads, being 2562 hogsheads more than was exported in 1850. The value of the imports for 1851 was 112,748*l.* 3*s.* 2*d.*, being an increase over those of 1850 of 20,229*l.* 10*s.* 6*d.* The climate, though hot, is considered healthy, but the island is subject to violent hurricanes. It lies north-west and south-east, 17 miles in length and 6 miles in breadth, and is separated from Nevis by a strait only a mile and a half wide. The plantations in the island are almost all in the hands of non-resident cultivators, a system which is prejudicial both to the interests of the proprietors and the prosperity of the island. The education of the people is conducted by the Established Church, the Wesleyan Methodists, and the Moravians. In 1851 the attendance of children at Church schools was 794, at Wesleyan schools 850, at Moravian schools 885. (*Parliamentary Papers*.)

CHUDIM, a town in Bohemia, 62 miles E.S.E. from Prague, stands on the right bank of the Chrudimka, a feeder of the Elbe, and not far from the Pardubitz station on the Prague and Vienna railway, in 48° 46' N. lat., 15° 50' E. long., and has above 6000 inhabitants. It is well built, surrounded with walls, and contains a magnificent collegiate church, a capuchin convent, and a high school. The city is a royal appanage, and has its own civil court. The time of the foundation of Chrudim is not known, but it is certain that it was reckoned one of the Bohemian towns in the year 1055.

CHUDLEIGH, Devonshire, a market-town in the parish of Chudleigh and hundred of Exminster, is situated on the road from Exeter to Plymouth, a short distance from the left bank of the river Teign, in 50° 36' N. lat., 3° 36' W. long.; distant 9 miles S. by W. from Exeter, and 184 miles S.W. from London by road. Starcross station of the South Devon railway, which is about 5 miles from Chudleigh, is 202 miles from London. The population of the parish of Chudleigh in 1851 was 2401. The living is a vicarage in the archdeaconry and diocese of Exeter.

The manor of Chudleigh formerly belonged to the Bishops of Exeter, who had a palace here. In the time of Edward VI. the manor was alienated; it is now the property of Lord Clifford. The town, which is situated in the midst of much picturesque scenery, consists chiefly of the main street. The houses are rather irregularly built. In 1808 a fire consumed the greater part of the town, the damage having been estimated at 60,000*l.*; a subscription for relief of the poorer sufferers, and to assist in re-building the houses, amounted to

upwards of 20,000. There are four large corn-mills and a tan-yard. Cider is extensively made in the district. The Kingsteignton Canal, 4 miles in length, constructed at the cost of Lord Clifford, and opened in 1848, has been of considerable advantage to the town. The parish church was dedicated by Bishop Bronescombe on the 6th of November 1259; it consists of a chancel, nave, south aisle, north transept, and a tower, in which are six bells, a clock and chimes. The church has been recently restored. The Wesleyan Methodists and Independents have places of worship. There are British and National schools. Pynsent's Free school, founded in 1669, has an income from endowment of 30*l.* a year, and had 33 scholars in 1851; one of the number was a free scholar. A literary society has a library and reading-room. Saturday is the market-day. Fairs are held on Easter Tuesday, on the third Tuesday and Wednesday in June, and on October 2nd, chiefly for cattle. A plot of ground called the Play Park is appropriated as a public pleasure ground. Ugbrooke Park, the seat of Lord Clifford, within half a mile of Chudleigh, is much visited in summer on account of its extensive and picturesque grounds. In the park, which is well wooded, are upwards of 500 head of deer. Chudleigh Rock and its remarkable and capacious cavern are objects of great interest to visitors. From the summit of the rock is obtained an extensive and beautiful prospect. The blue limestone, known as Chudleigh marble, is quarried here in considerable quantities.

(Polwhele, *Devonshire*; *Route Book of Devon*; *Handbook of Devon*; *Communication from Chudleigh*.)

CHUMLEIGH. [DEVONSHIRE.]

CHUNDOWSY. [BARRILLY.]

CHUQUISACA, the capital of Bolivia, in South America, is situated near 19° S. lat., and between 64° and 65° W. long. It stands on a table-land about 9000 feet above the sea-level, between the Pilcomayo and the Guapai, and therefore near the watershed of the La Plata and the Amazonas. The town, which was formerly called *Charcas*, is well built, and has a magnificent cathedral, with large towers rising from each angle. "The towers that rise," says Temple, "over each angle of the cathedral, and the domes and steeples of the numerous churches and convents, give the city an appearance of splendour and extent from a distance; within it is a neat cheerful town." The population is about 26,000. The city was founded by one of Pizarro's officers, on the site of an old Peruvian town called 'Choque Chaka,' or Bridge of Gold, the treasures of the Incas having passed through it on their way to Cuzco. It formerly gave title to an archbishop, whose palace is now the residence of the president of the republic. Among the other public buildings worthy of notice are the Hall of Congress, in which the legislature of the republic meets; the University, established in a former monastery; the College of Arts and Sciences and the Mining School, both established in 1826. The climate of Chuquisaca is delightful, owing no doubt in great part to its elevated site. (General Miller; Temple, *French in Peru*, &c.)

CHUR. [CORN.]

CHURCH, STATES OF THE. [PAPAL STATES.]

CHURCH-STRETTON, Shropshire, a small market-town and the seat of a Poor-Law Union, in the parish of Church-Stretton and hundred of Munslow, is situated in 52° 32' N. lat., 2° 47' W. long.; distant 13 miles S. by W. from Shrewsbury, and 158 miles N.W. by W. from London by road. The population of the township of Church-Stretton in 1851 was 1873. The living is a rectory in the archdeaconry of Salop and diocese of Hereford. Church-Stretton Poor-Law Union contains 14 parishes and townships, with an area of 44,783 acres, and a population in 1851 of 9110. Church-Stretton is situated on the turnpike road from Ludlow to Shrewsbury, in a narrow valley, bounded S.E. by the Cantlopp Hills, the highest of which is 1200 feet above the sea, and W. by the Long Mynd, a range of hills 1674 feet high in the most elevated part. The parish church is a cruciform building with a central tower. Some of the inhabitants are employed in the manufacture of flannel and of coarse linen cloth for packing wool and hops. Sheep are reared in considerable numbers on the hills, and their wool forms an important article in the trade of the town. The situation of the town is healthy, and the soil is good. The market-day is Thursday. Fairs are held on March 10th, May 14th, July 3rd, September 25th, and on the last Thursday in November. On the summit of Caradoc Hill are some remains of an ancient camp, and in the neighbourhood is an insulated hill, with entrenchments on its summit, called Brocard's Castle.

CHURCHTOWN. [CORK.]

CHUSAN, or as Lord Macartney writes it, the Chusan Islands, are a group of islands on the eastern coast of China, and forming an appendage to the province of Che-kiang. Their number is very great, and they are dispersed over that part of the sea where 30° N. lat. cuts 121° E. long. Staunton states that between the Chusan Islands and Amoy Harbour, through a space of about 60 miles in length and 30 miles in width, the number of islands exceeds 300; but others, apparently not less numerous, lie north of Chusan Island. These numerous islands contain almost as many harbours or places of perfect security for ships of any burden. Most of the islands consist of hills rising with a regular slope and rounded at the top. Though mostly close to each other they are divided by channels of great depth. Some of them have a very inviting aspect, and one of them in par-

ticular, called Poo-too, is described as a perfect paradise. It belongs to a sect of religious men, and contains 400 temples. The principal island, which gives its name to the group, is about 30 miles long, and varies in width from 6 to 8 miles. The surface is diversified by pleasant heights and well-cultivated valleys. The chief harbour is on the southern coast towards the Chinese continent, and only a few miles distant from Kee-to Point, the most eastern cape of China. It is formed by three small islands, which lie about a mile from Chusan, and has four entrances; but these entrances are so completely shut in by the remoter points, that the harbour looks like a lake surrounded by hills, and it has excellent anchorage for vessels. About a mile from this harbour is the capital of the island, Ting-ghae. The intervening space is a plain intersected with rivulets and canals, and cultivated like a garden. The road which traverses it though good is very narrow, in order that as little land as possible may be lost to cultivation. The town is inclosed by walls 30 feet high, which overtop the houses. Along the walls at the distance of every hundred yards are square stone towers. The town is in some degree surrounded as well as intersected by canals, and the bridges thrown over them are steep and ascended by steps, like the Rialto of Venice. The streets, which are narrow, are paved with square flat stones. The houses are low and mostly of one story. The numerous shops contain chiefly articles of clothing, food, and furniture, which are arranged in good taste. Numerous towns and villages are scattered over the island. The productions of the island include rice, wheat, sweet potatoes, chestnuts, walnuts, and tobacco. Tea, silk, and cotton are also produced to some extent. The mean temperature in winter is about 41° Fahr.; in autumn it is about 68°.

The Chusan Islands are of great importance to China in a commercial view, especially for its intercourse with Japan. This commerce is chiefly carried on by the three commercial towns of Ning-po, Hang-toheou, and Shang-hai, which are situated on the continent opposite to the islands. The junks, by which this commerce is carried on, assemble at the Chusan Islands, and depart thence for Nangasaki. The islands are of importance, as protecting the commerce from the Strait of Formosa on the south, to the peninsula of Shang-tong on the north. If a foreign nation or a piratical chief should get possession of them the whole coast above mentioned would be at their mercy, and the maritime intercourse would be interrupted. In 1840, in consequence of disputes between the British and Chinese governments respecting some commercial transactions at Canton, a British force was sent to the Chusan Islands, which captured them after a slight resistance. The Chinese government then became more disposed to yield, and after some negotiations a truce was agreed upon near Tientsing, between the Chinese imperial commissioner and the British plenipotentiaries, who left Chusan for Canton on the 15th of November 1840. On the 24th of February 1841 the British troops were compelled to abandon the Chusan Islands on account of their unhealthiness. The Chinese refusing to fulfil the conditions of the treaty of Tientsing, the Chusan Islands were again captured in 1842, after a vigorous defence, and the British army advanced towards Nanking. Upon this the peace of 1842 was agreed to, by which Chusan was restored to the Chinese, and the island of Hong Kong ceded to the British in perpetuity. [CHINA; HONG KONG.]

CILICIA, an ancient division of Asia Minor, was bounded N. by the Taurus, which separated it from Cappadocia and Lycaonia; S. by the Mediterranean Sea; E. by the Amanus range, which separated it from Syria; and W. by Pamphylia. According to Herodotus (v. 52), the Euphrates was the boundary of Cilicia and Armenia. Cilicia anciently comprised two divisions, the names of which were derived from their physical character. The western and mountainous part was called the Rough Cilicia (*Τραχεία*), and the eastern part the Plain Cilicia (*Πεδίος, campestris*). Many attempts have been made by ancient and modern writers to account for the name Cilicia; the Greeks derived it from Cilix, son of Agenor, who was said to have colonised this country. (Herod. vii. 91.) The inhabitants were formerly called Hypachæi, according to Herodotus (vii. 91). Level Cilicia is described by Xenophon as a large, beautiful, well-watered plain, abounding in all kinds of forest-trees and vines. It yielded sesame, panic, saffron, millet, wheat, and barley, which with rice, sugar, and cotton are still cultivated there. The date-palm is indigenous. Mountainous Cilicia was famous for a fine breed of horses; and the annual tribute of the Cilicians to Darius consisted of 360 white horses and 500 talents of silver. (Herod. iii. 90.) It also contained much timber, and cedar especially was abundant there.

The first town in Mountainous Cilicia on leaving Pamphylia was Coracesium, according to Strabo (pp. 667, d, 670, a, Casaubon). The modern name is Alaya; it is a strong natural fortress situated on a high and almost insulated rock. Coracesium held out against Antiochus. (Livy, xxxiii. 20; Beaufort's 'Karamania'.)

The next town of importance was Selinus, situated on a steep hill. The emperor Trajan died there, and the town was afterwards called Trajanopolis: the modern name is Selinty. Cape Anemurium (now Anamur) is the most southern point of Asia Minor; and probably from this circumstance derived its name, which means 'windy point.' The small town and port of Celenderis (now Chalindreh) lies between Anemurium and Seleucia, the modern Selefkah. The ruins of the

ancient Seleucia are many miles from the shore, on the west side of the river Calycadnus (Gök-Su), which now at any rate flows into the sea a few miles east of Cape Zephyrium. (Beaufort, p. 226.) A coast-range separates the valley of the Gök-Su (the most extensive level in Mountainous Cilicia) from the sea; on the north it is screened by the Taurus. The general course of the river is eastward to Selefkeh, below which it enters the sea. The shore presents a line of noble promontories and white marble cliffs rising perpendicularly from the sea. This rocky character diminishes a few miles west of Selefkeh, where the highlands begin to recede from the coast. Many rare kinds of animals and birds are found on the coast, and almost every district is said to have some peculiar to itself. (Beaufort, p. 209.) In the time of Cicero, Cilicia was famous for panthers.

There is no town of much importance between Selefkeh and the river Latmus (now Lamas), which was the boundary of Mountainous Cilicia. (Strabo, p. 671, c.) Here the rocks and cliffs cease, and are succeeded by a gravelly beach and broad plains, which extend to the mountains. The plain of Cilicia was drained by three large rivers—the Cydnus (now the river of Tersus); the Sarus (now the Sihun); and the Pyramus (now the Jihun)—all of which were navigable to a considerable distance from the sea, but small boats can now with difficulty cross the bars formed by alluvial deposits at their mouths. The Cydnus passes through the celebrated Cilician Gates. The Sarus at Adana is above 300 feet wide. Adana or Adanah is still a place of some trade; it gives name to a pashalic, and is surrounded by a fertile tract of well-cultivated gardens. The Jihun is 490 feet wide half a mile above its mouth; on its eastern bank, and near its mouth, in ancient times stood Mallus. The river breaks through the Taurus by a frightful chasm well described by Strabo (p. 536); in its lower course it now divides into several arms, and forms a delta. [ANATOLIA.] The principal towns in Level Cilicia were Soli, Tarsus or Tarsi, and Issus or Issi. (Xenoph. 'Anab.' i. 2, 23, 26.) Soli was afterwards called Pompeiopolis, because Pompey settled the remains of the pirates there. This town was the birthplace of Chrysippus and of the poets Philemon and Aratus. (Strabo, p. 671, d.)

Tarsus, anciently one of the most celebrated cities in Asia Minor, still bears a respectable rank: its modern name is Tersoos. Tarsus was the birthplace of the apostle Paul, and a school for the study of philosophy and the arts. It stood in a plain on the banks of the Cydnus. The water of the Cydnus, as of the other rivers along this coast which carry down the melted snow from the ridges of Taurus, is extremely cold; injudicious bathing in it proved fatal to Frederick Barbarossa, and nearly so to Alexander the Great. The Cydnus has undergone a great change from the deposits carried down from the mountains: formerly it received large ships of war; now none but the smallest boats can enter it. (Beaufort, p. 265.) Issus was situated in the eastern part of the plain of Cilicia, at the head of the Issic Gulf, or Gulf of Scanderoon: here Alexander defeated Darius B.C. 333. The Pyramus, between Tarsus and the plain of Issus, has brought down such a quantity of sand and earth that the river has been diverted twenty-three miles from its ancient course: in Strabo's time the Pyramus entered the sea a little to the east of Cape Megarsus (Karadash); now the mouth is not much west of Ægeæ (Ayas). Strabo (book xii. p. 536, a) says that it passes under ground for a great distance, and bursts forth again through a cleft of Mount Taurus: he was well aware of the immense deposits which were brought down by the stream. Cilicia included the level strip of land along the eastern shore of the Issic Gulf. [AMANUS.]

The origin of the Cilicians is uncertain; they were probably a Phœnician colony. (Herod. vii. 91.) Their character in historical periods did not stand very high, and in this respect they were commonly classed with the Cappadocians. They were the only nation within the Halys except the Lycians whom Croesus did not reduce. (Herod. i. 28.) Our earliest information represents them as governed by kings; and when Cilicia became one of the Persian satrapies it evidently continued to be governed by native kings, subject of course to the Persian empire. The name of one of the Cilician kings, Syennesis, is familiar to the reader of Xenophon's 'Anabasis' (i. 2), and he was not the first of his name. Herodotus (i. 74) mentions one as contemporary with Alyattes; and Æschylus ('Pera.' 326, Dindorf) has immortalised the bravery of another who joined Xerxes in his expedition against Greece.

Cilicia became a Macedonian province on the downfall of the Persian empire; Seleucus and his descendants, after the death of Alexander, held the sovereignty till Pompey reduced the level country to a Roman province. Cicero was pro-consul of Cilicia A.U.C. 702; and for his success against those who had fortified themselves in the mountains, and had held out against his predecessor Appius Claudius Pulcher, he was rewarded on his return with a triumph. Till the reign of Vespasian Mountainous Cilicia appears to have been governed by kings who were appointed by the Romans, but after that time it became a province. (Strabo, xiv. pp. 668-676, Casaub.; and Beaufort's 'Karamania'.)

CINCINNATI, a city, the capital of Hamilton county, in the state of Ohio, is situated on the right bank of the Ohio River, and 20 miles above the mouth of the Great Miami River, in 39° 6' N. lat., 84° 27' W. long.; distant 494 miles from the mouth of the Ohio, and 1447 miles N.E. by N. from New Orleans. The popula-

tion in 1800 was 750; in 1810 it was 2540; in 1830 it was 11,834; in 1840 it was 46,338; in 1850 it had increased to 115,134.

Cincinnati is the largest inland city in the United States, and with respect to the cities of the Union generally, ranks sixth in point of population. It is governed by a mayor, recorder, and municipal town council. It has a separate judiciary, and a commercial court to try causes arising between merchants. The city stands in a beautiful valley about 12 miles in circumference, which is surrounded by hills, and is divided into two nearly equal parts by the river Ohio. The first settlement took place here in December 1788. In laying out the divisions of land appropriated to individuals, one square mile in each township was reserved for school purposes, and one section in each for the support of religious societies. The city was incorporated in 1819. The streets are regularly laid out, and cross each other at right angles, except where they approach the river side. The city is built partly on the first bank of the river, which is about 48 feet above low water-mark, and partly on the second bank, which has a further elevation of about 60 feet. The streets which run east and west from the river are called First, Second, Third streets, &c., according to their order in the series; the streets which run north and south are called Walnut-street, Sycamore-street, &c., after the forest-trees of the district. The streets are in general well paved. The public buildings, many of which are of considerable elegance, include several public halls, the county and city courts, a mercantile exchange, an observatory, a museum, four theatres, and numerous buildings belonging to literary and philosophical institutions. There are in the city about 80 churches, of which a considerable number are spacious and handsome edifices; there are also 3 colleges, 4 medical schools, a law school, a college and several educational seminaries for females, 6 classical schools, and numerous public schools. Cincinnati is the seat of extensive and varied manufactures, including machines of different kinds, carriages, waggons, cutlery, edge-tools, mathematical and optical instruments, pottery, hats, &c. There are numerous foundries, iron rolling-mills, tan-yards, breweries, distilleries, flour-mills, saw-mills, glass-works, ice-packing establishments, soap and candle works, steamboat building-yards, stereotype foundries, wine manufactories, tobacco factories, &c.

The navigation of the Ohio and the numerous canals and railways which communicate with the city afford Cincinnati valuable opportunities of cultivating commercial intercourse with other cities and states in the Union. Its position on the Ohio renders it also an important centre of traffic, which in its further development must add rapidly to the wealth and importance of the city. The Miami Canal and the Ohio division of the Wabash and Erie Canal, form a line of communication about 251 miles in length between the Ohio and Lake Erie. The Little Miami railway to Cleveland traverses a distance of 255 miles; the Cincinnati, Hamilton, and Dayton railway, with its connected railway to Sandusky, 218 miles; and numerous other lines, completed or in progress, render Cincinnati the centre of the railway system of the Western States. There is communication by electric telegraph between this city and every large city from Maine to Florida, and from the Atlantic to beyond the Mississippi. The traffic on the river is carried on chiefly by steamers, plying to Pittsburg and New Orleans. The number of steam-vessels which arrived in the port during the year ending August 31st 1850 was 3698; the departures were 3298. The amount of shipping owned in the Cincinnati district in 1850 was 17,181 tons, all of which except vessels amounting to 275 tons burden were navigated by steam power. There are upwards of 50 newspapers and periodicals published in Cincinnati, of which 8 are published daily. Near the city are two beautiful suburban villages, Mount Auburn and Walnut Hills, occupying elevated sites, and chiefly used as places of residence by Cincinnati merchants. The New School Presbyterians have an important theological institution at Walnut Hills, called the Lane Seminary, from the name of its earliest benefactors, who were merchants in New Orleans. There are numerous vineyards in the neighbourhood of the city.

(Cotton, *Statistical Gazetteer of the United States of America*, 1853.)

CINCO VILLAS. [ARAGON.]

CINTRA. [ESTREMADURA, PORTUGUESE.]

CIOTAT, LA. [BOUCHES-DU-RHÔNE.]

CIRCARS, NORTHERN, a large maritime province, lying between 15° and 20° N. lat., and between 80° and 86° E. long., extends along the western side of the Bay of Bengal, from the Chilka Lake on the north to the river Gondegama on the south. It has thus the district of Cuttack for its northern, and the Carnatic province for its southern boundary; on the east it has the Bay of Bengal, along a line of coast extending 470 miles; and on the west are Orissa, Gundwana, the dominions of the Raja of Berar and of the Nizam, and the ceded Balaghaut districts. The average breadth of the province is about 80 miles, and its area about 38,000 square miles. A continued range of mountains, impassable by carriages and difficult for horsemen, extends along the whole western frontier, from the Chilka Lake on the north to the bank of the Godavery on the south. South of that river the province is separated from the Nizam's territory by a detached range of small hills. The province is watered by several small rivers, which rise among the hills forming the western frontier, and flow into the Bay of Bengal; it receives likewise the

waters of the Godavery and Kistna rivers, whose mouths are within the province.

The Circars are politically divided into seven districts: Chicacole, Condapilly, Ellore, Ganjam, Guntoor, Rajamundry, and Vizagapatam. The climate of these districts exhibits a general uniformity. About the middle of June the westerly wind sets in, accompanied by moderate showers, until the end of August, when the harvest of the small grains is secured. From the beginning of September to the end of the following month the rain is more abundant; the wind is generally violent as November approaches, and then changes to the north-east, when the rice-harvest, which constitutes the main dependence of the inhabitants through the greater part of the province, is housed. The season is then fair and pleasant, and at the vernal equinox the maize harvest commences. The season between the end of March and the setting in of the rains in the middle of June is hot, but the temperature is somewhat moderated by the sea breeze during the day. The soil toward the south is better than in the north. Fruits and garden vegetables are scarce. Sugar, cotton, and tobacco are produced, and of the tobacco some is exported. The forests upon the hills to the west contain abundance of teak-wood of large growth. At the principal mouths of the Godavery ship-building is carried on, and vessels of 500 tons burden have been constructed. From the nature of the country a great part of the trade is prosecuted in coasting vessels. The aggregate burden of these vessels exceeds 50,000 tons.

The district of Chicacole forms the largest portion of the recently created electorate of Ganjam, including its capital. Exclusive of mountain streams, which are numerous during the rainy season, Chicacole is watered by four rivers, the mouths of which are at the towns of Chicacole, Calingapatam, Bimlipatam, and Vizagapatam. There are few extensive plains in this district. The town of *Chicacole*, the Mohammedan name of which is *Maphus Bunder*, is in 18° 15' N. lat., and 84° E. long. It is irregularly built on the rising ground which forms the north bank of the Chicacole River. This river rises in the mountains of Gundwana, and joins the sea three miles below the town, where it is about 1750 feet broad. The centre of the town contains barracks, which are little used, and there are numerous mosques, the principal of which, a building of stone, erected in the year 1051 of the Hegira (A.D. 1641) is held to be of considerable sanctity. Condapilly district, called by the Mohammedans *Mustaphanaghur*, is separated from Ellore and Rajamundry by the salt-water river *Ooputair*. This river is navigable by boats to the Colair Lake, the surplus waters of which it carries off to the sea; this it reaches after a winding course between Samaldang and Gullapollam. The town of *Condapilly*, the capital of the district, stands in 16° 37' N. lat., 80° 15' E. long. This place was formerly a fortress of some strength, but the walls are now in ruins. The districts of Ellore and Condapilly occupy the whole of the territory of the province comprehended between the Kistna and the Godavery. The town of *Ellore*, situated in 16° 43' N. lat., 81° 15' E. long., is the residence of the collector of the Masulipatam district, of which collectorate Ellore district forms a part. The houses, which are one story in height, are built with some regularity. Guntoor district lies between the Kistna and the Goudegama. The soil is very fertile. From the want of moisture during a great part of the year the cultivation of rice is little attended to, but the most luxuriant harvests of maize are raised. *Guntoor*, the chief town, is situated in 16° 17' N. lat., 80° 32' E. long. It is extensive, but irregularly built; the walls of the houses are of mud, and the roofs of many are thatched. It contains a great number of trees, and is divided into two portions by a large reservoir. The district of Rajamundry lies on both sides of the Godavery river, but principally on the left side. The soil is fertile, particularly the island of *Nagarum*, a triangular space, comprehending an area of 500 square miles, which is formed by two great branches into which the Godavery divides, 35 miles from the sea. Besides the two greater branches of the river by which it is inclosed, this island is intersected by five lesser branches, and the means of irrigation thus afforded, together with the sliny mould brought down by the greatest river of the Decoan, render the soil highly productive. The forests produce an abundance of teak timber, and in the plains sugar, rice, ginger, turmeric, and various leguminous plants are raised. Cotton is also generally cultivated. The capital *Rajamundry* is on the left bank of the Godavery, about 5 miles from its mouth, in 18° 59' N. lat., 81° 58' E. long. The town is long, but narrow, extending along an elevated bank adjoining the river. During the dry season the Godavery is here a clear blue stream, exhibiting many islands and shoals, and the banks on both sides are from 20 to 30 feet high, but in the rainy season the stream is a mile broad and very deep. *Vizagapatam* district, which lies to the north of Rajamundry, is mountainous; a lofty ridge runs parallel to the sea-shore, and frequently within a very short distance of it, through nearly its whole extent; to the westward of this ridge is another chain; the intermediate space is a narrow and well-cultivated valley. The town of *Vizagapatam* lies on the coast in 17° 42' N. lat., 83° 24' E. long., near to a promontory called the 'Dolphin's Nose,' a mountain about 1500 feet high. The town contains a considerable number of well-built houses: but the situation being unhealthy, the place has been

almost wholly deserted by Europeans, who have retired to the village of *Waltier*, about 3½ miles from the town, with which it communicates by an excellent road. There is a Hindoo temple of great fame and antiquity at *Semachittum*, near *Vizagapatam*.

The Northern Circars were among the earliest of the territorial possessions of the East India Company. They were granted in August 1765 by the Mogul Shah Allum, "by way of free gift, without the least participation of any person whatever in the same." In November of the following year, this grant was recognised by the Nizam or Subahdar of the Decoan. The district of Guntoor was at the date of the grant held as a jaghire for life by *Bazaulet Jung*, the Nizam's brother, by an agreement with whom the Company rented that district, and it did not come into their actual possession until the death of *Bazaulet Jung* in 1788. For the whole province the Company paid to the Nizam an annual 'pesheush' or tribute of seven lacs of rupees (70,000*l.*), which was redeemed in 1823 by the payment of about 1,200,000*l.*, in virtue of which the Circars are now held in full sovereignty by the British. The natives are represented as being superior both in appearance and in private character to the natives of Bengal. The province is settled on the zamindari system, and the old zamindars are said to be a remarkably fine and noble race of men: as regards the cultivators of the soil, they are very much on the footing of the Scottish chieftains of former days, the attachment between the two classes being continued through succeeding generations. With the exception of a few Mohammedans settled in the towns, the population of the Northern Circars is wholly Hindoo. They are composed of two nations, the *Telinga* and the *Oaria*, or *Orissa*, who speak and write different dialects, and have distinguishing customs and rites, although both adhere to the fundamental doctrines and discipline of the Hindoo faith, and give undisputed pre-eminence to the Brahmins. The people have lived from time immemorial under the simple form of village government, and have preserved unaltered the names and limits of each of their villages, with its establishment of officers and servants, undisturbed by the changes which have transferred the sovereignty of the land from one set of rulers to another. Different clusters of *Hanelee* villages have been formed into zamindaries, which have been put up to public auction, the purchasers being entitled to hereditary possession upon payment of the revenue fixed in perpetuity upon the entire lands of the zamindary. The revenue collected in the Northern Circars is said by *Major Rennell* to have amounted in 1753 to about 43 lacs of rupees (430,000*l.*) per annum. By a statement furnished by the East India Company in 1832, it appears that the revenue had then been augmented to 76,68,018 rupees (766,800*l.*), an augmentation of nearly 80*l.* per cent.

(*Rennell, Memoir of a Map of Hindustan*; *Mill, History of British India*; *Parliamentary Papers*.)

CIRCASSIA, or the country of the Circassians or *Tscherkesses*, is situated along the northern declivity of the Caucasus, and is now understood to comprehend the whole of this tract from the shores of the Black Sea to the vicinity of those of the Caspian, so that not only those portions which were formerly called the *Great* and *Little Kabardia*, but also *Tchechnia*, the country, of the *Midszeges* or *Tchetchenes*, who live towards the shores of the Caspian Sea, between the *Terek* and the *Kuma*, are included in it. [CAUCASUS.] The rivers *Terek* and *Kuban*, as far as their courses lie east and west, are considered as constituting the northern boundary; and the highest part of the Caucasian chain forms the southern. The greater part of this country has been in some degree subjected to the sway of Russia, and forms the province of *Hither Caucasia*, to which is assigned by Russian official documents an area of 41,410 square miles, with a population of 402,300 in 1846.

The greater part of this country is a succession of mountain ridges, which branch off from the northern side of the Caucasus, and terminate near the rivers *Terek* and *Kuban*, and of valleys which lie between them. The mountain ridges lower gradually, but with abrupt declivities as they proceed northward, and are commonly covered with wood in their lower portions. The highest of these collateral branches is that which detaches itself from *Mount Elbruz* [CAUCASUS], runs north between 42° and 43° E. long., and terminates abruptly near 44° N. lat. in *Mount Bechtan*, which is 4320 feet high. This range is nearly destitute of trees, and contains a great number of warm and other springs, which are much visited. Between the mountains are many extensive and well-watered valleys, which are very fertile: they contain numerous narrow passes, which render the access to them very difficult to an invading enemy, and tend to foster those predatory habits for which the inhabitants are notorious, and which render them the scourge of travellers and of their neighbours in the plain. The Russians, though nominally masters of the country, are not able to prevent their hostile excursions. Their generals and other officers have often been made prisoners, and have obtained their liberty only by paying large ransoms. To protect the adjacent plains, the Russian government has established a line of small fortifications along the banks of the *Terek*, *Kuma*, and *Kuban*. The *Toherné-Gori*, or *Black Mountains*, which form the northern and lower part of the Caucasian chain, and are so called from their being densely covered with foliage, which contrasts strongly with the snow-clad crest of the eastern part of the chain, are rent and broken into numerous chasms and ridges; on the western side, between *Anapa* and *Sudjuk*.

Kalé, forming inaccessible gorges and defiles. All this region is untraversed by a single road, and some of the tribes here have been able to maintain their independence against the Russians.

There are no towns in Circassia, the habits of the people being opposed to the concentration of a great number of houses or of people on one spot. They live in small villages, the site of which is frequently changed. They cultivate the fertile soil of their valleys, which yield grain of excellent quality; millet and barley are the favourite grains, but wheat and rye, with vegetables and tobacco, are also raised. Agricultural operations are performed by the aid of oxen; mules and asses are the beasts of burden. The vine is cultivated on the sunny slopes, and good wine is made; but it is spoiled by being kept in pitched skins. Every family possesses several hives of bees: honey is consumed in vast quantities, and mead is a favourite beverage. The country abounds with every description of timber, which is left to decay for want of means of transit. The Turks used before the Russian occupation of the country to ship considerable quantities of oak, valona, and box for Constantinople. The rearing of cattle is more attended to than agriculture, as the mountain-plateaus afford excellent and abundant pastures, and the banks of the numerous brooks are fringed with luxuriant meadows. Their horses are of a fine breed, and equally strong, swift, and beautiful; the people are proud of them, and, like the Bedouins, preserve the genealogies of their breed: they are used only for the saddle. The sheep, which are of the broad-tailed kind, are also much esteemed. Cattle are small. Milk, with millet, forms the principal food of the inhabitants, and they make of it an inebriating beverage called 'kumiss.' As they are Mohammedans they do not rear swine. Hunting is followed by the chiefs as a diversion. Salt, gunpowder, fire-arms, calico, and woollen cloths are the chief imports.

The Circassians, or Tschorkesses, are the most numerous of the different nations that inhabit this country. They occupy the lower part of the mountains and valleys from the river Sundsha or Sunja on the east to near the shores of the Black Sea. They consist of eleven tribes, independent of one another, and governed by their own hereditary princes and hereditary nobility. Their internal government resembles the feudal system. As the eastern portion of their country is called Kabardah, they have been sometimes called Kabardians; it is certain that the Kabardians and Circassians belong to the same stock and speak the same language. Kabardah being of easy access to the Russians, has been subjected to them for a considerable time. The Terek divides it into Great and Little Kabardah. To the east of the river Sunja live the Midszegees, also called Kistes and Tchetchenes, who differ entirely from the Circassians in language, but not much in character, being, if possible, still greater robbers. West of them are some smaller tribes, but the most western portion of the Caucasus is inhabited by the Abkhazians, who are less addicted to war than the Circassians, and more willingly submit to the Russians. [CAUCASUS.] Many Tartars and Cossaks are settled in Circassia. The traffic in female slaves has long been carried on between the Circassians and Turks; it was checked for a while by the Russians, but by a treaty between them and the Circassians in 1845, the traffic was re-established. About 1000 young girls are sold yearly by their parents, and carried to the Constantinople market.

(Pallas; Reineggs; *The Caucasus*, by Ivan Golovin; Spenser, *Travels in Western Caucasus*.)

CIRENCESTER, Gloucestershire, colloquially called Cicester, an ancient market-town, parliamentary borough, and the seat of a Poor-Law Union, in the parish of Cirencester and hundred of Crowthorne and Miuty, is situated on the river Churn, in 51° 48' N. lat., 1° 58' W. long.; distant 17 miles S.E. from Gloucester, 88 miles W.N.W. from London by road, and 95 miles by the Great Western railway. The town is governed by two constables and fourteen wardmen, who are elected annually; and returns two members to the Imperial Parliament. The population of the borough in 1851 was 6096. The living is a vicarage in the archdeaconry of Bristol and diocese of Gloucester and Bristol. Cirencester Poor-Law Union contains 39 parishes and townships, with an area of 86,170 acres, and a population in 1851 of 21,328.

Cirencester occupies a portion of the site of an important Roman military station. By Ptolemaeus it is called Corinium; by Richard of Cirencester, Corinum; and by Antoninus, Durocornovium. Three Roman roads met here: the Fosseway, the Ermine-street, and the Icknield Way. It is said that the walls of the town were 2 miles in circumference. The Roman remains which have at various times been discovered at Cirencester are of uncommon extent, variety, and interest. From the character of the villas which have been traced Corinium appears to have been the residence of a wealthy people. Hypocausts of elaborate construction, tessellated pavements, some of them of very superior design and execution, statuettes, pottery, fibulae, bracelets, beads, and other personal ornaments, coins, statars (a sort of steel-yards), weights, &c., have been found, as well as sepulchral inscriptions of much historical value. Some very important discoveries were made in the latter part of the year 1849, which, as well as the other antiquities found here, are fully described in the work of Professor Buckman referred to at the end of this article.

During the Heptarchy, Cirencester was successively included in the kingdoms of Wessex and of Mercia. In 879 it was stormed and

taken by the Danes, and was the seat of a great council held by Canute. It was again stormed and completely dismantled in the civil war between Henry III. and the barons. A magnificent abbey for black canons was built in 1117 by Henry I., on the foundation of a college for prebendaries, which was established by the Saxons long before the Conquest. The revenue of this abbey at the dissolution was 1051*l.* 7*s.* 1*d.*; its mitred abbot had a seat in Parliament.

Cirencester parish church is a fine old structure, partly of the 13th and partly of the 15th centuries. The building is especially interesting on account of its magnificent porch-house and mortuary chapels. Its embattled tower contains a peal of twelve bells. In the interior are several interesting monuments. A new church, dedicated to St. John the Baptist, has been recently erected. The Independents, Baptists, Wesleyan Methodists, Quakers, and Unitarians have places of worship. The Free Grammar school, founded in 1750, has an income of 28*l.* a year, and had 42 scholars in 1852. There are an Endowed parochial school, three hospitals supported from endowments, almshouses, a savings bank, a museum, a public library, and a dispensary. A county court is held. An agricultural college of a complete and important character was established at Cirencester in 1846.

Cirencester is not a place of much trade; its appearance is that of a very respectable and opulent country town. The town is paved and lighted, and well supplied with water. The market days are Monday and Friday. Fairs are held on Easter Tuesday, on July 18th, on the Monday before and after Michaelmas, and on November 8th, chiefly for agricultural stock and produce. In the vicinity is the handsome mansion of Oakley Park, the seat of Earl Bathurst. Oakley Park and woods are celebrated both on account of their picturesque character and of the frequent mention of them in the letters of Pope, Swift, and their correspondents.

CÎTEAUX. [CÔTE-D'OR.]

CITTA VECCHIA. [MALTA.]

CIUDAD REAL. [CASTILLA LA NUEVA.]

CIUDAD RODRIGO. [LEON.]

CIVITÀ-DI-PENNE. [ABRUZZO.]

CIVITÀ-DUCALE. [ABRUZZO.]

CIVITÀ-SAN-ANGELO. [ABRUZZO.]

CIVITA VECCHIA, a town and sea-port in the Papal States, the capital of the Delegation of Civita Vecchia, and the port of Rome, is situated on the Mediterranean, 40 miles N.W. from Rome, and has a population of about 7000. Its harbour is formed by two piers, or moles, of marble blocks, first raised by Trajan and afterwards restored under the popes. At the entrance between the extremities of the two moles is another mole, or breakwater, formed of large pieces of rock thrown into the sea, under the reign of the same emperor. On the southern extremity of the breakwater is the lighthouse, which stands in 42° 4' 6" N. lat.; 11° 45' E. long. Pliny the Younger ('Epist.' 31) describes the manner in which the breakwater and the piers were made. There is from 14 to 18 feet depth of water in the harbour, which is the only safe one on the south coast of the Papal States; it is frequented by about 1000 vessels of various sizes, most of them coasting vessels, in the course of the year. There is a lazaretto for ships coming from infected countries. There are docks also, and a prison for galley-slaves. The lighthouse and the citadel were built after designs by Michael Angelo. The present town of Civita Vecchia was built by Pope Leo IV., and is regularly fortified. The massive architecture of the buildings round the harbour gives the place an imposing appearance from the sea. The streets are regular and the houses well built. The town has a cleanly and bustling appearance. The air, although not very good in summer, is not altogether unwholesome, but the country around is subject to the malaria, and has a desolate appearance like the rest of the lowlands on this coast. Several lines of steamers plying between Marseille, Genoa, Leghorn, and Naples put into the harbour, and many thousand travellers land here during the year. A large quantity of the produce of the Pontifical States is brought here for export, including wheat, alum, cheese, skins, bark, staves, &c. The imports consist of woven goods, chiefly from England, salt provisions, wine, colonial produce, salt, drugs, and haberdashery.

Trajan had a villa here, called *Centum Cellæ*, around which and the port a town of the same name sprung up, and gradually became of considerable importance, as the harbour at the mouth of the Tiber became choked up with sand. Centum Cellæ was of importance also as a fortress. It was captured by Belisarius, afterwards by Totila, but soon recovered by Narses; and it continued to flourish till A.D. 812, when the Saracens utterly destroyed it. The inhabitants who escaped founded a new settlement in the interior, and the site of the ancient city began to be spoken of as Civita Vecchia (Old City), a name which it has retained ever since. Besides the substructions of Trajan's mole there are remains of an aqueduct and numerous fragments of Roman buildings. Since the insurrection of 1849 the French have garrisoned the citadel of Civita Vecchia.

The Delegation of Civita Vecchia has an area of 373 square miles, and had a population of 24,312 in 1848. It is inclosed from north-west to north-east by the Delegation of Viterbo; south-east by the

Comarca di Roma; and south-west by the Mediterranean. The western part of the surface is generally level, low, and dotted with small lakes. The eastern part is covered with ramifications of the Tuscan Sub-Apennines. The rivers are small, the most important being the Marta, which forms the outlet of the lake of Bolsena, and the Mignone (the ancient Minio), which falls into the sea some miles north of Civita Vecchia. There are large salt-works on the coast at the mouth of the Marta, which retains its ancient name. The mountains in the north-eastern districts of the delegation contain rich alum mines; the mineral is refined at the government works at Tolfa in the interior. The Delegation of Civita Vecchia was included in ancient Etruria; it forms part of the Patrimony of St. Peter.

CIVITAS AURELIA AQUENSIS. [BADEN-BADEN.]

CIVITELLA-DI-TRONTO. [ABRUZZO.]

CLACKMANNAN. [CLACKMANNANSHIRE.]

CLACKMANNANSHIRE, a county in the eastern part of Scotland, bounded S. and S.W. by the river Forth, N. and W. by Perthshire, E. and S.E. by Perthshire and Fifeshire, lies between 56° 5' and 56° 14' N. lat., 3° 33' and 3° 56' W. long. In form it is very irregular, but its greatest length from north-west to south-east may be stated at 10 miles, and its greatest breadth from north-east to south-west at 8 miles. This county is the smallest in Scotland. Its area is 29,744 statute acres. The population in 1841 was 19,155; in 1851 it was 22,951.

Coast-line.—The river Forth, which rises in Stirlingshire, is the southern boundary of the county. It is navigable above Stirling. The only port in the county is ALLOA, though there are several creeks along the Frith of Forth, which are frequented by fishermen. At Clackmannan Pow there are good piers and a small harbour; there is also a small harbour at Kennet Pans.

Surface and Geology.—The surface of the county in the southern part consists of level alluvial tracts, which are very productive. Towards the northern extremity the land rises gradually into the Ochill Hills, which traverse the county from south-west to north-east. The bases and sides of the Ochills supply good pasturage. The woodlands cover upwards of 500 acres, and at least 2000 acres are laid out in plantations. The low grounds have a fine fertile soil; the subsoil of part being clay. The elevated land has a substratum generally of gravel, with a surface of good loam. On the high grounds the soil is thin, and on the hills there is a considerable extent of moss. In the vale of the Devon there are some pieces of black moss on both banks of the stream, but these are rapidly disappearing. Bendeuch, the loftiest of the Ochills, is 2400 feet high. Tho King's Seat, Dollar Hill, and the Wisp, in the north-east part of the county, do not exceed 1900 feet. From these hills streams descend through romantic glens, and at Dollar, Alva (in Stirlingshire), and Tillicoultry, supply water for the shawl and blanket mills and fulling works of these thriving villages.

The Ochills are composed of trap rocks of various kinds. The great mass is of the amygdaloid rock and clinkstone porphyry of a light colour. Greenstone is also found in considerable quantity. In the whole range many veins of copper and lead are found. From the face of the Ochills southward the rocks are of the coal formation, consisting of sandstone, shale of a dark colour, fire-clay, ironstone, and limestone. Above the coal formation are both old and recent alluvial clays, the recent being the deposit from the Forth and its tributary streams washing down the old alluvial clay. The old alluvial clay consists of clay, sand, gravel, and boulders intimately mixed, impervious to water and the most sterile of compounds. The recent alluvial deposit is of blue, soft mud or silt in the lower part, and strong clay at the surface.

Hydrography.—The Devon or North Devon rises in Perthshire, and traverses the northern part of the county from east to west, along the base of the Ochills, till, turning southward, after a short course in that direction, it falls into the Forth at Cambus, a village two miles W. from Alloa. It receives in its winding course, through the rich and beautiful vale of Devon, several tributary mountain streams, the larger being those of Dollar, Tillicoultry, and Alva. The South or Black Devon has its source in Fifeshire, and flows westward through the southern part of the county in a direction nearly parallel to the North Devon, falling into the Forth opposite Clackmannan. In summer it is a small stream, its waters being principally collected in dams, for the mills on its banks.

Communications.—The communications of the county with the east coast and the sea are through the ports of Alloa and Kincardine. An excellent road traverses the county east and west. By the Stirling station of the Scottish Central railway, the county has railway communication with the south and north-east of Scotland; and a short branch connects Alloa with the Falkirk station of the Edinburgh and Glasgow railway. The Stirling and Dunfermline railway traverses the southern part of the county, and connects it with the Scottish Central railway, with Fifeshire, and with the eastern coast.

Climate.—The prevailing winds are from the south-west; they bring rain, but are accompanied by a mild temperature. The least frequent winds are from the east and north-east, which blow for a short time in spring, the weather being then dry and cold. Considerably less rain falls in the southern part of the county than in the vicinity of the Ochills, while the low grounds, protected from the

north winds by the hills, have the atmosphere kept clear, and heat and cold alike moderated by the exposure of the coast to the Frith of Forth and the German Ocean.

Agriculture.—Upwards of three-fourths of the land in the county is under cultivation. In the low grounds the land is cropped in a regular system of rotation, the hills being devoted exclusively to pasturage. Agriculture may be said to be in a state of continual improvement: great attention is paid to manuring; draining is almost universal, frequently with tiles, but chiefly with stone. The lands are also well fenced with stone walls or hedges; where hedges are used they are always neatly trimmed. The blackfaced, or a mixture betwixt the blackfaced and Leicester breeds of sheep, are bred on the hills. The Teeswater breed of cattle is reared also, though a preference is given to Ayrshire and short-horned cattle. Leases are generally for 19 years, sometimes at fixed money rents, though in many cases at specific quantities of grain rents, or at rents dependent on the fiars prices of the county. There are several fairs held in the county, but none of any general importance.

Industry.—In the parish of Alloa are distilleries, breweries, manufactures of yarns, plaidings, shawls, tartans, druggets, and blankets, corn and flour mills, a glass-work, a foundry, a brick and tile work and pottery, and a tan work. There are salmon fishings in the Forth. Woollen shawls and tartans are made at Tillicoultry. Small quarries of sandstone and limestone are wrought in various parts of the county. The extensive coal-fields in Alloa and Clackmannan parishes, which form that part of the county lying on the banks of the Forth, supply large quantities of coal for exportation. The iron manufacture carried on at Devou ironworks, on the banks of the Devon stream, is important. Small railways connect these works with Alloa harbour and Clackmannan Pow, and they possess ready communication with all the great markets by the Stirling and Dunfermline line of railway.

Divisions, Towns, &c.—The county contains four parishes, the largest being Alloa, to which is united the ancient parish of Tullibody, of which Alloa itself was once a chaplainry. There is a chapel of ease at Sauchie near Clackmannan, and occasional service at Tullibody. The Free Church has 6 congregations, the United Presbyterians have 4, the Episcopalians 1, and there are in the county a few other congregations of Dissenters. The county is within the synod of Perth and Stirling. Clackmannanshire, along with the county of Kinross, sends one member to the Imperial Parliament. Its constituency was 1149 in 1853.

The most important place in the county is ALLOA.

Clackmannan, the county town, is 2 miles E. from Alloa, about 29 miles N.W. from Edinburgh. It is situated on elevated ground rising from the plain or shore of the Forth. The population of the town, with which is included the villages of Kennet and Newtonshaw, was 1535 in 1853. The only public buildings are the parish church and county hall. The courts of the county are held at Alloa.

The following villages may be mentioned:—*Dollar*, at the foot of the Ochills: population, 1079. There are bleaching works and woollen manufactures. The Dollar Institution is an academy founded in 1818 by Mr. John Mac Nab of London, who directed a large fortune made by his own exertions to be applied to educational purposes in his native parish. The ancient and modern languages and the ordinary branches of education are taught. The income from endowment is about 2000*l.* a year. The number of scholars in 1852 was 350. There are several villas in the neighbourhood. *Tillicoultry* is at the foot of the Ochills: population, 3217. The inhabitants are chiefly employed in the manufacture of shawls, tartans, and serge. There are also fulling-mills. *Tullibody*, a village about 2 miles W. from Alloa: population about 700. It contains an ancient chapel, built by David I. *Cambus*, a village at the confluence of the Devon and the Forth: population about 300. There are schools at all these places; the county possessing of parochial, endowed, and private schools perhaps a greater proportion than any other shire in Scotland.

History, Antiquities, &c.—Clackmannanshire was the seat of the Bruces for many generations, and an old tower in Clackmannan parish is said to have been built by King Robert Bruce. Sauchie Tower, in the same parish, is the ruin of a castle once the property of the earls of Cathcart. Schaw Park (Lord Mansfield's) and Kennet (the mansion of Bruce of Kennet) are the modern residences in this parish. In Dollar parish are the ruins of the very fine old feudal stronghold called Gloome Castle, or Castle Campbell, burned by the Marquis of Montrose in 1645. It occupies a romantic situation, on the top of a steep and nearly precipitous hill, near the village of Dollar. The keep is still in fine preservation. Roman sepulchral vases and stone coffins of an earlier period have been found in the county. Lord Abercromby has a seat at Tullibody, which is said to have been the scene of the battle in which Kenneth, king of Scots (A.D. 834), destroyed the Picts. The ancient chapel of Tullibody dates from 1149.

In 1851 there was one savings bank in the county, at Clackmannan. The amount owing to depositors on November 20th 1851 was 2015*l.* 2*s.* 9*d.*

CLAGENFURTH. [KLAGENFURT.]

CLAIRVAUX, a small town in France, in the department of Aube, is situated between wooded hills on the left bank of the river Aube and about a mile or two from the confines of Haute-Marne. It

is of no importance in itself, but it retains the name of one of the most celebrated Benedictine abbeys in Europe.

The abbey of Clairvaux was founded in A.D. 1114 by St. Bernard, at the head of a few monks from the abbey of Cîteaux, the chief establishment of the Cistercians. Hugues, count of Champagne, was its first benefactor, who endowed it with the valley of Clairval (Clara Vallis), originally called the valley d'Absinthe (of Wormwood), and the woody region around it. The foundation was increased subsequently by Thibaut, count of Champagne; and the kings of France, the counts of Flanders, and many of the nobility of France added largely by their gifts to the revenues of the abbey. After the community had lived at Clairvaux for seventeen years it was found necessary in consequence of the increasing numbers of those who joined the order to enlarge the buildings; and at the death of St. Bernard in 1153 there were 700 monks in the abbey.

The monks were not idle. The rule under which they lived was eminently calculated to make them industrious and useful; and civilisation owes the Benedictines of Clairvaux much. If in after times the revenues of Clairvaux became enormously, or as some would say scandalously wealthy, this was owing not so much to rich gifts from royal and noble benefactors, as to the wise regulations of the sagacious founder, who infused into his followers and bequeathed to his successors the spirit of useful labour. In fact the abbey of Clairvaux was an immense industrial establishment. Timber was felled and saw-mills set at work; hydraulic works, drainage, and irrigation were practically studied; oil-mills, corn-mills, fulling-mills, and tan-yards were established; wool was spun, cloth woven, metals were forged, and farms tilled by the monks of Clairvaux. Each of these trades and occupations was under the direction of a prefect styled 'master of the forests,' 'master of the forges,' &c. Whatever products were not required for the consumption of the abbey were sold at the fairs of Châtillon-sur-Seine, Bar-sur-Aube, &c., and the proceeds added to the resources of the community. Such energetic management could not fail to make Clairvaux wealthy; accordingly we find that in the 17th century it possessed nearly 50 villages and a vast number of farms, above 1500 acres of meadow land, extensive vineyards, about 60,000 acres of forests, 4 metal forges and foundries, &c., and the gross annual income from all sources was valued at 600,000 livres, about 24,000*l*. Not less than 537 religious houses in France and different parts of Europe were affiliated to Clairvaux. To give a notion of the size of this vast monastery it will be enough to add that an arbitration about a wager which is given in the archives of the Aube proves that in 1633 the circuit of the abbey walls exceeded that of the neighbouring town of Chaumont by 693 feet.

At the same time that all the above mentioned utilitarian processes were carried on Clairvaux was a nursery of learning. Pope Eugene III., fifteen cardinals, and a large number of archbishops, bishops, and statesmen were at different periods inmates of the abbey. The poor were fed, and travellers, rich and poor, entertained.

When religious houses were suppressed in France there were still 40 choir monks and 20 lay brothers in Clairvaux. The revenue of the abbey then amounted to 66,000 livres, besides 700 setiers of corn (each equal to 4·4 bushels), and 700 muids of wine (each equal to 70·8 gallons). Within the precincts of the abbey, which were then about a mile and a quarter in circuit, were magnificent cloisters, several churches, and a vast cellar, in which was a vat containing 800 muids of wine (about a year's income of that sort of produce). The abbey buildings were greatly injured at the revolution; they were subsequently sold, and a glass-factory was established within the walls. They were re-purchased by the state in 1808 and converted into a mendicity house, which the government of the restoration transformed into a central house of detention for the departments of Ain, Ardennes, Aube, Côte-d'Or, Jura, Marne, Haute-Marne, Meurthe, Meuse, Moselle, Nièvre, Saône-et-Loire, and Yonne. The buildings are remarkable chiefly for their solidity and extent. The refectory has been converted into a chapel; it resembles the nave of a church, has a vaulted roof 27 feet high, and wainscotted walls, on which are several rudely-executed figures ascribed to the handiwork of the monks; this chapel can hold with ease 2000 prisoners. Across the middle of the hall that served (and still serves) for a laundry, a living stream three yards broad runs between inclined flagstones. The prisoners detained at Clairvaux are made to work as carpenters, tailors, shoe-makers, rope-makers, &c., or they are engaged in the manufacture of cotton, woollen, hempen, and linen tissues.

(Merlin, *Observations Historiques sur la Maison de Clairvaux dans les Mémoires de Trévoux*, Août 1739; Hermand, *La Bibliothèque de Clairvaux*; *Dictionnaire de la France*.)

CLAMECY. [NIÈVRE.]

CLAPHAM. [SURREY.]

CLARE. [SUFFOLK.]

CLARE, a maritime county in the province of Munster, Ireland, is bounded N. by Galway Bay and the county of Galway, E. and S. by the river and estuary of the Shannon, which separates it from the counties of Tipperary, Limerick, and Kerry, and W. by the Atlantic Ocean. It lies between 52° 32' and 53° 7' N. lat., 8° 25' and 9° 58' W. long.; the greatest length north-east and south-west is 87½ miles; the greatest breadth north-west and south-east is 38 miles; the area is 769,245 acres, of which in 1851 there were 164,555 acres under

crops, 377,002 acres in grass, 8562 in plantations, 5173 fallow and uncropped arable land, and 212,972 acres estimated extent of bog, waste land, and water. The population in 1851 was 212,428.

Surface, Hydrography, Communications.—The portion of the county lying between the Shannon and the Galway boundary is, to the extent of about 150 square miles, occupied by the mountain group of Slieve Baughta. This group stretches into the adjoining county, and contains three principal connected lakes: Lough Teroig, on the boundary of Clare and Galway; Lough Graney, farther south in the centre of the group; and Lough O'Grady, between Lough Graney and that expansion of the Shannon called Lough Derg on the east, into which the waters of the district discharge themselves by the Scariff River at the village and creek of Scariff. Southward from the Slieve Baughta group extends the mountainous tract of Slieve Barnagh, which runs with little interruption from Scariff on the north to Bunratty on the south, where the waters of Lough Breedy, Lough Doon, Lough Cloonlea, and several other lakes lying along the western border of the range discharge themselves by the Ougarnee River into the Shannon. The chief drain of the eastern part of this district is the Blackwater, which falls into the Shannon a little above Limerick. The highest points of the Slieve Baughta and Slieve Barnagh range are 1312 and 1746 feet respectively. West of these groups, and occupying the central district of Clare, there is a comparatively level country stretching north and south, the waters of which, collected from Loughs Inchiquin, Tedane, Inchicronane, Dromore, Ballyally, and several others, unite about the centre of the county and form the Fergus, a fine navigable river, which augmented by the Clareen at Ennis, the county town, flows due south by Clare, and after forming a large estuary with numerous islands and excellent anchorages, unites with the Shannon about eight miles west of Bunratty. The junction of these rivers forms a very noble expanse of water. The remainder of the county, from the shore of Galway Bay on the north to Clonderalough on the south and thence westward to the ocean, is occupied by highlands, the waters from which flow chiefly into the Atlantic by the Dunbeg and Ennistymon rivers. Of these heights the principal is Callan Mountain, 1282 feet, rising westward from Ennis over Milltown, a small town situated about midway on the western line of sea-coast. Clare has a much greater extent of coast-line than any other county in Ireland. From Scariff on the Shannon to Curranroe on Galway Bay the whole length of coast-line is 230 English miles, of which about 140 miles lie along the Shannon and 80 miles on the coast of the Atlantic. The Atlantic coast, from Black Head on the north to Loop Head on the south, a direct line of nearly 60 English miles, has only two harbours, and these not capable of sheltering vessels of more than 50 to 100 tons. With the exception of the small bays or fishing stations of Kilkee, Dunbeg, Milltown, and Liscannor, the whole coast towards the Atlantic is iron-bound. The cliffs in some places are remarkable for their great elevation and perpendicular section towards the sea. At Moher, on the north of Liscannor Bay, the cliff-line for a distance of five miles is nearly perpendicular, and has an average elevation of 400 feet: at one point it attains the height of 587 feet. The strata are horizontal and variously coloured, and in many places they overhang. These cliffs are exposed to the full force of the Atlantic, the waves of which during a gale break against them with extraordinary violence. Numerous islands and detached stacks of rock worn into fantastic forms mark the devastating effects of these storms, which have disconnected them from the mainland.

The shore of the Shannon commencing from Loop Head has numerous creeks which might be rendered useful either as asylum-harbours or stations of trade, but at present there is no security for vessels of heavy tonnage in hard weather nearer to Loop Head than the anchorages of the Fergus. At Carrigaholt, a small village immediately under Loop, is a fishing pier; and at Kilrush, formerly a very prosperous place about halfway between Carrigaholt and the Fergus, is a pier with a quay; but the roadstead is exposed to southerly winds.

Eastward from Kilrush the Shannon, which at its entrance is ten English miles in width, begins to contract; but after sweeping in a comparatively narrow and very deep channel—100 to 120 feet in mid-channel—round the peninsula of Clonderalough, between which and the shore of Limerick is the Race of Tarbert, it expands again to a width of several miles at its confluence with the Fergus, about ten miles farther inland. The entrance of the Fergus lies between Innismurry Island on the west and Rinana Point on the east. The estuary is here five miles wide. Towards the western side it is encumbered by islands, of which there are eight considerable ones covering about four square miles. These islands contract the ship-channel to a breadth of about three-quarters of a mile. The channel is safe for vessels drawing 16 feet of water, and on the mud-banks at either side a ship may at all times ground with safety. From the Shannon to Clare the river is called the Lower Fergus, and from Clare to Ennis the Upper Fergus. The Upper Fergus is a deep and quiet piece of water more like a large canal than a river. It is separated from the Lower Fergus by a ledge of rock on which the abutments of the bridge of Clare are built. This natural dam keeps the upper part of the river constantly full and navigable to Ennis, the county town, three miles distant. Several drainage works have been recently executed by government with a view to facilitate the navigation of the river and to improve the land on its banks.

Eight miles east from Rinana Point is the mouth of the Ougarnee River, up which the tide flows to Six-Mile Bridge; but the vicinity of Limerick renders its navigable capabilities of little importance. One suburb of Limerick lies in the county of Clare. In this county are also the chief lines of canal by which the Shannon navigation is continued from Limerick to Killaloe. Within the last twelve years great improvements have been effected in the roads of the county under the direction and with the aid of the commissioners of public works.

Geology, Mineralogy, &c.—The geological constitution of the surface is simple. The Slieve Baughta Mountains consist of a nucleus of clay-slate, supporting flanks of sandstone, intruded through a break in the surrounding limestone plain, in the same manner as the Slieve Bloom Range on the opposite bank of the Shannon. The limestone which insulates this mountainous district spreads westward over the more level basin of the Fergus, and rises into very rugged elevations towards the Galway boundary on the north-west. Beyond the basin of the Fergus commences an extensive clay-slate and trap formation, which stretches westward from the limestone-field to the waters of the Atlantic, to which it presents the precipitous escarpments of the coast-line. The whole of this coast abounds in phenomena of the greatest interest.

Beds of ironstone and strata of coal occur upon Mount Callan; a seam of coal three feet thick appears in the face of the rock a little above high-water mark over Liscannor Bay, near Ennistymond; and again near Mutton Island, both inland and on the shore of Malbay; another seam appears in the bed of a river near Carrigaholt, as also at Fieragh Bay, Leinaduff, and Longhill Ferry. Iron-ore is found at several places, and in considerable quantities on the Malbay coast; on the banks of the Ardsallas, a feeder of the Fergus flowing from the east; on the shore of Liscannor Bay adjacent to the coal tract, between Corrofin and Ennis in the centre of the county; and in several other places. Lead-mines are worked at Kilbricken. Rich lead-ore abounds in the limestone district, particularly in the mountainous parts of the barony of Burren in the north of the county. Copper pyrites is plentiful in the same barony. Manganese is found at Ennistymond, Carrigaholt, Cross, and other places on the sea-coast. Chalybeate waters abound in the district westward from the sources of the Fergus. Very fine black marble has been raised at Craggliath, near Ennis; it takes a high polish, and is free from spots. On the shore of Lough Graney is found a hard crystalline sand much used for scythe-boards, which are greatly superior to those brought from England. The coast from Kilrush to Carrigaholt abounds with excellent slate and flag quarries. There are also quarries of flag of a good quality at Ennistymond. The Broadford slates from the Slieve Bernagh district are considered nearly equal to the best Welsh; an inferior kind is obtained from the slate-quarries at Killaloe.

Soil, Climate, &c.—The characters of the different soils correspond to the characteristic geological division. In the schistose and trachyte districts the soil is cold and moory; in the calcareous region warm and friable, though light; on the borders of the different tracts, especially of the slaty and calcareous, deep and loamy. In some districts there are detached spots of very remarkable richness. These are usually situated along the banks of the large rivers, and are liable to periodical inundations. They are called corcaghs or corcasses, a word nearly synonymous with the English provincial term bottoms. The corcass lands lie chiefly along the Shannon and Fergus from Limerick westward, in some places extending inland to a considerable distance. Another species of rich grazing land of frequent occurrence here as well as in Galway, is the turlogh, or periodical lake, an accumulation of water either forced upward by subterranean channels, or formed by surface waters which have no outlet. These floods lie in the turlogh during the winter, and leave it prepared for the most abundant vegetation in the spring. The whole of this calcareous tract abounds with subterraneous communications through which the water passes from lake to lake, as at the sources of the Fergus, or rises to the surface and forms temporary pools and turloghs. The barony of Burren, which comprises the north-western portion of the limestone field of Clare, is a very remarkable district. Here the bare limestone rock rises to the surface in all directions, so as to give the whole district the appearance of being covered with a white cement. The country is everywhere very rugged and hilly, and the worst supplied with water of any in Ireland. The only supply of water in the interior is by turloghs. One of these at Kilcorney, a place remote from any river, is fed by a periodical stream issuing each winter from a cave in the vicinity. Notwithstanding its sterile appearance, this country is far from being unproductive. In the crevices of the limestone rock sprouts a very sweet and nutritious grass, particularly well suited for fattening sheep. Yarrow, white clover, trefoil, cinquefoil, virga aurea, juniper, and yew, grow spontaneously and in abundance, although in patches. The supply of fuel is scanty, there being little or no bog; yet from the numerous remains of castles in all parts of the barony it is evident that it must have been thickly inhabited during its possession by the old Irish. The present inhabitants of the coast procure their supply of turf in boats from the opposite shores of Galway. In all other parts of the county there is abundance of fuel, particularly towards the south-west, where a tract of bog, containing 14,950 Irish, or about 24,000 English acres, extends from the Shannon at Kilrush to the

shores of the Atlantic at Moore Bay and Dunbeg. There is no limestone in this part of the county, but an inexhaustible supply of sea-sand can be had at Dunbeg. Although the county is very bare of trees, the bogs abound in timber. The mode of finding bog timber as practised here is rather remarkable. It is observed that the dew does not lie on the part of the bog immediately above a tree, as it does elsewhere. The position of a piece of timber is thus easily ascertained before the dews rise in the morning.

The climate is healthy. The county is in general much exposed, particularly to violent gales from the Atlantic. Frost and snow seldom continue long. In the sheltered portions of the eastern district, the climate is moist and very mild. The fishing industry of the county is now almost extinct.

History, Antiquities, &c.—Clare constituted a portion of the ancient territory of Thomond or North Munster. An English force, under Robert Fitz-Stephen, was admitted by Donell, the petty sovereign, in A.D. 1171. The English retained the fortresses of Bunratty and Clare, and a considerable territory, until the death of Richard de Clare, in 1317; from which period until the submission of Murragh O'Brien in 1543, this part of Thomond was entirely in the hands of the native families. In 1565 the county was made shire-ground by Sir Henry Sidney, and included in the province of Connaught. From Connaught it was again transferred to Munster, on the petition of the second earl of Thomond, in 1601. Large allotments were made in Clare for the satisfaction of adventurers and soldiers by the English Parliament in 1653; but it was not until after the forfeitures consequent on the revolution of 1688 that a permanent proprietary was established. The rebellion of 1798 scarcely extended to this county.

During the present century Clare was for a time remarkable for agrarian disturbances, now happily at an end. The Clare election of 1828, in which a Roman Catholic was returned to the Imperial Parliament previous to the removal of the civil disabilities affecting that part of the population, forms an important epoch in Irish history.

There are round towers at Scattery Island, off Kilrush (120 feet high, a known landmark in the navigation of the Shannon), at Drumcliff in the barony of Islands, at Dysert and Kilnaboy in the barony of Inchiquin, and at Innis Cailtree, an island in the creek of Scariff, on Lough Derg: the abbey of Ennis, which the famous Turlogh O'Brien enriched in 1306 with bells, crosses, rich embroidery, and painted glass windows ('Annals of Innisfallen and Caithersim Toirdelbach'), is still standing. The abbey of Quin, in the barony of Bunratty, about five miles east of Ennis, is a noble pile of black marble, for the building of which, in the 13th century, Concha More Macnamara, the founder, is said to have been created a prince by the pope. The ruins on the islands of Innis Scattery and Innis Cailtree are also of great interest to the antiquary. Cromlechs are numerous, and the tomb of Conan on Mount Callan, with its Ogham inscription, is still the subject of inquiry and dispute.

Divisions, Towns, &c.—Clare is divided into the baronies of Burren on the north, Corcomroe on the north-west, Ibrickan on the west, Moyarta on the south-west, Clonderalagh on the south, Inchiquin in the north centre, Islands in the south centre, Bunratty, Upper and Lower, on the south-east and east, and Tulla, Upper and Lower.

ENNIS, the county town, and the seat of a Poor-Law Union; BALLYVAGHAN, CORROFIN, ENNISTYMON, KILLADYSERT, KILRUSH, SCARIFF, TULLA, which are likewise the seats of Poor-Law Unions, and KILLALOE, which gives title to a bishopric, will be found described under their respective titles. The following minor places we notice here, with the populations in 1851:—

Broadford, population 342, about 8 miles W. from Killaloe, is pleasantly situated near Lough Doon. In the neighbourhood are several fine mansions. There is here a station of the county constabulary force. Petty sessions are held, and there are fairs on June 21st, and November 21st. There is a dispensary of the Ennistymon Union. *Carrigaholt*, population 320, a fishing village at the head of Carrigaholt Bay, about 9 miles W. by S. from Kilrush, possesses a Roman Catholic chapel. There is here a dispensary of the Kilrush Union. The fishery carried on is of some importance, and large quantities of turf are sent to Limerick. The pier and harbour are not adapted to afford anchorage or security to large vessels. *Clare*, population 892, besides the inmates of an auxiliary workhouse 939, in all 1831; is situated on the river Fergus, about 2 miles S. by E. from Ennis. The old castle has been converted into a barrack. A stone bridge crosses the river here. This town which was once the county town is now of very little importance. Fairs are held in May, August, and November. *Kilfenora*, population 387, besides 510 in the auxiliary workhouse, is situated about 14 miles N.W. from Ennis. The parish church is a respectable building, with a massive square tower. Kilfenora was the seat of a bishop as early as 1265. It is now united with the sees of Killaloe, Clonfert, and Kilmacduagh. [KILLALOE.] In the 'Ulster Annals' it is stated that the abbey and town were burned by Murtogh O'Brien in 1055. A fragment of the old abbey still remains; near it are several ancient crosses. The land around the village is fertile and well cultivated. *Kilkee*, population 1869, a small watering place situated on a small creek of Malbay, about 8 miles W.N.W. from Kilrush, is much resorted to by sea-

bathing visitors from Limerick and other places. Kilkee possesses a small harbour, and is a station whence fishing operations are to some extent carried on. *Lehinch* or *Lahinch*, population 999, besides 610 in the workhouse, situated at the head of Liscanor Bay, about 2 miles S.W. from Ennistymon, is visited in summer for sea-bathing, for which the neighbouring strand is well adapted. Near the village are the ruins of Moy Castle, also the natural curiosities called the Puffing-Holes and the Dropping-well. *Liscanor*, population 429, is situated on the north side of Liscanor Bay, about 4 miles W. from Ennistymon. It possesses a small pier and harbour affording valuable shelter to vessels of small burden, the rocky character of the coast for some distance giving few opportunities of such a refuge. A fishing trade of some importance is carried on here. *Milltown-Malbay*, population 1452, besides 1050 inmates of workhouses, is situated on the road between Ennistymon and Kilkee, about 8 miles S.W. by S. from Ennistymon, and at the head of a cove of Malbay. It is favourably situated for sea-bathing, and has on that account risen into comparative importance. Petty sessions are held. There is a dispensary of the Ennistymon Union. Seven fairs are held during the year. *New-market-on-Fergus*, population 1111, a small market-town, about 7 miles S.E. by S. from Ennis, possesses a good local trade. Five fairs are held in the year. Petty sessions are held, and the town is a station of the constabulary force. In the vicinity are several interesting relics of antiquity. *O'Brien's Bridge*, population 401, situated on the right bank of the Shannon, opposite the village of Montpelier, county Limerick, with which it is connected by the bridge from which the village takes its designation. The rapids which at this place made the navigation of the Shannon very difficult, have been deepened, and the span of several of the arches of the bridge has been enlarged. The bridge, which has stood for several centuries, has in its original construction been strongly built of rubble-stone, though rather roughly put together. Fairs are held on July 25th and November 7th. *Quin*, population 284, situated about 3 miles E. from Clare, is remarkable as containing the remains of Quin abbey, one of the best preserved old monastic buildings in Ireland. It was erected at the commencement of the 15th century. The square tower, the cloisters, and the aisles, are worthy of attention. *Six-Mile Bridge*, population 762, about 11 miles S.E. from Ennis, was formerly of some importance, but has now little to attract observation. Quarter and petty sessions are held here. Besides an Episcopal church, there are two chapels for Roman Catholics, a court-house, a market-house, and a dispensary. An annual fair is held on December 5th.

Of the 164,555 acres under cultivation in the county of Clare in 1851, which were comprised in 18,419 holdings, 9293 acres were under wheat, 42,128 oats, 21,080 barley, bere, and rye, 7826 peas and beans, 23,625 potatoes, 11,733 turnips, 2469 mangel-wurzel, carrots, parsnips, and cabbage, 313 vetches, rape, and other green crops, 1014 flax, and 45,074 meadow and clover. In 1851 on 19,018 holdings, of which 1519 were under 1 acre each, there were 13,087 horses, 8032 mules and asses, 1963 head of cattle, 85,512 sheep, 42,314 pigs, 10,983 goats, 233,734 head of poultry; of which the total value was estimated at 984,785*l*. The chief trade in the county is in corn and provisions. Sheep and cattle of excellent quality are reared in the county. Coarse linen and hosiery are made for home use.

Divisions for Ecclesiastical and Legal Purposes.—The county includes the diocese of Kilfenora, now united with that of Killaloe, the greater part of Killaloe and a portion of Limerick dioceses. The county returns three members to Parliament, two for the county, and one for the borough of Ennis. The assize town is ENNIS. Quarter sessions are held in rotation at Ennis, Ennistymon, Killaloe, Kilrush, Six-Mile Bridge, and Tulla. The county infirmary is at Ennis; there are fever hospitals at Ennis and Kilrush; the district lunatic asylum, to which Clare county may send 18 patients, is at Limerick. The Poor-Law Unions in which the county is comprised are those of Ballyvaghan; Corrofin; Ennis; Ennistymon; part of Gort; Killadysert; Kilrush; part of Limerick; part of Scariff; and Tulla. The county is within the military district of Limerick. The head-quarters of the constabulary establishment, comprising 9 districts and 56 stations, and including 421 men, including officers, are at Ennis. In December 1851 there were 130 National schools in operation in the county, attended by 17,233 children, of whom 8915 were males and 8318 females.

(*Ordnance Survey Map; Statistical Survey of the County of Clare; Thom, Irish Almanac; Parliamentary Reports; MSS. in British Museum, and Library of Royal Irish Academy.*)

CLARE ISLAND. [MAYO, County of; ACHILL.]

CLARE, or CLAREMORRIS, county of Mayo, Ireland, a port and market-town, and the seat of a Poor-Law Union, in the parish of Kilcoleman and barony of Claremorris, is pleasantly situated in 53° 43' N. lat., 8° 57' W. long.; distant 20 miles S.E. from Castlebar by road. Claremorris is a clean well-built place, and possesses an extensive retail trade. It contains a parish church, a Roman Catholic chapel, a dispensary, and a Union workhouse. Quarter sessions are held in the town, and petty sessions on the second Thursday of every month. Fairs are held on May 24th, June 22nd, September 27th, and November 23rd. Adjoining the town is Claremount, the seat of James Browne, Esq., and in the neighbourhood is the extensive demense of Castle Macgarret, the seat of Lord Oranmore. Claremorris Poor-Law Union

comprises 19 electoral divisions, with an area of 110,788 acres, and a population in 1851 of 32,668.

CLAUDE, ST. [JURA, Department of.]

CLAUSENBURG, properly *Klausenburg* (Klusch, Kolosvár), a royal free town and capital of the principality of Transylvania, in Austria, is situated in about 46° 47' N. lat., 23° 32' E. long.; 72 miles N.N.W. from Hermannstadt, and has about 22,000 inhabitants. The town (it is said) was founded by the Romans, who gave it the name of Claudia, whence its Latin designation *Claudiopolis*. In 1178 the town was enlarged by a colony of Saxons, who from its locality called it Clausenburg, from the old word 'Klause,' which signifies a 'mountain defile.' The citadel, which is built on a hill, was not erected till 1721, since which date commodious barracks have been made in it. Clausenburg is situated on the river Szamos, in the midst of a romantic valley, surrounded with mountains, and laid out in fields, gardens, and vineyards. It is defended by lofty walls and towers, and is divided into the inner town (consisting of an older and more modern quarter), and six suburbs; the former though of small extent has a very pleasing appearance. It has some handsome streets and houses, and a large market-place, 500 paces long and 360 broad. There are six Roman Catholic churches, the most striking of which is the cathedral, erected in pursuance of a vow by King Sigismund in 1399; it is 94 paces long and 34 broad, and contains some fine monuments. The Calvinists, Lutherans, Greek Catholics, and Unitarians have places of worship in the town.

Clausenburg contains an academical lyceum, with a public library attached; a Roman Catholic gymnasium; Reformed and Unitarian colleges; a Roman Catholic seminary; several convents; a normal school; an orphan asylum, two hospitals, and various other charitable institutions. There is a large national theatre, and several public gardens are laid out around the town. Among the other buildings is the old castle, which is now in ruins, the town-hall in the market-place, and numerous palaces belonging to the nobility.

Clausenburg is the seat of the government of Transylvania, of Protestant and Unitarian consistories, of a board of education and other public departments. Being a free town all its civil and other affairs are conducted by its own judges and magistrates. The population is composed of Hungarians, Saxons, Armenians, Greeks, and Jews. The manufactures, which are inconsiderable, are chiefly woollens, earthenware, and paper. Clausenburg is the birth-place of Matthias Corvinus, king of Hungary.

CLAUSTHAL, the largest and most important of the mining towns of the Harz, is situated upon two bleak and naked eminences, 25 miles N.E. from Göttingen, 48 miles S.E. from Hanover, and has about 10,000 inhabitants, including the town of *Zellerfeld*, which is separated from it only by a rivulet called *Zellerbach*. It is the seat of administration for the mining districts of Hanover, and stands at an elevation of 1170 feet above the sea. The streets are straight and broad, and planted in general with chestnuts and lime-trees, but are very badly paved. The houses are mostly constructed of wood. The town contains two churches, an orphan asylum, a mint, a mining academy, to which a seminary for teaching forest economy is attached, with collections in mineralogy, models of mines and mining machinery, &c.; a gymnasium, manufactories of ironware, yarns, woollens, camlets, &c. In the immediate vicinity are the richest mines of the Upper Harz, which yield silver, copper, lead, and litharge, and give employment to above 2000 workmen. In the mine called *Georg-Wilhelm* is one of the deepest shafts in the Harz, reaching (it is said) to a depth of 2000 feet below the level of the Baltic. In the *Silber-segen* mine, which is entered by a shaft 176 fathoms deep, there is a subterranean canal, 2339 fathoms long, by which the ore is conveyed from some of the shafts. All the mines are drained by a tunnel cut through the mountain, 6 miles in length, and emerging at the little town of Grund. The machinery for working the mines, forges, tilt-hammers, and stamping-mills, is put in motion chiefly by water-power, and all the rain-fall of the neighbourhood is collected into reservoirs, of which there are more than 50, to supply the works of Clausthal and Zellerfeld.

CLAYS. [NORFOLK.]

CLEOBURY-MORTIMER, Shropshire, a market-town and the seat of a Poor-Law Union, in the parish of Cleobury-Mortimer and hundred of Stottesden, is situated on the little river *Rea*, in 52° 22' N. lat., 2° 28' W. long.; distant 30 miles S.S.E. from Shrewsbury, and 137 miles N.W. by W. from London. The population of the parish in 1851 was 1738. The living is a vicarage in the arch-deaconry of Salop and diocese of Hereford. Cleobury-Mortimer Poor-Law Union contains 17 parishes and townships, with an area of 51,900 acres, and a population in 1851 of 8555.

Cleobury-Mortimer is so called from having once belonged to the family of Mortimer. A castle erected here by Hugh de Montgomery, was destroyed in the time of Henry II. There is little trade carried on. The town is lighted with gas. The church is a fine old building in the early English style, with some Norman work about the tower. The chancel is spacious, and the chancel arch very fine. The Wesleyan Methodists and Roman Catholics have places of worship. The Free school, founded in 1714 by Sir Lacon Childe, has an annual income of 500*l*, and contains about 100 boys and 90 girls. In the vicinity of the town is a paper manufactory. Coal mines employ

some of the inhabitants. The market-day is Wednesday, and fairs are held on April 21st, Trinity Monday, and October 27th, for cattle, sheep, and pigs. A county court is held in Cleobury.

(Communication from Cleobury-Mortimer.)

CLERMONT-FERRAND, the capital of Basse-Auvergne and of the department of Puy-de-Dôme, in France; the seat of a provincial university, of an academy of sciences, literature, and art, of an endowed college, of a secondary school of medicine, and a departmental school of midwifery, of a consultative chamber of manufactures and an exchange; stands at the entrance of a vast semicircular plain, hemmed in except towards the east by a line of hills clothed with woods and vineyards, behind which springs up the majestic peak of the Puy-de-Dôme. To eastward the view extends for several miles over the beautiful district of the Limagne. The town is built close to a mountain torrent, which rises in the Puy-de-Dôme, and flows into the Allier; it stands at a distance of 237 miles S. by E. from Paris, in 45° 46' N. lat., 3° 5' E. long., and has 30,563 inhabitants, without including the suburb of Montferrand, which numbers about 5000 inhabitants.

In approaching the town from Paris the traveller passes through the suburb of Montferrand, which is united to Clermont by a noble avenue, 2 miles long, perfectly straight, and bordered with willows and walnut-trees. Clermont itself, built on an eminence, forms when viewed at a little distance, a noble termination to this avenue, and inspires the traveller with a notion of beauty which the interior of the town does not realise. It is not well laid out; the streets are narrow, and the houses, though not ill-built, yet present, from the dark colour of the lava which is the chief building material, a sombre appearance. The town is separated from the faubourgs by a line of boulevards, which are for the most part planted with trees. The squares are large but irregularly built. The Place-du-Taureau is remarkable for a handsome fountain in the form of an obelisk, dedicated to the memory of General Desaix. This Place and those of Poterne and L'Espagne command most agreeable prospects: that of Delille, or Champleix, is adorned with a gothic fountain, richly sculptured. The Place-d'Armes, or de Jaude, as it is also called, is inclosed mostly by new and well-built houses. In recent times many improvements have been introduced, by widening the streets and laying down smooth pavements instead of the rough pebbles formerly used. The fountains are supplied with water which is conveyed through pipes to the highest part of the town. One of the most remarkable of them is the Château d'Eau, which presents a multitude of sculptured figures, bas-reliefs, jets, and basins, disposed in a pyramidal form, and producing a singular but rich effect.

Of the public buildings the principal is the cathedral. The first cathedral of Clermont was built in the 5th century, by St. Namatius, ninth bishop of Auvergne. According to Gregory of Tours, this structure was 164 feet long and 65 feet wide; it was lighted through 42 windows, entered by 8 doors, and the roof was supported by 70 columns. This church was destroyed by the barbarians, rebuilt and again destroyed. The present cathedral dates from A.D. 1248; it stands in the centre of the city, and though it has never been completely finished, is regarded as one of the finest monuments of gothic architecture in France. The interior is 328 feet long, 140 feet broad, and 108 feet high, from the pavement to the vault of the roof, which is supported by 56 clustered pillars. The pillars of the choir are especially remarkable for their delicacy. The choir is surrounded by chapels. Of the painted windows the splendid roses of the transept are particularly worthy of attention. The whole structure is covered in with lead, and over the aisles are terraces, whence extensive views are obtained over the town and the surrounding country. The dark stone with which the structure is built gives it a severe and imposing aspect, increased by its lofty site. There is no good near view of the exterior, on account of the houses and shops that press close upon it. The church of Notre-Dame-du-Port is curiously decorated and very ancient, many of its parts dating from the time of the original construction in A.D. 863. The other remarkable objects at Clermont are the public library, containing 18,000 volumes, the botanical garden, the endowed college, the museum of natural history, mineralogy, and antiquities, the house in which Pascal was born in the Rue St.-Gènes, the theatre, town-house, court-house, the buildings in which the corn and linen markets are held, the two large hospitals, and the numerous promenades in the town and its environs. In the Place Jaude there is an intermittent fountain, the waters of which are advantageous in fevers and diseases of the digestive organs. In the suburb of St. Alyre, a fountain gives birth to a little stream which deposits such a quantity of calcareous and ferruginous sediment as gradually to raise its bed to a level with the surface of the fountain, when of course the waters would flow in a new channel and with the same result. But to prevent the ground from being covered with these petrifications the bed of the stream is destroyed from time to time. Once only the process was suffered to go on to the last degree, and the result was a level wall 18 feet broad, 262 feet long, and with a height varying with the slope of the ground.

Clermont is the seat of a bishop, whose see comprises the department of Puy-de-Dôme; it is also the head-quarters of the 20th Military Division, which includes the departments of Puy-de-Dôme, Haute-Loire, and Cantal.

Woollen cloth, consisting of piece-dyed goods for the home market and for exportation to the Levant, jewellery, and plated goods are the chief industrial articles; but silk stockings, room-paper, cotton-yarn, painted glass, and various other articles are manufactured. The town has also a large commerce in the linen of Auvergne, corn, hemp, wool, flax, hides, wine, oil, salt, dried and preserved fruits, cattle, cheese, and various other objects of local industry.

Clermont-Ferrand occupies the site of Augustonemetum, which Strabo calls Nemossus, and erroneously places on the Loire. It was afterwards called *Arverni*, from the Celtic nation whose capital it was, and whose name is perpetuated in Auvergne. Julius Caesar does not mention Nemetum or Augustonemetum; in his time the capital of the Arverni was Gergovia, which he unsuccessfully besieged. An annalist of the time of Pepin mentions the castle of Clarns Mons which defended the ancient town, and from this no doubt the modern name Clermont is derived. The ancient town seems to have occupied the height on which the cathedral stands, and the level ground to the south-east of it; several fragments of marble columns and parts of mosaics have been found on this site. In A.D. 408 the town was sacked by the Vandals, who destroyed all the principal edifices; in 412 it was again taken by the soldiers of Honorius. Euric, the Arian king of the Visigoths, unsuccessfully besieged it in 473, but it fell into his hands with the rest of Auvergne the following year, when he imprisoned Sidonius Apollinaris, bishop of Auvergne, for encouraging the townsfolk in resisting the siege. Thierry, the natural son of Clovis, took Clermont in 507, when all Auvergne was first subjected to the Frankish kings. Childebert having seized upon Clermont in 532, Thierry besieged and took it, destroying the Roman aqueduct, and plundering the inhabitants of all they possessed. The town was ravaged again by Pepin, who made himself master of the castle of Clarns Mons in 761. From the plundering ravages of the Northmen it suffered severely in 853 and 916.

In a council held at Clermont A.D. 1095, the first crusade was resolved on. Pope Urban II. presided. The transactions of this council were numerous and important. In the middle ages, and up to the period of the French revolution, Clermont ranked as the capital of Auvergne. The bishopric of Auvergne was founded about A.D. 250, and the bishop held the first rank among the suffragans of the archbishop of Bourges; and until the erection of the bishopric of St. Flour in 1317 was the only bishop in Auvergne. Since about 1160 the prelates have been styled bishops of Clermont. The diocese at present comprehends the department of Puy-de-Dôme.

Louis le Gros besieged Clermont in the year 1100, in order to compel the townspeople to admit the bishop whom they had expelled. In the intestine commotions and the wars with the English in the 12th and 13th centuries, the town suffered often; in 1220 they were allowed the privilege of defending themselves, of meeting and choosing their own officers, and in lieu of this service were exempted from all taxes. In 1285 the high tribunal of justice was for some reason transferred to Montferrand by Philip the Fair. Clermont was again made the capital of the duchy of Auvergne in 1556, and the first commission of assizes was held there in November of that year. During the wars of the League the inhabitants of Clermont were devoted adherents of the king. From the 28th of September 1665, to the 1st of February following, a commission of assize sat in Clermont to investigate and punish the vexatious oppressions of the Auvergnat nobles.

The environs of Clermont are very interesting on account of abundance of evidence they bear of the volcanic agency that once desolated the region of Auvergne. The gorge in which the village of Royat is built abounds with springs that gush forth from basaltic rocks, and flow in beds hollowed out in what was once a molten torrent of lava. The Puy-de-Dôme and other summits that surround it are easily reached from Clermont.

The plateau of Gergovia, some three miles to the south-east of the town, is considered to be the site of the Gergovia from which Julius Caesar was obliged to retire in his campaign against Vercingétorix. ('Bell. Gall.' vii.)

(*Dictionnaire de la France.*)

CLERMONT-LODÈVE. [Hérault.]

CLERMONT-OISE. [Oise, Department of.]

CLEVEDON. [Somersetshire.]

CLEVELAND. [Yorkshire.]

CLEVES (Kleve, German), the most north-westerly district of the kingdom of Prussia, and part of the old duchies of Cleves and Guelderland, is the name of a circle in the province of Düsseldorf, in the Prusso-Rhenish provinces. It contains about 185 square miles, and had a population of 46,000 (chiefly Roman Catholics) in 1846. Cleves lies between the Rhine and Holland. The surface is partly of moderate elevation, but for the most part a complete level, and some of it near the Rhine is so low as to be flooded occasionally by the river, from which however it is protected by a high dam. The soil, though very sandy in many parts, has in general been rendered extremely productive by careful cultivation. There are few parts of Germany in which farming is conducted on a better or more profitable system than in Kleve. In the westerly districts lies the extensive Reichswald, or Forest of Cleves: 31,000 acres of this circle are occupied by woods and forests, while of the remainder 58,350 acres are arable

land, and 23,200 acres are in meadows or pastures. The produce is chiefly wheat, rye, barley, oats, buckwheat, tobacco, peas and beans, potatoes, clover-seed, butter, and cheese, of which three last-mentioned articles much is exported. Cattle are fed for the consumption of the manufacturing towns of Düsseldorf and Elberfeld, and large quantities of flax and seeds are grown for exportation to Holland and England. The district is almost exclusively agricultural, but there are some manufactures of cotton-yarn, woollens, silks, cottons, linens, cutlery, fine leather, &c.

The capital is *Cleves*, formerly also the chief town of the duchy of Cleves, which is pleasantly situated in 51° 47' 40" N. lat., 6° 7' E. long., 48 miles N.W. from Düsseldorf, on the Kermisdahl, about a mile from the banks of the Rhine, with which it communicates by the Spoy Canal. It is walled, well built in the Dutch style, and divided into upper and lower towns; the upper town being built on three hills the streets are steep and irregular. Formerly it was fortified, and was considered a place of strength until the middle of the 16th century. It contains a Catholic cathedral built in 1346, with two towers; three Protestant churches; a synagogue; and a royal palace called the Schwanenburg, the tower of which, built by the Duke of Cleves in 1439, is extremely massive, and being on the highest point of the hill on which the palace stands forms a stately ornament to the town. The palace is now used partly for government offices and partly for a prison. Anne of Cleves, one of Henry VIII.'s ill-fated wives, was born in it. There are extensive gardens round the palace, which contains a valuable collection of Roman antiquities found in the town and its environs. Cleves possesses a high-school, three hospitals, a house of industry, house of correction, &c. The population is about 8000. The manufactures consist of yarns, cotton goods, silks, woollens, flannels, stockings, linens, tobacco, brass-ware, &c. There are three squares or open spaces, and in the vicinity a park of about 700 acres, and a chalybeate spring surrounded by handsome grounds, which was opened in 1742. The place is much frequented by visitors in summer.

The old duchy of Cleves extended along both banks of the Rhine. After the Franks had driven the Romans from this territory it was governed for a long time by counts. Otho I. united Cleves to the German empire, but it was still ruled by counts as a fief of the empire. Adolphe II., count of Lamerck, having married Mary, daughter of Thierry VII., last count of Cleves, inherited the county, and having obtained the investiture of it from the emperor Sigismund, assumed the title of Duke of Cleves in 1439. On the death of the Duke Johann Wilhelm in 1609 the duchy fell to Sigismund, elector of Brandenburg, who had married Anne, niece of the last duke. The house of Brandenburg held the duchy till 1794, when the French seized it. Napoleon I. united the portion of the duchy that lay along the right bank of the Rhine to the grand duchy of Berg in 1806. These territories were restored in 1815 to Prussia, which formed them into a province called for a time Cleve-Berg, or Juliers-Cleve-Berg, from a part of the duchy of Juliers having been united with them. All these duchies are now merged in the Prussian province of the Rhine. [RHEIN-PROVINZ.]

CLIFDEN, county of Galway, Ireland, in the parish of Omoy and barony of Ballinahinch, a sea-port and post-town, and seat of a Poor-Law Union, is situated in 53° 30' N. lat., 9° 58' W. long., distant 47 miles W.N.W. from Galway, and 178 miles W. from Dublin. The population in 1851 was 1602 in the town, 11 in the bridewell, and 639 in the workhouse. Clifden Poor-Law Union comprises 19 electoral divisions, with an area of 192,938 acres, and a population in 1851 of 25,389.

Clifden is situated at the head of an inlet of Ardbear Haven, one of the numerous deep indentations of the western coast of Connemara. It stands on the elevated banks of the Owenglen River, a rapid stream descending from the neighbouring mountain group of the Twelve Pins, or Bins, which form a grand background to the picturesquely-situated town. Clifden owes its origin to the enterprise of the late Mr. Darcy, who about 1812 erected the first buildings here. It consisted only of a single two-story slated house and a few thatched cabins until 1822, when the new lines of road from the interior being opened by the government, a place for the storage and shipment of produce was required to accommodate the increasing agriculture of the district. Mr. Darcy offering building leases in perpetuity a town sprung up with extraordinary rapidity. In 1835 the revenue was 7000*l*. The potatoe blight and consequent famine of 1846 and the succeeding years with other causes, reduced the town to a very helpless condition. The town was sold in the Encumbered Estates Court along with the rest of the Darcy estates. There are in Clifden a handsome church in the gothic style, a school-house, a large Roman Catholic chapel, a dispensary and fever hospital, and barracks for military and constabulary. Quarter sessions for the county of Galway are held in rotation. Vessels of 200 tons can come up to the pier; and in Ardbear harbour, outside the inlet of Clifden, is safe anchorage for vessels of any tonnage. Clifden Castle, the seat of the former proprietor, is finely situated on the northern shore of Ardbear harbour, about a mile west of the town. The mansion is castellated, and presents an imposing and picturesque appearance. A late eminent traveller remarks that the scenery here is more Swiss in character than anything he had seen in Ireland.

(Lewis, *Topographical Dictionary*; Inglis, *Ireland in 1834*; *Map of the Darcy Estate in the Court for Sale of Encumbered Estates in Ireland*.)

CLIFTON, Gloucestershire, a suburb, and generally reckoned as forming a part of the city of Bristol, and the seat of a Poor-Law Union, in the parish of Clifton and hundred of Barton Regis. The population of the parish of Clifton in 1851 was 17,634. The living is a perpetual curacy, with the curacy of Dowry annexed, in the archdeaconry of Bristol and diocese of Gloucester and Bristol. Clifton Poor-Law Union contains 12 parishes and townships, with an area of 37,189 acres, and a population in 1851 of 77,950.

Clifton owed its early prosperity to the Hotwells, which made it a favourite resort as a watering place. It is now much used as a place of residence by the merchants of Bristol. Its name is derived from its situation on the precipitous heights overhanging the river Avon. From these heights are obtained extensive views over rich and picturesque scenery. Clifton parish church, erected in 1822, will accommodate 1700 persons; there are four other churches in Clifton belonging to the Established Church, and a large Roman Catholic Cathedral. The Independents, Baptists, and Wesleyan Methodists have places of worship. Schools are attached to most of the churches and chapels. For a further notice of Clifton, see BRISTOL.

CLITHEROE, Lancashire, a market and manufacturing town, municipal and parliamentary borough, and the seat of a Poor-Law Union, in the parish of Whalley and hundred of Blackburn, lies in the valley of the river Ribble, 216 miles N.N.W. from London by road, 225 miles by railway via Bolton and Manchester, and 26 miles S.E. from Lancaster by road; in 53° 52' N. lat., and 2° 3' W. long. The population of the municipal borough in 1851 was 7244; of the parliamentary borough 11,480. The borough is governed by a municipal corporation, consisting of 4 aldermen and 12 councillors, one of whom is mayor; and returns one member to the Imperial Parliament. For sanitary purposes the borough is governed by a Local Board of Health. The living is a perpetual curacy in the rectory of Whalley. Clitheroe Poor-Law Union contains 34 parishes and townships, with an area of 129,990 acres, and a population in 1851 of 22,367.

The town is pleasantly situated upon a low outlying hill of mountain limestone. The main street runs along the ridge of the hill, which is crowned at its southern extremity by the ruins of the old castle of Clitheroe, and is terminated at its northern extremity by the parish church of St. Mary Magdalene. The suburbs of Waterloo and Salford are built on the low lands near Mearley Brook, east of the town; while on the west side a road runs through the suburb of Bawdlands to the detached village and factory of Low Moor, by the side of the Ribble. The name, anciently spelt Cliderhaw, is descriptive of its situation, a 'hill by the waters.' The family of De Lacy, who came over with the Conqueror, built the castle, which consisted of a keep, with a tower and arched gateway, merely as a fortress. Within the walls by which the castle was inclosed was a chapel dedicated to St. Michael, which was destroyed when the fortress was dismantled in 1649. The Honor of Clitheroe was, for nearly three centuries, a part of the possessions of the duchy of Lancaster, till Charles II. granted it to General Monk, duke of Albemarle, from whom it has descended to the present proprietor, the Duke of Buccleuch.

The church of Clitheroe is an ancient structure, with a fine Norman arch between the nave and the choir; it is dedicated to St. Michael. Besides the parish church, there is a district church of St. James, built in 1837. The Roman Catholics, Independents, and Wesleyan Methodists have places of worship. Contiguous to the churchyard is a Grammar school, founded and endowed by Philip and Mary in 1554, at the recommendation of Bishop Bridgman, who drew up the statutes. The annual income from endowment is about 450*l*. The number of scholars in 1852 was 25. There are National and Infant schools, a mechanics institution, and a savings bank.

Clitheroe was a borough by prescription as early as the 11th century; but its existing corporate arrangements were settled by the Municipal Corporation Act of 1835.

Extensive print-works and cotton manufactories have been recently established at Clitheroe, which, along with the lime-kilns, provide ample employment. The neighbourhood abounds with limestone, for which there is a great demand, as it can now be conveyed by water to any part of the kingdom. The chief establishment in the town is the celebrated print-works of Messrs. Thomson at Primrose Lodge, on the south-west margin of the town. A dam has been thrown across the valley of Mearley Brook, to form a reservoir for working the great water-wheel of these works. Attached to the works is a farm of 80 acres, supplied with manure by means of sewage refuse, which would otherwise contaminate the streams. There are four cotton factories at Clitheroe. Nearly one third of the total population of Clitheroe, adults and children, are employed at the five large establishments. The market is on Tuesday: and on every alternate Tuesday there is a large cattle-market. Fairs for horses, cattle, and pedlery are held on March 24th, August 1st, the fourth Friday after September 29th, and December 7th. On the west of Clitheroe is the celebrated eminence, Pendle Hill, the summit of which is 1808 feet above the sea.

(Whitaker, *History of the Original Parish of Whalley and Honor of Clitheroe*; Baines, *Lancashire*; *Communication from Clitheroe*.)

CLOGHEEN, county of Tipperary, Ireland, in the parish of Shanrahan and barony of West Iffa and Offa, a post-town and the head of a Poor-Law Union, is situated in $52^{\circ} 17' N.$ lat., $7^{\circ} 57' W.$ long., distant 14 miles W.S.W. from Clonmel, 119 miles S.S.W. from Dublin, on the road from Clonmel to Fermoy, and 18 miles E.N.E. from Fermoy. The population in 1851 was 1562, besides 1822 in the workhouse and other public institutions. Clogheen Poor-Law Union comprises 14 electoral divisions, with an area of 118,427 acres, and a population in 1851 of 88,952.

Clogheen is a well-built cheerful town, situated on the southern verge of the great valley included between the parallel ranges of the Galtee Mountains on the north, and the Knockmeleadow Mountains on the south. This vale lying at a low elevation and possessing a rich limestone soil, produces abundant crops of wheat, the grinding of which constitutes the principal branch of industry in Clogheen. The Tar, an affluent of the Suir, furnishes an abundant water-power. Here are a bridewell and sessions house, in which quarter sessions are held, a barrack for two troops of horse, a fever hospital, and a dispensary. At Skeheenarinky, about six miles west by north from Clogheen, are the remarkable caverns in the limestone rock, generally known as the 'Caves of Mitchellstown.' They consist of a series of natural vaults and galleries extending about 800 feet in length by 570 feet in breadth, and exhibiting a surprising and beautiful variety of crystalline concretions. The depression of the lowest chamber beneath the level of the entrance is 50 feet.

(Fraser, *Handbook for Ireland*; Lewis, *Topographical Dictionary*.)

CLOGHER, county of Tyrone, Ireland, in the parish and barony of Clogher, an ancient episcopal see and post-town, and the seat of a Poor-Law Union, is situated on the road from Enniskillen to Aughnacloy and Dungannon, 98 miles N.N.W. from Dublin. The population in 1851 was 558 in the town, exclusive of 442 in the workhouse. Clogher Poor-Law Union comprises 18 electoral divisions, with an area of 101,679 acres, and a population in 1851 of 31,388.

The town of Clogher is situated on the Launy, a feeder of the Blackwater, and consists principally of one straggling street. The cathedral, which also serves as the parish church, is a plain cruciform building; the bishop's palace stands in a handsome demesne of 500 acres, adjoining the town. The diocese embraces the greater part of the county of Fermanagh, and the whole of Monaghan, and extends into portions of Donegal, Tyrone, and Louth. It contains 45 parishes, constituting an equal number of benefices, being the only diocese in Ireland in which these divisions coincide. The chapter consists of dean, precentor, chancellor, archdeacon, and five prebendaries. The see is held by the Archbishop of Armagh.

Saint Patrick is said to have been the first bishop of Clogher, where Jocelyn reports that he founded a see before the erection of the church of Armagh in A.D. 444. Maccartin, the disciple of Patrick, built a cell and monastery here before his death in 506. The church was rebuilt in 1041, in 1295, and again, a century later, by bishop Arthur Mac-Camuel, the former building having been destroyed by fire, together with the cell of Maccartin, the Monastery of the Virgin, two chapels, and 32 other houses, including the episcopal court. The first Protestant advanced to this see was Miles Magrath, in 1570: he was afterwards Archbishop of Cashel, to which he was translated in the same year in consequence of the impoverished state of Clogher about this time. The see was afterwards greatly enriched by a grant of the revenues of the abbey of Clogher, annexed to this bishopric by King James I. Among the names of the more recent bishops of Clogher are those of Spottiswood, Lesly, Boyle, and Dr. Sterne, the munificent founder of the University Printing-house in Dublin.

(Ware, *Bishops: Reports of Commissioners*.)

CLONAKILTY, or **CLOGHNAKILTY**, county of Cork, Ireland, in the parish of Kilgariff and barony of East Carberry, a post-town and the seat of a Poor-Law Union, and formerly a parliamentary borough, is situated on a channel about a mile from the harbour of Clonakilty, in $51^{\circ} 37' N.$ lat., $8^{\circ} 53' W.$ long., distant 196 miles S.W. from Dublin. In 1851 the population was 3300. Clonakilty Poor-Law Union includes 20 electoral divisions, with an area of 80,455 acres, and a population in 1851 of 31,473.

The principal part of the present town has been built since the year 1790, about which time a marked improvement took place in trade of all kinds. The erection of quays and extensive stores created an independent market, and made this port the point of export of heavy goods for the surrounding country. About the same time it became the most frequented linen and yarn market in that district. The linen trade has since been abandoned. An export of corn to Cork and import of coals are the principal branches of traffic. The public buildings are a church, a Roman Catholic chapel, a barrack, a court-house, a linen-hall now disused, and a county bridewell.

(*Reports of Commissioners; Statistical Survey of the County of Cork*; Fraser, *Handbook for Ireland*.)

CLONDALKIN. [DUBLIN COUNTY.]

CLONES, county of Monaghan, Ireland, in the parish of Clewes and barony of Dartry, a post-town and the seat of a Poor-Law Union, is situated in $54^{\circ} 7' N.$ lat., $7^{\circ} 15' W.$ long., distant 86 miles N.N.W. from Dublin, and $12\frac{1}{4}$ miles S.W. from Monaghan. The population in 1851 was 2383, besides 510 in the workhouse and other public institutions. Clones Poor-Law Union comprises 16 electoral

divisions, with an area of 78,506 acres, and a population in 1851 of 28,183.

Clones is situated on the high road from Monaghan to Belturbet. The town is substantially built for the most part of stone, and has a comfortable and thriving appearance. The market-place is a triangular space having the market-house in the centre. An ancient sculptured stone cross of that kind peculiar to Ireland, in which the arms of the cross are inclosed in a circle, stands on the summit of a flight of steps in the market-place. In or near the town are places of worship for Episcopalians, Roman Catholics, Presbyterians, and Wesleyan Methodists; a sessions court-house; a bridewell; an infirmary; and a fever hospital. There is a considerable trade in linens and in agricultural produce. Here are extensive corn-mills and a brewery. Clones is rich in antiquities. On the south side of the town, on the road leading to Cootehill, are the ruins of an ancient monastery alleged to have been founded early in the 5th century, including a round tower. The Ulster Canal passes near the town. Quarter and petty sessions are held here.

(Lewis, *Topographical Dictionary*; Thom, *Irish Almanac*.)

CLONFERT. [GALWAY; KILLALOE.]

CLONMACNOIS, or **CLUANMACNOIS**. [KING'S COUNTY.]

CLONMEL, counties of Tipperary and Waterford, Ireland, a post and assize town, a municipal and parliamentary borough, and the seat of a Poor-Law Union, in the parish of St. Mary of Clonmel, chiefly in the barony of Iffa and Offa East and south riding of the county of Tipperary, and partly in the barony of Upperthird and county of Waterford, is situated on the river Suir, 104 miles S.W. by S. from Dublin, $52^{\circ} 13' N.$ lat., $7^{\circ} 43' W.$ long. The population in 1851 was 12,367 on the Tipperary side of the river and 151 on the Waterford side, besides 2818 persons in the workhouse and other public institutions. Clonmel is governed by a corporation consisting of a mayor, free burgesses, and a commonalty; and returns one member to the Imperial Parliament. Clonmel Poor-Law Union comprises 14 electoral divisions, with an area of 86,811 acres, and a population in 1851 of 36,650.

Clonmel is built principally on the northern or Tipperary side of the Suir, and on an island formed by that river, with a small suburb on the southern or Waterford bank. There are five bridges, two of which connect Moore's Island with both banks of the river, and two are carried over Long Island, which is about three furlongs in length by one furlong wide. The fifth bridge crosses the whole breadth of the river. Long Island is entirely built over. The town contains several good streets, the main street extending parallel to the river for upwards of a mile in a series of divisions known by different names. Several short and narrow streets lead southward to the river, three of them conducting to the bridges. The streets which diverge from the main street towards the north are more numerous and of higher pretension than those leading to the river. The material employed in building is limestone, which abounds in the vicinity. The streets are paved and lighted with gas. The parish church of St. Mary is situated north of Main-street. It is an ancient and spacious building with two towers, one of 84 feet surmounted by an octagonal lantern, and has a fine oriel window adorned with gothic tracery and stained glass. A large nunnery stands on the opposite side of the river. There are places of worship for Roman Catholics, Presbyterians, Wesleyan and Primitive Methodists, Quakers, and Unitarians; two convents, and an institution of the Society of Christian Brothers. An Endowed school founded in 1685 has an annual income from endowment of about 600*l.*; the number of scholars in 1851 was 13, of whom 6 were free. In Clonmel are the county lunatic asylum, an infirmary, a fever hospital, a dispensary, the county jail and court-house, house of correction and town bridewell, barracks, the county club-house, and other buildings. There are a mechanics institute, a savings bank, and a Model school under the National Board of Education.

Clonmel is a place of considerable antiquity. It is said to have been walled by the Danes. Otho de Grandison, who had a grant of Tipperary and a considerable portion of Cork, was the first English possessor. He founded a Franciscan friary here in 1269. From its situation on the frontiers of the pale, Clonmel was a convenient station for assembling on any emergency. On the breaking out of the war in 1641, Clonmel declared for the Roman Catholic cause. It made a good defence against Cromwell, who besieged and finally took it in 1650. Few antiquities remain: a gate-house at one end of the main street is the principal part of the old works standing. The assizes for the south riding of Tipperary are held here, and quarter-sessions in rotation, besides weekly petty sessions. The market-days are Tuesday and Saturday. Fairs are held on May 5th, November 5th, and the first Wednesday in every month. The exports from Clonmel are chiefly corn, cattle, butter, and provisions; of wheat from 200,000 to 300,000 barrels are annually brought into the town. The flour-mills, which are numerous and extensive, are chiefly situated on Suir Island. Clonmel is the depot of the great posting establishment of Mr. Bianconi. There are several breweries, an extensive distillery, and a cotton manufactory. Barges of from 20 to 50 tons ply on the Suir to Waterford. The northern bank of the Suir, between the two lower bridges, is quayed in. The Waterford and Limerick railway passes through Clonmel. The ruins of the ancient church of St.

Stephen remain at the western and those of the church of St. Nicholas at the eastern end of the town: there are also some remains of the ancient castle. The environs of the town are particularly rich and attractive. The name signifies 'the vale of honey.'

(*Ordnance Survey Map*; Thom, *Irish Almanac*; Fraser, *Handbook for Ireland*.)

CLONTARF. [DUBLIN COUNTY.]

CLOUD, ST., a small town in France on the Paris-Versailles railway, on the left bank of the Seine, is situated in the department of Seine-et-Oise in France, about 5 miles W. from Paris. It is said to have been known in the earlier ages of the Frankish monarchy by the name of Nogent. Chlodwald, one of the three sons of Chlodomère, king of Orleans, retired hither in the 6th century, having embraced a monastic life to avoid the fury of his uncles Childebert and Clotaire, who had (533) murdered his two brothers in order to seize their inheritance. This prince was canonised, and his name, corrupted into St. Cloud, has been given to the town where he passed his life and where he was buried.

St. Cloud is celebrated for its park and palace. Within the limits of the park was formerly a chateau belonging to a Florentine, Jerome de Gondi, in which Henry III. of France took up his quarters during the siege of Paris by his own forces and those of Henry IV., king of Navarre. Here he was killed in 1589 by the monk Jacques Clement. The domain with an adjacent one was purchased by Louis XIV., and given to his brother the Duke of Orleans. The present palace, built by the duke, has engaged the talents of several architects, among whom was Mansard. It was purchased a little before the revolution by Marie Antoinette, who much enlarged it, and rendered it more magnificent. Bonaparte on his return from Egypt (1799) assembled the Council of the Five Hundred in the palace of St. Cloud, and dissolved them by force; and here he was named First Consul. After the Restoration the palace of St. Cloud was the favourite summer residence of the royal family. The memorable ordinances which were the immediate cause of the revolution of 1830 were dated from St. Cloud. Louis Philippe made the palace of St. Cloud his summer residence, and it is now the usual country residence of the Emperor Napoleon III.

The park of St. Cloud extends from Sèvres to the town of St. Cloud, on a hill which rises above the bank of the Seine. The lower part of the park, along the bank of the river (from which it is separated by a road and towing-path), is occupied by a magnificent plantation of elms and by green lawns; it is the part most frequented by those on foot, as being the nearest to Paris and the most commodious for walking. But the upper part of the park, and the wooded slope of the hill on which it lies, excel the lower part in picturesque beauty. The slope, skilfully planted, is adorned by masses of foliage, by frequent steep declivities, and by pleasant recesses. Down this slope falls the cascade of St. Cloud, the water tumbling from one basin to another carved in the form of shells, and adorned with grotto-work, statues of marble and figures cast in lead; at the bottom of the cascade the 'giant jet' spouts up a column of water to the height of more than a hundred feet. The upper part of the park has spacious lawns and alleys of trees stretching beyond the reach of the eye, but the turf is not so fresh nor are the trees so vigorous as in the lower part. At the edge of the slope a platform called La Balustrade commands an extensive view, including the long meanderings of the Seine, the whole extent of the capital, and a considerable part of the surrounding country. From this platform rises a lofty square tower, from the top of which is a prospect still more extensive. This tower was built by Bonaparte in 1801, and on the top of it is a copy of the Monument of Lysicrates, or Lantern of Demosthenes. The park was laid out by Le Nôtre. In one of the numerous shady alleys of the Great Park, as the lower part of it is called, is annually held the fair of St. Cloud, which lasts from the 7th to the 15th of September, and is numerously attended by the Parisians. Whilst the fair lasts the water-works play, the palace is thrown open to visitors, and in the evenings the park and the Great Avenue are illuminated.

The chateau of St. Cloud is equally admired for the beauty of its situation and the elegance of its architecture. It has not indeed the vast magnificence of Versailles, but it is as beautiful with less pretension. It consists of a principal front and two wings at right angles, inclosing three sides of a square; the fourth side is formed by a terrace and balustrade, from which there is a view of the park and of the same objects which the platform commands. There are three porticos of the Corinthian order—one in the centre of the principal front and one at the extremity of each wing; the intervals are adorned with statues and reliefs. The most remarkable parts of the interior are the chapel, the orangery, the theatre, the pavilion, the riding school, and the royal offices. The private apartments are richly furnished, and contain a great number of marble statues, porcelain vases, and above two hundred paintings by the most celebrated masters. The gallery was painted by Mignard; in the room called the Salon de Mars, the ceiling of which was painted by the same artist, are four superb marble columns. The chateau was much improved and splendidly furnished by Napoleon I.

CLOYNE, county of Cork, which gave its name to the merged barony of Clonyne, is a small post and market-town in the barony of north, distant 160 miles S.S.W. from Dublin. The population in

1851 was 1713. The chief object of interest here is a round tower, 92 feet in height, surmounted by a modern battlement, the original conical roof having been destroyed by lightning in 1749. East of the round tower, on the opposite side of the street, stands the cathedral, a small heavy building, supposed to have been raised about the end of the 13th century. The episcopal palace adjoins the town; it is a plain mansion, and stands in a handsome demesne. Cloyne is an inconsiderable town, consisting chiefly of one street of mean houses. Being the only market-town in a considerable extent of country, its fairs are usually well attended. Here are an Endowed and a Free school.

The founder of the bishopric was Colman, son of Lenin, the chief bard of Aedh, king of Munster, who died in 604. About 1430 it was united to the see of Cork, and thus continued till 1638, when it was constituted a separate see. By the 3rd and 4th Wm. IV., c. 37, sec. 121, Cloyne has become reunited to Cork and Ross.

(Ware, *Bishops*; Thom, *Irish Almanac*; Croker, *Sketches in the South of Ireland*.)

CLUN, Shropshire, a small market-town and borough, and the seat of a Poor-Law Union, in the parish of Clun and hundred of Purslow, is situated on the river Clun, in 52° 25' N. lat., 3° 0' W. long., distant 24 miles S.S.W. from Shrewsbury, and 159 miles N.W. by N. from London by road. The population of the township of Clun in 1851 was 984; that of the entire parish, including 14 townships, was 2121. The living is a vicarage with the curacy of Chapel Lawn annexed, in the archdeaconry of Salop and diocese of Hereford. Clun Poor-Law Union contains 19 parishes and townships, with an area of 62,871 acres, and a population in 1851 of 10,118.

The district in which Clun is situated was formerly reckoned as a distinct hundred, called the hundred of Clun, and was reputed part of Wales. Shortly after the Norman Conquest the place gave a title to the celebrated family of Fitz-Alan of Clun, who maintained a castle here. In the time of Elizabeth the castle came by marriage into the possession of the Howards of Norfolk. It subsequently became the property of Lord Clive, and now belongs to his descendants. The dukes of Norfolk still retain the title of Baron of Clun. The ruins of the castle are situated on the banks of the stream. The borough of Clun is a borough by prescription. Besides the parish church there are places of worship for Wesleyan and Primitive Methodists. An hospital, founded in the early part of the 17th century by Henry Howard, earl of Northampton, has an income of about 1200*l.* per annum. In this institution 14 poor men are maintained, having each two or three rooms, a garden, clothing, fuel, and 10*s.* per week. The hospital is a neat quadrangular building with a large garden in front. There is no manufacture in the place. The weekly market, held on Wednesday, is well attended. Fairs for sheep and cattle are held on Whit-Tuesday, on September 23rd, and November 22nd.

CLUNY, a town in France, in the department of Saône-et-Loire, is situated in a narrow valley traversed by the little river Grône, 12 miles N.W. from Mâcon, and has about 4200 inhabitants, including the whole commune.

Until the early part of the 10th century Cluny was a mere village. In 910 Guillaume I., duke of Aquitaine, who had purchased the village, founded here an abbey of the Benedictine order. About 20 years afterwards St. Odon, second abbot of Cluny, introduced a reform into the Benedictine order, which reform spread very widely; and in course of time 2000 religious houses adopted the discipline of Cluny, which alone of the houses that observed the rule retained the rank of an abbey; the others were all simple priories, the abbots laying aside their title and rank. The abbot of Cluny was the recognised superior of the whole order. The abbey was very extensive. When in A.D. 1245 Pope Innocent IV., accompanied by twelve cardinals, a patriarch, three archbishops, the two generals of the Carthusians and Cistercians, and the King of France (St. Louis) and three of his sons, the Queen Mother, Baudouin, count of Flanders and emperor of Constantinople, the Duke of Bourgogne, and six lords, visited the abbey, the whole party, ecclesiastical, royal, and noble, were lodged in the building of the monastery without disarranging the order of the monks, who amounted to four hundred. The abbot had the disposal of a great number of benefices, and of the priories of the different houses of the order. The revenues of the establishment were estimated in 1762 at about 5000*l.* In 1789, a time when conventual property seems to have been valued very highly, the revenues of the abbey were said to amount to 12,000*l.* Of the abbey buildings only the abbot's house, one chapel, and a part of the church towers, escaped destruction. The church of the monastery, one of the largest in the kingdom, built in the form of a cross, with nave, aisles, double transepts, and choir, was totally demolished by the Vandals of the time. It was 656 feet long and 130 feet wide; the greater transept was 218 feet, the less 132 feet in length; the nave was 102 feet and the aisles 60 feet high; the vaulted roof was supported by 60 pillars. The monastery had been three times plundered by the Huguenots: before the last pillage the library contained 1800 manuscripts, and even after this event it was one of the richest in France; but it was dispersed or transferred elsewhere at the revolution. A college is now established in the abbot's house, we believe.

The town of Cluny occupies as much ground as Mâcon, though it is far less populous. It was formerly defended by walls, part of which

remain. There is a stone bridge over the Grône, and before the revolution there was one religious establishment, besides the abbey, and two hospitals, one for the poor and one for the sick. The inhabitants manufacture coarse woollens, paper, tiles, vinegar, shoe and glove leather, cream of tartar, and steelware; they also trade in corn, wine, leather, and wicker-work. The valley affords pasturage, and produces grain and wine: alabaster and jasper are obtained from the neighbouring mountains.

CLUTTON, Somersetshire, a village and the seat of a Poor-Law Union, in the hundred of Chew, is situated in $51^{\circ} 19' N.$ lat., $2^{\circ} 33' W.$ long.; distant 10 miles S. by E. from Bristol, and 118 miles W. by S. from London. The population of the parish of Clutton in 1851 was 1480. The living is a rectory in the archdeaconry of Bath and diocese of Bath and Wells. Clutton Poor-Law Union contains 29 parishes and townships, with an area of 46,209 acres, and a population in 1851 of 25,224. The village of Clutton is small, and the houses are not built on any regular plan. The parish church is ancient. There are chapels for Wesleyan Methodists and Independents; also National schools. Coal-mines are worked in the vicinity.

CLWYD, a river in North Wales, in the counties of Flint and Denbigh. It rises on the eastern declivity of the Bronbanog hills, a ridge belonging to the Hiraetog hills, and its upper course for a few miles is to the south. It then suddenly turns east-north-east, and continues nearly 8 miles in that direction. About 3 miles above Ruthin it declines to the north, and preserves this course to its mouth. The upper part of its course is through a narrow valley, which presents some very fine views. Below Ruthin it enters the fertile vale of Clwyd, which extends upwards of 15 miles in length, and is a pretty level tract from 5 to 7 miles wide. Being studded with towns, villages, and seats, covered with verdant meadows and luxuriant fields, and inclosed on every side by brown and barren hills, this vale offers by the contrast a very pleasant view. A little below St. Asaph the Clwyd is joined by the Elwy, which traversing a hilly tract brings to it a large mass of water, and the river below this town increases considerably in breadth. It soon afterwards enters the fertile and extensive marsh of Rhuddlan, called Morva Rhuddlan: 3 miles below the town of Rhuddlan it enters the sea through a small estuary opening northward, and forming a port for small coasting vessels. The whole course of the river is about 30 miles; it is navigable for flat-bottomed boats of about 70 tons up to Rhuddlan quay.

CLYDE, a river in Scotland, the third in magnitude, but the most important for its commerce and navigation. Its sources lie between $55^{\circ} 15'$ and $55^{\circ} 28' N.$ lat., where the highest summits of the mountain range which traverses South Scotland, the Lowthers (3150 feet), the Lead Hills, Queensbury Hill (2259 feet), and the range connecting the latter with Hart Fell (2790 feet), form nearly a semicircle. The rivulets which descend from this range unite in one stream about $55^{\circ} 27'$, and form the Clyde. The largest of these streamlets is the Daer; but a smaller stream is called Clyde, before the union. After the junction of these streams, the Clyde continues in the direction of the Daer northward to Robertson, 12 miles lower down: in this part of its course the current is very rapid, and preserves the character of a mountain-stream. North of Robertson, the Tintoe Hills (2310 feet high) direct its course north-east; at Biggar it changes to the north-west and north, but its course soon becomes west-south-west to its confluence with the Douglas Water, thus making a large bend round the Tintoe Hills. The valley through which it flows is wide, and the current is so gentle that in some places it is hardly perceptible. After the junction with the Douglas Water the rapidity of the stream increases, and immediately afterwards the 'Falls of Clyde' change at once the level and the character of the stream. The first of these falls is Bonniton Linn, a cascade about 30 feet high, which is followed by Corra Linn, where three waterfalls occur near one another, each apparently as high as Bonniton Linn. The rocks on both sides narrow the bed of the river so much, that the waters in some places rush down a chasm not more than four feet wide. Corra Linn is two miles above the town of Lanark. Two miles lower down is the fall of Stonebyres, which also consists of three distinct falls, altogether about 70 feet in height. The falls and the scenery near them are extremely picturesque. It is probable that the river in a space of about six miles descends not less than 280 feet, and the valley of the river above the falls may be about 400 feet above the sea. Below the falls, the river, continuing its north-west course, runs in a fine valley to Blantyre and Bothwell, the lands rising in a gentle ascent on both sides. Here and lower down its banks are sometimes bold and richly wooded: sometimes they extend in level plains. At Glasgow the Clyde forms the harbour of the city. From Glasgow to the vicinity of Dumbarton the Clyde runs through a level country. At no great distance from the castle of Dumbarton the Kilpatrick Hills rise on the north, and the Renfrew Hills on the south. Between these ranges the Clyde forms an estuary, which at Dumbarton is upwards of a mile across, and widens in its progress to the west, being at Greenock more than two miles in breadth. To the west of the latter place at Cloch Point it turns abruptly to the south, and reaches the sea by the two straits which lie between the island of Bute, the Cumbrae islands, and the coast of Ayrshire. The river south of Cloch Point is called the Frith of Clyde, a term which is frequently extended to

that part of the sea which lies between the island of Arran and the coast of Ayrshire. The whole course of the Clyde, from the source of the Daer to the southern extremity of the island of Bute, is about 100 miles.

CNIDUS was a city of Caria on the south-west coast of Asia Minor, at the extremity of a peninsula between the Sinus Ceramicus, or Gulf of Cos, and the Gulf of Syme, and facing the south part of the island of Cos, which is 10 miles west of Cape Crio, or Triopium, near which Cnidus stood. (Leake's 'Asia Minor,' and Beaufort's 'Survey of the Coast of Caramania.') Cnidus is about 25 miles south of Halicarnassus. It was a Dorian colony, like Cos, Halicarnassus, and the other towns which formed the Dorian confederation of the Hexapolia. (Herod. i. 144.) Strabo, describing Cnidus, says, "It has two ports, one of which can be closed, and is intended for triremes; and it has a station for twenty ships. There lies in front of the city an island about seven stadia in circuit, joined by the causeway to the mainland, and making Cnidus in a manner two cities, for a large part of Cnidus is on the island which shelters both harbours." The island is now joined by a narrow isthmus to the mainland, and is called Cape Crio. The remains of two moles which inclosed the south or larger harbour are still visible, as well as those of the city walls, and a multitude of other ruins. Leake says that "there is hardly any ruined Greek city in existence which contains specimens of Greek architecture in so many different branches. There are still to be seen remains of the city walls, of the closed ports, of several temples, Stoa, artificial terraces for public and private buildings, of three theatres, one of which is 400 feet in diameter, and of a great number of sepulchral monuments." Designs of the most important of these curious remains have been published by the Dilettanti Society. The site of Cnidus," says Hamilton, "is covered with ruins in every direction, particularly on the north-east side of the harbour. To the south-west are the remains of an ancient quay, supported by cyclopean walls, and in some places cut out of the steep limestone rocks which rise abruptly from the water's edge. The city is inclosed by two walls, one running east and west, the other almost north and south, and united at the summit of the hill to the north-east of the town; the former is partly cyclopean and partly pseudisodorous, but the style improves as it ascends. The northern part of the wall is very perfect, and contains two or three towers in a state of great preservation; it is also the best constructed, being probably of a later date and purely isodorous. . . The walls in the peninsula are also well preserved, containing a round tower of great beauty, at the extremity near the northern harbour." (Hamilton's 'Researches in Asia Minor.')

Strabo (xiv.) speaks of an observatory at Cnidus, and he mentions among the distinguished natives of the place, Eudoxus the mathematician, a contemporary of Plato; Ctesias, physician to Artaxerxes, who wrote on Syrian and Persian history; and the peripatetic Agatharchides, a friend of Julius Caesar. He also says that Lipara, near Sicily, was a colony of Cnidus. He says nothing about the celebrated temple of Venus, said by some to have existed at Cnidus, but Cicero mentions, among the numerous works of art seized by Verres, a marble Venus from Cnidus. ('In Verrem,' iv. 60.)

COBLENZ, a fortified city in the Prussian Rheinland or Rhein-Provinz; capital of the administrative circle of Coblenz, and of the whole province, is situated in $50^{\circ} 21' N.$ lat., $7^{\circ} 30' E.$ long.; 50 miles S.S.E. from Cologne, 300 miles S.W. from Berlin, and has a population of about 22,000 including the garrison. The city stands in a beautiful situation at the conflux of the Moselle and Rhine, whence the city obtained its ancient name *Confluentes*. The emperor Drusus erected, on the right bank of the Moselle, a castle which subsequently came into the possession of the Frankish monarchs. After the division of the monarchy among the sons of Lewis, in 843, Coblenz fell to the share of Lotharius, and was included in Lotharingia, which province was alternately in the possession of the French and Germans till it was finally annexed to the Germanic empire by Henry I. In 1018 the emperor Henry II. gave this city to the Archbishop of Trèves; since which period Coblenz has remained attached to that archbishopric, though no longer among its temporalities. It was the occasional residence of many of the German emperors, and it was here that Conrad of Hohenstaufen was elected emperor in 1150.

Coblenz was anciently fortified with walls and ramparts, traces of which still exist, and this part retained, for many centuries after it had been considerably extended, the name of Old Town. The present fortifications connect the works on the left bank of the Rhine with the citadel of Ehrenbreitstein on the right bank, and render Coblenz the bulwark of Prussia and Germany on the side of France. They form a fortified camp capable of containing 100,000 men, and are constructed on the united systems of Carnot and Montalembert. The approach from Cologne and Trèves is commanded by the fort Kaiser Franz, which is erected over the grave of Marceau and Hoche. The roads to Mayence and the Hunsrück are swept by the cannon of forts Alexander and Constantine, which also command the town and are erected on the site of the old Chartruse. The batteries of Ehrenbreitstein and some others erected upon the neighbouring height command the Rhine and the Nassau road.

Coblenz is very irregularly built, with narrow streets and old houses. In what is still denominated 'the Old Court' stood the Roman castle, which became subsequently the palace of the Frankish

monarchs, the German emperors, and the archbishops of Trèves. In this part of the town is the church of St. Castor, built in the fork between the two rivers. It is surmounted by four towers, and dates from A.D. 836. In this church the grandsons of Charlemagne met to divide the empire between them, and within its walls in 1338 Edward III. of England, when he laid claim to the throne of France and sought the assistance of Germany, met the emperor Louis with other princes and several archbishops. In front of the church is the fountain erected by the French in 1812, and bearing an inscription to commemorate the invasion of Russia. Underneath is the addition 'vu et approuvé' made by St. Priest, the Russian commandant of Coblenz in 1814. In the street facing the Moselle bridge are the ancient town-hall and the castle of the Electors of Trèves, built in 1558, and now converted into a factory of japan-ware. Both of these adjoin the bridge: farther on are the Stamm-Haus in which Prince Metternich was born, and the hospital which is under the excellent management of the Sisters of Charity. The 'Clement,' or New Town, which is very handsome, was built by the last electoral prince, Clement Wenceslaus of Metternich. In the new town is the modern palace of the Electors, which has a long and handsome façade towards the Rhine just above the bridge of boats: but the principal front is towards the Great Square in which the military of the garrison are exercised. The French converted the building into barracks; it is now a court-house. In the new town also are the casino or club-house, which is an elegant building with reading-rooms, ball-rooms, and gardens; the former Jesuits' house, now the grammar school, underneath which are vast cellars. Coblenz contains several Roman Catholic and two Protestant churches, and one synagogue: among the former the principal is the collegiate church of St. Castor—already mentioned. The collegiate church of St. Florian, said to have been founded by the empress Helena, has been fitted up for Protestant worship. The chapel of the new palace, which is built in a style of noble simplicity and adorned with paintings, has been also fitted up for Protestant worship. The castle yard is planted with trees and decorated with a pyramid 60 feet in height; the castle in the New Town has, since the French revolution, been converted into an hospital and magazines, &c. There are two bridges: one of stone, over the Moselle, 480 paces long, consisting of 14 arches, which was commenced in 1844 by Archbishop Baldwin; the other of wood, built in 1819 across the Rhine to the valley of Ehrenbreitstein, is 485 yards in length, and rests on 38 pontoons. The gymnasium, or grammar school, has a considerable revenue, and a fine library formed out of the remains of the monastic libraries. Among other institutions in the town are a Catholic seminary, house of industry, savings bank, an orphan asylum, and various other charitable institutions. There is also a handsome theatre.

Coblenz is the residence of the governor of the Rhein-Provinz, the seat of the provincial administration, and of the Protestant consistory of the Rhein-Provinz. It is the head-quarters of the 8th corps of the Prussian army. It is a free port, and carries on a brisk trade in colonial produce and other articles up and down the Rhine, the Moselle, and the Lahn. The exports consist of wine, mineral waters, corn, iron, volcanic products (from the Eifel in the form of mill-stones, ground lava to form the Dutch subaqueous cement called 'trass'), bark from the Eifel and Hunsdruck forests, building-stones, and potter's clay. The leading articles of manufacture are linen, calico, japan-ware, furniture, and carriages. Many of the inhabitants are engaged in the culture of the vine. Coblenz is said to surpass almost every town on the Rhine in beauty of situation, and the views from the heights of Ehrenbreitstein, Pfaffendorf, and the Karthausenberg are peculiarly beautiful. Steamers ply regularly to Cologne, Mayence, and Trèves. A railway is in course of construction from Cologne to Wiesbaden, which passes a little to the east of Coblenz.

The administrative division or circle of Coblenz has an area of 2320 square miles, and had at the end of 1849 a population of 502,924, consisting chiefly of Catholics and different sects of Protestants, comprised under the name of Evangelicals, the former being to the latter very nearly in the ratio of two to one. [RHEIN-PROVINZ.]

There is a small village named *Coblenz* in the canton of Aargau in Switzerland, situated at the junction of the Aar and the Rhine. Some Roman antiquities have been found here, and there seems no doubt but it is also named from the word 'Confluentes' by which the Romans expressed the junction of two rivers.

COBOURG. [CANADA.]

COBURG, the most southern of the small Thuringian duchies, is bounded by the territories of Schwarzburg, Meiningen, Hildburghausen, and Bavaria; it lies between 50° 9' and 50° 24' N. lat., 10° 30' and 11° 13' E. long., including the newly acquired territories of Königsberg and Sonnenfeld. Its area is 222 square miles, and its population at the end of 1852 was 44,456. It is composed of the valley of the Itz, which is bordered on the north by the Thuringian Mountains, and is traversed by the rivers Itz, Rodach, Steinach, Nasslach, Lanter, and others. The duchy of Gotha, which is inclosed by Saxe-Weimar, Prussia, Hesse Cassel, and Schwarzburg, and has an area of 547 square miles, with a population of 105,956, is now united to the duchy of Coburg; and the whole constitutes the duchy of Saxe-Coburg-Gotha. Coburg belonged formerly to the counts of Henneberg; it came by marriage to the house of Saxony, whence it passed

into the Ernestine line, and in 1735 to the branch of Saalfeld. The principality of Lichtenberg was added to it in 1816, and the duchy of Gotha (with the exception of some small districts) in 1826, in consequence of that house having become extinct by the death of Duke Frederick IV., when it was made over to the house of Saxe-Coburg-Saalfeld, by virtue of a family compact among the ducal-Saxon branches, in exchange for the duchy of Saalfeld and several other districts. The principality of Lichtenberg, which lies west of the Rhine between the Palatinate, Prussia, and Birkenfeld, was ceded to Prussia in 1834.

The majority of the inhabitants are Lutherans: the Catholics enjoy the free exercise of their religion. The government of the united duchies is a constitutional monarchy; the ministry consists of two sections, one for each duchy. The duchies have also separate judicial, administrative, financial, and police establishments, as well as district consistories for the direction of Protestant worship. The right of citizenship is enjoyed by natives only, who are all equal in the eye of the law, without regard to their religious profession. The united duchy of Saxe-Coburg-Gotha is a state of the Germanic Confederation; it has one vote in the full assembly of the Diet, and in conjunction with Saxe-Weimar, Saxe-Meiningen, and Saxe-Altenburg, has the 12th place in the Federative government.

The climate of Coburg is mild, especially in the fruitful valley of the Itz. The agricultural products are timber and fuel, grain, peas, beans, hops, vegetables, &c. Iron, copper, cobalt, coals (but none of them in large quantities), limestone, sandstone, marble, alabaster, gypsum, porcelain earth, &c. are found here. The inhabitants are chiefly occupied in the manufacture of linen, woollens, and cotton, wooden toys, and the rearing of cattle. The articles of export are fatted cattle and grain; besides butter, leather, wood, wool, linen, and other manufactured goods.

Coburg, the capital of the duchy, is situated in a picturesque valley on the banks of the Itz, in 50° 15' N. lat., 10° 50' E. long., and has about 10,000 inhabitants. It is surrounded by walls, and with its long suburbs is divided into nine quarters, which have two market-places. The town is far from being handsome; the houses are small, the streets rough, and in many places overgrown with grass. The ducal palace of Ehrenburg is a very elegant residence, containing a fine banqueting room called the 'Hall of Giants,' from the colossal caryatides which surround its walls; a library of 26,000 volumes; and a collection of natural history, minerals, coins, and prints. The government buildings are constructed in the Italian style. Among the other edifices may be named the town-hall; five churches, of which St. Maurice's contains the ducal vault and some good monuments; the arsenal, orphan asylum, a new theatre, a casino, three hospitals, and a workhouse. The gymnasium, founded in 1605 by Duke John Casimir, hence called 'Casimirianum,' has all the rights and privileges of a university. There are besides two public libraries, a collection of natural history, an observatory, with a normal school attached to it; a society of arts and sciences, &c. The manufactures consist of woollens, cottons, linen, furniture, marquetry, buckles, gold and silver articles, chocolate, tools, &c. There are also several dye-houses, and a considerable trade in wool, cloth, cottons, horse-hair, flour, seeds, &c. There are several pleasure-grounds round the town, as well as many delightful rides and walks—among other places, to the ducal country seat, Rosenau, which was an old baronial castle, and has been restored in the gothic style. Near the town are marble-polishing mills, and iron and copper works. On a lofty hill in the vicinity, which commands a beautiful prospect, is the ancient castle of Coburg, surrounded with a strong wall and five bastions. It contains many interesting remains of antiquity, arms, armour, &c. It was for some time the residence of Luther; the bedstead on which he slept, and the pulpit from which he preached in the old chapel of the castle are still shown. The castle is now partly converted into a prison and house of correction. There are also, in the neighbourhood of Coburg, the picturesque castles of Callenberg and Lautenberg; the latter is in ruins.

The other places worth naming in the duchy are *Rodach*, a town on the river of the same name, with a ducal mansion, a church, and about 1800 inhabitants; *Sonnenfeld*, a market-town of about 600 inhabitants; *Königsberg* on the Nasslach, with a grammar school, and about 800 inhabitants; and *Neusadt*, at the foot of Mount Mupp, with a ducal seat, about 2000 inhabitants, a tobacco-manufacture, hop-grounds, and some trade. [GOTHA.]

COCHIN, a town in Hindustan, on the western coast of the peninsula, in 9° 51' N. lat., 76° 18' E. long., is the place where the first European settlement was formed in the East Indies. In 1503 the Portuguese fleet, under the conduct of Alfonso and Francisco Albuquerque, obtained from the sovereign of Cochin permission to erect a fortress there in recompense for the assistance they had given him in his wars with the Zamorin of Calicut. The country in the neighbourhood being very fertile, the Portuguese carried on an advantageous trade until the town was taken from them by the Dutch in 1663. The trade continued to flourish under the Dutch government. In the beginning of the war between Holland and England, in 1795, Cochin was taken possession of by the British, to whom it was finally ceded in 1814. Since then its trade has considerably diminished. The population is about 30,000.

Cochin is the best port in the presidency of Madras, and the only port for ship-building, and there are no places throughout the whole extent of the western coast which afford shelter to large vessels except Bombay and Cochin. In this part of Hindustan is found a very remarkable system of inland navigation called the Backwater. It is a kind of lake, or lagoon, which extends from Chowgaut ($10^{\circ} 40'$) on the north to near Trivandrum, the capital of Travancore ($8^{\circ} 30'$) on the south, a distance of 170 or 180 miles. An artificial continuation northward of this inland water-system is navigable for boats during the rains, from Chowgaut to Cotah, 16 miles south of Tellicherry, a farther distance of about 90 miles. The Backwater runs nearly parallel to the sea, sometimes at the distance of a few hundred yards, at others of 4 or 5 miles. Its breadth varies from 12 and 14 miles to 200 yards; its depth from many fathoms to a few feet. This Backwater receives the rivers which descend from the mountains that lie to the eastward. There are six channels of communication between the Backwater and the sea, but only one is navigable for ships, being that on the southern bank on which the town of Cochin is built. There is a bar at its mouth, but the depth of water on it is 17 or 18 feet at high-water of spring-tides. The anchorage without is good, and the gales during the south-west monsoon rarely blow with such violence as is experienced in this season in the harbour of Bombay. Within the bar the Backwater expands into a fine estuary, 3, 4, and 6 miles wide, at least 12 miles long, and deep enough for the largest vessels. The narrow strip of land between the Backwater and the sea is sandy, but its lower tracts are thickly overgrown with cocoa-nut palms, which yield a great quantity of fruit. The country east of the Backwater is low and level along its banks, and produces rich crops of rice. Farther inland it rises into low hills, partly covered with high forest-trees and partly with grass; but the valleys between them are exceedingly fruitful. Cotton, hemp, oils, pepper, ginger, turmeric, cardamoms, betel-nut, copra (cocoa-nut kernels cut into slices and dried for exportation), ivory, gold-dust, iron, and drugs are extensively produced. Indigo grows spontaneously, and the cane, coffee, clove, nutmegs, pimento, and raw-silk succeed well. The hills are covered with forests, the timber cut from which is floated down the various small rivers which fall into the Backwater, and is then easily conveyed to Cochin. Much timber is sent to Bombay, but hardly any vessels are built at Cochin for European merchants. The Imam of Muskat however has had most of his vessels built there. A few country vessels are annually built. The trade of this place is still considerable. Europeans rarely visit the port; but an active commerce is carried on between it and Bombay in country vessels. The trade with Arabia and the countries surrounding the Persian Gulf is more important. As these countries have no forests, they receive from Cochin all the timber required for repairing their different craft. There is also some commerce carried on with Singapore. In the vicinity of Cochin a number of Catholic and Indian Christians are found, and also many Jews. Cochin is the seat of a Roman Catholic bishop, in whose diocese Ceylon is included. There are also Protestant missionary establishments at Cochin, and several English schools.

COCHIN-CHINA, called also ANAM, is in that part of Eastern Asia which is usually known as India without the Ganges, of which it forms the eastern portion. It extends from $8^{\circ} 40'$ to about 23° N. lat., and from 102° to $109^{\circ} 20'$ E. long. Its length from north to south is about 980 miles, but in width it varies from 100 to 300 miles. Crawford assigns to it an area of 98,000 square miles; but Berghaus makes its surface about 140,000 square miles. On the W. it borders on the kingdom of Siam, or Shan; on the N.W. on the unknown regions of Laos, or Lachho; and on the N. on the Chinese provinces of Yun-nan, Quang-si, and Quang-tun (Canton). To the east of it extends the sea, called by the Chinese Nan-hai, or the Southern Sea, which here forms an extensive gulf between the northern province of Cochin-China and the island of Hai-nan, called the Gulf of Tonkin. To the south of Cochin-China extends the southern part of the China Sea. The northern part of the coast is rocky, and is fringed by a great number of islands. Among these are a group of small reefs called the Triangles, and the dangerous Macclesfield shoals. Vessels running aground here have to dread not only the heavy swell of the sea, but also the fierce attacks of the marauding Cochin-Chinese, who sail up and down looking out for such windfalls, falling upon and plundering the wreck without mercy. At 21° N. lat., or near the mouth of the river Song-ca, and farther to the south the shores are low, and partly sandy and swampy. For nearly 100 miles the coast is fringed by the Paracel shoals, which may be described as an overflowed continent, lying just beneath the surface of the water. Between the shoals and the coast is left a narrow navigable passage, which is constantly used by vessels sailing in these seas. Near 17° N. lat. commence a series of capes several hundred feet in elevation, between which large bays run deep into the land. This general character continues to Cape James ($10^{\circ} 17'$ N. lat.) The coast is lined with numerous small rocky islands and cliffs, but it contains safe and excellent harbours. The remainder of the coast from Cape James to the boundary of Siam is low and mostly swampy, being formed by the alluvial deposits of the river Maekhaun, or Camboja.

Cape James is the southern extremity of an extensive mountain range, which as far as the parallel of Cape Padaran ($11^{\circ} 20'$ N. lat.) runs north-east and then about due north to 14° N. lat., whence it

continues with a north-north-western course to 16° N. lat. Farther north the range is little known. It occupies perhaps a hundred miles in width, and seems to consist of a number of parallel ridges. The mountains in the range are of considerable height. A road, described as very difficult and dangerous, leads through the mountainous district, forming a communication between the towns of Sai-gun and Phu-yen.

Several short offsets which branch off towards the sea cover the greatest part of the maritime districts between $10^{\circ} 20'$ and 17° N. lat.; some of them are 4000 feet above the sea. The range which, in about $17^{\circ} 30'$, forms the boundary between Cochin-China and Ton-kin contains a depression, forming a mountain pass, about 6 miles in width, which is shut in by a wall, traversed by an artificial road, which leads from Hué to Kecho. The length of this road is estimated at 400 or 500 miles.

The boundary between Cochin-China and the Chinese province of Quang-si is partly formed by the river Ngannan-kiang, and partly by a mountain range, which seems to be a lateral range of the Yu-ling, a mountain system of Southern China.

The northern part of Cochin-China, which formerly constituted the separate kingdom of Tonkin, comprehends an extensive plain, surrounded, except where it borders on the Gulf of Tonkin (between $19^{\circ} 30'$ and 21° N. lat.), by mountains, which increase in height as they recede from the sea. This plain appears to extend above 100 miles in length and width. Being very low, a great portion of it is annually inundated by the river Song-ca, which fertilises the soil, so that two or three crops of rice are annually cut. It is by far the most fertile and populous part of the country. The valleys which run up far into the mountains are equally fertile: the greatest part of them may easily be irrigated, and the mountains themselves are rich in metals. The Song-ca, or Sang-coy, the principal river of this country, rises in the mountain region of Yun-nan in China, in two branches—the Ho-ti-kiang and Li-sien-kiang—which run nearly parallel in a south-eastern direction till they enter Cochin-China, where they unite, and take the name of Song-ca (Great River). Before this river enters the sea it divides into numerous branches, two of which are navigable. The whole course of the river is estimated to be about 400 miles in length.

The country east of the mountain range, between $19^{\circ} 30'$ and 15° N. lat., consists of an alternation of small plains and intervening mountain ridges. The elevations are in some places covered with forests. Cultivation extends a considerable height up the sides of many of the mountains. Most of the plains are irrigated and well cultivated. The rivers which traverse them have a short course, but are generally navigable for some miles. In some places the plains are traversed by canals.

The country which extends from Cape Avarella to the neighbourhood of Cape James is mountainous. The rocky masses approach so close to the sea as to leave a level tract along the beach only in a few places. In its numerous indentations a few narrow valleys of small extent occasionally appear, mostly inhabited by fishermen. The interior of this part of the country is said to contain much cultivated ground, and to have a numerous population.

That portion of Cochin-China which lies to the west of the mountain range constituted till lately the principal part of the independent kingdom of Camboja, or Cambodia. The southern portion, which is imperfectly known, consists, except near the boundary of Siam, of an immense plain, which appears to be formed of the alluvium of the great river by which it is traversed. The shores and the adjacent country, as far as the tide ascends, are covered with trees and bushes. About 30 miles from the sea the ground begins to be cultivated and is exceedingly fertile. In the interior there are it is said numerous fresh-water lakes and swamps.

Two large rivers traverse this plain. The Sai-gun, or Saung, which runs through its eastern portion, has been navigated by European vessels as far up as the town of Sai-gun, but farther northward its course is not known. Towards its mouth it sends off two or more branches, which join the eastern arm of the great river of Camboja. This river, called by the Birmans Maekhaun, is said to send off in the upper part of its course various lateral branches which fertilise the country through which they flow, and then reunite with the river. About 150 miles from its mouth is the ancient capital of Camboja, Ponsipret, to which European vessels ascended in the 17th century, but this navigation has been discontinued. Some distance below this town the river sends off to the west and south-west numerous arms, which inclose and traverse an extensive delta, that stretches out into the sea with an acute angle. Most of these arms are navigable for large river-barges during the rainy season. To make the navigation continuous through the whole year a canal was made from it in 1820, which joins the principal river some miles south of Panompeng, the modern capital of Camboja. The three principal mouths of the Maekhaun lie on the eastern side of the delta, and are all navigable for vessels of considerable burden up to the capital of the country. The river Maekhaun is supposed to have its source in the Chinese province of Yun-nan; and it has been estimated that its entire course is about 1500 miles. It reaches Camboja through the Laos territory.

The climate of the plain of Camboja resembles that of Bengal. The rainy seasons last from the end of May or the beginning of June to

September! The mountains interrupt the clouds brought by the south-west monsoon, and accordingly the dry season prevails in that period: the north-east monsoon brings rain. The wet season sets in at the end of October and continues until March. In the greatest summer-heat the thermometer never rises above 103°; in the greatest cold it never falls below 57°. In the countries on the shores of the Bay of Tonkin the south-west monsoon brings the rain, and the wet season begins in May and terminates in August. The heat is occasionally very excessive, and the cold in December, January, and February very sharp: the weather is often rendered unpleasant by heavy fogs, as in Lower Bengal. Typhons and hurricanes rage with the utmost fury in the Gulf of Tonkin and on the adjacent coasts. They are commonly accompanied with heavy and incessant rains. The country generally seems to have a very healthy climate for Europeans as well as for natives.

The iron mines of Tonkin are about six days' journey from Cachao, and the gold and silver mines about twelve days' journey, both in a western direction. The mines are worked by Chinese. Cochin-China is said to have tin, which however is not worked. Rice, the principal article of food, is very extensively cultivated in the plains of Tonkin and Camboja. Indian corn, earth nuts (*Arachis hypogaea*); and the *Convolvulus batatas*, are also cultivated. The sugar-cane is extensively cultivated on the coast south of 16°. The true cinnamon (*Laurus Cinnamomum*) is probably indigenous; and though its bark is much thicker than that of Ceylon, it is preferred by the Chinese.

Cotton is cultivated everywhere, and exported to China. Silk is in Tonkin and Cochin-China a general object of attention with the peasantry. Tea, of a coarse kind, grown in the neighbourhood of the capital Hué, is called Hué tea.

The population of Cochin-China has been variously estimated at from about 5 millions to 22 millions, but no reliable statement has been given on this point.

The natives call the eastern part of their country Anam. They belong to the same race as the Chinese and Mongols. Their language is monosyllabic, and the signification of the words is, in a great measure, regulated by their accentuation. But the Anamese language is totally different from the Chinese language. The Chinese characters are only used in printing; for common purposes they use others. The inhabitants of Camboja, who call themselves Kammer, constitute a different nation; they extend on both sides of the river Maekhaun to 15° N. lat. In manners, laws, religion, and state of civilisation, they bear a nearer resemblance to the Siamese than to the inhabitants of Cochin-China Proper.

On the mountain range live two independent nations. The Loye or Loi extend from Cape James at least as far as 15° N. lat. They once extended to the coast, and occupied all Chianpa, or Tsiompa (the district between Cape Avarella and Cape James), but having been expelled from it, they retired into the mountain fastnesses. The Loyes are a large muscular and well-formed tribe, with reddish complexions, slightly flattened noses, and long black hair. A shirt and trousers with a kind of petticoat, occasionally faced with silk, form their costume. Their language differs essentially both from the Anamese and Cambojan. To the north of 15° N. lat. the interior districts of the mountain range are occupied by another nation, called Moi, which extends over a tract of country lying between Laos and Cochin-China, about 120 miles in length, and from 20 to 30 miles in breadth. The inhabitants of this district are said to be uncivilised but inoffensive. The government of their king, who holds his petty court at Feneri, is very oppressive, and some crime is always sure to be brought home to whoever is guilty of possessing any superior degree of riches. The people generally are in a state of semi-slavery. Their only covering is a cloth wrapped around their middle. The chief productions of this part of the country are a little cotton, indigo, and inferior silk. An extensive fishery is carried on along the coast.

The government of Cochin-China is described as a hereditary military despotism. Its administrative authority is in the hands of six mandarins, and a mandarin of the first or military class is placed over each province. The standing army consists of about 40,000 men, besides the royal guards, and 800 elephants for war service. The naval force includes about 200 gun boats, 100 galleys, and 500 vessels of smaller size. The political division coincides nearly with the historical division of the country. Anam, or the eastern portion, is divided into two provinces—Tonkin the northern, and Cochin-China the southern. The boundary-line between them, at about 19° N. lat., is nearly the same line which separated the ancient kingdom of Tonkin from Cochin-China. That portion of Camboja which has been united to Cochin-China constitutes a province by itself.

1. Tonkin or Tonquin comprehends the most northern portion of Anam, or the plain which extends on both sides of the river Song-ca, and is bounded by the mountain ranges within on all sides. It produces and exports rice, cotton, and silk to a large extent. Its mountains abound in gold, silver, and iron. The capital, Cachao, or Kai^o o^o, called by the natives also Bakthan, is a large town with 150,000 inhabitants, situated on the banks of the Song-ca, about 80 or 90 miles from the sea. Its commerce, especially with China, is considerable. Hoan is on the same river, about 18 miles lower down; the largest junks come up to this place.

2. Cochin-China Proper comprehends the coast from about 19°

N. lat., to the neighbourhood of Cape James. The natives distinguish it by the name of Dong-traoing or Dang-trong (that is, the interior or central country); and they call Tonkin Dang-ngoi (the external country). Its principal products are sugar, silk, cinnamon, cardamoms, pepper, &c. The harbours along this coast are numerous, safe, and spacious; there is a considerable number of small towns. The capital is Hué, the metropolis of the whole country, a populous town with extensive fortifications, erected about 85 years ago after European models. The works are about five miles in circumference. The town of Hué is intersected with canals, which besides affording facilities for conveying merchandise, are used by the inhabitants for bathing in. Every family keeps a covered boat, which is usually adorned with a carved and gilded head. The canals when traversed by these boats, which are painted with vivid colours, present an animated scene. The best and most frequented harbour is Touran or Ham; the houses in this town have a neat appearance, and considerable traffic is carried on. The spacious bay contains good anchorage for ships. The hills around the town are low and covered with bushes, interspersed with little rude altars, erected by the fishermen who frequent the bay, on which to offer rice or burn odoriferous woods as a propitiation or thanksgiving to their deities. The houses in the town are low, built chiefly with bamboo, and thatched with rice-straw or rushes. Both men and women wear long-sleeved gowns reaching to the feet. They wear caps and turbans but no shoes. The feet, and particularly the toes, are much used in working at boat-building and other occupations. To the south of Touran is the town of Faifo, with from 5000 to 6000 inhabitants, mostly Chinese, who carry on an active trade with China. The large towns of Qui-nhon, Phu-yen, and Nhatrang are not visited by Europeans.

3. Camboja extends over nearly the whole of the ancient kingdom of Camboja, one province of it, Batabang, having been united with Siam about 1809. On this occasion one of the claimants of the throne of Camboja applied to the Cochin-Chinese for help against the Siamese; but before the armies of Siam and Cochin-China met in battle it was agreed to divide the country into two portions. The Siamese retained Batabang province, and the remainder was united to Cochin-China or Anam. The Chinese name of this country is Kan-plu-tche, from which Camboja is derived. As far as this country is known, it is a level, formed by the alluvia of its large rivers, and very fertile and well cultivated. Its principal commercial productions are rice, arecane, betel, spices, gamboge, sandal-wood, sapan-wood, and ivory. There are several iron mines. Elephants and buffaloes are numerous. Deer abound in the forests, and horned cattle in the plains. There are large numbers of hogs, wild and tame; goats, hares, cranes, and all kinds of poultry. Sai-gun, situated on the Sai-gun River, about 50 miles from its mouth, may be considered as its capital, being the seat of the provincial government. Sai-gun consists of one street running along the brow of a hill to preserve it from the annual inundations of the river. Sai-gun is situated near the site of the metropolis of the ancient Thinae. It is said that extensive marble ruins have been found to the north-west of the modern city. Two Arabian travellers, who visited Camboja in the 9th century, report that the finest muslins in the world were manufactured there, and that the people wore garments woven so fine that they might be drawn through a moderate sized ring. Pontaipret, or Camboja, on the Maekhaun, was anciently the capital, and a considerable town when visited by the Dutch in the 17th century. Panompeng, or Calompe, was at a later period the capital, and is still the residence of the nominal king of Camboja; it is in a populous and well-cultivated country. Kang-kao, or Kiang-kong, about 2 miles from the mouth of the Kang-kao River, which forms a shallow port, has some commerce with Singapore and the countries inhabited by the Malays. A large part of its exports to Singapore consists of mats.

The Cochin-Chinese have made some progress in most of the arts of civilised life. Barrow says that they excel in naval architecture, and that their row-galleys for pleasure are remarkably fine vessels. They manufacture lacker-ware, coarse cotton and silk cloth, articles of filigree work, earthenware, and vessels of cast-iron. Fire-arms are largely imported from Europe.

Since the establishment of Singapore an intercourse has been established with that colony, carried on chiefly by Chinese merchants. The exports to Singapore in 1844 amounted to 177,606 dollars; the imports from Singapore were 229,413 dollars. The commerce with China is in a great measure limited to the harbours of Cachao, Faifo, and Sai-gun, in Cochin-China, and to Canton, Amoy, Fu-tcheou-foo, and Ning-po, in China. Numerous junks are employed in this traffic. They export from Cochin-China rice, cotton, silk, eagle-wood, and spices; they import tea, the finer kinds of cotton and silk goods, and china; also opium, and English broadcloth. From Singapore are imported iron, fire-arms, opium, catechu, and terra japonica. Some commercial intercourse is also maintained between Faifo and Sai-gun, and Bang-kok, the capital of Siam. The junks engaged in this trade convey to Bang-kok silk, worked and raw, matting for sails, &c., and take in return iron, tobacco, opium, and some European goods. Among the articles exported from Cochin-China are edible birds'-nests and pearls. The king, it is said, monopolises the legal trade, which is carried on by means of several large vessels, sailing between Cochin-China and British India, Batavia, and Canton.

COCKBURN ISLAND. [NORTH POLAR COUNTRIES.]

COCKBURN SPATH. [BERWICKSHIRE.]

COCKENZIE. [HADDINGTONSHIRE.]

COCKERMOUTH, Cumberland, a parliamentary borough, a market-town, and the seat of a Poor-Law Union, in the parish of Brigham, ward of Allerdale above Derwent, and western division of the county; stands at the point of confluence of the rivers Cocker and Derwent, in $54^{\circ} 40'$ N. lat., $3^{\circ} 20'$ W. long., 25 miles S.W. from Carlisle by road. The population of the borough in 1851 was 7275. The borough sends two members to the Imperial Parliament. The living is a perpetual curacy in the archdeaconry of Richmond and diocese of Chester: this archdeaconry is to be hereafter transferred to the diocese of Carlisle. Cockermouth Poor-Law Union contains 47 parishes and townships, with an area of 106,756 acres, and a population in 1851 of 38,142.

The name of the town is derived from its position on the river Cocker, at the point of its confluence with the Derwent. The Cocker flows from Buttermere-water, and after passing through Crummock-water, divides the town of Cockermouth into two parts which communicate by a stone bridge. The Derwent, after it has received the Cocker, is also crossed by a handsome bridge, erected in 1822, at a cost of 3000*l*. The ruins of the castle (which was formerly the baronial seat of the lords of Allerdale, and is now the property of the Earl of Egremont), stand on the brow of a bold eminence near the confluence of the rivers. The castle was occupied by the parliamentary army during the civil war in 1648, and sustained a month's siege by the royalists. It is now habitable only in a small part. To the north of the town is a tumulus called Foot Hill, and to the west the rampart and ditch of a Roman camp. The town is pleasantly situated in an agricultural district, and has a promenade a mile in length on the banks of the Derwent, but the streets in some parts are narrow and confined. The houses are chiefly built of stone and roofed with slate; considerable improvements have been recently introduced. The town is well supplied with water, and is lighted with gas.

Besides the episcopal church, there are places of worship for Wesleyan and Primitive Methodists, Independents, Quakers, and Roman Catholics. The Free school, founded in 1676, has an income from endowment of about 12*l*. a year, and had 41 scholars in 1851. There are a National school and six other public schools, a parochial public library, a subscription library, a savings bank, and a dispensary. The court-house, or moot-hall, built about 1800, is the chief building for the transaction of public business. A county court is held at Cockermouth, and quarter sessions are alternately held here and at Carlisle. Cotton, linen, woollen fabrics, hats, hosiery, and paper are manufactured; tanning is carried on. In the neighbourhood are extensive coal mines. A market is held on Mondays for corn and cattle; and on Saturdays for provisions. From May to Midsummer cattle shows are held every alternate Wednesday. Fairs for horses and cattle are held on February 18th, and October 10th; and for hiring servants on Whit-Monday and the Monday next Martinmas Day. Cockermouth is connected by a railway of about 8 miles with Workington, whence other railways extend north to Carlisle and south to Furness.

(Lysons, *Magna Britannia*; *Communication from Cockermouth*.)

COEL. [ALLIQUOR.]

COETHEN. [ANHALT; KOETHEN.]

COGGESHALL, Essex, sometimes called Great Coggeshall, a market-town situated on the left bank of the river Blackwater, in the parish of Coggeshall and Witham division of Lexden hundred, in $51^{\circ} 52'$ N. lat., $0^{\circ} 41'$ E. long., distant 15 miles N.E. by N. from Chelmsford, and 44 miles N.E. from London by road. Kelvedon station of the Eastern Counties railway, which is 3 miles from Coggeshall, is $41\frac{1}{2}$ miles from London. The population of the town was 3484 in 1851. The living is a vicarage in the archdeaconry of Colchester and diocese of Rochester.

By some antiquaries Coggeshall has been supposed to occupy the site of the Roman station Canonium. An abbey for Cistercian monks was founded here in 1142 by King Stephen and his queen Maud. At one period the manufacture of woollen cloth was carried on in Coggeshall, and a white baize, called 'Coggeshall whites,' was in considerable repute. The town is situated partly on low ground adjoining the river, and partly on a cluster of hills rising from it. Many of the houses are well built, but the streets are rather irregularly laid out. The town is lighted with gas. The parish church, dedicated to St. Peter, a spacious building in the perpendicular style, erected about 1400, has been recently in part repaired; at the west end is a square tower. The Independents, Baptists, Wesleyan Methodists, and Quakers have places of worship. There are in Coggeshall an Endowed school founded by Sir Robert Hitcham, and connected with Pembroke College, Cambridge: National, British, and Infant schools, a mechanics institute, and three almshouses. The silk manufacture is now the principal manufacture of the place; the great factory is for silk-throwing; fine velvet is extensively manufactured; satins, French patent silk plush for hats, and patent gelatine are made, and also some worsted at one of the old clothing mills. Some of the females find employment in tambouring lace. Iron-founding, malting, and brewing are carried on. A considerable quantity of garden-seeds is raised here for sale. The market is on Thursday for corn and

provisions; occasionally live stock are sold. A small part of the abbey is still remaining in the hamlet of Little Coggeshall.

(Morant, *Essex*; Wright, *Essex*; *Communication from Coggeshall*.)

COIMBATORE, a province situated in the region of the Eastern Ghaut Mountains, in the south of India, about 11° N. lat.; and bounded N. by Mysore, W. by Malabar, S. by Dindigul, and E. by Salem and Trichinopoly. The length of the province from north to south is 50 miles, and its breadth from east to west about 45 miles. The surface of the country varies exceedingly. Towards the south the level is not more than 400 or 500 feet above the sea, but it gradually rises towards the north, and even in what is considered the low country the level rises to 900 feet above the sea. About $11^{\circ} 35'$ N. lat., the mountains called the Eastern Ghauts occur; the Kumbertine Hill, in $11^{\circ} 35'$ N. lat., $77^{\circ} 20'$ E. long., is reckoned to be 5548 feet above the level of the sea. Some summits of the Nilgherry Mountains, which are in the north-west part of the province, and unite the Eastern and Western Ghauts, are still higher; one of the peaks, called Moorchoorti Bet, is 8800 feet above the sea. The soil is generally dry, but in the south there is some marshy ground. The climate is considered healthy, and in particular the Nilgherry Mountains are resorted to by European residents for the recovery of their health. In these hills the mean temperature in April and May is 35° Fahrenheit. During the cold season the thermometer sometimes sinks to freezing point, when the air is peculiarly clear and elastic. Coimbatore is watered by the rivers Bhavani, Amaravati, and Cavery, the first and second of which fall into the Cavery; the Bhavani, at Bhavani-Kudal, 58 miles N.E. from the town of Coimbatore, in $11^{\circ} 26'$ N. lat., $77^{\circ} 44'$ E. long., and the Amaravati about 10 miles below the town of Caroor. These rivers are filled by both monsoons; by the south-west in June, July, and August, and by the north-east in October, November, and December. During the last 40 years an improved system of administration has tended to develop the productive capabilities of the soil. In 1814-15 the government assessment was considered to be equal to one-third of the gross produce of the soil, and in 1825-26 it did not exceed one-fifth; the price of land during that time was doubled. The population of the province is about 800,000. The principal places in the province, in addition to the capital COIMBATORE, are Animalaya, Aravacourchy, Bhavani-Kudal, Caroor, Daraporam, Errood, Palachy, Satimangalum, and Sivana Samudra. *Animalaya* is on the west side of the small river Alima, in $10^{\circ} 31'$ N. lat., $77^{\circ} 1'$ E. long. This town is the common thoroughfare between Malabar and the southern part of the Carnatic. A fort stands at a short distance west of the town, and had fallen into decay, when, to provide materials for repairing it, Tippoo pulled down five large temples. The forests in the neighbourhood contain abundance of fine timber. *Aravacourchy*, the seat of Arava, so called from the name of the founder, is situated in $10^{\circ} 41'$ N. lat., $77^{\circ} 54'$ E. long. The town was destroyed towards the end of Hyder's reign by an English force under Colonel Laing, but it has since been rebuilt. The inhabitants mostly speak the Tamul language. *Bhavani-Kudal*, at the confluence of the Bhavani and Cavery rivers, contains two celebrated temples, one dedicated to Vishnu, and the other to Siva; and is considered a place of great sanctity by the Hindoos. *Caroor*, on the north side of the Amaravati River, in $10^{\circ} 53'$ N. lat., $78^{\circ} 4'$ E. long., a town of some trade, containing 1000 houses, was formerly a place of great commercial activity. *Daraporam*, or more properly *Dharmapuram*, is a populous town situated in an open country near the Amaravati, in $10^{\circ} 37'$ N. lat., $77^{\circ} 35'$ E. long. The streets are wide and regularly laid out, and many of the houses are spacious. *Errood* was a very considerable place in Hyder's reign; during the invasion of the country by the English under General Meadows, the town was in a great measure destroyed. It has since been made a military station. *Palachy* is a small but thriving town, situated in a well-cultivated country, in $10^{\circ} 39'$ N. lat., $77^{\circ} 6'$ E. long. Some coins of Augustus and Tiberius have been dug up in the vicinity. *Satimangalum*, in $11^{\circ} 31'$ N. lat., $77^{\circ} 16'$ E. long., contains a large fort, and is built in a straggling manner about the plain. There is here a spacious temple dedicated to Vishnu. This place is considered unhealthy, and the air is usually intensely hot. The island of *Sivana Samudra*, formed by the Cavery, is the site of the ancient Hindoo city of Gunga Raja; two cataracts are here formed by the Cavery, one on its northern and the other on its southern arm. The southern gate of the wall by which the ancient city of Gunga Raja was surrounded may still be seen, and a street about a mile in length may be traced. There are besides visible the ruins of several Hindoo temples, in one of which is a colossal statue of Vishnu, but the whole place is choked by jungle, and occupied by banyan and other forest-trees. A considerable quantity of dry grain is raised in Coimbatore province; cotton and sugar are likewise cultivated, and weaving is carried on extensively. Tobacco, salt, nitre, and live stock are among the products of the country. The province was acquired by the British from the Raja of Mysore in 1799.

(Rennell, *Memoir of a Map of Hindoostan*; Buchanan, *Journeys through Mysore, Canara, and Malabar*; *Parliamentary Papers*.)

COIMBATORE, the capital of the province, in $10^{\circ} 52'$ N. lat., $77^{\circ} 5'$ E. long., is a well-built town, containing about 2000 houses, being little more than half the number which it contained under the government of Hyder Ali. His son Tippoo sometimes resided at Coimbatore, where he built a mosque. About two miles from the

town, at a place called Peruru, is a celebrated temple, dedicated to Iswara, and called Mail (high) Chitumbra, to distinguish it from another Chitumbra near Pondicherry. The idol is said to have placed itself here at a very remote period, and about 3000 years ago the temple was built over it by a raja of Madura. This building exhibits a profusion of Hindoo ornaments, but is destitute of elegance, and the figures are not only rude but many of them indecent also. This temple was plundered of its gold and jewels by Tippoo, who excepted it however from the general order which he issued for the destruction of all idolatrous buildings; and although its splendour was then destroyed, the Brahminical worship has always been continued. The town was taken by the English in 1783, but was restored at the peace in the following year. It was again taken by the English in 1790, and retaken by Tippoo's general, but was transferred with the province to the British government in 1799, and has since remained in their possession. The travelling distance from Seringapatam is 122 miles, and from Madras 306 miles.

(Rennell, *Memoir*; Mill, *History of British India*; Buchanan, *Journeys through Mysore, &c.*)

COIMBRA, a city of Portugal, capital of the province of Beira, is situated on the slope of a hill near the north bank of the Mondego, in 40° 12' N. lat., 8° 25' W. long., 115 miles N.N.E. from Lisbon. It is the see of a bishop, suffragan of the archbishop of Braga. The population is about 16,000.

A substantial stone bridge here crosses the Mondego, a river which in summer is very shallow, but in winter and in rainy seasons is wide and rapid, so that it is only occasionally navigable for small craft and boats. The harbour for Coimbra is Figuera, 24 miles distant, at the mouth of the Mondego.

The city was formerly strongly fortified, but now is merely surrounded by old walls flanked by a few towers. The interior is gloomy. The houses are mostly old, and the streets narrow, ill-paved, and dirty. There are several squares, with fountains well supplied with water, which is conducted to the city by an ancient aqueduct supported on twenty arches. The principal public buildings are—the cathedral, 8 parish churches, the University of Coimbra, a large hospital, a poor-house, the convent of Santa Cruz, now occupied as a barracks, and other conventual buildings in and around the city. The University of Coimbra is the only one in Portugal. It occupies the palace which formerly belonged to the kings of Portugal. It was originally founded at Lisbon in 1290, was transferred to Coimbra in 1308, removed again to Lisbon, and finally transferred to Coimbra in 1527. It consists of 18 colleges, attended by about 1400 students, and has a library of 30,000 volumes, occupying three large halls. Theology is taught by 8 professors, canon-law by 9, civil-law by 8, medicine by 6, mathematics by 4, and philosophy by 4. There is a botanical garden, a museum of natural history, a chemical laboratory, and an observatory well furnished with instruments. The university is rich, and the professors well paid. The lectures are mostly gratuitous. The Benedictine convent has a library equal perhaps in number of volumes to that of the university, and containing works of more modern date. The manufactures are chiefly linen and woollen fabrics, earthenware, and combs.

It is doubtful whether the Romans had a town on or near the site of Coimbra. It seems to have been built by the Goths, from whom it passed to the Moors. It was taken by Henri, count of Burgundy, and afterwards count of Portugal, about the year 1100. His son, Alfonzo-Henrique, became the first king of Portugal, and Coimbra became the capital of the kingdom, and so continued till about 1500, when the court seems to have been transferred to Lisbon.

The immediate neighbourhood of Coimbra is delightful, and filled with gardens and country-houses. The tract of country between it and Condeixa, south of the Mondego, is styled 'the fruit-basket of Portugal.' The splendid and extensive monastery of Santa Clara is situated with its gardens upon a hill near the south bank of the Mondego. In the same direction, not far from the convent of Santa Clara, is the Quinta das Lagrimas (Villa of Tears), in a romantic sequestered spot, where Donna Inez de Castro is reported to have been murdered. (Camoens, *Lusiadas*.) North of Coimbra the country is mountainous. The Serra de Busaco, an offset from the Serra de Alcoba, is distant about 15 miles N. by E.

COIRE, in Romansch *Coira*, in German *Chur*, on the site of the ancient *Curia Rhetorum*, the capital of the Swiss canton of Grisons, is situated in 46° 40' N. lat., 9° 35' E. long., 60 miles S.E. from Zurich, in a valley traversed by the Plessar, which here divides into three arms, and after driving several corn and saw-mills, enters the Rhine about a mile below the town. It stands on uneven ground, is surrounded by walls and ditches, has narrow and crooked streets, and is altogether a dull-looking place. Its position however on the great line of communication between Italy, Switzerland, and Western Germany gives it a considerable share in the transit-trade between those countries. The cathedral church of St. Lucius, part of which dates from the 8th century, and the bishop's palace, a curious antique building, are situated in the highest part of the town, and are the most noteworthy of the public buildings. Behind the palace is a ravine lined with vineyards, beyond which is the Catholic seminary. The other habitations in this quarter of the town are occupied by Catholics; the quarter is inclosed by battlemented walls pierced by two

fortified gates. Among the other edifices are the Reformed church of St. Martin, distinguished by its high towers, and the town-house, which contains the public library. Many of the private houses are built in a curious antique fashion. The town has Protestant and Catholic cantonal schools, and some manufactures of zinc plates, edge-tools, and shot. Coire has given title to a bishop since A.D. 452, and the see is perhaps the oldest in Switzerland. A newspaper is published in the town in the Romansch language, a descendant of the Latin.

COLAPOOR, a small dependent Mahratta state, situated within the province of Bejapore, in the region of the Western Ghaut Mountains, being partly below and partly within the Ghats. The territory of the Colapoor Raja is so intermixed with that of the British, and of other Mahratta chiefs, that it would be difficult to describe its boundaries. The state of Colapoor was founded by Sumbajee, the grandson of Sevajee. In 1728 Sumbajee was confederated with the Nizam, and accompanied his army to Poona; and in 1731 a treaty was concluded between the Peishwa and Sumbajee, by which the country between the Kistna and Warna, and the Toombuddra was to belong to Sumbajee, with half of all conquests south of the Toombuddra. The territory thus assigned to the raja of Colapoor was then partly in the actual possession of the Moguls, and partly of other chiefs called Dessyes who had set up for themselves. It was not until the subsequent reign of Madhoo Ras, about the year 1762, that the whole was effectually brought under the raja's power. The Colapoor territory became after this the constant scene of war and turbulence, and a place of refuge for all the plunderers and pirates of neighbouring countries. In 1804 the raja was at war with the Peishwa, and after a long struggle, in which the latter succeeded in capturing the chief places in the state, and in reducing the raja's government nearly to the point of extinction, the British government interfered for the establishment of peace, and procured the restitution of his towns. This occurred in 1812, after which the state of Colapoor enjoyed a long continuance of tranquillity from without. In 1821 the raja was privately assassinated in his palace, and was succeeded by a son of immature age, during whose long minority the country fell into a state of great disorder. The young raja, on taking the government into his own hands, early lost the good esteem of his subjects by his exactions and his degrading vices. In 1825, 1826, and 1827 the raja having committed aggressions in the territories of some Mahratta Jagheerdars under the protection of the English, his territory was occupied by British troops, and the powers of government were temporarily placed in the hands of a minister appointed by the governor of Bombay. In each of the years just mentioned a treaty was concluded with the raja, but these treaties were broken by him upon every occasion that presented itself. In 1829 a definitive treaty restricted the raja from keeping up a greater force than 400 horse and 800 foot soldiers; some districts in which he had committed oppressions against the Zamindars were at this time taken from him: British garrisons were placed in the capital and in the fortress of Punnalaghur at the raja's expense, and a chief minister for the future management of his government was to be permanently appointed by, and removable solely at the pleasure of, the English government. The Colapoor territory, including its dependencies, includes an area of 3445 square miles, and a population of about half a million; the revenue of Colapoor is about 55,000*l.* a year; that of its dependencies may be stated thus: Bhowda, 5167*l.*; Inchulkunjee, 7500*l.*; Khagul, 7276*l.*; Vishalgur, 12,314*l.*; and 113 Surinjams or minor dependencies, 63,163*l.* The chief towns are COLAPOOR, the capital, Colgong, Mulcapoor, and Parnellah.

COLAPOOR, the capital of the state of Colapoor, is situated in 16° 19' N. lat., 74° 25' E. long., about 120 miles S. from Poona, in a valley between a curved range of hills, by which it is protected on three sides, the fourth side being protected by two hill-forts about 10 miles north-west from the town. These forts stand upon rocks about 300 feet above the level of the valley, which present natural perpendicular ramparts of basalt, from 30 feet to 60 feet high. The two forts are connected together; one of them, called Punnalaghur, covers a space 3½ miles in circumference, in which area are several dwellings, lofty trees, gardens, and fine tanks. The works immediately connected with the town of Colapoor are not strong.

COLBERG, or KOLBERG, a town and strong fortress in the Prussian province of Pomerania, is situated about 170 miles N.E. from Berlin, 26 miles W. from Cöslin, in 54° 9' N. lat., 15° 34' E. long., and has about 8000 inhabitants. It stands on the right bank of the Persante, which empties itself into the Baltic about a mile below the town, and at its mouth forms a harbour, which properly consists of two dams, carried out from the banks of the river into the sea, and protected by redoubts. Colberg contains a cathedral, several Lutheran churches, five hospitals, a workhouse, a house of correction, an exchange, a foundation in a nunnery for seven daughters of noble families and for nine of citizens; an orphan asylum, a gymnasium, &c. The inhabitants are engaged in the salmon, haddock, and lamprey fisheries, and in the manufacture of woollen-cloth, anchors, salt, and spirits. Fresh water is supplied to the town from a distance by admirable but very expensive water-works: the water, which is raised by a wheel to the height of 40 feet, is conveyed in pipes to every part of the town.

Colberg was formerly one of the Hanse towns, and till 1812 the seat of a collegiate chapter. The modern fortifications and outworks were commenced in 1778. It was taken after a siege of several weeks by Gustav Adolph in 1630; was besieged by the Russians in 1758, 1760, and 1761, and surrendered to them by capitulation on the 16th December, in the last-mentioned year. The French invested it without success in 1807. It has a considerable trade, both inland and foreign, and a brisk woollen market. Its military strength is greatly increased by the swampy nature of the country around it.

COLCHESTER, Essex, a municipal and parliamentary borough, market-town, and the seat of a Poor-Law Union, is situated in 51° 53' N. lat., 0° 53' E. long.; distant 22 miles N.E. by E. from Chelmsford, 51 miles N.E. by E. from London by road, and 51½ miles by the Eastern Counties railway. The population of the borough in 1851 was 19,443. The borough is governed by 6 aldermen and 18 councillors, one of whom is mayor; and returns two members to the Imperial Parliament. The livings are in the archdeaconry of Colchester and diocese of Rochester. Colchester Poor-Law Union, which is co-extensive with the parliamentary borough, contains an area of 11,770 acres.

Colchester is generally supposed to be the Camalodunum of the Romans. There are few places in England where more Roman antiquities have been found: Morant mentions 'bushels of coins' of Claudius, Vespasian, Titus, Domitian, and their successors. The town-walls, the castle, many of the churches, and other ancient buildings are chiefly built of the Roman brick. Numerous vases, urns, and lamps both in bronze and in pottery, rings, bracelets, &c., tessellated pavements, pateræ, and other Roman antiquities have at various times been dug up within the walls and in the neighbourhood. By the Britons it was called *Caer Colon*, and by the Saxons *Colne-Ceaster*, from the Latin 'Castra,' and its situation on the river Colne. Colchester was strongly fortified by Edward the Elder, and was at the time of the Domesday Survey a place of considerable note. In 1189 the town had its first charter from Richard I. Colchester appears to have sent members to Parliament at even an earlier period than London. In the reign of Edward III. the town contributed five ships and 170 marines towards the naval armament raised to blockade Calais. Early in the civil wars the inhabitants of Colchester declared against the Royalists; and in 1648 the town sustained a memorable siege. Having been obliged to surrender to the royal forces, the city was garrisoned by Sir Charles Lucas and Lord Goring. Fairfax soon arrived, and summoned Lord Goring to surrender, on whose refusal he proceeded to storm the city; after seven or eight hours' attack he changed his plans, and began a most rigorous blockade. The Royalists held out for eleven weeks, but the provisions of the place having been consumed, the garrison surrendered at discretion. Sir Charles Lucas, Sir George Lisle, and Sir Bernard Gascoigne were condemned to death. Gascoigne being a foreigner had his sentence remitted.

The ruins of the old castle, St. John's Abbey, St. Botolph's Priory, the Moot Hall, and the churches, form the principal ancient and public buildings of Colchester. Of the walls by which the city was surrounded, which were one mile and three-quarters in circumference, some detached portions exist. The remains of the castle stand upon an eminence and form a parallelogram. The keep is in a good state of preservation, and its walls are 12 feet thick. The building, which is a compound of flintstone and Roman brick, is so hard that repeated attempts to demolish it for the sake of the materials have proved unsuccessful.

St. John's Abbey was founded by Eudo, dapifer or steward to Henry I., for monks of the Benedictine order. A handsome gateway, of the later style of English architecture, is all that now remains of this abbey. In St. Giles's church, adjoining the abbey, is a monument erected to the memory of Sir C. Lucas and Sir George Lisle. St. Botolph's Priory, not far from St. John's, was founded by Eulph in the beginning of the 12th century. The remains of the western front of its stately church are highly interesting. St. Botolph's parish church is a handsome modern erection, of white brick, with a massive embattled tower. The church of St. James, erected prior to the time of Edward II., has a fine altarpiece representing the Adoration of the Shepherds. St. Peter's church is mentioned in Domesday Book as the only church then in Colchester. St. Leonard's church is a large and commodious structure. There are places of worship for Baptists, Independents, Wesleyan Methodists, and Unitarians. The Free Grammar school, founded in 1584, for which a new school-house has just been built, has an income from endowment of about 190*l.* a year, and had 59 scholars in 1852. With the National school a Charity school has been incorporated, and the united school has an attendance of upwards of 400 children, of whom more than 100 are clothed as well as educated. There are also British, Infant, and Roman Catholic schools. A school endowed by a member of the Society of Friends has a library attached. A library founded by Dr. Samuel Harsnett, archbishop of York, is in the care of a literary society which meets once a week in the castle. In Colchester are a literary and philosophical society, with museum, a botanical and horticultural society, a mechanics institute, and numerous religious and benevolent associations.

The town of Colchester is pleasantly situated close to the river
GEOG. DIV. VOL. II.

Colne, over which there are three bridges. One of these, at the northern entrance to the town, is an elegant cast-iron structure of three arches, erected at a cost of 1800*l.* The town is lighted with gas, well paved, and plentifully supplied with water. The houses are generally well built. The site is considered healthy: there are good walks and pleasant views in the vicinity. Baize was formerly made in the town to a considerable extent, but this branch of industry has ceased. The silk manufacture is carried on. There are also iron and brass-foundries, machine-works, coach-works, rope and sail-works, breweries, and vinegar and other works. The oyster fishery is here an important branch of industry. The river Colne is navigable to the Hythe, a suburb and the port of Colchester. The subjoined statement shows the extent of the shipping trade of the port for the year 1852:—The number and tonnage of vessels registered as belonging to the port of Colchester on December 31st, 1852, were—sailing vessels under 50 tons 187, tonnage 3950; above 50 tons 65, tonnage 7156; and one steam vessel of 23 tons. The number and tonnage of vessels entered and cleared at the port during 1852 were as follows:—Coasting trade: inwards 657, tonnage 50,281; outwards 305, tonnage 13,866. Colonial and foreign trade: inwards 46, tonnage 2748; outwards 31, tonnage 2308.

Colchester has a plentiful supply of fish. The principal market for corn and cattle is on Saturday: another is held on Wednesday for poultry and fruit. Vegetables are extensively raised on the neighbouring grounds. Several annual fairs are held. A county court, quarter sessions, and meetings of justices are held in Colchester. There is a savings bank in the town.

(Morant, *Essex*; Wright, *Essex*.)

COLCHIS, a country of Asia, extending along the eastern shore of the Euxine Sea, from the town of Trapezus, according to Strabo; or from the Phasis according to Ptolemaeus. Pityus was the most southern town in Colchis, and Dioscurias the most northern, the distance between the two, according to Arrian, being about 350 stadia. It was bounded N. by the Caucasus, S. by Armenia, E. by Iberia, and W. by the Euxine. The name Colchis appears in the early legends of the Greeks as connected with the expedition of the Argonauts, and the story of Jason and Medea.

The chief river of Colchis was the Phasis (now called Faz and Rioni), which receiving the small streams of the Glaucus and Hippus from the neighbouring mountains flows into the Euxine Sea. Among the most important cities were Pityus, the great mart of the district; Phasis, on the river of the same name, where the Argonauts are said to have landed; Aea, on the Phasis; Cyta, or Cutatisium (now Kchitais or Kutaia), the traditional birthplace of Medea; and Dioscurias, a seaport originally founded by a colony from Miletus, but under the Romans, who rebuilt it on or near the old site, it was called Sebastopolis. Colchis was a very fertile district, and abounded in timber (which was well adapted for ship-building), in various kinds of fruits, and in hemp, flax, wax, pitch, and gold-dust. The inhabitants were famed for their linen manufactures, which formed a considerable article of export. The honey, which Strabo (p. 498, *b*) represents as being very bitter, produced violent and even fatal effects on the Greeks who eat of it during the retreat of the Ten Thousand; it deprived them of their senses, disabled them from standing upright, occasioned vomiting, &c., but finally all recovered. (Xenophon, 'Anab.' iv. s. 20.) The richness of the country in silver and gold mines was probably the cause of the Argonautic expedition. The pheasant (*Phasianus aris*) derives its name from its native place, the banks of the Phasis.

The Colchi were originally from Egypt, according to Herodotus (ii. 104), and part of the army with which Sesostris invaded Scythia. The facts on which he founds his opinion are—similarity of physical features, of language, and of peculiar customs, such as circumcision. The curled hair and swarthy complexion, on which Herodotus relies in support of his position, seem however no longer to exist in Mingrelia. The Colchians were divided into numerous clans or tribes, settled chiefly along the coast of the Euxine. The Machelones, Henischi, Zydretæ, and Lazi lived south of Phasis; north of it were the Apsidæ, the Abasci (whose name remains in Abassia), the Samige, and the Coraxi; and the Coli, Melanchlæni, Geloni, and Snani along the Caucasus Mountains to the north and west; and the Moschi among the Moschici Montes, an offset of the Caucasus to the south-east of Colchis.

Colchis was governed by kings when we first read of it. Helius is mentioned by Diodorus as king before the Argonautic expedition. Aetes is mentioned by Strabo (p. 45, *d*) as king at the time of the expedition. Colchis was afterwards divided into several small kingdoms or states (Strabo, 45, *d*), and we hear nothing more of it till the time of Xenophon, who ('Anabasis,' v. 6, 37) speaks of a son or grandson of Aetes as reigning over the Phasiani. The Colchi were not then subjects of the Persian empire, but were independent. (Xen., 'Anab.' vii. 8, 25.) They opposed the Greeks in the retreat of the Ten Thousand. Mithridates afterwards subdued Colchis, and the government was administered by præfects, one of whom, Moaphernes, was Strabo's uncle. (Strabo, p. 449, *a*.) Under the early emperors the family of Polemon (son and successor of Pharnaces, son of Mithridates) reigned over the Colchians. (Strabo, p. 499, *a*.) Under both the western and eastern empires the Romans occupied the coast by numerous castles and factories, so as to command the valuable trade

of the country. In the 6th century Colchis was commonly called Terra Lazica, from the Lazi, one of the Colchian tribes.

Colchis seems to have comprised the whole of modern Mingrelia, parts of Imeritia and Abkhazia, and the narrow strip between the mountains and the sea east of Trebizond. In this latter district there is still a numerous and warlike people called Laz, from whom the district is sometimes called Lazistan, and the coast-range, which divides it from the basin of the Choruk-su, the Lazistan Mountains.

COLEFORD. [GLOUCESTERSHIRE.]

COLEFORD. [LEICESTERSHIRE.]

COLERAINE, county of Londonderry, Ireland; partly in the parish of Killowen and barony of Coleraine, and partly in the parish of Coleraine and barony of the north-east liberties of Coleraine; a sea-port and post-town, a municipal and parliamentary borough, and the seat of a Poor-Law Union; is distant 145 miles N. from Dublin. The population in 1851 was 5920, exclusive of 842 inmates of the Union workhouse. Coleraine returns one member to the Imperial Parliament. The paving, lighting, &c., of the town are under the care of 21 town commissioners. Coleraine Poor-Law Union comprises 20 electoral divisions, with an area of 112,866 acres, and a population in 1851 of 43,021.

Coleraine is situated on both banks of the river Bann, at a distance of 4 miles from the sea. The principal part of the town is on the right bank, and consists of a central square called the Diamond, with several leading streets diverging from it. The bridge connecting this portion of the town with the suburb of Killowen or Waterside on the left bank of the river is a stone structure of three arches, 288 feet long and 32 feet in breadth, erected at a cost of 14,500*l.* There is a great thoroughfare by this road between the northern parts of the counties of Antrim and Londonderry. The parish churches of Killowen and Coleraine stand in the respective divisions on either side of the river. There are also two Roman Catholic chapels and six meeting-houses of various denominations of Dissenters, an Endowed school, a National Model school, and a savings bank. The old court-house and town-hall stands in the centre of the Diamond. There is a new market-place with a commodious market-house. The town is lighted with gas. Vessels of 200 tons burden can ascend the river to the quay; but the principal maritime trade of Coleraine is conducted from the harbour of Port Rush, 5 miles distant on the coast near the embouchure of the river. At Port Rush is a harbour formed by two piers of 800 feet and 650 feet in length, inclosing an area of 8 acres, with from 15 feet to 20 feet of water at the wharfs. The customs duties of the Coleraine district in 1851 amounted to 6733*l.*; the excise duties amounted to 37,240*l.* The number and tonnage of vessels belonging to the port in 1852 were:—Under 50 tons 11, tonnage 279; above 50 tons 1, tonnage 76. The entries and clearances at the port in the coasting and cross-channel trade in 1852 were:—Sailing vessels, inwards 162, tonnage 7145; outwards 20, tonnage 716; steam vessels, inwards 377, tonnage 104,632; outwards 207, tonnage 57,087. In the foreign and colonial trade there entered 12 vessels of 2379 tons, and cleared 6 vessels of 1223 tons. The principal trade is the manufacture and bleaching of linens and the salmon-fishery. A fine description of linen manufactured here is known as 'Coleraines.' The annual sales of linens are estimated at 600,000*l.* The fisheries (of salmon and eel) are the property of the Irish Society, who farm them out at an annual rent of 1200*l.* Upwards of 300 persons are employed as water-bailiffs in the protection of the Bann and its tributaries. Fairs are held on May 12th, July 5th, and November 3rd; markets are held on Monday, Wednesday, Friday, and Saturday. There are tanneries, bleach-grounds, paper-mills, and soap and candle works. Quarter sessions of the peace for the county of Londonderry are held here in rotation; and petty sessions fortnightly. Coleraine in the Presbyterian Church arrangement is the seat of a Presbytery of the General Assembly, consisting of 16 congregations.

Coleraine is remarkable in early Irish history as the place in which Patrick found a Christian bishop already located on his first progress through the northern parts of Ireland. A castle was built here in 1213 by Thomas Mac Uchtred, a Scottish adventurer. One of De Courcy's followers, called De Sendall, also erected a castle very soon after the conquest. The present town stands on the site selected by the Irish Society in 1613. It was at first fortified by an earthen wall with bastions. The place held out against the rebels in 1641. In 1688 the whole customs of the port amounted to only 18*l.* 9*s.* 8*d.* The neighbourhood is rich and well cultivated. A fall of the Bann over a ledge of rock 12 feet high, at the Cutts, about a mile above the town, adds considerably to the picturesque interest of the environs.

COLESHILL. [WARWICKSHIRE.]

COLIGNY. [AIN.]

COLINSBURGH. [FIFESHIRE.]

COLL ISLAND. [ARGYLSHIRE.]

COLLIN, properly KOLLIN, a town in Bohemia, is situated on the Elbe, in 49° 59' N. lat., 15° 10' E. long., at a distance of 39 miles by railway E. from Prague, and contains about 6000 inhabitants. Large quantities of garnets, topazes, and carnelians are found in the

vicinity and polished here. In the neighbourhood, between the castle of Chotsemitz and the village of Plapian, Marshall Daun, the commander of the Austrian army, gained a decisive victory over Frederick the Great on the 18th of June 1757.

Collin is a station on the railway from Vienna to Prague. It contains a grammar school, cotton and potash factories, a Capuchin monastery, a church and a town-hall, both in the gothic style, and a castle with grounds and a botanical garden attached to it. The town is well built, surrounded by walls, and finely placed upon an elevated rock, beneath which the Elbe has a considerable fall.

COLLON. [LOUTH.]

COLLONGES. [AIN.]

COLLUMPTON, or CULLOMPTON, Devonshire, a market-town in the parish of Collumpton and hundred of Hayridge, in 50° 51' N. lat., 3° 23' W. long., is situated on the right bank of the river Culm, a tributary of the Exe; distant 10½ miles N.E. by N. from Exeter, 160 miles W.S.W. from London by road, and 181½ miles by the Great Western and South Devon railways. The population in 1851 was 2765. Collumpton is a town of some antiquity. The town is of considerable size; the main street, which forms a portion of the Exeter and Taunton road, is about a mile long. The parish church, a handsome edifice of the 14th century, was carefully restored in 1849. It has a very rich screen. A chapel on the south side erected in 1528 by John Lane, a clothier, is remarkable for the sculpture on the exterior, which represents the implements then used in the making of cloth. The Independents, Baptists, Wesleyan Methodists, and Unitarians have places of worship in the town. There are a National school and a Mental Improvement society. The woollen manufacture, particularly that of serge, is carried on to some extent in Collumpton. The market-day is Saturday; a monthly market recently established is held on the first Saturday of each month: fairs are held in May and November. Petty sessions are held once a month.

COLMAR, the capital of the department of Haut-Rhin, in France, stands on the Lauch and the Fecht, both tributaries of the Ill, a feeder of the Rhine, at a distance of 352 miles E.S.E. from Paris by railway through Strasbourg, 40 miles by railway S. from Strasbourg, 49 miles N.N.W. from Bâle, in 48° 4' 41" N. lat., 7° 21' 43" E. long., and has 19,153 inhabitants, including the whole commune. In a straight line the distance from Colmar to Paris is only 250 miles.

The town, which is beautifully situated in a plain near the foot of the Vosges Mountains, has well-built houses, but the streets are ill laid out; they are however kept clean by small streams from the Lauch and the Fecht. It is entered by three gates, those of Brisach, Bâle, and Rouffac. The Place-de-la-Cathedrale is the principal square, and in it the weekly market is held. Boulevards planted with trees surround the town, and there are several handsome promenades on the south side of the town, outside the gate of Bâle. The cathedral is the most remarkable building; the tower is ascended by 303 steps, and on the inside of its walls inscriptions in Hebrew, Greek, Latin, and German recount the dreadful ravages of the plague of 1541. The other objects worth notice are the court-house, town-house, college (which has a library of 36,000 volumes, and a collection of paintings on wood by Martin Schön, Albert Dürer, and others), the institution for deaf-mutes, hospital, theatre, museum, and the beautiful church of the Dominicans, in the nave of which the corn-market was not long ago held. The high court for the departments of Haut-Rhin and Bas-Rhin is held in the town, which has also tribunals of first instance and of commerce.

Colmar is one of the principal seats of the cotton manufactures in France. The machinery of its numerous factories is chiefly moved by the mountain-streams above named, but steam is also largely employed. All descriptions of cotton-goods, as well as cloth, hosiery, ribands, room-paper, and leather, are manufactured. The town has also large cotton-printing and cotton-spinning establishments; and a brisk trade in corn, wine, iron, groceries, &c. Before A.D. 1220 Colmar was a mere village. In that year it was raised to the rank of a town. It was enlarged in 1282, and soon after was made an imperial free town, and disputed with Ensisheim the precedence among the towns of Upper Alsace. In 1552 it was surrounded with fortifications, which were considerably augmented at a subsequent period. The Swedes took Colmar in 1632. Louis XIV. took it in 1678 and razed the fortifications. It was united to France by the treaty of Ryswick. Colmar was formerly included in the diocese of Bâle.

(*Dictionnaire de la France; Annuaire pour l'An 1853.*)

COLMARS. [ALPES, BASSES.]

COLMONELL. [AYRSHIRE.]

COLNBROOK. [BUCKINGHAMSHIRE.]

COLNE, Lancashire, an ancient market and manufacturing town in the parish of Whalley and hundred of Blackburn, is situated on an elevated ridge near the river Calder, in 53° 51' N. lat., 2° 9' W. long.; distant 85 miles S.E. by E. from Lancaster, 218 miles N.N.W. from London by road, and 222 miles by the North-Western and East Lancashire railways. The population of the town of Colne in 1851 was 6644. The government of the town is in the hands of the county magistrates. The livings are perpetual curacies in the archdeaconry and diocese of Manchester.

Colne is a town of considerable antiquity, although antiquaries are not agreed as to the date of its origin. The town was known in the

commencement of the 14th century as a seat of the woollen manufacture. At present cotton-spinning and the making of printed calicoes and *mousselines de laine* are the chief occupations of the place. Cologne has increased very much in the course of the present century. Several limestone and slate quarries and coal-pits are in the neighbourhood. The Leeds and Liverpool Canal passes near the town. The church is ancient; it has been several times repaired, the last time in 1815. Several district churches have been erected since 1835. The Baptists, Independents, and Wesleyan and Primitive Methodists have places of worship in Cologne. The Free Grammar school is of ancient foundation: at this school Archbishop Tillotson was in part educated. There are several National schools, and a savings bank. A county court is held. Many interesting old mansions are in the neighbourhood. The market-day is Wednesday. Fairs are held in March, May, and October for cattle, and in December chiefly for woollen and fancy goods; a fair for cattle is held also on the last Wednesday of every month.

COLOCZA (Kalocsa, Kalotscha), a town in Hungary, is situated in a swampy plain, on a small arm of the left bank of the Danube, near 46° 32' N. lat., 19° 0' E. long., and has about 6000 inhabitants. It is the seat of an archbishop. The most striking buildings are the palace of the archbishop, which resembles a fortress, and contains a library of 30,000 volumes; and the cathedral church of the Annunciation. To the archbishopric of Colocza is united the bishopric of Bacs, the metropolitan chapter of which has its seat also here. The town has an archiepiscopal lyceum, with a theological seminary; a Piarist college, a gymnasium, and a grammar school. The library contains a Manuscript called the 'Colocza Codex of Old German Poems,' supposed to have been written in the latter part of the 15th century. This valuable work is written and illuminated on beautiful parchment, contains 336 pages, and comprises 15 poems, consisting in all of 54,000 verses. The inhabitants are chiefly engaged in the breeding of horses and cattle, and in the Danube fishery. Steamers plying on the Danube stop opposite Kalocsa.

COLOGNE (Cöln and Köln), an ancient and fortified city in Prussia,

by railway through Hanover and Magdeburg; and had in 1853, 100,000 inhabitants, including the garrison and the suburb of Deutz, on the right bank of the Rhine. The city extends in a crescent-shape along the left bank of the Rhine. It is inclosed by a lofty wall about six miles in circuit, defended by 88 towers, and surrounded with ramparts and deep ditches. It has 24 gates on the land and water sides, and in front of the 7 principal gates strong redoubts have been erected. Cologne occupies the site of the *Oppidum Ubiorum*, or chief town of the Ubii, a German nation (Tacitus, 'Ann.' i. 36). This town was a Roman station, and subsequently a colonia, under the name of Colonia Agrippina, or Agrippinensis, so called by the emperor Claudius in honour of his wife Agrippina, who was born here while her father Germanicus commanded in these parts. Agrippina adorned it with an amphitheatre, temples, aqueducts, &c., the ruins of which may still be traced. It soon became a very large and important city, and the chief town of Germania Secunda. Vitellius was at Colonia when he was proclaimed emperor. Trajan also, on the death of Nerva A.D. 98, assumed the purple here. Colonia continued to be the capital of Lower Rhenish Gaul till A.D. 330, about which time it was taken by the Franks; it was recovered however by Julian, about A.D. 356, and was then a strongly fortified place. The Franks took permanent possession of it in the first half of the 5th century, and Childeric, Chlodowig, and others of their kings resided in it. After a frequent change of masters it was annexed to the German empire in 870. Some remains of the Roman walls are still seen, and the gate called Pfaffen Porte is supposed to be the *Porta Claudia*. Many statues and sarcophagi have been found with the inscription C. C. A. A. Colonia Claudia Augusta Agrippinensium; and there are many traces of Roman roads in the neighbourhood. The old town of Cologne was that which was inclosed with walls by the Romans, and was called, till near the close of the 12th century, '*Civitas intra Coloniam*.' About A.D. 1180 a new wall inclosed the suburbs.

Cologne took part in some of the many disputes which arose in the German empire, and was besieged by Henry V. for its attachment to his father Henry IV.; and afterwards unsuccessfully by Philip of Swabia, for having proclaimed his rival Otto IV. In 1349 the principal Jews of Cologne, anticipating the same fearful persecutions as in other places, shut themselves up with their wives and children, and set fire to their houses; upon this the surviving Jews were compelled to leave the city, and though they subsequently obtained permission to return, they were again obliged to quit it in 1429.

Cologne was one of the most powerful and wealthy cities of the Hanseatic league. In the 13th century it could muster an armed force of 30,000 men, and its population amounted to 150,000. When the Hanseatic league engaged in a war with England in 1452, Cologne sided with England, on which account it was formally excluded from the league; but on the conclusion of peace by the treaty of Utrecht in 1474, it was re-admitted to this privilege upon the intercession of the emperor Frederick III. During the whole of this period the commerce of Cologne was extremely flourishing. In the 11th century the

Colognese vessels carried Rhenish wines, corn, flour, malt, beer, linen, and other German produce to all countries lying on the German Ocean and the Baltic, to England, France, Spain, Portugal, Italy, Norway, Sweden, and Russia, and brought back the productions of those countries.

The trade of Cologne with England at this early period was very considerable, and King John conceded to the merchants of Cologne commercial privileges rarely granted to his own subjects. Cologne had a large factory in Norway and another in the Netherlands; and after 1259 all vessels navigating the Rhine were obliged to unload their cargoes at Cologne, whence they were conveyed in its own ships. The arts and sciences were equally flourishing, partly it is supposed in consequence of frequent intercourse with Italy; and its university, suppressed during the French occupation of the city, was one of the most famous in Germany. The specimens of its architecture, paintings on glass, sculptures, and pictures, which still exist, attest the perfection which its artists had attained. The manner in which the carnival is celebrated, and the amusement of the puppet theatre, are proofs of a former close connection with Italy. Intestine divisions, the expulsion of the Jews, the public destruction of its looms, which compelled their owners to emigrate, and various other causes, hastened its decline. Another and perhaps a leading cause of the decline of this city was the closing of the navigation of the Rhine by the Dutch in the 16th century. The restriction was removed in 1837, and Cologne, which is now a free port, trades directly with foreign countries, and sea-going ships are built in it. Cologne ceased to be a free town soon after the first French revolution. The French took the city, shut up the monasteries, and plundered several of the churches and collections in the town, which they made the capital of the department of the Rôer from 1801 to 1814. At the peace Cologne and its dependencies fell to Prussia.

Cologne is divided into four sections, and is built in a very irregular manner; the streets, many of which still retain their Roman names, are generally narrow, dark, and crooked, and paved with basalt. Of late years however many of the streets have been widened and neatly paved, new houses built and old ones repaired, so that the town is less dirty than it formerly was. A large portion of the area within the walls is now occupied by neglected fields and gardens, the once well-tilled property of the conventual houses. It contains 25 churches, 8 chapels, a synagogue, and many other public buildings. The Cathedral is the most magnificent monument of gothic architecture in the world. The name of the architect who furnished the original plan (which still exists), is unknown, but the structure was begun in 1248 by Archbishop Conrad of Hochstedten. It is in the form of a cross, 500 feet in length and 200 feet in breadth; the roof rests on 100 columns, of which the four central ones are 30 feet in circumference. The only part however which was finished until the present century was the splendid choir (which is 180 feet high), with its surrounding chapels and its superb painted glass windows. Of the two towers, which were intended to have been 500 feet in height, one was raised only half this elevation, and the other not more than 21 feet. But by the munificence of the Prussian government, and by means of subscriptions, the works have been pushed on with vigour, especially since 1842, and the body of this magnificent cathedral was solemnly opened in presence of the Archduke Johann of Austria and the King of Prussia on the 15th of August 1848, the 600th anniversary of the foundation of the building. The choir contains the tombs of Archbishop Conrad, its founder, and Mary de Medicis; and abounds in relics and curiosities, especially the chapel of the Three Kings, which is richly adorned with gold and precious stones. Among the other interesting churches are those of St. Ursula, St. Columba, the Annunciation, St. Gereon, and St. Peter, which last contains the Crucifixion of Peter painted by Rubens. The other buildings of note are—the ancient Carthusian convent, the town-hall, the Gurzenich, where the several diets of the German empire formerly met, the archiepiscopal palace, the court-house, the exchange, theatre, museum, the Roman tower, &c. Between Cologne and Deutz (which is included in the line of fortifications) is a bridge which rests on 39 pontoons, and is 1250 paces long. A bridge is we believe in course of construction between Cologne and Deutz, for the purpose of connecting the railways on each bank of the Rhine.

Cologne is the residence of an archbishop, and the seat of various public boards. It contains two gymnasia; has several good libraries; collections of Roman antiquities, manuscripts, coins, natural history, &c.; and a great number of educational establishments.

The manufactures of Cologne are cotton-yarns, cotton-goods, hosiery, woollens, silks, velvets, tobacco, brandy and spirits, Eau de Cologne, of which above a million bottles are annually exported, &c. Being a free port, and having communication by railway with Belgium and various parts of Germany, Cologne has an important transit trade in home and foreign produce, which has greatly contributed to its present prosperity. In the vicinity of the city are several coal-mines, and abundance of a particularly fine sort of porcelain-earth and potter's clay. Steamers ply regularly between Cologne and the towns along the Rhine.

Cologne gave title to a bishop from A.D. 314 to the 8th century, when the see was raised to an archbishopric. In the 14th century the archbishops were made Electors of the German empire; they

were further styled archbishops of the empire in Italy, and held the third rank among episcopal electors. The last elector of Cologne was Maximilian, who died in 1551. The diocese comprised a large territory on the left bank of the Rhine, now included in the Rhein-Province; a portion of the duchy of Westphalia, of which Arensburg was the capital, and the county of Recklinghausen. The archbishops of Cologne formerly resided at Bonn. [BOHN.]

The government or administrative division of Cologne comprises an area of 1582 square miles, and had at the end of 1849 a population of 497,330, of whom about six-sevenths are Catholics. [RHEIN-PROVINCE.]

COLOMBIA is the name which was adopted by the northern countries of South America in 1819, when New Granada and Venezuela united and established one central government for the purpose of resisting the Spanish government. In 1829 Venezuela renounced the union, and constituted itself a separate republic. After the resignation of Bolivar in 1830 it again joined New Granada; but this union lasted only a short time. In November 1831 a new separation took place, and Colombia was divided into the three republics of Ecuador, New Granada, and Venezuela.

COLOMBO, or **COLUMBO**, an episcopal city, the capital and seat of the British government in Ceylon, is situated on the western coast of the island, in 6° 59' N. lat., 80° 4' E. long., 368 miles S.W. from Madras. The population, which is composed of Europeans, burghers, Malabars, Singhalese, and Moors, besides some Malays, Chinese, Parsees, Caffrees, and Pattangs, amounts to about 40,000.

The fort of Colombo is on a promontory, two-thirds of the extent of which is washed by the sea. It has a circuit of about a mile and a quarter, and is defended by eight principal bastions, four of which are towards the sea, and three face a lake and command the narrow approach from the town. Towards the land the fort is surrounded with a deep moat, and a lake bordering on the glacis adds to the strength of the place. On the side of the sea, where the surf does not render a landing impracticable, every part is well commanded by the batteries. Inside the fort are several straight and regular streets. The residence of the governor, called the 'Queen's house,' is in King-street; and behind it is the lighthouse, a handsome edifice, the light of which is 97 feet above the level of the sea. The principal government offices and courts are within the fort; also an English church, a public library, a medical museum, an hospital, a lunatic asylum, a well-arranged prison, besides hotels and numerous shops. A fine statue of Sir Edward Barnes has been recently erected.

The lake before alluded to being connected by canals with the Mutwal River, almost insulates the town. In the centre of the lake is a piece of land called Slave Island, covered with cocoa-nut trees, and easy of access from the town or fort by a small stone bridge. It is the head-quarters of the Ceylon Rifle regiment.

Colombo has a small semicircular harbour admitting vessels not exceeding 200 tons. Ships of larger burden anchor in the roads. The town is regularly built, with several streets, the chief of them running east and west, and the others at right angles to them. The houses are built of cabook, white-washed, and present a good appearance. The pithah, or black town, lies on the north side of the fort; it consists of two principal and several cross streets, some of which have a row of trees on each side.

Among the public buildings are the supreme court-house, and the various public offices. There is also a library belonging to the burghers, a small-pox hospital, a masonic hall, and a number of religious edifices. Trinity church was consecrated by the Bishop of Colombo in 1846. There are places of worship belonging to the Wesleyan Methodists and Baptists, the Dutch Protestants, and the Roman Catholics. The Dutch church, erected in 1746, is a lofty cruciform building, standing in the centre of the town. A college was established here some years back by the Bishop of Colombo for training native clergy, catechists, and schoolmasters. There are also the government academy or college, and several other schools, a savings bank, and many religious and benevolent institutions. The diocese of Colombo includes the whole island. The Bishop of Colombo has now an allowance of 2000*l.* a year from the East India Company.

The commerce, external and internal, which is very extensive, has been noticed under CEYLON. The exports to Europe are cinnamon, pepper, coffee, cocoa-nut oil, plumbago, cordage, arrack, cardamoms, elephants' tusks, deer horns, tortoiseshells, ebony, satin-wood, &c.; and the imports consist of articles of European manufacture. There are now at Colombo large establishments for crushing the cocoa-nut by steam power, and the manufacture of cocoa-nut oil, besides several native presses. The quantity of cocoa-nut oil now exported to England from Colombo is very great. At Colombo are fine cinnamon gardens; and between Colombo and Kandy is the government botanical garden.

The climate of Colombo, which is very salubrious, has been spoken of under CEYLON.

COLORADO RIVER. [CALIFORNIA; NEW MEXICO.]

COLSTERWORTH. [LINCOLNSHIRE.]

COLUMB MAJOR, ST., Cornwall, a market-town and the seat of a Poor-Law Union, in the parish of St. Columb Major and hundred of Pyder, is situated in 50° 24' N. lat., 5° 1' W. long., distant 12 miles

W. from Bodmin, and 244 miles W.S.W. from London. The population of the parish in 1850 is 1351, of this number the town probably contains about one-half. The living is a rectory in the archdeaconry of Cornwall and diocese of Exeter. St. Columb Poor-Law Union contains 16 parishes and townships, with an area of 71,126 acres, and a population in 1851 of 17,360.

St. Columb Major is a small town, but being placed on the slope of a hill which commands some interesting views, the situation is pleasant. The parish church is a spacious cruciform edifice, and has in the interior some curious specimens of early workmanship, and numerous monuments. The living of St. Columb Major is the richest benefice in Cornwall. The Wesleyan and Calvinistic Methodists have places of worship in the town. The market-day is Thursday; in summer there is also a market on Saturday. Fairs are held on the Thursday in mid-Lent and the Thursday after November 18th. In this parish is an extensive circular encampment called Castle-an-dinas.

COLUMBIA, DISTRICT OF, the seat of the government of the United States, lies on the left side of the Potomac, and is bounded on the N.E., N.W., and S.E. by the state of Maryland; the Potomac separates it from the state of Virginia, on the W. and S.W. Until 1846 it occupied a square of 100 square miles; but in that year the portion of the district on the right side of the Potomac was retroceded to Virginia, and the area of the district is now only 60 square miles. The total population in 1850 was 51,687, including 9973 free coloured persons and 3687 slaves. That part of the district which was on the right side of the Potomac was ceded by the state of Virginia, and that which is on the left side of the same river, by the state of Maryland, to the United States, July 16, 1790, when it had been determined to establish the seat of the Federal Government on the banks of the Potomac. Washington became the seat of the Federal Government in 1800. The government of the district is vested solely in Congress. The inhabitants send no representative to Congress, and have no voice in the election of federal officers.

The surface of the district is diversified by slight elevations; the soil is rather light and poor. The Potomac receives here a small affluent called the Eastern Branch, and by their junction a spacious harbour is formed for the largest vessels. The tide ascends as far as Georgetown. Excellent coach-roads, railways, and canals afford every facility for communication with the interior. Agriculture is chiefly directed to the supply of the city markets with vegetables and fruit; but wheat, rye, oats, and maize are raised in considerable quantities. In 1850 there were in the district 16,267 acres of improved and 11,187 acres of unimproved lands, which together were valued at 1,730,460 dollars. The number of farms was 264; the value of farming implements and machinery 40,320 dollars. The number of horses was 824, asses and mules 57, milch cows 813, working oxen 104, other cattle 123, sheep 150, and swine 1635.

In manufactures a capital of one million dollars is invested, and about 1000 persons are employed. There are two iron works, a cotton and a woollen factory, and a large number of small handicraft establishments.

The foreign commerce is inconsiderable. Georgetown is the only port: most of the commerce of this part of the river is centred in Alexandria, which lies on the right bank of the Potomac, and was the chief port of Columbia until ceded to Virginia in 1846. The number of vessels entered at Georgetown in 1850 was nine, of the aggregate burden of 1414 tons, and there cleared ten vessels of 1720 tons. The tonnage of the district amounted to 17,010 tons. The steam marine measured 1949 tons.

The towns of Columbia are WASHINGTON (38° 53' N. lat., 77° 1' W. long.), the capital of the United States, and Georgetown.

Georgetown, the port of Columbia, is separated from Washington by Rock Creek, but the towns are connected by several bridges. The town is built on undulating ground, which rises above the Potomac and is backed by heights on which are numerous handsome villas: the population in 1850 was 8366. The town has been much improved of late years, and is now a well-built place. It has several good public buildings, one of the most conspicuous of which is the Roman Catholic University, which has 160 students, a museum, and a library of 24,000 volumes. A square of five acres by the river side has a botanical garden in the centre, and on the sides the Roman Catholic bishop's palace, a neat chapel, convent, and schools. There are several churches and schools belonging to different sects, and several literary institutions. On the heights is a cemetery with a neat gothic chapel. In the town are a cotton factory, a rolling-mill, and several flour-mills. The commerce of the port has been noticed above. The Chesapeake and Ohio Canal is here carried across the Potomac by a magnificent aqueduct 1446 feet long and 36 feet above high-water mark. It is supported by nine massive granite piers: the cost of construction was two million dollars. Georgetown is connected by canal and railway with all parts of the Union.

The judiciary of Columbia consists of a circuit court, presided over by a chief judge with a salary of 2700 dollars, and two associate judges with salaries of 2500 dollars each; a criminal court, the judge of which has a salary of 2000 dollars; and an orphans' court, the judge of which has a salary of 1500 dollars.

COLUMBIA. [CAROLINA, SOUTH.]

COLUMBIA RIVER is the largest of the American rivers which fall into the Pacific, running probably more than 300 miles. Its numerous upper branches rise in the Rocky Mountains between 42° and 54° N. lat. and are at their source about 650 miles from the Pacific in a straight line. The principal branch rises in a lake near 50° N. lat., and runs first in a north-north-western direction along the base of the Rocky Mountains; but in the neighbourhood of Mount Brown (near 53° N. lat.) it suddenly turns to the south, and continues in that direction through more than three degrees of latitude till it meets another of its great branches, the river Clarke, which also rises in the Rocky Mountains near 45° N. lat., and traverses more than three degrees of latitude in a north-western direction. At the point of junction the Columbia turns to the west, but by degrees declines again to the south, so that at its junction with the river Lewis or Saptin, which also rises in the Rocky Mountains, it has a complete southern course. At their junction the width of the Columbia is above 3000 feet, and its level 1286 feet above the Pacific. Between the mouths of the Clarke River and the Lewis, in its passage through the Cascade Mountains, occur the greatest impediments to navigation. Not far below the mouth of the Clarke River are the Kettle Falls, 21 feet high; and above that of the Lewis are other cataracts, where the descent in 1200 yards is 37 feet 8 inches, and where the rapids extend from three to four miles. From the lowest of these rapids to the Pacific, a distance of 120 miles, the Columbia, though in many places obstructed by sand-bars, is navigable for vessels drawing under 12 feet of water. In this part it is from one to three miles wide, embracing a number of islands, some of which are of considerable extent. It empties itself into the Pacific a little north of 46°. At its mouth it is seven miles wide, but from each of the opposite points, Cape Adams and Cape Disappointment, there extends a sand-bar which renders the navigable channel very narrow. Throughout its course the Columbia receives a vast number of tributaries, some of which are considerable streams. The Columbia forms the boundary between the United States territories of OREGON and WASHINGTON. The Indian name of the river is Oregon.

COLUMBUS. [OHIO, State of.]

COLVILLE. [PRINCE EDWARD'S ISLAND.]

COLYTON, Devonshire, a small market-town in the parish and hundred of Colyton, is situated on the little river Coly, a feeder of the Axe, in 50° 44' N. lat., 3° 4' W. long., distant 22 miles E. from Exeter and 151 miles S.W. by W. from London. The population of the parish of Colyton, including the tithing of Colyford, in 1851 was 2504. The living is a vicarage, with the perpetual curacies of Moncton and Shute annexed, in the archdeaconry and diocese of Exeter. Colyton is pleasantly situated in a vale through which run the two small rivers the Axe and the Coly. The houses are built mostly of flint and roofed with thatch. The church is a cruciform edifice in the perpendicular style. In the interior are a fine stone screen and some interesting monuments. The Independents and Unitarians have places of worship. There is an Endowed school for 25 boys. The parish of Colyton contains much good dairy land, and the inhabitants are chiefly employed in agriculture. The market days are Tuesday, Thursday, and Saturday, and fairs for cattle are held on May 1st and November 30th. In the parish is the village of Colyford, which is incorporated, and has a mayor, who receives the profit of a large cattle fair held annually. Near the town is Colcombe Castle, once the seat of the Courtenays, earls of Devonshire, now converted into a farm-house.

COMANCE. [VIRGIN ISLANDS.]

COMBE MARTIN. [DEVONSHIRE.]

COMBER. [BHURTPUR.]

COMBRAILLES, a district in Lower Auvergne, in France. Its capital was Évaux. Combrailles now forms the eastern part of the department of Creuse. [CREUSE.]

COMMAGENE, a small but rich and fertile district in ancient Syria, was bounded N. by the Taurus, E. by the Euphrates, W. by the Amanus Mountains, which divided it from Cilicia, and S. by the great western bend of the Euphrates, and *Cyrrhestica*—a country which lay between the southern part of Amanus Mountains and the Euphrates in its southern course below Zeugma. Commagene was annexed to Syria under the Seleucids; but in the disorders that followed upon the dissensions of Grypus and his brothers it recovered its independence, which it maintained for upwards of a century. During this period it was ruled by kings. Upon the death of Antiochus III. A.D. 17, the kingdom of Commagene was reduced to a Roman province, but in A.D. 38 it was restored by Caligula to Antiochus IV., whose territories were enlarged by grants of a part of Cilicia, and afterwards of a part of Armenia, on account of his services under Corbulo in the Parthian War, A.D. 59. In A.D. 73 Antiochus was deposed on a charge of conspiring with the Parthians; and his kingdom was finally reduced to the condition of a province.

The district of *Cyrrhestica* (so named from one of its chief towns *Cyrrhus*, ruins of which are seen at the village of Khofos, about 30 miles S.W. from Aintab and near 37° E. long.), was united by Constantine to Commagene: the united territory which was called *Euphratenensis* was placed under a *Præses*, and had Hierapolis instead of Samosata for its capital. *Cyrrhestica* was the scene of the campaign between the Romans and Parthians, which ended in the utter defeat

of the latter under Pacorus, who was slain in the battle. The Romans were commanded by Publius Ventidius Bassus.

Commagene is now usually considered part of Asia Minor. *Cyrrhestica* is included partly in the pashalic of Aleppo, and partly we believe in the pashalic of Marash.

The chief town was Samosata, a fortified place, which contained a royal residence; it was the birthplace of Lucian. The Zeugma, or one of the great passes of the Euphrates, was in Commagene.

COMMENTRY. [ALLIER.]

COMMERCEY. [MEUSE, Department of.]

COMMINES. [FLANDERS, WEST; NORD.]

COMMINGES, a district of the former province of Gasconne, in France, which is now chiefly included in the departments of Haute-Garonne and Ariège. Among the towns comprehended in this district were St-Bertrand the capital, on the Garonne, and Lombes, which was formerly of episcopal rank; St-Girons, on the Salat, and St-Gaudens, on the Garonne.

COMO, a province of Austrian Italy, is bounded N. by the province of Valtellina, and the Swiss cantons of Grisons and Ticino, from which it is separated by several offsets of the Rhetian Alps; W. by the Lago Maggiore, which divides it from Piedmont, S. by the Milanese, and E. by the province of Bergamo. The length of the province from Mount S. Giori, on the frontiers of the Grisons, to the borders of the province of Milan, near Missaglia is about 40 miles. Its breadth is very irregular. The area is 1090 square miles, and the population according to the official returns of 1850 and 1851 was 423,206.

The east or larger division of the province incloses the whole length of the *Lago di Como*, the *Lacus Larius* of the Romans, a fine piece of water, long, narrow, and tortuous, shut in between shores which are richly diversified by numerous promontories, gulfs, and little bays. Its most northern extremity called Laghetto (or 'small lake') is joined to the other part by a narrow channel. At the junction of the Laghetto with the wide part of the lake, the Adda, coming from Valtellina, enters it on the east side. The lake then extends nearly due south for 15 miles; after which it divides into two branches: one to the south-west, which is about 18 miles in length, retains the name of Lago di Como, the city of Como being at the extremity of it; the other branch runs south-east for 12 miles, and is called Lago di Lecco, from the town of Lecco. The Adda issues out of the lake at Lecco. The breadth of the lake is very unequal; towards the middle, just above the separation of the two branches, it is about 3 miles, but in most other places it is only between one and two miles. A steamer plies between the city of Como and the several towns along the shores of the lake.

Two projections of the Rhetian Alps encompass the basin of the lake. One of these proceeding from the group of the Splügen runs parallel to the western shore, and divides it from the basin of the Lake of Lugano, the level of which is more than 200 feet above that of the Lake of Como: the highest summit in this ridge, called Monte S. Giori, or Iöri Berg, is about 9000 feet above the sea. The eastern ridge is an offset of the chain which divides Valtellina from Lombardy, and in Monte Legnone, to the north-east of the Lake of Como, rises to about 9000 feet above the sea; it thence runs south, parallel to the eastern shore of the lake, dividing the province of Como from the Val Brembana, in the province of Bergamo. These two ridges sink lower and lower as they advance to the south, until at last both merge into the great plain of Lombardy. They send out many offsets towards the lake, forming transverse valleys, which are drained by numerous streams that empty themselves into the lake. The neighbourhood of the Lake of Como is one of the most delightful regions of Italy, the climate being mild and genial, the soil productive in fruits and vegetables, and the country studded with thriving villages, with fine villas and mansions. Among the latter may be mentioned the Villa d'Este, in which Queen Caroline of England long resided, and on the east bank, near the pretty village of Torno, the villa called Pliniana, on account of the intermittent spring which Pliny the naturalist (ii. 103) describes, and which continues to exhibit the same phenomena: these are described also, though with some discrepancy, by the younger Pliny (iv. 30). On the promontory which divides the two branches of Lecco and Como, is Bellagio, where Pliny's seat, which he called 'Comædia,' is believed by some to have been, on account of the gay appearance of the landscape. His other villa, which he calls 'Tragædia,' was probably at Lenno, on the west bank, where the landscape is wild and stern. The most northern part of the province includes the lower heights of the Alps, which are covered generally with forests of larch, fir, birch, oak, and chestnut; while the slopes and valleys are covered with pasture. The southern declivities of the mountains are formed into terraces, and cultivated with great labour. At Bellagio also is the Villa Melzi, once inhabited by the vice-president of the Italian republic in the first years of Bonaparte's dominion. Farther north on the east bank is a fine cascade, called Fiume di Latte, with a glass manufactory near it; next comes Varena, in a sheltered warm situation, where the olive, vine, and orange and lemon trees, and other southern plants are seen thriving. Higher up on the same side is Bellano, at the entrance of the Val Sassina; a district subject to very cold winds from the Alps. A wild romantic spot in this neighbourhood, where the stream Pioverna forms a cascade among

the rocks, is called L'Orrido di Bellagio. Farther north is Colico, whence the high-road of the *Stato* begins, but it is now continued as far as Lecco. A branch road strikes off to the left near Colico, leading by Chiavenna to the pass of the Splügen. On the west shore are Donato, where the steam-bus from Como stops; Gravedona, a large village (3500 inhabitants), with the vast marble palace of the dukes d'Alvito; Dongo, with its iron mines and works; the castle of Munio, cut in the rock, where the Condottiere Gian Giacomo Medici of Milan, brother of Pope Pius IV., defended himself for eight months against all the forces of Francesco Sforza II., duke of Milan, whom he obliged at last to grant him 35,000 gold sequins, and a full amnesty, in 1532. Near Munio are quarries of white marble, of which the cathedral of Como is built. Lower down are Crenna, Remonico (Rhoeticum), and Menagio, another large village, whence a road leads over the mountains to Porlezza, on the north extremity of the Lago di Lugano, which here protrudes into the province of Como.

In the triangle formed by the two south branches of the lake are two ranges of hills, one parallel to each branch, both meeting in the promontory on which Bellagio stands. Between these ranges is the valley called Assina, in which the river Lambro, a feeder of the Po, has its source; here also are the town of Asso, the little lake of Sagrino, and the two villages of Castel Marte and Proserpio. At the south entrance of the valley stands the little town of Erba, in the middle of a plain encircled by hills, the southernmost of which form the group known by the name of Colline di Brianza, which extend between the Lambro and the Adda, and on the borders of the two provinces of Como and Milan, to within a few miles of Monza. These are the nearest hills to Milan, and the favourite resort of the wealthy Milanese in the summer and autumn. Among them are many mansions, country-houses, gardens, and cheerful villages. This district produces excellent wine, of which that of Mont' Orobio (a village which perpetuates the name of the Orobii, the most ancient inhabitants of this region) is the best; but it is not carefully enough prepared to be fit for exportation. Here and in all the southern part of the province, extending from the Adda to the upper valley of the Olona and the Lago Maggiore, the culture of the white mulberry-tree and the rearing of silk-worms form a most important branch of industry; and nowhere is the preparation of raw silk for manufacturing use better understood than here. In the environs of the city of Como there are great pine-forests. The cypress flourishes in many parts of the province. The roads are good, as they are in all Austrian Italy. There is a branch railroad from Como to Milan through Monza.

The western part of the province of Como consists of the district of Varese and the east coast of the Lago Maggiore. Varese is a bustling town with above 8000 inhabitants and several silk factories. It stands near the little lake of Varese, in a fine hilly country, where some of the best silk in Lombardy is produced. The lake is about five miles long and two miles wide at its greatest breadth. This is another favourite place of resort with the Milanese, and is full of handsome country-houses. On a steep hill north of Varese is the sanctuary of La Madonna del Monte, to which the country people resort in the month of September. A road leads from Varese to Laveno, whence boats cross over the Lago Maggiore to Pallanza in Piedmont. On the Como side of the lake is Luvino, near the river Tresa, an outlet of the Lake of Lugano into the Lago Maggiore. The district of Cuvio, or Valcuvio, not far from Luvino, has been drained of an extensive marsh. To the east of Valcuvio, and separated from it by a range of hills, is Viconago, on the west bank of the Lake of Lugano, which on this side touches the province of Como, and where are lead-mines and works. Towards the Milanese the hills gradually sink, and the southern verge of the province of Como merges into the great plain of Lombardy. The districts of Tradate and Appiano are situated at this end.

The province of Como is well cultivated; it produces corn, wine, fruit, and silk. The lake abounds with fish, especially of the trout species. The people are industrious, and elementary education is very widely diffused among them. A great number of young men from the mountain districts emigrate in quest of employment; many follow the trade of masons and lapidaries as in ancient times, when, under the Lombard kings, master-masons in Upper Italy were generally styled 'magistri Comaceni'; others go to various countries as pedlars, carrying barometers, spectacles, looking-glasses, &c., which are manufactured at Como.

The province of Como is divided into 26 districts and 528 communes. In each commune there is at least one elementary school; and there are also several holiday schools, charitable foundations, and private schools authorised by the government. The civil, criminal, and commercial courts for the whole province are held at Como.

Besides the capital, Como, which is noticed in the next article, there are hardly any places in the province deserving of special notice. The villages are numerous, but their population is seldom above 3000, and in many cases it is not so much as 1000. The following however may be here given:—Lecco, about 17 miles E. from Como, at the point where the Adda emerges from the Lago di Lecco, has about 5000 inhabitants, who manufacture silk, cotton, and woollen stuffs. Mariano, 10 miles S.S.E. from Como, has about 4000 inhabitants.

COMO, the capital of the province of Como in Italy, is situated at the south-west extremity of the lake of Como, surrounded by hills on which

are several old castles, in 45° 45' N. lat., 9° 6' E. long., 22 miles N. by W. from Milan, and has a population of 20,000, including the nine suburbs. The railway to Milan (25 miles in length) commences at Camerlata, about a mile south of the town. The city of Como is surrounded by old walls flanked with towers and pierced by lofty gateways, which are remarkably fine specimens of the military architecture of the middle ages. The streets are wide and regular, and the houses well built; a harbour is formed in the lake by two piers, each terminating in a square pavilion, the view from which over the tranquil waters of the lake, and the bright cheerful scenery along its shores, is peculiarly interesting. The suburb of Vico, to the north of the town, abounds with pleasant walks and villas; among the latter the Villa Odescalchi is the most splendid. The suburb called Borgo di San Augustino is the manufacturing quarter of Como. Como gives title to a bishop.

Among the twelve churches of the city, almost all of which are decorated with fine paintings, the cathedral is the most celebrated. This very beautiful building was commenced in 1396, but the cupola or dome was not completed till 1732. In a work so long in construction it might be expected that different styles and tastes might be exhibited, but this is not the case; the building belongs to the Italian gothic, and it is surpassed only by the Duomo of Milan and the Certosa of Pavia. The edifice was built entirely by the voluntary contributions of the townspeople, and is a noble monument of their piety. The exterior is cased with white marble. The pilasters and other portions of the façade are covered with curious religious symbols in bas-relief—the fountain, the vine, the lily, the church upon a hill. In the arch above the portal is represented the Adoration of the Magi in large bas-reliefs. But the most remarkable ornaments of the façade are statues of Pliny the Elder and his son, who are claimed by the Comaschi as 'fellow citizens,' and are enthroned under ornamental canopies. The lateral fronts are also richly and tastefully ornamented; the doorways particularly are admired for the delicacy and finish of their sculptures and carving. The interior is spacious, and has a very imposing effect. It is lighted through stained-glass windows. The groining of the vault is painted and gilt. The numerous altars and other parts of the building are adorned with valuable paintings. The baptistry is attributed to Bramante. The cathedral has two fine organs. Adjoining the cathedral is the Broletto, or town-hall, which is constructed with red and white marble in alternate courses. This building, completed in 1215, consists of a loggia upon open pointed arches, with a floor above lighted through large, round-arched windows, the central one of which is projected, and from this spot the members of the municipality of Como used in the olden times to address the parliaments or assembled democracy. This building is surmounted by a belfry tower.

Como has an imperial and royal lyceum, the front of which is adorned with busts of the worthies of Como; it contains a good library, reading-rooms, a collection of natural history, a chemical laboratory, &c., and is a handsome building. There are besides in the city a gymnasium, a diocesan school for theological students, a college for boarders called Gallio, and an institution for female education under the direction of the nuns of St. Francis de Sales. The church of S. Fedele is still older than the cathedral; both this church and that of S. Abondio, which contains the tombs of several bishops of Como, date from the time of the Lombard kings. They are both remarkable for their rude ornamentation—serpents, griffins, lions, &c. The interiors of both have been somewhat modernised. The palace of the Giovin family, called *Aedes Jovine*, has a collection of ancient inscriptions placed under its portico and round the court. The theatre is also a handsome building with a good façade; it stands upon the site of the old castle, and adjoins the lyceum. On a hill above Camerlata, near the road to Milan, is the old tower Del Baradello in which Napoleone della Torre, the popular chief and lord of Milan, being defeated by his rival Ottone Visconti in 1277, was shut up in an iron cage, in which he died after nineteen months' confinement. Como is the native country of the two Plinys; of Paolo Giovin, and his far more worthy brother Benedetto Giovin, the historian of Como, whose monument is in the cathedral; of Piazzi, the astronomer; of Pope Innocent XI.; and of Alessandro Volta, the great discoverer in electricity, to whom a statue by Marchesi is erected in the Piazza Volta.

Comum is said to have been built by the Orobii, the oldest known inhabitants of the country. It was afterwards occupied by the Gauls with the rest of Insubria. In the year B.C. 196 M. C. Marcellus, having defeated the Boii and the Insubres, occupied Comum. The place was afterwards ravaged by the Rhodians. C. Pompeius Strabo, father of the great Pompey, sent a colony to Comum; and Cæsar is said to have sent a fresh colony, among whom were 500 Greeks of distinguished families. It then assumed the name of Novum Comum. After the fall of the empire Como passed under the Goths, Longobards, and Franks, and became at last an independent municipal community. It was one of the chief towns of the Ghibellines in Lombardy, and as such quarrelled repeatedly with the Milanese, who took it after a long siege, and burnt it in 1127. It was afterwards gradually rebuilt where it now stands.

Como has several considerable manufactories of silk, woollens, and soap.

COMORN, or **KOMORN**, a royal free town and fortress in Hungary, situated at the extreme extremity of the island of Schütt, opposite the mouth of the Danube into the Danube, in 47° 45' N. lat., 18° 1' E. long., and has about 20,000 inhabitants. The town is irregularly built, and the streets are dark and narrow; but it is well situated for trade, and carries on to a great extent in grain, honey, wine, timber, and so forth. It contains four Roman Catholic churches, of which the most important is of considerable dimensions, two places of worship, a Greek church, and a synagogue; a council-house, a Roman Catholic and Protestant gymnasium, grammar-school for the citizens, and an hospital. To the east of the town, at the point where the Waag and Danube form a junction, stands the massive fortress of Comorn, which is defended by extensive works and 1500 men on both banks of the Danube; it was founded by Matthias Corvinus, and has been re-built and rendered one of the strongest places in Europe by the additional fortifications erected since 1805. The town itself is included within the modern defences. The Danube is crossed at this spot by a bridge of boats. Comorn became celebrated towards the close of the Hungarian insurrection for its defence against the Austrians. Its surrender or capitulation to the Austrians on the 28th of September, 1849, put an end to the insurrection.

COMORO ISLES, a group of four islands in the Mozambique Channel, between Africa and the north-west coast of Madagascar. *Comoro*, the largest of them, is about 30 miles long, and 12 miles broad. Fat bullocks, sheep, and goats are cheap; oranges, lemons, and plantains abundant. No spring-water is to be had on this island, which is seldom visited by Europeans. There is a large town with a landing-place for boats on the east side of it. *Mohilla*, the smallest of the group, is about 30 miles S.E. by S. from Comoro; it contains several villages, and abundant supplies of water and provisions. The coast is dangerous on account of the reefs and the surf; but there are two tolerable anchorages. *Mayotta*, the most southern of the islands, is entirely surrounded with reefs; provisions and water can be had, but there is danger in attempting to land. This island has been held by France since 1841. *Johanna*, or *Anzouan*, or *Hinzuan* is the best known of the group, having been long frequented by European ships for the purpose of getting provisions on the outward voyage to India. At the town of Machadou on the coast there is good anchorage; and water and other provisions may be obtained. The island has 12,000 inhabitants, who trade in slaves and the produce of the island with the coast of Arabia, from which they carry back Indian piece-goods and other commodities. Small fat bullocks, poultry, rice, yams, sweet potatoes, pine-apples, oranges, guavas, and other fruits are given to ships' crews in barter for red and blue cloth, apparel, nails, iron, razors, knives, beads, looking-glasses, muskets, cutlasses, gunpowder, flints, &c. The sultan of the islands resides at Machadou, which has 3000 inhabitants. The population of the islands is said to be diminishing in consequence of the incursions of pirates from Madagascar, who carry the people away into slavery. The group is of volcanic origin, and contains several peaked mountains, one of which in *Johanna* is 6000 feet high. Except on these summits the soil is very fertile. (Sir W. Jones; Horsburg, *Directory*; Macgregor, *Statistics*; Balbi, *Géographie*.)

COMPIÈGNE, a chief town of arrondissement in France, in the department of Oise, is situated on the left bank of the river Oise, just below its junction with the Aisne, 36 miles E. from Beauvais, and has 8986 inhabitants, including the whole commune. It is a first class station on the railroad from Paris to St. Quentin, from which it is distant 65 and 46 miles respectively. The St. Quentin line leaves the Northern-of-France railway at the Creil junction, 23 miles S.W. from Compiègne. The town is ancient; most of the streets are ill-built; and there are few good houses except in the neighbourhood of the palace and the Rue St. Corneille. The churches of St. Jacques and St. Antoine, and the town-house are fine buildings, and remarkable for their sculptured decorations; the new theatre and the bridge over the Oise are handsome structures. But the edifice which renders Compiègne eminently worthy of being visited is the magnificent palace built here by Louis XV., according to the designs of the architect Gabriel. It is surrounded by extensive gardens, adjoining which is a forest containing 37,000 acres. This palace was the residence of Charles IV. of Spain and his queen, during the first part of their captivity in France. Here Napoleon and Maria Louisa, archduchess of Austria, first met on occasion of their marriage in 1810. The present emperor of France, Napoleon III., occasionally visits Compiègne. The palace has electro-telegraphic communication with Paris. Hosiery, cotton-yarn, and ropes are made, and boats for the navigation of the Oise are built in the town. There is a considerable trade carried on in corn and wheat. The town has a college, a tribunal of first instance, and a public library.

Compiègne originated in a hunting seat called Palatium, erected and much frequented by the early kings of France. Charles the Bald gave the town the name of Carlipolis, and founded there the abbey of St. Medard. Clothaire I. died here in A.D. 561. A parliament was held in Compiègne in 757. Louis le Debonnaire here surrendered (840) to his son Lothaire. In 877 Louis le Begue was crowned at Compiègne, where he also died and was buried. Carloman assembled the nobles of France at Compiègne in 884 to devise measures to check

the ravages of the Northmen; and at a parliament held here in 888, composed of the bishops and grandes of France, Rudes count of Paris was chosen king. Louis V., the last king of the second race, was crowned and died at Compiègne. At a general assembly convoked at Compiègne in 1022, Hugues, the eldest of the sons of Robert, was raised to the crown in conjunction with his father. The town obtained a charter in 1322. In the wars between the Bourguignons and the Armagnacs, Compiègne was seized by the former; but they were forced to surrender in 1414 to Charles VI., who held it till 1417, when the English and the Bourguignons entered the town without resistance. The town afterwards opened its gates to Charles VII., who was besieged in it by the English. It was in a sally from Compiègne upon this occasion that Jeanne d'Arc was taken prisoner.

COMPLUTUM. [ALCALÁ DE HENARES.]

COMPOSTELLA. [GALICIA.]

COMPTON, LONG. [WARWICKSHIRE.]

COMRIE. [PERTSHIRE.]

COMTAT D'AVIGNON, LE, a county in France, which originally extended along the Rhône and the Durance from the city of Avignon, which it included, to the town of Tarascon. A portion of this territory, subject to the Pope from 1348 to 1791, comprised only the city of Avignon, the village of Morières, and the parish of Montfavet. The Comtat d'Avignon in this restricted sense is now included in the department of Vaucluse.

COMTAT VENAISIN, LE, a small province in Provence, which before the first French revolution formed with the county of Avignon an independent state, the sovereignty of which was vested in the Pope. It took its name from Venasque (Vindiscina), now a poor village but formerly an important town, which was its capital; and gave title to a bishop till the 11th century. This county formed part of the kingdom of Arles, and subsequently of the marquise of Provence. In 1225 it fell to the count of Toulouse, in whose family it remained till 1229, when Raymond VII. signed a treaty in Paris ceding all the territories he possessed to the east of the Rhône to the Holy See. Gregory IX., then pope, renounced the grant in favour of the count; but Gregory X., after the estates of the counts of Toulouse fell by succession to Philippe le Hardi, king of France, insisted upon the fulfilment of the treaty, and Philippe made over the territory in question to the Pope in April, 1274. By a decree of September 14, 1791, the county was re-united to France, and it now forms about two-thirds of the department of Vaucluse. From the time of François I. the inhabitants of the county were considered as Frenchmen.

The capital of the county whilst it was under the Holy See was Carpentras; other towns were Valréas, Cavaillon, and Vaison. The county was governed by an officer called Recteur, who was assisted by a general assembly, which met every year at Carpentras. The Roman law and the Papal constitutions were in force in the country whilst it was subject to the Pope. [VAUCLUSE.]

CONCAN, NORTH AND SOUTH, a maritime district of Hindustan in the Bombay presidency, extending from the sea to the Western Ghaut Mountains, which form its eastern boundary. Its length from north to south is about 220 miles; its breadth in no part exceeds 50 miles, and on the average is 35 miles. The entire area is estimated at 12,270 square miles. The district includes many fertile places, which yield abundant harvests of rice: sugar, spices, cocoa-nuts, and hemp are also produced; but the surface is in general very rough, and much intersected by steep and rocky hills. The mountain range is from 2000 to 4000 feet high, and exceedingly abrupt on the west: the passes are numerous but steep, and very seldom practicable for carriages. The northern part of the chain of ghauts and that part of this district which lies at the base is inhabited chiefly by Bheels. More to the south the country is inhabited by Coolies, who are less predatory in their habits and altogether more civilised than the Bheels. The Bheels live quietly when in the open country, but resume all their wildness in places that are strong either from hills or jungle. They are small of stature and black; they wear few clothes, and are usually armed with bows and arrows.

The Northern Concan, which extends from the district of Surat on the north, or about 20° 20' to about 18° 50' N. lat., was ceded to the British in 1817; and the Southern Concan, which extends farther in the same direction to about 16° N. lat., was obtained partly by cession and partly by conquest in 1817 and 1818. A great part of the Northern Concan was once held by the Portuguese, who divided the lands into large estates. These estates were given to Europeans, whose opulence is proved by the remains of many splendid public buildings and private dwellings which they erected, some of which are still standing in places which are now mere wastes. The district is traversed by numerous mountain streams, but has no river of magnitude. It contains along the coast many small bays and harbours. The land and sea breezes blow alternately during the 24 hours. The Northern Concan is divided into 46 pergunnahs, containing 2111 villages. The Southern Concan comprises 47 pergunnahs and 2291 villages. The whole population is estimated at rather more than a million. Five-sixths of the inhabitants are Hindoos. The roads throughout the district are little more than paths, excepting near the sea-coast, where, at some of the more difficult and precipitous places, steps of an easy ascent have been constructed, mostly at the expense of private individuals.

CONCEPCION. [CHILL.]

CONCEPTION BAY. [NEWFOUNDLAND.]

CONDE. [CALVADOS; NORD.]

CONDOM. [GERS.]

CONDOMOIS, a district in the south of France, was a dependency according to some of Gascogne, to others of Guienne. It was bounded N. by Agenois, of which it originally formed part; S. by Armagnac; and E. by the Lomagne. The capital was Condom: other towns were Nérac and Gabarret. Condomois now forms the most northern part of the department of Gers, the most southern part of Lot-et-Garonne, and the most eastern part of Landes. In Julius Cæsar's time the territory of Condomois was inhabited by the Nitobriges, and was included in Aquitania. From the Romans it passed to the Visigoths, and subsequently to the dukes of Gascogne and Guienne. In the reign of Charles VII. it was united to the crown of France along with the Bordelais and the rest of Guienne.

CONGLETON, Cheshire, a market-town, municipal borough, and the seat of a Poor-Law Union, in the parish of Astbury and hundred of Northwich, is situated in 53° 10' N. lat., 2° 11' W. long., distant 33 miles E. from Chester, 162 miles N.W. by N. from London by road, and 170 miles by the North-Western and North Staffordshire railways. The population of the town of Congleton in 1851 was 10,520. The borough is governed by 6 aldermen and 18 councillors, one of whom is mayor. The living is a perpetual curacy in the archdeaconry and diocese of Chester. Congleton Poor-Law Union contains 32 parishes and townships, with an area of 50,357 acres, and a population in 1851 of 30,508.

The town of Congleton is about a mile in length: many of the houses are constructed of timber frame-work and plaster. The situation of the town is extremely picturesque; it is embosomed in a deep valley on the banks of the river Dane, and is surrounded by fertile fields inclosed by well-timbered hedge-rows, which at a distance give the appearance of a miniature forest. Numerous mansions stand at the west end of the town, and have ornamental gardens and shrubberies attached. The guildhall is a commodious brick building, erected in 1804 on the site of the old hall. The market-hall and assembly-room was erected in 1822 at the expense of Sir E. Antrobus of Eaton Hall, Astbury. Some have supposed that the Romans had a military station at Congleton. In Domesday Book it appears to be written Cogleton. From ancient burgh records it appears that bear-baiting was at one time a favourite amusement with the inhabitants.

There are three churches belonging to the Establishment. St. Peter's, a plain building, neatly fitted up in the interior, was rebuilt in 1740, with the exception of the tower, which was then repaired only, and had a clock placed in it with four dials. St. Stephen's, a neat brick edifice, will accommodate about 1000 persons. St. James's is a new building in the style of the 13th century. The Baptists, Independents, Wesleyan, Primitive, and New Connexion Methodists, Unitarians, and Roman Catholics have places of worship. The Free Grammar school, founded in 1590, had 36 scholars in 1851. There are several National and Infant schools, and schools connected with some of the Dissenting chapels. In the town are an Athenæum news-room and library, and a savings bank. A county court and petty sessions are held here.

The Macclesfield Canal passes through Congleton. At one period the chief manufactures of Congleton were gloves, and tagged-leather laces called 'Congleton points,' but for nearly a century the silk manufacture has been the principal occupation. The making of silk ribands has of late years grown into an important branch of industry, in which females as well as males find employment. In the neighbourhood are several extensive coal-mines. The market-day is Saturday. Fairs are held on the Thursday before Shrove-tide, on May 12th, July 12th, and November 22nd, for cattle, Yorkshire woollen cloths, and pedlery. The Congleton viaduct of the North Staffordshire railway, about half a mile from the station, is a fine work of ten arches. It is constructed of blue brick with stone bastions and stone parapet. The arches are 50 feet in span. The height from the bed of the stream to the rails is 114 feet; the length of the viaduct, exclusive of the embankments, is 231 feet.

CONGO. This name, in its most extensive application, as explained under the word ANGOLA, comprehends the whole of the region lying along the western coast of Africa, which is more correctly divided into the four kingdoms or districts of Loango, Congo Proper, Angola, and Benguela. In this large and loose sense it extends from Cape Lopez Gonsalvo, in 0° 44' S. lat., to Cape Negro, in 15° 40' S. lat. Congo, properly so called, however, at least according to its modern limits (for it is said to have been more extensive formerly), does not stretch to the north beyond the river Zaire (otherwise called the Congo), in about 6° S. lat., which separates it from Loango, nor to the south beyond the river Dando, in 8° 20' S. lat., which separates it from Angola. It is believed to extend a considerable distance into the interior, but we have no distinct information respecting its limits in that direction, and they are probably not very definitely marked.

The first European who reached Congo was the Portuguese navigator, Diego Cam, who made his way thither from Elmina in 1484. Diego revisited the country in 1489, making his voyage on that occasion from Portugal. The following year another armament arrived

from Portugal, under the command of Ruy de Souza. After this the king of Congo and many of his subjects made professions of Christianity, and the Portuguese formed considerable establishments in the country. It was in the course of the 17th century however that the most strenuous endeavours were made in the work of converting the natives. Ample accounts of the proceedings of the Portuguese missionaries are given in the 'Voyage' of Michel Angelo di Gattina and Dionisio Carli di Piacenza, two Capuchin friars, who set out to join the mission in Congo in 1666; in that of Geronimo de Almeida Sorrento, another Capuchin, who joined the same mission in 1673; and in a work drawn up by Filippo Pigafetta from the journal of Duarte Lopez, a Portuguese captain, about 1589. Various information about the country is given also in Purchas, Hakluyt, and other English collections. But it may be added, that although much has been written about Congo, not much is really known about the country.

According to the old accounts, the native division of Congo into the six provinces of Bamba, Sogno (or Sonio), Sondi, Pango, Batta, and Penda. The Portuguese however appear to have divided the country into what they called the metropolitan province of San Salvador, the duchy of Bamba, the duchy of Sondi, the marquisate of Pango, and the county (or earldom) of Sogno, thus uniting altogether Pango and Batta, or comprehending them under some of the other names. The Portuguese province of San Salvador is a part of the native province of Pango, the marquisate of Pango being the remainder. It is placed along a portion of the left bank of the river Congo, immediately to the north-east of Sogno, which occupies the angle formed by the river and the sea-coast. In this province is the capital, called Banza Congo, or 'chief town of Congo.' The Portuguese having established a settlement here, gave the place the name of San Salvador. It is described as situated about 150 miles from the sea, and about a third of that distance from the river, in a hollow on the south-east side of a lofty mountain, having on the summit a plain of about ten miles in circuit, which is covered with towns and villages. The palace of the native sovereign and the Portuguese part of the town are each surrounded by an inclosure of about a mile in circumference; but the suburbs of the Portuguese town are described as also of considerable extent. The principal ornaments of San Salvador were—a cathedral and nine or ten other churches, all built of stone, although, with the exception of that of the Jesuits, roofed only with thatch. The religious establishment consisted of a bishop and chapter, a Jesuits college, a convent of Capuchins, &c. It appears however that even before the end of the 17th century the ravages of war had almost ruined San Salvador, and the native sovereign had transferred his residence to another place, called Leimba, in the province of Bamba, and nearer the sea-coast.

The Congo River was formerly supposed to be the embouchure of the Niger; but long before this point was settled, the soundest geographers were of a different opinion, although Captain Tuckey's expedition (of which a 'Narrative' was published in London in 1818), was undertaken with the view of ascertaining the matter; and in the official account of the voyage the identity of the two rivers is elaborately contended for by a writer who declares that "the hypothesis which makes the Niger to pour its waters into the Gulf of Benin is entitled to very little attention." The Congo is not properly called the Zaire, it seems, as Diego Cam was led to suppose (that being merely a word signifying any great river), but the Moienzi Enabadi, which means the river that swallows up all other rivers. The old accounts represent the velocity with which it rushes into the sea to be so great that it preserves its stream unaffected by the salt water for twenty leagues or more. This description Captain Tuckey found reason to believe considerably exaggerated. It had been usually stated that the Congo was always full of water; but when he entered it, in the beginning of July, he found it from eight to eleven feet lower than the point which from the marks on the rocky banks it appeared to have reached at other seasons. The tide also was very perceptible at 140 miles up the river. The velocity of the current at the mouth of the river was found nowhere to exceed 4½ or 5 knots an hour, and in many places it was not more than 2½. The accounts of some preceding navigators make it flow at the rate of six or seven knots, and so it very possibly may do when the channel is more full of water. The depth however in the middle of the stream here was very great, no bottom having been found with a line of 160 fathoms; so that when the river is at high flood the mass of water which it pours forth must be immense. Its breadth for some distance from the sea is not less than five or six miles; it is then divided by a number of islands into several streams: at the distance of 140 miles from the mouth the 'Narrows' commence, and continue for about 10 miles, during which it forces its way between two opposite banks of steep rocks, not more than from 300 to 500 yards asunder. Long ledges of rocks stretch across this part of the river, the most formidable of which however, called the Great Yellala, or Cataract, has a fall of only about 30 feet in 300 yards, and would be more appropriately designated by the term 'Rapid.' Above the Narrows, which terminate at a place called Inga, the river expands to a breadth of two, three, and even four miles. Tuckey ascended it for about 100 miles beyond this point, and he was assured by the natives that after this there was no impediment to its continued navigation for a great distance. In this direction,

according to their account, continued to be nearly in a straight line towards the north-east; and Tuckey appears to have felt convinced that it must have its source in some vast lake or chain of lakes several degrees to the north of the equator. Much surprise was experienced at finding that it did not receive the water of any other stream in the whole distance along which the survey extended. The old delineations of the river, it is to be observed, also represent it as without any tributaries in this part of its course; but they make numerous rivers to flow into it higher up. The torrents that pour down in the rainy season however, through the ravines between the hills on both sides of it, probably bring it a considerable supply. In the lower part of its course the Congo spreads out into extensive swamps, which are covered with mangrove and palm-trees, as are also the islets by which it is here interrupted; above the swampy region, hills, none of which much exceed 2000 feet, rise at a short distance from the channel. Up to the great Yellala these hills are stony and nearly barren, and the rocks at the Narrows are composed of masses of micaceous slate; but beyond this point the rocks are of limestone, and the country is described as fertile and beautiful. Even below this however, between the hills and the water, vegetation is in many parts very luxuriant, and numerous villages are to be seen both in the hollows and even on the flat summits of the mountains. The old maps make five or six smaller rivers fall into the sea between the Congo and the Dando.

The climate is hot and unhealthy along the coast, but temperate and salubrious in the interior. The range of the thermometer in the period of a month during Captain Tuckey's survey, from about the middle of July to the middle of August, was never below 60° during the night, nor above 80° during the day; the common noon-day heat was 76°. Among the vegetable products (for many of which the natives must have been indebted to the Portuguese) are mandioc or cassava, yams, maize, sweet potatoes, pumpkins, millet, calavanses, cabbages, spinach, pepper, capsicum, the sugar-cane, and tobacco. Of fruits they have the banana, the papaw, the orange, the lime, and the pine-apple, which last Captain Tuckey found growing in the open places at the extreme point to which he penetrated. Wine is made from the juice of the palm-tree, which is described as an agreeable and a wholesome drink. Of domestic animals there are goats, hogs, fowls, ducks, and pigeons, as well as a few hairy sheep. There are also some horned cattle. Of wild animals, the country abounds with elephants, leopards, lions, buffaloes, large monkeys, antelopes, wild hogs, &c. Guinea fowl and red-legged partridges are abundant, large, and fine; and wild pigeons, of three or four species, very plentiful. Bees are in great numbers; the flea and the bug were the only insects that were found troublesome. The lower part of the river Congo abounds in different species of fish, which form an important part of the subsistence of the people; it also, especially above the Narrows, swarms with hippopotami and crocodiles.

The native sovereign of Congo resides at Banza Congo, six days' journey southward from the river. Under the king are the Chenooks. "The Chenookships," says Captain Tuckey, "improperly named kingdoms by Europeans, are hereditary fiefs, passing in the female line, that is, on the decease of the Chenook the succession instead of passing to his son goes to his brother, or uterine uncle or cousin." Of the inferior officers, the chief is the Mafook, or collector of the customs, who is generally qualified to act as an interpreter to the European visitors of the coast. These functionaries used to amass considerable wealth by giving their services as agents to the slave traders who formerly resorted to Congo. A place called Embomma, on the north bank of the river, and about 50 miles from its mouth, was the great slave mart.

The natives of Congo cultivate regularly two crops of Indian corn in the year. Rights of property are well understood among them. But their houses are mere huts constructed of a few posts stuck in the ground and interwoven with reeds; and they go naked, with the exception of a small apron, generally of grass-matting, tied round their loins. They tattoo their bodies and file away the two upper front teeth. They seem to be a timid and unwarlike race, and both their inclinations and their sensuality are extreme. Their women are their drudges in all kinds of laborious work, and, not excepting the sisters, daughters, and wives of the highest personages, are eagerly offered by them for a trifle to a white man of any grade. Their sense of the white being a race of beings altogether distinct from themselves seems to be complete. They scarcely appear to have gained a step towards civilisation by their intercourse with the Portuguese.

The language of Congo, which is a dialect of that of Angola, Benguela, and the other neighbouring districts, is (it is said) radically the same as that spoken by the natives of the east coast of Africa. This was first noticed by Mr. Marsden (author of the *History of Sumatra*), and the statement is corroborated by the lists of Congo words collected by Captain Tuckey.

CONI, properly CUNEO, an administrative division of Piedmont, is bounded N. by the division of Turin, E. by that of Alessandria, S.E. by the Apennines and the Maritime Alps, which separate it from Genoa, Nizza (Nice), and France. Its greatest length from east to west is 69 miles, from north to south 58 miles. The area is 2710 square miles, and the population in 1848 amounted to 600,872. The surface presents mountain ridges springing from the

Alps and Apennines, all converging to the basin of the Po, and inclosing valleys of great fertility, which yield corn, maize, wine, silk, pulse, hemp, and fruits. The white mulberry-tree is cultivated with great care and success for the rearing of silk-worms, which gives profitable employment to great numbers of the peasantry. The lower slopes of the mountains are covered with forests of chestnut; and their higher parts afford abundant summer pastures, on which great numbers of cattle are fed. Iron, lead, marble, slates, mineral salt, &c., are found.

The rivers are numerous. They are all tributaries of the Po, which, rising from the eastern side of Monte Viso, flows east to within a short distance of the town of Saluzzo; it then turns north-east and enters the province of Torino or Turin. The Vraita flows east from the Maritime Alps as far as Castiglione, whence it turns north, and enters the Po on the right bank, a little above Carmagnola. The Maira rises also in the Maritime Alps, and flows in a direction parallel to that of the Vraita, and enters the Po about 2 miles nearer Carmagnola. The next river to the south is the Stura, which flows parallel to the preceding as far as Fossano, where it turns north-north-east, and enters the Tanaro on the left bank near Cherasco; its principal affluent is the Vermegnana or Geaso, which enters it on the right bank below Cuneo. The Tanaro, rising in the Maritime Alps a little east of the Col-di-Tende, flows nearly due north at a little distance west of an offshoot from the main chain as far as Cherasco, where it passes through a gap to the eastern side of the ridge, passing the towns of Alba and Asti; from the latter it runs east to a little below Alessandria, near which it receives from the Apennines the Belbo and the Bormida increased by the Orba from the right bank, and then turning north-east enters the Po about 7 miles north of Marengo. From Asti the Tanaro is navigable for barges, but with some difficulty, owing to the rapidity of the stream at some points. A railway runs from Turin through Savigliano to Fossano in the administrative division of Cuneo. The line will probably be continued to Cuneo.

The division of Cuneo consists of four provinces, which, with the area, mandamenti, and population of each, are as follows:—

Provinces.	Area in sq. miles.	Mandamenti.	Population in 1848.
Cuneo . . .	1003	18	179,636
Alba . . .	408	12	118,844
Mondovì . . .	679	18	148,450
Saluzzo . . .	620	14	153,942
Total . . .	2710	62	600,872

The Province of Cuneo contains 67 comuni, and occupies the south-western portion of the division. The chief town is Cuneo, which stands on the right bank of the Stura, 47 miles S. from Turin, and has, including the garrison, about 20,000 inhabitants. It is the seat of a bishop, and the residence of the intendant-general of the whole division; is well built, and has a cathedral and several other churches, a royal college, town-hall, theatre, and public baths. It is a busy place, and has cloth and silk factories, and a considerable trade in the produce of the country by means of the canal joining the Stura and the Po, which runs from this town to Carmagnola. The city was strongly fortified in 1800; its defences were dismantled by the French after the battle of Marengo. It is still however inclosed by a wall. Busca, on the left bank of the Maira, stands at the foot of a hill, in a rich wine district, and has 9000 inhabitants. Boves, S. of Cuneo, at the foot of mountains in which iron mines and marble quarries are worked, has 8709 inhabitants. Caraglio, 6 miles W. from Cuneo, has a college, some silk manufactures, and a population of 7000. Chiusa, on the left of the Pesio, a feeder of the Tanaro, has 5800 inhabitants, who manufacture silk and glass. Demonte, a fortified town, 15 miles W.S.W. from Cuneo, on the left bank of the Stura, has a population of 6956, including the whole commune. The town is defended by a strong fortress which commands the valley of the Stura and road to France by the Col-d'Argentiere. The fort was taken by the French and Spaniards in 1744, and destroyed on their retreat from Cuneo. It has been since rebuilt. Dronero, 10 miles W.N.W. from Cuneo, on the Maira, which is here crossed by a handsome bridge, has a college, and a population of 7716. Fossano, on the left bank of the Stura, 15 miles N.N.E. from Cuneo, 37 S. by E. by railway from Turin, is a well-built town, with a royal college, a handsome cathedral, silk factories, paper-mills, and tanneries. The town, which is inclosed by old walls, stands on a hill, the summit of which is surmounted by an old castle. The streets are rather gloomy, the houses being built over arcades, which form the footways. It is the seat of a bishop, and has 16,041 inhabitants, who trade in corn, hemp, and cattle. Limone, at the foot of the Col-di-Tende, and near the source of the Vermegnana, has 3500 inhabitants, who are employed as guides, and in keeping in repair the terraced roads over the neighbouring mountains. Peteragno: population, 6080.

The Province of Alba, before described, occupies the north-eastern part of the division, and contains 77 comuni. [ALBA.]

The Province of Mondovì lies east of that of Cuneo, south of Alba, and contains 71 comuni. The chief town, Mondovì, stands on the Ellero, a feeder of the Tanaro, 50 miles S.S.E. from Turin, and has 16,921 inhabitants. It is defended by walls and a strong castle,

contains several fine churches, ecclesiastical and royal colleges, and has manufactures of silks, woollens, leather, iron, cotton, paper, and hats. The town gives title to a bishop. The French under Napoleon here routed the Sardinians, April 22, 1796; and Marshal Soult sacked the town in 1799. *Cherasco*, a walled town at the confluence of the Stura and Tanaro, 30 miles S.S.E. from Turin, has a college, two hospitals, and 8893 inhabitants, who trade chiefly in wine and silk. The town is well built and contains several fine buildings: it is quadrangular in form, and is supposed to occupy an ancient site. Each of the principal streets terminates in a noble arch. Cherasco is supplied with water by a canal, which drives the machinery of several silk factories. The neighbourhood of the town is famous for its white truffles. The chief towns of the other mandamenti have populations under 5000.

The *Province of Saluzzo* occupies the north-western part of the division, and contains 52 comuni. The capital, *Saluzzo*, 31 miles from Turin, stands on the northern slope of a ridge that projects from Monte Viso, and separates the waters of the Po from those of the Vraita. It is a large episcopal town, and contains an old castle formerly belonging to the marquises of Saluzzo, but now used as a prison; a handsome cathedral, several other churches, a royal college, an hospital, and 14,426 inhabitants, who trade in the produce of the country, and manufacture silk, leather, hats, linen, and iron. The part of the town built on the hill is walled; the lower town is open. Saluzzo was the capital of the department of Stura during the French occupation of Italy. *Racconigi*, a pretty town near the confluence of the Grana and the Maira, is situated in the most fertile part of Piedmont, and has 10,102 inhabitants. Here is the place of the Prince of Carignan, situated in a fine park. Racconigi is a station on the railroad to Fossano, and is 23 miles distant from Turin. *Savigliano*, east of Saluzzo, and 32 miles S. from Turin, stands in a fertile plain watered by the Maira and other feeders of the Po, and has 15,516 inhabitants. It is a well-built town, and has a fine market-place, several handsome churches (one of which is collegiate), two hospitals, and silk, linen, and cloth factories. At the end of the principal street a triumphal arch is erected in honour of the marriage of Victor Amadeus with the princess Christine of France. This is a favourite place of residence with the provincial nobility and landed proprietors. It is surrounded by old fortifications. There are several other towns, but none of them have a population exceeding 5000.

CONN, LOUGH. [MAYO.]

CONNAMARA. [GALWAY.]

CONNAUGHT, a province of Ireland, containing the counties of Galway, Mayo, Roscommon, Leitrim, and Sligo. It lies between 52° 52' and 54° 25' N. lat., 7° 33' and 10° 15' W. long. The latitude is about that of Yorkshire and Lincolnshire; but from its proximity to the ocean the climate is much more moist and variable. It is bounded N. and W. by the Atlantic Ocean, E. by the river Shannon and the counties of Cavan, Fermanagh, and Donegal, and S. by the county of Clare. Clare, which is now annexed to Munster province, was at one time a part of Connaught, to which indeed it would appear naturally to belong. The greatest length of Connaught, from Scariff on the borders of Clare on the south to Mullaghmore Head on those of Donegal on the north is 108 miles; and its greatest breadth from the boundary of Leitrim on the north-east to Slyne Head on the south-west, 118 miles. The area comprises 4,392,043 acres, of which 2,220,960 are arable, 1,906,002 uncultivated, 48,340 in plantations, 3877 in towns, and 212,864 acres under water. In 1851 there were 712,204 acres under crops, of which 359,807 acres were under corn, beans, and peas, 151,976 under potatoes, and 55,409 acres under other green crops. The population in 1841 was 1,418,859; in 1851 it was 1,012,006.

The mountain ranges are distributed round the coast. From their inland declivities the province has a comparatively level surface to the Shannon. This river thus becomes the main drain of the intermediate country. Its chief feeders in Connaught are the Suck and the Gara; the latter discharges the waters of Lough Gara and Lough Key, and the former, a large river, is navigable from its confluence with the Shannon to Balliforan, a distance of about 20 miles. The streams which flow to the ocean are much more numerous, but the body of water brought down by them is not so great. They take their rise chiefly in lakes, which are distributed through the mountain districts of Galway and Mayo. Of these Loughs Corrib, Mask, and Carra discharge their united waters southward by Galway; and Loughs Conn, Arrow, and Gilly northward by Ballina, Ballasladare, and Sligo respectively. The rivers which flow westward from the lakes of Connamara and Erris are short and rapid in their course, and comparatively inconsiderable in the quantity of water; so that with reference to its rivers the province may be divided generally into three districts: that of the Shannon, that of the basin of Lough Corrib, and that of the basin of Lough Conn. The neighbourhood of Ballihaunis in Mayo, about the centre of the province, forms the summit-level from which these principal slopes diverge; and lines drawn from this point to Scariff on the south-east, Sligo on the north-east, and Westport on the west, will be found to mark pretty nearly the boundaries of each.

The limestone field of Connaught is very nearly co-extensive with the low district between the Shannon and the western elevations.

The mountain groups that inclose this plain present towards the inland field successive elevations of sandstone, clay-slate, granite, and quartz, corresponding pretty nearly with the development of the same strata on the opposite side of the island. The limestone field is very much encumbered with bog, which in Ireland is almost always found to rest on limestone gravel. The remainder of the province is more mountainous than any other district of equal extent in Ireland; so that Connaught, in produce and population, is far behind the other provinces.

Connaught was formerly a kingdom of the Irish Pentarchy. Its kings were of the race of O'Connor. It enjoyed a comparative independence until the year 1590, when it was made shire-ground under the 11th Eliz. c. 39, and divided into six counties, namely, those above enumerated and Clare, which had formerly been part of Munster. In 1602 Clare was re-annexed to the latter province, yet so late as 1792 remained on the Connaught circuit. In the various rebellions down to the end of the 17th century Connaught was the refuge of the fugitive and dispossessed Irish. The Irish language is still very prevalent; and the condition of the poorer classes to this day attests the miserable circumstances which brought the population together. Employment is here more difficult to be obtained than in any of the other provinces. The loss of the potato crop in 1846, and the diminished value as well as amount of agricultural produce consequent on that calamity, and on the legislative changes induced by it, completed the ruin of great numbers of proprietors, and entailed a wide-spread concurrent devastation among the occupying tenantry. In the year 1847-8 alone the total number of holdings evicted or thrown up by the occupiers was 26,599, or one-sixth of the entire number of holdings in the province.

The state of Connaught both physical and moral has been perhaps too generally underrated, though it must be admitted that as a whole it is beneath the average state of the three other provinces of Ireland. Numerous projects have been formed for the improvement of this province and the development of its great resources. The improvement of the navigation of the Shannon has given a continuous line of water-carriage along the eastern boundary of the province.

Perhaps the most useful of the various efforts made for the improvement of Connaught has been the introduction or revival of the culture of flax. The quantity grown in 1847 was 10,866 cwt.; in 1851 it was 21,597 cwt. The system of farming has been greatly improved in those districts which have passed through the transition attendant on the change of proprietary and occupants. The main resources of the province must however for a considerable period continue to rest on the industry of the native race of small farmers.

CONNECTICUT, one of the United States of North America, is bounded S. by Long Island Sound, which separates it from Long Island; E. by Rhode Island; N. by Massachusetts; and W. by the state of New York. It lies between 41° and 42° 2' N. lat., 71° 40' and 73° 43' W. long. The form of Connecticut is nearly that of a parallelogram, which is about 85 miles long from east to west, with a mean width of 60 miles from north to south. The area is 4674 square miles. The following table shows the increase of the population since 1810. The total population in—

1810	was	262,042,	including	6453	free coloured persons and	310	slaves.
1820	"	275,202,	"	7944	"	97	"
1830	"	297,675,	"	8047	"	25	"
1840	"	309,978,	"	8104	"	17	"
1850	"	370,792,	"	7486	"	0	"

The federal representative population in 1850 was 370,792, which entitled the state to send four representatives to Congress. To the Senate, like all the other United States, Connecticut sends two members.

Coast-line, Surface.—Connecticut has a sea-coast of about 95 miles along the Long Island Sound, which is indented by several good harbours, of which New London, Stonington, New Haven, Bridgeport, and Norwich are the chief. The best of the harbours is that of New London, which is spacious, deep, and not liable to be frozen over in winter. Stonington and Bridgeport harbours are protected by breakwaters. The Sound admits of free navigation along the entire coast of the state for ships of the largest size. There are lighthouses at the west side of the entrance to the Thames; at the west side of the entrance to the Connecticut; on Faulkner's Island, off Guilford Harbour; on a point at the east side of the entrance to Stonington Harbour; at Morgan's Point, near Mystic; on the north side of Fisher's Island Sound; on Five-Mile Point, at the east side of the entrance to New Haven Harbour; on Stratford Point, at the entrance of Stratford Harbour; on Fair-Weather Island, at the entrance to Black Rock Harbour, Fairfield; on Norwalk Island, at the mouth of the Norwalk; on Great Captain's Island; and on North Dumplin Island, in Fisher's Island Sound. There are also floating lightships on Bartlett's Reef, off New London, and on Eel-Grass Shoal.

The surface of the country is generally uneven, but there are no lofty mountains. The principal ranges of high ground, which are continuations of the Massachusetts mountain ranges, run from north to south in the direction of the Housatonic and the Connecticut, the two principal rivers of the state. The Green Mountain range terminates at High Rock, 2 miles N.W. from New Haven. The Lyme range on the east side of Connecticut River separates the lower basin

of the Connecticut from the Thames. A range of high land of moderate elevation, called the Middletown Mountains, or Mount Tom range, runs from Hartford on the Connecticut, past Middletown to East Rock, 870 feet high, north-east of New Haven, where it terminates. The Blue Hills in Southington, a part of this range, are said to be the loftiest in this state, attaining an elevation of 1000 feet. The Housatonic Mountains run along the western margin of the state, on the west side of the Housatonic River.

Hydrography, Communications.—The rivers are generally only navigable in their lower courses. The most important is the *Connecticut*, which rises in Lower Canada, about 45° 20' N. lat. Its general course is south by west, and then south-west to the point where it breaks through one of the Appalachian ranges, and receiving the Passamaic, descends over the Barnet Falls from the high valley in which it has hitherto flowed into a lower basin. From the junction of the Passamaic it continues as before to form the boundary between New Hampshire and Vermont till it enters Massachusetts, through which state it flows, still in a generally southern course. It leaves Massachusetts about 5 miles below Springfield. Its general southern course continues to Middletown in Connecticut, where it is deflected to the south-east by some high land, and continuing this direction it enters the Sound. The whole course of the river is probably not less than 400 miles. The Connecticut is in many respects a very remarkable river. Its general course, as already described, is nearly due south; though it receives numerous streams, they are comparatively of small importance. The river basin above the junction of the Passamaic is about 30 miles wide: below this point it widens to about 40 miles; the whole surface of the basin is calculated to be about 9300 square miles. The river generally flows in a deep and often narrow valley, bordered by high lands, which, where they recede from the river, leave fine alluvial plains. One of these alluvial plains stretches uninterruptedly for 40 miles from a little above Middletown, in Connecticut, to South Hadley, in Massachusetts. The alluvial tracts on the river are exposed to dreadful inundations. The river has a bar at its mouth, but it is navigable for vessels drawing 10 feet of water to Middletown, which is at the head of tide-water, and 36 miles from the Sound; vessels drawing 7½ feet ascend to Hartford, 15 miles above Middletown. Though this river is much obstructed by rapids, falls, and shoals, it has been made navigable, by means of canals and locks, for boats of considerable size to the mouth of Well's River in Vermont. The Tunxis, or Farmington, which has its source on the Green Mountains in Massachusetts, is the principal tributary of the Connecticut in this state. The *Housatonic* rises in Berkshire county, Massachusetts, in a fine plain 1000 feet above the sea, and running a general southern course through a picturesque valley enters the Sound at Milford Point, after a course of about 120 miles. Large vessels cannot enter it, but it has a sloop navigation for about 12 miles. The *Thames*, which is formed by the confluence of the Quinnebaug and the Shetucket a little above Norwich, at which town it is swelled by the junction of the Yantic, has a navigable course of about 14 miles, and falls into the Sound at New London. The small streams which add so much to the fertility of the country are very numerous.

There is now no canal in the state of any length or consequence, the Farmington Canal having been filled up and converted into a railway.

The common roads are numerous and well kept. The railways running east and west through the state are the lines between New Haven and Worcester, in all about 126 miles, which together form a part of the southern main-trunk line, connecting New York and Boston; and the Hartford, Providence, and Fishkill railway, of which little more than 50 miles are yet completed. The lines running north and south from the ports on the Sound are the Norwich and Worcester, 66 miles, of which about 40 miles are in Connecticut; the New London, Willimantic, and Palmer, 66 miles; the New Haven, Hartford, and Springfield, 62 miles; the New Haven and Northampton, on the bed of the old Farmington Canal, 45 miles; the Naugatuc, 57 miles; the Housatonic (Bridgeport to Pittsfield, 110 miles), 74 miles completed; and the Danbury and Norwalk, 24 miles. Besides these there are several branches and small lines: the total length of railway completed in the state in October 1853 was 565 miles, and about 100 miles were in course of construction.

Geology, Mineralogy.—The prevalent rocks of the hill ranges are granitic, or hypogene; metamorphic limestones; and in a depression of the granitic rocks occur thin bedded strata of new red-sandstone, shale, and conglomerate, with masses of trap intruded, the beds dipping to the eastward at angles varying from 5 to 50 degrees. The triassic rocks, according to Sir Charles Lyell, must have been "formed in shallow water, and for the most part near the shore, and some of the beds have been from time to time raised above the level of the water, and laid dry, while a newer series, composed of similar sediment, was forming." The red flags of thin-bedded sandstone are often ripple-marked; and "on some shales of the finest texture impressions of rain drops may be seen, and casts of them in the incumbent argillaceous sandstones." But what has rendered this formation an object of unusual interest to scientific men is the circumstance of the numerous impressions and casts of the footprints of a great variety of birds and reptiles which walked over the strata at the time when they were deposited. According to Professor Hitchcock "the footprints of no less than thirty-two species of bipeds and twelve of quadrupeds have

been already detected in these rocks. Thirty of these are believed to be those of birds, four of lizards, two of chelonians, and six of batrachians. The tracks have been found in more than twenty places, scattered through an extent of nearly 80 miles from north to south, and they are repeated through a succession of beds attaining at some points a thickness of more than 1000 feet, which may have been thousands of years in forming." (Lyell, 'Elements of Geology,' Hitchcock, 'Mem. of American Academy,' New Ser., iii. 129.) No fossil bones, either of birds or reptiles, have as yet been met with in these rocks; the fossil fish are however numerous and very perfect: they belong to a peculiar type which has received the name of *Ischypterus*.

The mineral wealth of Connecticut is considerable. Iron ore is found at Salisbury, Kent, and other places, in great abundance, and of excellent quality. In copper ore this state is one of the richest in the Union. The chief mines are those of Bristol and Plymouth. According to Professor Silliman the Bristol vein extends for above 30 miles from Bristol southward as far as Hampstead, and if fully worked is capable of affording employment to 30,000 miners. The Plymouth mines are said to be equally rich. Copper is likewise found at Granby. Lead, zinc, plumbago, cobalt, and manganese are also met with. At Milford a very fine marble is obtained, and marbles of different kinds occur there and elsewhere. A freestone much in demand for building purposes is quarried in several parts of the state. The mineral springs at Stafford are much resorted to.

Climate, Soil, Agriculture.—The climate is subject to sudden and extreme variations of heat and cold, especially along the coast. With a change of wind a great alteration generally occurs in the weather. In the winter the north-west winds are very keen, the south winds are warmer and more genial.

The soil of Connecticut is only of a medium quality, more suitable for grazing purposes than the growth of wheat, except in the river valleys, some of which contain rich alluvia. In the valley of the Connecticut the soil varies from a hard stiff clay to a light sandy loam. In the eastern part of the state a warm, strong, fertile soil prevails, which is excellent for grasses. In the western part are many fertile districts. The north-western is more cold and sterile, but contains some good grazing districts. In the south the peach perfects its fruit. The farms are mostly small and carefully cultivated; but the farmers usually follow some manufacturing occupation during a part of the year.

In 1850 there were in the state 1,768,178 acres of improved land, and 615,701 acres of unimproved land, which together were valued at 72,726,422 dollars. The number of farms under cultivation was 22,445. The total produce of the principal crops in 1850 was—wheat, 41,762 bushels; rye, 600,893 bushels; maize, 1,945,843 bushels; oats, 1,158,738 bushels; barley, 19,099 bushels; buckwheat, 229,297 bushels; potatoes, 2,689,725 bushels; hay, 516,131 tons; clover-seed, 13,841 bushels; other grass-seed, 16,603 bushels; peas and beans, 19,090 bushels; tobacco, 1,267,624 lbs.; maple sugar, 50,796 lbs.; flax, 17,928 lbs.; wine, 4269 gallons. The value of orchard products was 175,118 dollars; of market-garden products, 196,874 dollars.

The number of horses in 1850 was 26,879; asses and mules, 49; milch cows, 85,461; working oxen, 46,988; other cattle, 80,226; sheep, 174,181; swine, 76,472. The products of animals were thus returned:—wool, 497,454 lbs.; butter, 6,498,119 lbs.; cheese, 5,363,277 lbs. Value of animals slaughtered during the year, 2,202,266 dollars. Silk cocoons, 328 lbs.; bees-wax and honey, 93,304 lbs.

Manufactures, Commerce, &c.—Connecticut possesses considerable manufactures, but the manufacturing industry of the state is distributed over a large number of small shops. The number of establishments in 1850 producing to the value of 500 dollars and upwards annually was 3913, of which 128 were cotton factories, employing 2708 males and 3478 females; 149 woollen mills, employing 2907 males and 2581 females; and 91 iron-factories, of which 60 manufactured castings, employing 942 persons, 13 pig-iron, employing 148 persons, and 18 wrought-iron, employing 374 persons. There are also factories for the manufacture of steam-engines and locomotives, hardware, cutlery, fire-arms, gunpowder, paper, soap, candles, boots and shoes, and most of the ordinary articles of home consumption; besides numerous flour, grist, and saw-mills, distilleries, breweries, tanneries, potteries, glass-houses, &c.

The foreign commerce of the state is not large. The exports in 1852 amounted to 506,174 dollars, the imports to 394,675 dollars, of which the value brought in foreign vessels was only 18,397 dollars. In the same year 65 vessels, of 9034 tons burden, were built in the state. The amount of shipping owned in the state in 1850 was 113,085 tons, of which 81,028 tons were employed in foreign commerce, 11,483 tons in the whale-fishery, 5249 tons in cod-fishing, and 571 tons in mackerel-fishing; the remainder were chiefly employed in the coasting trade. The steam marine of the state, which is wholly employed in the coasting trade, amounted to 8455 tons.

Divisions, Towns, &c.—The state is divided into eight counties—Fairfield, Hartford, Litchfield, Middlesex, New Haven, New London, Tolland, and Wyndham, which are subdivided into 148 townships. It contains 6 cities and 12 boroughs. The following are the cities,

all of which are port towns, and have daily communication by steam-boats with New York: the population is that of 1850:—

Hartford, the capital of Hartford county, and one of the seats of the state legislature, is on the right bank, and 50 miles from the mouth of the Connecticut, at the head of the ship navigation, 41° 45' N. lat., 72° 40' W. long., 385 miles N.E. from Washington: population, 17,966. The city stands on rising ground, is regularly laid out, and is a mile long and three-quarters of a mile wide. The principal public buildings are the state-house, city-hall, custom-house, arsenal, market-house, Trinity college, the American asylum, the retreat for the insane, and Wadsworth athenæum. Some of the churches, of which there are 24 belonging to the various sects, are handsome buildings. Besides Trinity college there are numerous academies and schools in the city. Hartford is the centre of the state railway system, and carries on a large trade with the interior. There are considerable manufactories of machinery, fire-arms, boots and shoes, &c., and several large lumber yards. Eight newspapers and two magazines are published in the city, and there is an extensive book-selling business. The American Asylum for the Deaf and Dumb was the first established, and is still the most flourishing and important asylum of the kind in the United States. The number of students in 1850 was 210, of whom a large number were supported by other states. The Retreat for the Insane is another very important institution; it contained 143 patients in 1850.

New Haven, the capital of New Haven county, and, alternately with Hartford, the seat of the state legislature, stands at the head of New Haven Bay, 4 miles from Long Island Sound, 41° 18' N. lat., 72° 56' W. long., 160 miles by railway S.S.W. from Hartford: population, 22,539. The city is pleasantly situated, the streets are wide, regularly laid, and generally bordered with rows of fine elms. The central square forms a sort of public park, planted with numerous rows of elms, and is said to be the finest public ground in the United States. In this square are three fine churches, the state-house, and the chief part of the buildings of Yale college. The city contains 22 churches, Yale college (next to Harvard college the most important university in America), several scientific institutions, two popular lyceums, having libraries and reading-rooms, numerous academies and schools, several benevolent institutions, and two extensive cemeteries, in which several of the more eminent Americans are interred. The public buildings are mostly of brick; the houses in the older part of the town are mostly of wood, and surrounded by shrubberies or gardens. The state hospital, founded in 1832, is a substantial stone edifice, standing on an elevated site. The new railway station is considered to be one of the finest structures of the kind in the United States. New Haven is the chief seat of the foreign commerce of the state, as well as of an extensive coasting trade, and considerable fisheries. The harbour is spacious but shallow, and is gradually silting up. The tonnage belonging to the harbour in 1850 was 15,731 tons, of which 2568 tons were propelled by steam. There are considerable manufactories, especially of carriages and clocks; ship-building yards, tanneries, potteries, woollen-factories, hardware and cutlery works, lumber yards, &c. Four or five railways meet at New Haven, and afford great facilities for communication with all parts of the Union. Several newspapers and monthly and quarterly magazines, as well as Professor Silliman's 'American Journal of Science,' are published at New Haven.

Bridgeport, situated on an arm of Long Island Sound, 78 miles S.W. from Hartford; population, 7538. The harbour is eligible for large steam-boats and coasting vessels. The manufactures are extensive. The city is neat and regularly built, and contains several churches. The Housatonic railway unites with the New York and New Haven railway at Bridgeport.

Middletown, on the right bank of the Connecticut, 14 miles S. from Hartford; population 8791; is situated on gently rising ground, the main street in which are all the principal buildings running parallel with the river, and the other streets at right angles with it. Some of the public buildings are handsome structures, and there are good mansions in the higher part of the city and its vicinity. Middletown has considerable manufactures and an extensive coasting trade. In the vicinity are very productive lead and silver mines, and inexhaustible quarries of felspar, in much request for the manufacture of porcelain. The Wesleyan University is a fine building. Railways connect the city with Hartford and other towns. Three newspapers are published here.

New London, on the right bank of the Thames, 3 miles above Long Island Sound, 43 miles S.E. from Hartford: population, 9006. The city contains the county buildings, seven churches, and several academies and schools. The harbour has a depth of 30 feet, and is the finest in the state. New London is the chief port for the coasting and whaling trade of Connecticut. The tonnage of the port in 1850 was 40,485 tons. The foreign trade is chiefly with the West Indies. The city has ample railway facilities.

Norwich stands on a very picturesque site on the Thames, at the junction of the Quinnebaug and Yantic rivers, 36 miles E.S.E. from Hartford: population, 10,265. It contains the usual county buildings, a town-hall, and eight churches. There are numerous manufactories of cotton and woollen goods, paper, hardware, cutlery, &c., the rivers affording great water-power. The celebrated Yantic falls are in the vicinity. Three railways pass through the city.

The following are the twelve boroughs:—**Danbury**, near the western border of the state, 48 miles S.W. from Hartford; population 964; possesses good water-power, which works several mills. There are seven churches and an academy in the town. **Bessex**, on the right bank of the Connecticut, 7 miles from its mouth; population about 1200; has a considerable coasting trade, and carries on a good business in ship-building, rope-making, &c. **Guildford**, a short distance from Long Island Sound, 36 miles S. from Hartford; population 2650; is celebrated for the picturesque scenery in its vicinity, and is much resorted to in the season for sea bathing. The harbour is frequented by coasting and fishing vessels. **Litchfield**, the capital of Litchfield county, lies between the Naugatuc and Shepaug river, 28 miles W. by S. from Hartford: population, 3957. The town contains the usual county buildings, several churches, academies, and schools. There are considerable manufactories of woollens, paper, leather, and iron, and numerous grist, fulling, and saw-mills. Great Pond covers an area of 900 acres, and is the largest sheet of water in the state. **New Britain**, 10 miles S.W. from Hartford; population 3028; has considerable manufactories of brass-ware and cutlery: the State Normal school is established here. **Newtown**, on the Housatonic railway, 41 miles S.W. from Hartford; population 3358; stands on high ground in the midst of a fertile district, and has several woollen and cotton factories, and grist and saw-mills, tanneries, &c. **Norwalk**, on the Norwalk River, at its entrance into Long Island Sound, 63 miles S.W. from Hartford; population 4651; is a place of considerable trade, and has extensive factories of felt-cloth and carpets, hats, &c., besides tanneries, potteries, and grist and saw-mills. Vessels drawing 6 feet of water ascend the river to Norwalk bridge. **Southport**, on the right bank of the Mill River at its entrance into Long Island Sound, and on the New York and New Haven railway, 60 miles S.S.W. from Hartford: population, 3184. The harbour, which affords good anchorage for vessels of 100 tons burden, is protected by an extensive breakwater constructed by the government of the United States. **Stamford**, on the Mill River, at its entrance into Long Island Sound, and on the New York and New Haven railway: population, 5004. The harbour admits vessels drawing 8 feet of water, and a considerable coasting trade is carried on. There are also extensive iron and wire manufactories, lumber-yards, &c. **Stonington**, on Long Island Sound, near the south-eastern extremity of the state, 51 miles S.E. from Hartford; population 5434; is a large well-built and busy town. The harbour, which is one of the best in the Sound, is protected by a breakwater built at the expense of the United States government, and has a lighthouse at its entrance. The shipping of the harbour in 1850 amounted to 19,913 tons, of which 4020 tons were engaged in the coasting trade, 8861 tons in the whale fishery, and 2226 tons in the cod and mackerel fisheries. Besides ship-building and other works of a maritime character, there are manufactories of plaids and linseys. During the summer Stonington is a fashionable watering place. The town has daily steam communication with New York, and the Stonington railway connects it with most parts of the Union. **Waterbury**, on the Naugatuc, 25 miles S.W. from Hartford; population 5137; is one of the busiest manufacturing towns in the state. The factories, for working which there are great facilities of water power, consist of very extensive works for making pins, gilt and plated buttons, silver and plated goods, hardware, India rubber webbing, &c.; there are also rolling-mills and woollen factories. The town is generally well built, and some of the churches and schools are said to be of a rather superior architectural character. **Willimantic**, on the Willimantic River, 23 miles E. by S. from Hartford, contains several large cotton factories and some paper and other mills: three railways pass through the town.

Government, Judiciary, Education, &c.—Every white male citizen of the United States, 21 years of age, who has resided 6 months in the town, has a freehold of the annual value of 7 dollars, or has done military duty for one year, or has paid a state-tax within the year, and has a good moral character, may vote at all elections on taking the oath; and is eligible to any office unless it be especially excepted. The legislative body, styled the General Assembly, consists of a Senate of 21 members and a House of Representatives of 120 members, who are chosen annually by districts of equal population. The General Assembly meets on alternate years at Hartford and New Haven. The governor, who with the council of state similarly elected forms the executive, is also elected for one year: he has a salary of 1100 dollars.

The revenue from all sources for the year 1852-3 was 150,650 dollars; the expenditure was 135,104 dollars. The state debt, chiefly contingent, was 91,212 dollars. The militia of the state is composed of 51,649 men, of whom 456 are commissioned officers.

The judiciary consists of a supreme and superior court, presided over by a chief justice with a salary of 1300 dollars, and 4 associate justices with salaries of 1250 dollars each, who hold their offices until 70 years of age; and of county courts, which have jurisdiction in civil actions where the matter in dispute exceeds 50 dollars: from the county courts there are appeals to the superior court in all cases where the damages exceed 200 dollars.

The state has a school-fund derived from the sale in 1795 of 2,500,000 acres of land in the north-eastern part of Ohio. The fund amounted in September 1852 to 2,049,482 dollars; the dividends from it amounted

to 143,693 dollars. The number of common school districts in 1852 was 1642; of children between the ages of 4 and 16 years, 96,382; attending school in winter, 74,100; average attendance, 55,100. The state has a Normal school at Hartford in which 200 pupils are instructed without charge; and schools or conventions for training teachers have been established in each county. A State Reform school for boys under 16 who have been convicted of offences punishable by imprisonment has been established at Meriden, the grounds of which cover an area of 161 acres. There are several colleges and superior academical institutions in the state. Yale College is one of the oldest, and next to Harvard University the most important and the most numerously-attended institution of the kind in the United States. It has a staff of 35 professors and tutors, and in 1850 had 555 students, of whom 432 were students in the academical department, 38 in theology, 26 in law, 38 in medicine, and 21 in philosophy and the arts. The buildings cover a large area, and contain a library of 53,000 volumes; the medical and theological libraries and schools; the finest geological and mineralogical collection in the United States; the Turbull gallery of paintings; chapel, &c. Trinity College is an Episcopal institution: it has 13 instructors and 79 students, and a library of 15,000 volumes. The Wesleyan University at Middletown has 7 instructors, 106 students, and a library of 12,000 volumes. The Congregational Theological Institution at Hartford has 3 instructors, 17 students, and a library of 5000 volumes. In 1850 the Congregationalists had 267 churches and 35,158 communicants; the Baptists 111 churches and 16,230 communicants; the Episcopalians 9360 communicants; the Episcopal Methodists 148 ministers. The total number of newspapers and periodicals published in the state in 1850 was 51, of which 30 were political and 21 religious, scientific, &c.

(Colton, *Statistical Gazetteer of the United States*, 1853; *American Almanac*, 1854; Darby; Haskel and Smith; Lyell, &c.)

CONNOR, county Antrim, Ireland, a small village situated on the Glenwhirry River in the barony of Antrim. Some six or seven centuries ago the village was a walled town or city, and gave its name to the bishopric of Connor. It was a place of some note in 1315, at the time of the invasion of Edward Bruce, by whom it was taken, after the defeat of the English under Richard, earl of Ulster, before its walls. It is supposed to have gone to decay after the irruption of the expelled Irish in 1333. A large Presbyterian meeting-house is now the chief object in the village.

The bishopric of Connor was founded by Aengus, the son of Nissa, usually known as Saint Maenish, who died in 514. In the 12th century the diocese was known indifferently as Connor and Dalnaraighe, or Dalaradia. In 1442 one John, being bishop of this diocese, prevailed on Pope Eugene IV. to unite the sees of Down and Connor. By the 3rd and 4th William IV., c. 37, sec. 121, the united bishopric of Down and Connor has become augmented by the diocese of Dro-more. The income of the united diocese is 4204*l.* per annum.

CONQUES. [AUDE; AVEYRON.]

CONSTANCE. [CONSTANZ.]

CONSTANTIA. [CAPE OF GOOD HOPE.]

CONSTANTINA (the *Qosthantynah* of the Arabs), the capital of the French province of Constantina in Algiers, stands on a high rocky peninsula formed by the Rummel in 36° 22' N. lat., 6° 37' E. long., at a distance of 185 miles E. by S. from the city of Algiers, and 45 miles due S. from the Mediterranean. The peninsula is joined to the adjacent country by an isthmus on the south-west side. Before the French conquest of the town it is said to have had upwards of 40,000 inhabitants; the population in 1847 exclusive of the garrison was about 21,000, of whom nearly 2000 were Europeans. The city is surrounded by old walls and entered by four gates, the elegant structure and sculptured decorations of which prove them to be the work of the Romans. The interior of the town has nothing remarkable. The streets are narrow and ill laid out. The houses are generally built of brick on stone foundations, low and without windows; and they have sloping roofs, a circumstance that denotes a colder climate than that of the sea-coast where the houses have flat roofs, to which the inhabitants ascend in the evening to enjoy the cool breeze. There are a college, an hospital, and a citadel in the town, which has also manufactories of saddlery, harness, and other leather goods, and trades in corn with Tunis, and in the products of Central Africa with the tribes to the southward.

Constantina occupies part of the site of the ancient *Cirta*, which was the capital of Numidia, and the birthplace of the Numidian kings Masinissa and Jugurtha. *Cirta* was built by architects from Carthage, and its name is a slight corruption of the Phœnician word for 'city.' *Cirta* was the residence of the kings of the Massylii, who had a splendid palace here. In the reign of Micipsa, who enlarged and beautified the city, it could send forth an army of 10,000 cavalry and 20,000 infantry. *Cirta* was the strongest fortress in all Numidia; it is frequently mentioned in the Punic, Jugurthan, and Civil wars. After the defeat and death of Jugurtha the ancient town passed with the rest of Numidia into the hands of the Romans, who sent out a colony to *Cirta*, which then got the name of *Cirta Sittianorum*, from the chief, Sittius, to whom it was granted by Julius Cæsar. It continued under this name to be the chief town of Numidia *Propria* till the time of Constantine, from whom it was called Constantina. In recent times it was the residence of a Bey until its capture after a murderous

assault by the French under General Danrémont and the Duc de Nemours, October 13, 1837. The city and its environs, especially the plain on the south-west side, abound in ancient Roman remains. Among these are—the bridge across the Rummel, which is adorned with bas-reliefs, and still in good repair; the four gates above mentioned; several sepulchral monuments; and numerous remains of cisterns, aqueducts, columns, and altars. The finest of the ancient remains, a triumphal arch, has been removed to Paris. The extent of surface over which these remains are spread proves the ancient city to have been much larger than the modern one. All the Roman roads in Numidia converged upon *Cirta*. Below the bridge the Rummel turns northward, and flows for about a quarter of a mile in a subterranean bed, issuing from which it forms a large cascade. From the height above this point criminals and infidels were precipitated into the river during the sway of the Arabs. The neighbourhood of Constantina is very fertile and well cultivated.

(Sallustius, *Bell. Jug.*; Shaw, *Travels in Barbary*; Balbi, *Géographie*.)

CONSTANTINOPLE (Stamboul), the capital of the Ottoman empire, is situated in 41° 0' N. lat., 28° 59' E. long., on the European shore of the Sea of Marmara, and at the southern extremity of the Bosphorus, which connects the Sea of Marmara with the Black Sea. [BOSPORUS.] The population is variously estimated, for there is no official census: some make the inhabitants number only about 600,000 (which may perhaps be the population of the city exclusive of the suburbs); others estimate them at a million, composed of about 200 different tribes and races. The following numbers are taken from notes of travellers who visited Constantinople in 1852 and 1853:—About 500,000 are Turks, 200,000 Armenians 60,000 Jews, 30,000 Greeks, and about 20,000 Franks.

The ground on which Constantinople stands is fitted by nature for the site of a great commercial city, the connecting link between Europe and Asia. A gently-sloping promontory secured by narrow seas stretches out in a triangular form towards the Asiatic continent, from which its extreme point is separated by so narrow a strait (the Bosphorus) that in a quarter of an hour a boat may row from one continent to the other. Indeed Scutari, on the Asiatic coast immediately opposite, is always considered as a suburb of the European capital. Just before the Bosphorus enters the Sea of Marmara it makes a deep elbow or inlet on the European shore, flowing between the triangle of Constantinople proper and its European suburbs of Galata, Pera, &c., and forming the magnificent port of the Golden Horn. [BYZANTIUM.] The triangle which, allowing for many vacant spaces within the walls, is entirely covered by Constantinople is thus washed on the north by the deep waters of the port, and on the south-east by the Sea of Marmara. The base of the triangle, or the ground immediately beyond the walls, which attaches it to the European continent is an open elevated flat, with some slight inequalities. The area of the triangle is occupied by gentle hills, which are highest towards the land side and suburb of Eynb, and gradually decline to the Seraglio point, the apex of the triangle, shelving off on each side to the Sea of Marmara and the port. As Rome was built on seven hills so the founders of Constantinople called these the Seven Hills, though if the principal chain only were counted there would be less; and if the minor hills or spaces were included there would be more than seven. The ridge of the first or most eastern hill is occupied by the buildings and grounds of the Seraglio, behind which a little on the reverse of the hill the dome of Santa Sophia shows itself. The second hill is crowned by the bold and lofty dome of the Osmanieh mosque. The still loftier mosque of Solyman the Magnificent towers on the third hill; whilst the aqueduct of the emperor Valens, the arches of which are of a considerable span, unites the summits of the third and fourth hills. On a fifth point, the most elevated of the little chain within the triangle, there is a slender lofty tower, built in 1828, in which a guard is constantly kept to watch the breaking out of fires, which are very frequent and destructive in a city where all the private habitations are built almost entirely of wood. The situation of Constantinople upon hills is the main cause, not only of its picturesque beautiful appearance, but of its general salubrity. (Malignant fevers prevail it is true during the heat of summer, but chiefly among people who expose themselves to the noonday sun.) It receives all the breezes from the Bosphorus, the Sea of Marmara, and the adjoining plains of Thrace; and the dirt, for which its streets are proverbial, partially at least descends the hill-sides to the port or the open sea, in both of which it is carried off by a strong current. The lower edge of the city, adjacent to the port, and the suburb of Galata (the Wapping of the Turkish capital) on the opposite side of the port are filthy places.

The form of the triangle is somewhat irregular, the side on the Sea of Marmara, from the old state prison called the Seven Towers to the Seraglio point, being considerably the longest; its length cannot be much short of 5 miles. On this side the old walls and towers are in a very ruinous state, and on the side towards the port they have almost entirely disappeared. But on the land side Constantinople presents a double line of strong and lofty stone walls (built in 447 during the reign of Theodosius II.), which might be easily put in a state of complete repair, and which in their more dilapidated parts present such magnificent and picturesque specimens of mural ruins as probably no other city can boast of. The length of this latter line

of wall, from the head of the port to the Sea of Marmara, near the Seven Towers, is about 4 miles. The walls are flanked at short intervals by towers, which are mostly rectangular. Of the towers 120 are now standing; there were 180 in 1422, according to a plan then made by Pondalmonte, a Florentine. Besides the double walls, which are almost entire, and still retain their ancient battlements, the outer ditch was faced with a wall which made a third rampart, but this is in part destroyed, and seems never to have been defended by towers. The intervals between the walls are in many places choked up with earth and masses of the ramparts which have fallen under the shocks of war or of earthquakes. The great ditch, which is about 30 feet broad, is partly cultivated and converted into kitchen gardens.

There are six gates on this (the land) side:—1. Egro-Kapoussi (the Oblique Gate); 2. Edrene-Kapoussi (the Gate of Adrianople); 3. Top-Kapoussi (the Cannon Gate), through which the conqueror Mohammed II. made his public entry on the capture of Constantinople; 4. Selivri-Kapoussi (the Gate of Selivria); 5. Yeni-Kapoussi (the New Gate); 6. The Gate of the Seven Towers. The 'Golden Gate,' so celebrated by the Byzantine writers, has been sought for in vain, though a gate now wholly blocked up, with two mean pillars supporting a low arch, is sometimes shown to travellers for it. Near to the Top-Kapoussi, where Paleologus, the last of the Christian emperors fell, is the breach through which the Turkish besiegers poured into the city: the wide rent, which has never been repaired, is now full of trees and shrubs.

A waste, a stillness, and a solitude, difficult to conceive near so great a capital, reign immediately beyond these walls, which are so lofty that from the road which passes under them the eye can scarcely catch a glimpse of the mosques and minarets of the city. This melancholy aspect is heightened by several cemeteries, with dark cypresses and white marble tombs, that lie outside of the walls. A recent traveller (Mr. Dickens) says, "Within gunshot beyond this great city, with its 600,000 inhabitants, there is not a road nor a bridge upon the most frequented ways; there is not a house, nor a garden, nor a thriving tree. Look along the shores of the Bosphorus. They are desert. Scarcely a plough stirs the land that might be one of the largest corn-growing districts in the world. . . . Not a merchant's bark, with the crescent flying at its mast-head, anchors in the waters; not a loom is at work, not a wine-press; no manufacturing plies its busy trade. . . . The Turks do nothing. Even the smart little steam-boat which still runs from the bridge at Stamboul to Bujukderé is manned with Englishmen, and our Caidje (boatman) is a Greek." The boatmen however are generally Turks.

The triangle on which Constantinople stands does not much exceed 13 miles in perimeter. The treble walls and ditches on the land side, the extensive gardens of the Seraglio, and other palaces, the large court-yards of the royal mosques, the Hippodrome and other vacant spaces, materially diminish the extent covered with houses.

With the exception of the land walls, and the church of Santa Sophia, there does not remain much of the Byzantine architecture; the greater part of the antiquities which were seen by Gyllius, by Spon, and other old travellers have disappeared. The fact is, the Turks, instead of digging in the quarry, have knocked down the Grecian buildings to use the materials in their own public edifices, such as mosques, minarets, and fountains, or to cut them up into tomb-stones.

The site of Constantinople is one of the worst sites that could be selected on the score of water supply. On the European side of the Bosphorus there is no mountain at any reasonable distance to look to, no lake, no river. But in the forest of Belgrade near the Black Sea there are gulleys and heads of valleys, down the sides of which the water pours in great abundance during the rains. In each of these valleys bends, or reservoirs, have been formed by building dams across them, and thence the water is conveyed by aqueducts to Constantinople for the use of the mosques and fountains. In the hot season a supplementary supply for private use is brought by water-carriers from Scutari, for then three-fourths of what dribbles through the aqueducts are absorbed by the mosques, which are entitled to be first supplied. Under the city are vast reservoirs, which were constructed by the Roman emperors, and kept full of water for the supply of the city during sieges, independent of the aqueducts. Many of these old cisterns still have water in them. There is a vast subterranean edifice of this kind, the roof of which is supported by 424 columns, each column being oddly formed of three separate pillars placed one on the top of the other. The Turks call it the palace of the 'thousand and one pillars;' not that this is the precise number, but because it is a favourite number with all eastern nations. Though the earth has in part filled it up, it is still of great depth. This particular one is dry; it is 240 feet long by 200 wide, and is occupied by a number of persons who spin silk by hand. Another which still exists as a cistern, though it is hardly known except to a few Turks whose houses are situated above it, and who call it the 'Subterranean Palace,' may be described as a subterranean lake, extending under several streets, having an arched roof that covers and conceals it supported on 336 marble pillars.

The Turks retain the translated name (they call it the At-Meidan, or horse course) of the famed Hippodrome, the scene of the massacre of the Janizaries; but all the ancient splendour of

the place has disappeared. It is now not a circus, but an oblong open space, about 300 paces long by 150 paces wide. It is partly flanked on one side by the mosque of Sultan Achmet, and partly on the other by the high dead walls of a building which was once an hospital, but recently used as the sultan's menagerie. At the upper end of the Hippodrome there is a granite obelisk of rather mean proportions, and partly covered with hieroglyphics of poor workmanship; it is called after Theodosius, though it is probable that emperor only removed it from another part of the city where it was erected by Constantine, and set it up here, after it had been thrown down by an earthquake. Near this obelisk is the fragment of the wreathed column of bronze, which according to an old tradition supported the golden tripod of Delphi, and was shattered by Mohammed II. with his battle-axe. It is now a poor mutilated thing, with one end in the ground, above which it does not rise more than 7 feet, and the other end open and almost filled with rubbish. The marble pyramid of Constantine Porphyrogenetus, the Colossus Struetilis of the old topographers, does not at present fairly stand on the At-meidan, though it is near it and visible from it: it has long been stripped of the plates of gilded bronze that once covered it; the shaft is held together by rude iron hoops, and blackened by the many conflagrations that have raged round it. It is now an unsightly object, about 90 feet in height, and 33 feet in circumference. Most of the great works of art which adorned the baths and squares of Constantinople were destroyed by the Latin crusaders. The four bronze horses of San Marco at Venice are the only relic left of the great works of art that once adorned the city of Constantine.

The famous Seraglio, or palace of the sultan, occupies the most eastern part of the city, and with its various gardens, baths, mosques, government buildings, and groves of cypress covers a space about three miles in circuit. It is separated from the rest of the city by high walls extending down to the Sea of Marmara. The inner inclosure or court of the Seraglio is occupied solely by the sultan and his harem. In the second court are the divan, the treasury, imperial stables and kitchen, the hall of justice, the arsenal (which was formerly the church of St. Irene), and the column of Theodosius. In the outer court are various state offices, the mint, infirmaries, &c. A large massive range of buildings occupied as government offices, mounted on a platform, ascended by a noble flight of stone steps, and ornamented by fine columns stands in the outer court, and contrasts strongly with the wooden kiosks and tall minarets; it is situated close to the large gate entrance of the Seraglio, from which it takes its name of the 'Sublime Porte,' which is also applied as a designation of the sultan's government.

Many of the mosques erected by the Turks are distinguished by grandeur and beauty. There are 14 chief or imperial mosques, nearly all lofty, and magnificent in their general dimensions, and built from base to dome, chiefly of white marble, slightly tinged with gray. Some of these have two, some four, and one (that of Sultan Achmet) has even six of those light, thin, lofty, arrowy, and most graceful towers called minarets. Besides the imperial mosques, there are 60 others, varying in size and beauty, but all considerable edifices; and then 200 and more small mosques, which have little minarets, often made of wood, contiguous to them.

The mosque which has been most talked of, because it was anciently a Christian temple, and was supposed to have suggested to the Turks the grand dome or cupola which predominates in all the great mosques they built themselves, is that of Santa Sophia, which is to the west of the Seraglio. Santa Sophia is built in the form of a Greek cross, 269 feet in length by 143 feet in breadth between the walls. It is surmounted by a flattened dome 180 feet high above the pavement, by several smaller cupolas, and by four minarets added by the Turks. In the interior are many large columns, a floor of variegated marble and magnificent bronze gates. The old Byzantine decorations have been marred by Turkish inscriptions, and the grand effect of the interior is destroyed by the lamps, globes, and insignificant ornaments hung up under the dome. Santa Sophia, originally a Christian cathedral, was built by the emperor Justinian (A.D. 531-8.) Several of the imperial mosques however in situation, boldness, and beauty far excel Santa Sophia, which externally is rendered hideous by the clumsy buttresses that have been built against it at different periods to keep it from falling. If the Turks really copied the dome from Santa Sophia they have improved on the original, which is comparatively low and heavy, whilst most of their cupolas are lofty, light, and elegant. This is particularly the case with the mosque of the Sultan Achmet, which flanks the Hippodrome, and which may be deemed altogether the grandest edifice in Constantinople. Among the other imperial mosques may be named those of Soliman the Magnificent, a masterpiece of Saracenic architecture; of Mohammed II., Bajazet II., Selim III., Mustapha III., Othman and Eyub, and the Valide mosque erected by the mother of Mohammed IV. There are 36 Christian churches and several synagogues in the city. The colleges and hospitals, which are generally attached to or near the great mosques, offer no striking architectural features, but some of them are grand institutions of the kind. The mosque of Mohammed IV. is surrounded by eight colleges, a house in which the poor are fed, an hospital, caravanserais, and baths, all surmounted by cupolas covered with lead. Some of the detached chapels or sepulchres

('turbés'), where sultans, viziers, and great personages repose, are handsome. The spacious barracks erected by the late Sultan Mahmud for the Nizam, or troops of the line, may be reckoned among the public ornaments of the city and suburbs. The government has established naval and military medical colleges, and numerous schools, but the instruction given in them is of a very confined and elementary character. The military hospital on the west side the city is a well-regulated establishment: there is also a plague hospital.

The public baths, of which there are said to be upwards of 120 within the walls, with their very low and small and flat domes, do not contribute to the beauty of the city externally, though within many of them are exceedingly handsome and spacious. The public fountains are remarkable and numerous: some of them, with their pure white marble façades, elaborate arabesque ornaments, and Chinese roofs, are most beautiful objects. The water is conveyed to Constantinople, as also to the suburbs of St. Dimitri, Pera, Galata, &c. by the aqueduct of the Sultan Mahmud, erected in 1732, and by means of narrow subterranean aqueducts, and 'souterazi,' or hollow hydraulic pyramids, which latter are placed at certain irregular distances, and so contrived as to overcome the inequalities of surface presented by the country that intervenes between the heights and the city. Within the walls the lofty aqueduct of Valens still performs its duty, carrying the fluid across a deep hollow.

From the sea Constantinople with its mosques, cupolas, and minarets, interspersed with dark cypresses, and with its port crowded with shipping, has a very imposing and splendid appearance; but a stroll through the city soon dispels this illusion. With the exception of one very long street, which traverses the city nearly from the high walls of the Seraglio to the gate of Adrianople, the streets are narrow, winding, filthy, and perilous from dogs and thieves; they display no public buildings of any account, no trade, no luxury, and are uncommonly dull and deserted. The houses are low, and mostly constructed with wood or rough stones. The 'gazebo' or 'shah-nishina' (projecting windows) are latticed and closed like the windows of convents; and many of the houses have no windows at all towards the street, but only a low, narrow, dingy door. All the life and activity of the interior of the city is concentrated in the bazaars or bezestines. These are long wide corridors, communicating with each other mostly in an irregular and striking manner; their side walls are built of stone, and they are covered in with stone arches or successions of domes, through which a subdued light is admitted. The dealers are separated by nations or religions and by trades. As in most eastern towns, and formerly also in European towns, persons who practise the same trade or follow the same occupation live together in streets by themselves. Towards the evening the coffee-houses, which are excessively numerous, though chiefly of mean appearance and dimensions, are much thronged by Turks, Armenians, Greeks, and Jews, all smoking and indulging in tiny cups of coffee; which is generally drunk by the poorer classes, not only without milk, but without sugar. The city proper comprises separate quarters for the Jews, Armenians, and Greeks. The Greek quarter called the 'Fanar' extends along the west shore of the Golden Horn, opposite Pera, and is connected with this suburb by a bridge of boats erected in 1837. The Turks leave commerce generally to the Armenians and Greeks, many of whom are very wealthy. The Jews of Constantinople are descendants of the Jews of Malaga and Granada, expelled from Spain in the 16th century; they still speak the Spanish language. The Turkish women in Galata and some other parts of the town are importunate beggars; the only male beggars to be seen are Greeks and Dervishes. The city is badly lighted at night: there is a law enjoining its inhabitants to hang out a lamp on every fifth house, but it is very generally disregarded, as is also the law which commands all persons going out after dark to carry a lantern.

The communication between the city and the opposite suburbs of Galata, Pera, and Tophana is kept up by means of caïques, or light fast wherries, the constant passing and repassing of which give the port an animated appearance in the day-time. The imperial dock-yard, the arsenal, the artillery barracks are all on the northern side of the Golden Horn, and the elevated plateau of Pera is the residence of the foreign ambassadors to the Porte, of the drogmanns, Frank merchants, &c. An active communication is also kept up by the same means with Scutari, where caravans and travellers are constantly arriving from various places in Asia Minor.

To an inhabitant of western Europe the number of dogs in Constantinople is a subject of astonishment. These animals are never domesticated but always live out of doors—wherever there is a dry spot in the filthy streets there they lie. They and the rats (which are numberless) are the only scavengers; they feed upon the offal thrown into the streets from butchers' shops and private houses, upon the carcasses of animals, and occasionally on the bodies washed out of the sea upon the shore of the Bosphorus, along which and in some of the cemeteries they prowling in search of prey. They seem to have divided the city into wards, and no dog is allowed under pain of a desperate worrying to trespass on his neighbour's territory. They are seldom known to bite any person unless trodden upon. Hydrophobia is unknown in the east. Myriads of pigeons too are seen in the city, each mosque feeding a great number of these birds; and

in the harbour and along the Bosphorus vast numbers of gulls, puffin birds, ducks, herons, and other water-fowl are seen, fearless of man, as the Turks never molest much less kill them.

The port of the Golden Horn is safe, capacious, and beautiful; but it has one serious drawback which affects it as an emporium. During the summer, the Etesian or north wind blows unremittingly from the Black Sea down the Bosphorus, the Sea of Marmara, and Straits of the Dardanelles, thus retarding the approach of all sailing vessels from the Mediterranean and Ægean to the capital. Sailing vessels undertaking the voyage upwards at that season are often detained two or even three months at Besier Bay or at Tenedos, on the coast of Troy, near the mouth of the Dardanelles, where whole fleets of wind-bound ships, laden with goods for the capital or the Black Sea, are frequently at anchor. This serious obstacle can only be overcome by steam-vessels. The first steamer that appeared on the Bosphorus was an English boat, purchased by the Turkish government in 1825. Now Austrian, Russian, French, and English steamers ply regularly to Constantinople. The Golden Horn extends for about 5 miles from south-east to north-west between the city and the suburbs of Pera, Galata, Tophana, Cassim Pasha, and St. Dimitri, and has a breadth of from one to four furlongs, with depth enough for the largest ships. It is capable of holding 1000 sail and is generally full of mercantile and other ships, with a vast number of cargoes, which ply between the city and the suburbs. In the suburb of Tophana, which lies along the north shore of the Golden Horn, to the north of Galata, and west of Cassim Pasha, are the government arsenals and dockyards and the baglio. The quays of the harbour are good, and ships lie alongside. The suburbs just mentioned are the residences of foreigners, and the principal commerce of Constantinople is carried on there. The present sultan has built a new palace in the Tophana suburb, which he inhabits in preference to the old palace at Seraglio Pont. The new structure is built of white marble, and has a fine effect rising from the water's edge. There are also extensive cannon foundries in this suburb.

As a manufacturing town Constantinople scarcely deserves mention; pipes and pipe-sticks, muslin handkerchiefs, costly saddlery, and horse-trappings are the principal articles produced. The foreign trade however is very considerable; it is entirely in the hands of the Armenians, Greeks, and foreign merchants. The exports are made up of raw silk, opium, carpets, hides, wools, Angora goats' hair, boxwood, galls, bullion and diamonds, yellow berries, madder, valonea, linseed, and bones. The imports comprise manufactures, colonial and other goods, not only for its own population but for a considerable portion of both European and Asiatic Turkey. The chief articles of import are corn, iron, timber, tallow, and furs, chiefly from Russia; cotton stuffs and yarn, woollens, silks, coals, tin plates, tin, cutlery, jewellery, watches, paper, furniture, glass, drugs, and dye-stuffs, from western Europe; corn and coffee from Egypt (but considerable quantities of coffee from Brazil and the West Indies are imported in English and American ships), wax, copper, drugs, gums, porcelain, rum, pepper, spices, &c.; sugar is imported partly from the East but chiefly from the West Indies. The exports are always very much less than the imports. Between 5000 and 6000 ships enter and clear out of the port annually, but these numbers include many vessels on their way to or from the Black Sea ports. The nations principally engaged in the foreign maritime commerce of Constantinople are England, Greece, Austria, Russia, Italy, and the Ionian Islands. A considerable foreign trade with Persia, Armenia, and other eastern countries is carried on by caravans from the suburb of Scutari, which is built on the Asiatic shore of the Bosphorus, opposite the entrance of the Golden Horn.

Although the land in the immediate neighbourhood of Constantinople is neglected and desolate, there are many beautiful spots to the northward along the shores of the Bosphorus. Among these may be mentioned Stenia, Therapia (the favourite resort of the Greeks in summer, and the site of the summer palace of the French embassy), and Bujukderé, on the European shore; the last-mentioned is situated at the eastern extremity of a beautiful valley, and contains many lovely gardens and the summer residences of most of the foreign ambassadors. The valleys and villages just named, and others in their neighbourhood, abound in picturesque and beautiful scenery, neat cottages, and thriving villages, situated among well-cultivated gardens. This enviable prosperity they owe to the immunities accorded to the foreign embassies, whereby they are exempted from the tyranny and extortions of the Pashas and Cadis, which have converted the land about Stambul generally into a desert. Nearly opposite Bujukderé, on the Asiatic shore, is Unkiar Skelessi, once a favourite resort with the sultans, on the site of whose palace now stands a paper factory, built of white marble, erected by Selim III. At the extremity of the valley of Unkiar Skelessi is the Giant's Mountain, or Inseha-Tagh, as it is called by the Turks, who have a tradition that Inseha, or Joshua, was buried on it. The Russian army in 1833 encamped on the Giant's Mountain and in the valley at its foot, and here the treaty of Unkiar Skelessi was signed (June 26), whereby Turkey bound herself to close the Dardanelles against the fleets of England and France. The suburb of Scutari, which has been merely mentioned in this article, is described under its proper head.

The Turks have never loaded trade with heavy duties or jealous prohibitions; their code extends immunities and high consideration

to merchants; but unfortunately these immunities are not enjoyed by the consumers, or by any class, and the cultivator of the soil is, or was till lately, the helpless victim of the extortion and tyranny of the government officers.

A city stood here in remote antiquity, the extent of which is probably marked out by the present walls of the Seraglio. [BYZANTIUM.] The present enlarged city was founded A.D. 328, by the emperor Constantine, but the 11th of May 330 is considered as the birthday of the city. It took its name from Constantine, who enriched it with treasures of art taken from all parts of the Roman world. Though called the rival of Rome it could never be compared to the Eternal City either in extent or population. The empire of the east of which Constantinople was the capital, commenced with the reign of Arcadius, A.D. 395. In the fifth year of the reign of Justinian the city was almost entirely reduced to ashes, in the memorable sedition of the Nika. Justinian, who reigned from A.D. 527 to 565, repaired the city, of which he is considered the second founder. The Persians, under Chosroes, maintained a camp in sight of the city from 616 to 626, and the Avars more than once during that period threatened Constantinople on the European side of the Bosphorus. In the latter year the masterly campaign of the emperor Heraclius delivered the city. The Arabs for the first time besieged Constantinople A.D. 668-675, but baffled by the strength of the walls and the strange effects of the Greek fire, they retired after losing 30,000 men. In the second siege, 716-718, they were again compelled to retreat. The Russians attacked Constantinople in A.D. 865, again in 904, a third time in 941, and a fourth time in 1043. In 1203 the Venetians, under 'the blind old Dandolo,' and the French besieged, and in 1204 stormed and pillaged the Imperial City, which then became the seat of the Latin empire till 1261, when it was recovered by the Greeks. The Sultan Amurath II. besieged Constantinople in 1422, but it was not till 1453 (May 29) that it was taken by the Sultan Mohammed II. Constantine XIII., the last of the Palæologi, fell in defence of the walls of his capital exclaiming 'θέλω θανεῖν μάλλον ἢ ζῆν' ('I had rather die than live').

CONSTANZ (Costnitz), the capital of the Baden See-Kreis, or Circle of the Lake, is situated on the southern shore of the Lake of Constanz, in 47° 36' N. lat., 9° 10' E. long., and has about 5000 inhabitants. It is fortified in the old style, with a high wall flanked by towers and a broad ditch, besides bastions on the western side and the side of the lake. Kreuzlingen, one of its suburbs, separated from it by a ditch, is defended by two bastions; and Petershausen, which lies on the other side of the strait that connects the Bodensee and Untersee, is united to Constanz by a covered wooden bridge, on which there are grinding and sawing mills. In this last suburb is the castle of Petershausen, a fortress, the works of which have been converted into pleasure-grounds. There is a third suburb, called Paradise, in which John Huss and Jerome of Prague were burnt. The most remarkable buildings in the town are the cathedral, which contains a magnificent high altar; the church of St. Stephen; the Kaufhaus, or mart, once a Carthusian monastery, built in 1388, which contains the hall where the council of Constanz sat (1414-18) which asserted its right to claim obedience even from the pope himself, deposed popes Benedict XIII. and John XXIII., elected Martin V., and condemned the tenets of Huss and Jerome of Prague; and the old Dominican monastery on the Island of Genf. Constanz is the seat of various official departments, and has a lyceum, gymnasium, hospital, and Dominican nunnery for the education of young females. In the 15th century its population was above 25,000. The chief occupations are trade, fisheries and navigation, the cultivation of vineyards and gardens, brewing, and some manufactures of silk, calico, and watches. Steamers ply between Constanz and the different ports on the lake. Constanz is one of the oldest towns in Germany, and some think that it occupies the site of the ancient Canodorum. It was for a long time a free imperial town. A treaty signed here in 1474 between the emperor Sigismund and the Swiss confederation put an end to the long struggle between Austria and Switzerland. Constanz belonged to the crown of Austria from 1549 to 1810, when it was transferred to Baden by the treaty of Pressburg. The bishopric of Constanz was suppressed in 1802. Constanz has magnetic communication with Zurich.

CONSTANZ (Bodensee Costnitz), a large lake in the south-west of Germany, on the confines of Austria, Bavaria, Würtemberg, Baden, and Switzerland. It lies between 47° 28' and 47° 48' N. lat., 9° 2' and 9° 44' E. long. It is 1283 feet above the level of the sea: its greatest length, from Bregenz to Bodmann, is about 45 miles; its greatest breadth, between Rorschach and Friedrichshafen, is about 13 miles, and its average depth is 320 feet, the greatest being 964 feet. The lake is divided into the Upper and Lower Lakes, of which the Upper, which is by far the most considerable, extends from Bregenz to Constanz. The Lower Lake is subdivided into Lake Zell, or Zellersee (which is about 60 feet deep, and contains the fertile island of Reichenau, belonging to Baden), and the Lower Lake (Untersee), through which the Rhine flows. The northernmost bight, which contains the island of Meinen, also belonging to Baden, and the island of Lindau, is called Lake Bodmer, or the Ueberlingersee. The Rhine enters the lake at Rheineck and leaves it at Stein. Above 50 larger and smaller streams empty themselves into Lake Constanz. Owing to its great depth it is seldom frozen over, but this has sometimes occurred.

It has on several occasions been subject to sudden risings of the waters. In 1549 it rose four or five times in one hour upwards of 2 feet above its ordinary level; in 1770 it rose in one hour from 20 to 24 feet above the ordinary level. There is a considerable traffic on the lake in corn, timber, cattle, wine, fruit, &c. About a dozen steamboats ply between the several towns along its shores. Many kinds of aquatic and marsh fowl frequent Lake Constanz, and it contains a great variety of shell-fish and other fish, particularly trout, pike, carp, and salmon (*Salmo murtana*). The wine, called lake-wine, grown along the lake, is rough, but becomes excellent when old. The Lake of Constanz and its environs, present the most varied and picturesque scenery in Germany. It is mentioned by ancient writers under the name of *Lacus Brigantinus*. The Helvetians lived to the south of the lake, the Rhetians on the south-east, and the Vindelicians on the north. In ancient times it was surrounded by dense forests, through which however the Romans carried a road, traces of which still exist at some distance from the northern shore. Tiberius built a fleet on it in order to attack the Vindilici, whom he conquered in a naval battle fought near an island in the lake, probably the island of *Reichenau*. (Stanbo, vii. 292.)

Two railroads now terminate on the north shore of the lake, one at Lindau, which runs through the Bavarian territory to Augsburg, and the other at Friedrichshafen, which traverses Würtemberg running through Biberach and Ulm to Stuttgart. Electro-telegraphic wires are laid down along both these lines.

CONSUÉGRA. [CASTILLA-LA-NUÉVA.]

CONVERSANO. [BARI, TERRA DI.]

CONWAY, more properly CONWY, or as it is sometimes called, ABER-CONWY (Conwy-Mouth), Caernarvonshire, a market-town, municipal and parliamentary borough, and the seat of a Poor-Law Union, in the parish of Conwy and hundred of Isaf, is situated near the mouth of the river Conwy, on its left bank, in 53° 16' N. lat., 3° 50' W. long.; distant 22 miles N.E. from Caernarvon, 223 miles N.W. from London by road, and 233½ miles by the North Western and Chester and Holyhead railways. The population of the borough in 1851 was 2105. The borough is governed by a mayor and corporation and is a contributory borough to Caernarvon in returning a member to the Imperial Parliament. The living is a vicarage in the archdeaconry and diocese of Bangor. Conwy Poor-Law Union contains 15 parishes and townships, with an area of 35,196 acres, and a population in 1851 of 11,616.

Some antiquaries consider Conwy to be the site of the Roman station Conovium; others place Conovium at a village now called Caer-Rhun, 5 miles higher up the river. Conwy Castle was built by Edward I. in 1283, for the purpose of keeping his Welsh subjects in check. In 1290 Edward was besieged here by the Welsh, under Madoc, and was reduced to great extremity by famine, but he was at length relieved by the arrival of a fleet with provisions. When Richard II. landed in Wales from Ireland to attack Bolingbroke (afterwards Henry IV.), on finding the disaffection of his army and nobles he took shelter in Conwy Castle, whence he was soon afterwards allured and delivered to his enemies. The parliament respected this noble edifice when they dismantled most of the other castles in Wales; but the roofs and floors were afterwards removed by the Earl of Conwy, to whom it was granted after the Restoration. One of the towers has a large breach in the lower part, caused by the inhabitants undermining it while digging for slates. The strength of the masonry has kept the upper part in its place.

This fortress, one of the noblest piles in Britain, is in form nearly a parallelogram, extending along the verge of a precipitous rock on the south-east side of the town: two of the sides are within the walls of the town; the others are washed, one by the Conwy, which here expands into an estuary, the other by a small stream which flows into the Conwy. The walls, which are partly covered with ivy, are from 12 to 15 feet in thickness, flanked on each of the two sides without the town by four vast circular unbattled towers with slender turrets rising from them. The grand entrance was on the west, towards the town, but there was a communication with the river by a small advanced work and a narrow flight of steps out of the rock. The interior consists of two courts; the apartments are only in a few instances traceable. The state hall was about 130 feet in length, 32 feet broad, and 30 feet high. The roof was supported by eight arches, some of which still remain. The mayor of Conwy is constable of the castle.

The town is still surrounded by its ancient walls, which are strengthened at intervals by 21 towers, besides two towers to each of the three entrances. The streets of the town are narrow and irregular, and many buildings are in a ruinous condition. Of the houses a large proportion are constructed chiefly of timber. One remarkable building, called the Plas Mawr, or Great Mansion, is an object of much interest. It is in the Elizabethan style, and was erected in 1576. The rooms are profusely ornamented with figures, coats of arms, scrolls, &c., and some are carved in oak. Devices of a similar description ornament the exterior of the house. From the turret a fine view of the town and vicinity is obtained. The parish church, which stands near the centre of the town, occupies the site of the conventual church of a Cistercian abbey, founded here in 1185, by Llewelyn ap Iorwerth, prince of Wales. The church is a venerable

and commodious edifice; the earliest parts, which are in the gothic style, date from the beginning of the 14th century. The Independents, and the Wesleyan and Calvinistic Methodists have places of worship in Conway. There are here National schools for boys and girls, and a parochial lending library.

In the river, about 100 yards from the rock on which the castle stands, is an insulated rock, eastward from which, for about half a mile, extend sands covered by the sea when the tide is up, but dry, with the exception of a narrow channel, at low water. When the improvement of the communication with Ireland was under the direction of parliamentary commissioners, it was determined to throw a suspension-bridge from the castle rock to that in the river (between which rocks is a deep and rapid tideway), and to connect the latter with the eastern shore by an embankment across the sands. The works were begun in 1822 and finished in 1826 by Telford, the celebrated engineer. The amount of public money voted for the construction of this bridge was 40,000*l.* The length of the bridge, measured between the centres of the supporting towers, is 327 feet; the height of the underside of the roadway above the high water of spring tides, 15 feet; the embankment, which is of mountain clay faced with stone, is 2015 feet in length, and averages 9 feet in height above the high water of spring tides, rising to 13 feet at the end next the bridge: the width of the base at the highest part is 300 feet, the breadth at the top 30 feet. The spring tides in the Conway rise 21 to 24 feet. Near this bridge is the wrought-iron tubular bridge, constructed in 1848 by Mr. Robert Stephenson, the engineer of the larger work on the same principle, the Britannia bridge, over the Menai Strait. Both of these works form part of the line of the Chester and Holyhead railway. The Conway tubular bridge cost 110,000*l.* The length of the tube is 400 feet. Its height above high-water mark is 18 feet. The line of railway runs immediately under that portion of the castle wall on which is the broken tower mentioned above.

The town and trade of Conway have been considerably improved since Telford built the suspension-bridge. Ship-building has been carried on to some extent, and several large vessels have been built. The harbour is convenient. Timber and slate are exported. The market-day is Friday; fairs are held on March 26th, April 30th, June 20th, August 10th, September 16th, October 20th, and November 15th. Conway is considered, as a place of residence, favourable to health. Numerous lodging-houses are here for the accommodation of visitors frequenting the town for sea bathing during the summer. Pearl oysters have been found in the river Conway, near the town.

(Parry, *Cambrian Mirror*; *The Land We Live In*, vol. iii.; *Communication from Conway*.)

COOCH BAHAR, or COOCH BEHAR, a principality occupying the north-east extremity of the province of Bengal, and lying between 26° and 26° 30' N. lat., and between 88° 52' and 89° 52' E. long. This principality, which once formed the western division of the ancient kingdom of Camroop, has long been in a state of absolute dependence on the English government. The revenue is about 13,200*l.* a year, of which one-half is paid to the British government in name of tribute. The extreme length of the principality from east to west is 60 miles, and its mean breadth about 22 miles; the area is 1364 square miles. The population of the principality is estimated at about 140,000.

The distinctive name, Cooch, has been given in order to mark the difference between this principality and the province of BAHAR. This name, Cooch, is derived from that given to the majority of the inhabitants. Many of the Cooch tribes have relinquished the practices of their ancestors and have adopted the Brahminical faith; while others who inhabit the northern quarter of the principality, near to the frontier of Bootan, continue rude and barbarous in their habits. The southern parts of the principality are much improved by culture, and are of considerable fertility; but in the north the country is low and marshy, and contains abundance of thick jungle. A considerable quantity of opium is produced, as well as indigo, and some cotton. Wheat is cultivated, and a little barley. Trade between the principality and the adjoining British territory is perfectly free, and the people have also commercial dealings with Asam and Bootan. The sovereign of this country is described in the *Ayin Akbari* as having been a powerful chief, having Asam and the whole kingdom of Camroop under his sway, his territory being bounded E. by the Brahmaputra River, S. by Gohaghaut, W. by Tirhoot, and N. by the Tibet Mountains. This country was conquered by the Moguls about the year 1660. In 1772, when the East India Company had succeeded to the rights of the Mogul emperor, the raja of Cooch Bahar applied to the collector of Rungpoor for protection against the attacks of the Bootaners, by whom he had been reduced to great extremities. The raja offered to pay an annual tribute to the English, equal to one-half of his revenue, which offer being accepted, a British force was despatched to his assistance, and the Bootaners were made to retire precipitately. The tribute having fallen into arrear once and again, and at last in 1813 the affairs of the district having fallen into confusion, and the country being in a state of anarchy, a resident English commissioner was appointed by the Governor-General. The raja was compelled to dismiss his ministers, and to appoint others on the nomination of the English government, and a system of criminal

jurisprudence was established, which was administered through the agency of the British commissioner.

(*Ayin-i-Akbari*; Rennell, *Memoir of a Map of Hindustan*; Mill, *History of British India*.)

COOK. [WALES, NEW SOUTH.]

COOKHAM, Berkshire, a village, formerly a market-town, and the seat of a Poor-Law Union, in the parish and hundred of Cookham, is situated on the right bank of the Thames, in 51° 30' N. lat., 0° 42' W. long., distant 28 miles W. by N. from London. The living is a vicarage in the archdeaconry of Berks and diocese of Oxford. Cookham Poor-Law Union contains 7 parishes and townships, with an area of 30,430 acres, and a population in 1851 of 11,768. Further particulars respecting Cookham will be found under *BERKSHIRE*.

COOKSTOWN, county of Tyrone, Ireland, a post-town and the seat of a Poor-Law Union, in the parish of Derrylaran and barony of Dungannon, is situated in 54° 39' N. lat., 6° 45' W. long., 109 miles N. by W. from Dublin, and 14 miles N. from Dungannon. The population in 1851 was 2993, exclusive of 296 persons in the Union workhouse. Cookstown Poor-Law Union comprises 16 electoral divisions, with an area of 96,478 acres, and a population in 1851 of 38,740.

The town consists of one very long and wide street, occupying the line of the leading road from Armagh northward to Coleraine and Londonderry. A double row of trees gives the street the character of a mall. The public buildings are a neat market-house, sessions court-house, linen-hall, parish church, two Presbyterian meeting-houses, and the Union workhouse. There is a considerable trade in linens. Killymoon castle, in the vicinity, is a handsome edifice in the gothic style, from designs by Nash. The plantations which adorn the demesne give additional interest to the appearance of the town. The Ballinderry river runs through the Killymoon grounds.

COORG, or CADUGA, a small principality which occupies the eastern part of the mountain range called the Western Ghauts, and extends from the Tamberacherry Pass, on the south, in 11° 25' N. lat., 76° 20' E. long., to the river Hennavutty, on the confines of Bednore, on the north, in 12° 42' N. lat. The greatest length is about 70 miles, and the mean breadth about 22 miles. It is bounded N. by Canara and Mysore, W. and S. by the province of Malabar, and E. by Mysore.

The country presents a succession of hills and valleys, enjoys a temperate climate, and has a fertile soil; in many parts it is well cultivated, in others it is overrun with jungle, which is the resort of wild elephants and many beasts of prey: some considerable forests also occur, and from these a good deal of sandal-wood is obtained. The Tungha and Bhadra, which after their junction are called the Toombuddra, and the Cavery, have their sources in the Coorg country. Rice is produced in sufficient abundance to allow of exportation to Mysore. Considerable quantities of cardamom-seeds are raised and exported. There is abundance of excellent pasture, on which great numbers of cattle are reared. The manufactures of the country are confined to a coarse kind of blanket. *Periapattam*, in 12° 22' N. lat., 76° 11' E. long., was formerly the capital of the principality, but its proximity to the Mysore territory occasioned it to be abandoned in favour of *Mercara*, which is now the residence of the raja and the seat of his government. This town stands surrounded by an amphitheatre of hills, in 12° 26' N. lat., 75° 30' E. long. The fort is a pentagon, with towers and bastions; within this is the raja's palace, which is handsomely furnished in the European style. Coorg was ceded to the British in full sovereignty in 1834. The raja of Coorg brought his daughter to England in 1853, for the purpose of having her instructed in the Christian religion. She was received by the Queen, and the duty of superintending the young lady's education was committed to a person approved by her Majesty. At the raja's request his daughter was baptised according to the mode of the Church of England.

COOTEHILL, county of Cavan, Ireland, a post-town and the seat of a Poor-Law Union, in the parish of Drumgoon and barony of Tulaghgarvey, is situated in 54° 5' N. lat., 7° 3' W. long., 73 miles N.N.W. from Dublin. The population in 1851 was 2105, besides 1101 in the Union workhouse and other public institutions. Cootehill Poor-Law Union comprises 19 electoral divisions, with an area of 105,848 acres, and a population in 1851 of 44,333.

Cootehill lies on the road from Kingscourt to Clones, and has four principal streets, which are wide and substantially built. It contains a neat church, besides chapels for Roman Catholics, Presbyterians, Methodists, Moravians, and Quakers. There is here a brisk trade in linens, and a large market for agricultural produce. The town stands at the western extremity of a series of lakes which are navigable for the greater part of the distance (7 miles) hence to Ballybay. The neighbourhood is well cultivated, and adorned with numerous demesnes and mansions. Quarter sessions for the county are held at Cootehill. There are here a bridewell, a dispensary, and a station of the constabulary force. A fair is held on the second Friday in each month.

COPENHAGEN (*Kjöbenhavn*, 'Merchants' Haven'), the metropolis of the kingdom of Denmark, is situated partly on the east coast of the island of Sjaeland, at the southern extremity of the Sound, which is here about 14 miles broad, and partly on the northern coast of the small island of Amager or Amak, in 55° 40' N. lat., 12° 34' E. long., and had a population of 129,695 in 1850. The city is about 8 miles in circumference; in this space are included the harbour and docks. It is divided into three principal districts—the Old Town, or Aldstadt,

the New Town, or Frederickstadt, and Christianshavn on the isle of Amak. These three quarters are surrounded by ramparts and ditches, and defended by 24 bastions, besides outworks, and towards the sea on the north-east by a very strong citadel called Frederikshavn, which is a regular polygon, with five bastions, and is joined to the city by an esplanade. Without the wall there are three suburbs. The city is divided into 12 quarters, and contains 10 public squares, 5 market-places, 3 royal palaces, 9 parochial and several other churches, a Roman Catholic chapel, 3 synagogues, 3 theatres, several hospitals, a foundling asylum, and 30 poorhouses. With the exception of some of the public buildings the architecture of the city is entirely devoid of beauty. The houses are built of brick and stucco in the plainest and most uninteresting style. Nevertheless its aspect on emerging from the narrow entrance into the port, which is capable of containing 500 merchant vessels besides the whole Danish navy, is grand and striking. The city is entered by four gates, one of which is on the isle of Amak. The ramparts of the town and citadel are planted with trees, and form pretty walks. The entrance to the harbour is defended by the Trekroner battery.

The Aldstadt, the most western quarter, is separated from the New Town by a canal and by a street called Gøthers Gade, which commences at the city walls a little east of the North Gate, and runs nearly north and south to the 'Strømmer,' or channel that separates the island of Seeland from that of Amak. The Aldstadt is united to Christianshavn by a drawbridge near the exchange. It consists for the most part of narrow winding streets; it comprises however the Castle Island, on which stand the Christiansborg palace, the exchange, the bank, and Thorwaldsen's museum. In this quarter also are the university and several of the finest churches, and the Gammel and Nye-Torv, or Old and New Market—a large open space near the West Gate, on one side of which is the Raadhus, a plain building, in which the courts of justice are held. The royal palace of Christiansborg, originally built by Christian VI. between 1732 and 1740, was burnt down in 1795, but has been since rebuilt on a vast scale. The principal façade in the Slots-Plads, or Palace-square, is remarkable chiefly for its great dimensions and for the four bas-reliefs of Thorwaldsen over the entrance, representing Minerva and Prometheus, Heracles and Hebe, Jupiter and Nemesis, and Æsculapius and Hygieia. The Riddersal, or banquetting-hall, in this palace is unequalled in Europe for the grandeur of its proportions. The apartments are decorated with paintings, friezes, and sculptures by Danish artists. In the entrance-hall is the Triumphant March of Alexander into Babylon, by Thorwaldsen. In connection with the palace are royal galleries of paintings; the royal chapel; a supreme court of justice; a library, in which are 400,000 volumes and above 15,000 manuscripts; a valuable collection of above 30,000 engravings; an arsenal, in which arms from the earliest period to the present time are arranged in chronological order; and a Museum of Northern Antiquities, which contains very numerous specimens beautifully arranged in periods designated from the material of which the antiquities are made—stone, flint, bronze, iron, &c. On the north side of the palace stands the Thorwaldsen Museum (a handsome building surmounted by a colossal statue of Fame), which contains casts of all the works of that great master, and several marble statues presented by him to his native city. The other remarkable buildings in this quarter are—Vor Frue Kirke (Our Lady's church), which was almost destroyed during the bombardment of the city in 1807, but has been since completely restored, and ornamented with many of the works of Thorwaldsen, who was buried in this church; the Helliggeistes Kirke (Church of the Holy Ghost); Trinity church, on the top of whose singularly-constructed round tower (which is 115 feet high) an observatory is erected; and the University, which was founded in 1478 by Christian I. This university is attended by about 1100 students, and has a library of 100,000 volumes, which are kept in the upper part of Trinity church, a collection of manuscripts relative to northern and Icelandic history, a museum of northern antiquities, a botanical garden, a cabinet of natural history, a theatre of anatomy, &c. In the Kongen's Nye-Torv (King's New Market) an irregular space of great extent nearly in the centre of Copenhagen, above twelve of the principal streets meet; in one of them, the Oster Gade, are the best shops in the capital. On the south side of the Torv is the palace of Charlottenborg, a huge, desolate-looking building, which was given to the Academy of Arts in 1788; it contains a gallery of casts from the antique. The grounds of the palace have been converted into a botanical garden. To the west of the palace is the principal theatre. In the centre of the Torv is a colossal equestrian statue of Christian V., made of lead, and of little merit.

The New Town is the most eastern quarter of the city; the southern part of it, called Frederickstadt, is the finest portion, but the whole of it is laid out in broad and regular streets, some of which however are unfinished. Here is the Castle of Rosenborg, in which are deposited the crown jewels, a beautiful collection of objects of art, arms and costumes belonging to Danish kings, and a cabinet of coins and medals. The castle gardens, which are extensive, are embellished with statues, and form a public promenade. The Castle of Rosenborg was erected in 1604, some say from a design by Inigo Jones. It is an irregular gothic structure, built of red brick, with a high pointed roof, and flanked by four towers. It originally stood without the walls, and was fortified; its defences have disappeared since the extension of

the city walls in 1608. The Riddersal, the most spacious room in the castle, is lined with tapestry representing the battles of Christian V. Fredericks Plads, one of the finest open places in the New Town, is a circus divided into four equal portions by four streets which run through it. The circus is inclosed by four palaces, two of which are inhabited by the king and the others by members of the royal family. In the centre of the circus is a metal equestrian statue of Frederick V., mounted on a pedestal of white Italian marble. Between the circus and the citadel are the Almindelig and Frederick hospitals; the latter faces the Bred Gade, in which are the Roman Catholic chapel and the garrison church. The Frederick church, which was commenced on a grand scale, has been long left in an unfinished state. Between the gardens of the castle of Rosenborg and the city walls are extensive ranges of barracks; and a little way outside the eastern gate is the naval cemetery, in which is a monolithic obelisk of Norwegian marble, erected in honour of those who fell in defence of the city on the 2nd of April, 1801.

The third division of Copenhagen is Christianshavn, situated on the island of Amager, and united to the town by two bridges. The narrow arm of the sea which separates Amager from Seeland forms an admirable harbour, which is the great naval station of Denmark. In this quarter, which presents regular well-built streets and handsome squares, is Vor Frøers Kirke (Our Saviour's church), the finest in Copenhagen, surmounted by a tower, 288 feet in height; and the warehouses of the Danish East India Company. In this direction are situated the two smaller islands, Frederiks Holm and Nye Holm, which are united by a bridge, and contain the stores, dockyard, slips, and arsenals of the fleet, &c. On the island of Amager is the Amager Torv, which is used as a fish and vegetable market, and presents an attractive sight; the Amagers (descendants of a Dutch or Frisian colony, settled here in 1516 by Christian II.) retaining still their original Frisian costume.

The Royal Museum of Natural History in the Storm Gade contains extensive collections of shells and minerals; it is peculiarly rich in insects, comprising those of Brazil, the East Indies, the Cape of Good Hope, and Europe. It possesses also a great variety of birds, fishes, and reptiles. In the mineralogical collection is the famous Kongsberg mass of silver, 6 feet long, 2 feet broad, and 8 inches thick, as it was taken out of the Norwegian mine. Outside the west gate, in the suburb of Vesterbro, is the Moerskabs Theater, the favourite theatre of the humbler classes; and near it the Tivoli gardens, the most fashionable place of resort in summer. Near the west gate, also on the road to the Roeskilde railway, is a column of Bornholm stone, called the 'Statue of Liberty,' and erected in 1788 in commemoration of the abolition of feudal servitude by Christian VII. On its sides are emblematical bas-reliefs and inscriptions. About half a mile from the west gate is the Palace of Frederiksberg, situated upon an eminence which commands splendid land and sea views. The grounds are laid out in the English style, and open to the public. A beautiful avenue, shaded by noble chestnuts and lime-trees, and about a mile in length, leads from the Vesterbro suburb to the entrance of the park, and is lined on both sides with pretty villas and tea-gardens. Outside the north gate is the principal cemetery, which is laid out like a garden, and is a favourite walking place with the townspeople. To the north of the city a road runs along the Sound, affording views of the Swedish coast and of the isle of Hveen, with the ruins of Tycho Brahe's observatory, Uraniborg, upon it. On the land side are many pretty villas and an extensive forest, called Dyrløve, or Deerpark, which is much frequented by the Danes in summer.

Copenhagen is the seat of the metropolitan bishop of Denmark. It contains 22 hospitals, a naval hospital, and other benevolent institutions for human infirmities. Besides the libraries already named the city possesses the Classensche library in the Annæ Gade, containing above 40,000 volumes. Among the establishments for higher education are the Military High school and the Polytechnic school. The principal learned societies are the Royal Academy, the Society for Promoting Northern History and Languages, a Society of National Economy, Societies for Icelandic Literature and for Northern Antiquities, and several reading clubs, some of which have good libraries.

The chief source of employment for the population of Copenhagen is commerce and navigation, which are greatly promoted by the East India Company and various commercial associations. In the harbour there is a depth of 17 or 18 feet, and vessels load or unload alongside the quays. The anchorage in the roads outside the boom is also good and safe. By means of canals large ships reach the warehouses and the centre of the city. The harbour of Copenhagen is the station for the naval force of Denmark; in connection with the naval harbour are, a cannon foundry, naval arsenal, and shipbuilding docks. Including the foreign, colonial, and coasting trade, about 4000 vessels of all sizes enter and clear out of the harbour annually. The imports comprise timber, pitch, and tar from Sweden and Norway; flax, hemp, masts, sail-cloth, and cordage from Russia; coffee, sugar, and other West India produce; tobacco from America; wine and brandy from France; coal, earthenware, iron, steel, salt, and manufactured goods from England. In the year 1849 the importation of coffee amounted to 9,510,311 lbs.; sugar, 19,477,266 lbs.; tobacco, 1,944,156 lbs.; wool, 892,706 lbs.; train-oil, 10,586 casks; fish-fat, 4316 casks. These articles also enter into the exports. The exports consist chiefly of agricultural produce—corn, rape-seed, oil-cake (of which 13,738 casks

were exported in 1849), butter, cheese, beef, pork, horses, cattle, wool, hides, skins, bones, grain spirits, &c. Copenhagen has a great number of spirit distilleries, several breweries, vinegar distilleries, sugar refineries, soap-boilers' works, manufactories of tobacco, cloth, cotton goods, hats, gloves, linen, cordage, and silk; numerous tanneries, iron-foundries, &c., and a royal china manufactory, in which the choicest of Thorwaldsen's designs are reproduced in bisque china. General trade has rather declined, principally in consequence of Altona being a free port, and of the high port charges at Copenhagen. A railroad, 15 miles in length, connects the city with Roeskilde. There is a railway also with electro-telegraphic wires to Elsinore.

Copenhagen was founded by Bishop Axel in 1168, when it was only a poor hamlet of fishermen; but as a town Copenhagen dates only from the 13th century, and as a city only since 1443, when, having been much enlarged, it received municipal privileges and became the royal residence. Previously the capital of Denmark was Roeskilde. In the winter of 1658-9 it successfully withstood a long siege by Charles XII. of Sweden. On the 2nd of April 1801 Lord Nelson gained here a great naval victory over the Danish fleet, the effect of which victory compelled Denmark to abandon the alliance with Napoleon against England. Copenhagen was bombarded by the British army under Lord Cathcart in 1807, when vast injury was done to the city and a large number of the townspeople were killed. The city on this occasion capitulated, and all the ships and military stores were conveyed to England, in order to prevent their being of service to Napoleon in furtherance of his design of invading England.

The climate is damp and unhealthy; the water is bad; and the mortality is said to be greater than in any other town in Denmark.

COPPERMINE RIVER is a river in North America, which falls into the Arctic Ocean. It rises in a rocky country, near 65° N. lat., 112° W. long., where a series of lakes unite and form the river. The river first runs nearly due north, until it has passed 66° 30' N. lat., when it turns west and flows along the foot of a rocky but not high chain of mountains. Having attained 116° 30' W. long., it turns abruptly north, and breaking through the mountains continues its course in a northern direction to its mouth, 65° 50' N. lat., and near 116° W. long. Its whole course may be about 300 miles. It contains numerous rapids, but none which form insuperable difficulties to canoes and boats which descend the river. The mouth of this river was the first place on the coast of the Arctic Sea of America which was visited by Europeans. (Franklin and Richardson.)

COQUIMBO. [CHILE.]

CORBRIDGE. [NORTHUMBERLAND.]

CORBY. [LINCOLNSHIRE.]

CORCYRA. [IONIAN ISLANDS.]

CORDOVA, or **CORDOBA**, a province of Spain included in the great territorial division of Andalusia, is bounded N. by the modern province of Ciudad Real (La Mancha), N.W. by the modern province of Badajoz in Estremadura, S.W. by the province of Sevilla, and E. by the province of Jaen. It is situated between 37° 13' and 38° 37' N. lat., 3° 58' and 5° 35' W. long. It is of a triangular form, each of the three sides being from 80 to 90 miles in length. The area is 4160 square miles. The population in 1849 was 348,956.

A general description of the provinces comprised in Andalusia is given under that head. [ANDALUSIA.] The mountain range of the Sierra Morena extends from east to west across the northern part of the province of Cordova: the Montes de Granada extend into the southern part, and there terminate. The Guadalquivir flows from east-north-east to west-south-west across the centre of the province, receiving on its northern bank, from the southern slopes of the Sierra Morena, the Rio de las Leguas, the Guadamehatto, the Guzua, the Guadaira, and the Bembazar. From the northern slopes of the Sierra Morena the Guadalupez and Guadaramilla flow to the Guadiana. The Guadajoz is the only considerable river which enters the Guadalquivir by the southern bank.

Towns.—The city of Cordova is the capital of the province. [CORDOVA.] *Alcolea*, 9 miles E.N.E. from Cordova, is a small town on the northern bank of the Guadalquivir, which is here crossed by a fine bridge of black marble. *Baena*, 25 miles S.E. from Cordova, occupies the side of a conical elevation, the summit of which is crowned by a castle once the property of Gonzalo de Cordova, the 'Great Captain.' The town has a good plaza, and contains two churches. The population in 1845 was 12,944. The neighbourhood is very fertile. About six miles northward a solitary farm-house marks the site of the *Castrum Priscum* of the Romans, a town of some note in ancient times. Many cinerary urns and other Roman antiquities have been dug up in the vicinity. *Cabra*, 30 miles S.S.E. from Cordova, is a rich agricultural town, surrounded with gardens. It is a tortuous place, situated between two hills, but the streets on the level ground are handsome, and are cleansed by running water. The plaza is irregular, but striking. It has a college, and manufactures of bricks, tiles, linen, and soap. The population in 1845 was 11,576. *Castro-del-Rio*, 18 miles S.E. from Cordova, contains three or four churches, and has manufactures of wool and hemp. Population 9000. *Fuente-Ovejuna* (Shoop-Well), 45 miles N.W. from Cordova, occupies the flat summit and sides of a hill of considerable elevation on the Sierra Morena. The plaza, church, and some of the buildings are on the summit of the hill, but most of the houses, which are of one story,

are on the sides of the hill, surrounded by gardens and vineyards, and bounded by walls and other defences, leaving the base of the hill entirely open. The wells which give name to the place are at the bottom of the hill, on the western side: population about 6000. *Hinojosa*, 45 miles N.N.W. from Cordova, has wide streets, with very small houses, generally of one story, white washed, and very clean and neat. Each house has a garden or small court. It is a Moorish town, and has a population of about 8000. *Lacuna*, 33 miles S.E. from Cordova, and 3 miles S. from Cabra, is an agricultural town, chiefly inhabited by a rural population and provincial gentry. It is ill-paved, most of the houses are in a dilapidated state, and the kennels are in a filthy condition. It has manufactures of coarse cloths and pottery. The population in 1845 was 16,665. *Montilla*, 20 miles S. from Cordova, is a well-built town on a hill-side. It contains two parish churches, and has manufactures of coarse linens and earthenware. There are also oil-mills, and the town is celebrated as having been the birthplace of Gonzalo de Cordova, the 'Great Captain,' and for the wine made in the neighbourhood: the population in 1845 was 13,224. *Montoro*, 26 miles E.N.E. from Cordova, stands on the south bank of the Guadalquivir, which almost encircles the town. There is here a good bridge over the river. The town is tolerably well-built, and has several fountains. There are manufactures of woollens and earthenware. The population in 1845 was 10,732. *Palma*, 30 miles S.W. from Cordova, stands in a plain on the southern bank of the Guadalquivir, and near the mouth of the Jemil (Xenil). There are several oil-mills: population, 5500. *Ranbla*, 23 miles S. from Cordova, and 6 miles W. from Montilla, stands on a hill, in a country very fertile in grain, wine, and oil. It has manufactures of woollens and of coarse pottery, especially the porous vessels for cooling water called 'alcarrazas.' Population, 9000.

(Ford, *Handbook of Spain*; Widdrington, *Spain and the Spaniards* in 1843; Murray, *Cities and Wilds of Andalusia*; Madoz, *Diccionario de España*.)

CORDOVA, a city of Spain, capital of the province of Cordova, is situated on the right or northern bank of the Guadalquivir, in 37° 52' N. lat., 4° 45' W. long.; 80 miles N.E. from Sevilla, and 180 miles S.S.W. from Madrid. The population in 1845 was 41,976. The bridge which here crosses the Guadalquivir was originally built by the Romans, and the foundations are Roman, but the bridge itself, formed of 16 stone arches, and was constructed by the Moors. The city stands on a gentle declivity, and is sheltered to the north and north-east by the summits and ridges of the Sierra Morena. It is inclosed by high walls flanked by square towers, and was formerly entered by several gates, most of which are now walled up. The walls and towers were built by the Moors on Roman foundations, and inclose a large area, much of which is now occupied by gardens or by ruins, and there is one large plaza surrounded by handsome houses. The rest of the city is a mass of narrow streets and alleys, very gloomy, and by no means clean. The public buildings consist of the cathedral, 13 parish churches, many convents, most of which are now applied to secular uses, a bishop's palace with fine gardens, a palace of the Moorish sovereigns now converted into stables for a royal stud of horses, a city-hall, a lyceum, three colleges, a theatre, and several hospitals.

The Cathedral of Cordova is one of the most extraordinary places of worship in the world. It was originally a Moorish mosque, founded by Abd-el-Rahman I. in 786, and completed by his son Hixam in 794. The shape is quadrangular, the length being 394 feet from east to west, and 356 feet from north to south. The exterior is castellated and gloomy, with square buttress-towers, and with a bell-tower similar to the Giralda of the cathedral of Sevilla; and there is a court adjoining it, now called the *Patio de los Naranjos* (Court of the Oranges), which is also similar to the one which adjoins the cathedral of Sevilla, but larger: it is 130 feet long by 210 feet wide, and has colonnades on three sides with fountains in the centre, and is planted with orange-trees and cypresses. The interior of the cathedral presents at first sight somewhat the appearance of a marble grove, the roof, which is only 35 feet high, being supported by a vast number of slender pillars, delicately wrought, with Corinthian capitals, and shafts of various-coloured marbles, and of jasper, porphyry, and other materials, so arranged as to form 29 aisles from east to west, and 19 from north to south. The pillars were obtained from Christian churches in different parts of the world where the Moslems had made conquests. The number of pillars is said to have been originally 1200, but a great many of them were taken away when the Christians, in order to convert the mosque into a cathedral, cleared an open space for a choir, and constructed a dome. The number of pillars still remaining is upwards of 850. The choir was begun in 1523, and completed in 1593. There are a number of chapels at the sides of the cathedral, of which the most interesting is the *Capilla de la Villa Vieiosa*, originally the *Maskurah*, or seat of the kalif, now generally called by the Spaniards the *Zancarron*, which name has reference to the heel-bone of the foot of Mahomet having been shown here as a relic.

The streets of Cordova seem now to be almost deserted. It was always celebrated for its silversmiths, who came originally from Damascus, and some of the profession still continue to work in the chased filigree style. The peculiar leather called from the town *Cordovan* (Cordwain) was once celebrated, but the Moors carried their

industry to Morocco, and their leather has since assumed that name. Dupont, the French general, entered the city in June 1808 without resistance, yet he not only plundered the cathedral, the churches, and other public buildings, but massacred the people. The Alameda, or public walk, is outside the walls; it is not much frequented.

Cordova was the *Corduba* of the Romans. It was one of the chief cities of Hispania, and appears to have been a Roman colony from its first foundation in B.C. 152. It was regarded as the capital of Bæturia, or the country between the Bætis (Gundalquivir) and the Anas (Guadiana). Numerous coins of the city are extant, but most of the other antiquities have been destroyed. It was the birthplace of the two Senecas and of the poet Lucan. Abel-el-Rahman I. obtained possession of Cordova in 756, and assumed the title of kalif, making Cordova the capital of his kalifate, and it so continued till 1036, when it was converted into one of the small Moorish kingdoms of Andalusia. [ANDALUCIA.] In 1234 it was taken by Fernando III. of Castilla, and is said to have then contained 800,000 inhabitants.

(Ford, *Handbook of Spain*; Borrow, *Bible in Spain*.)

CORDOVA, the most important next to Buenos Ayres of the provinces of the Argentine Confederation, South America, comprehends the Sierra de Cordova and the surrounding hilly country, with some adjacent plains. It is divided on the N.E., N., and N.W. by the Gran Salina from Santiago, Catamarca, and Rioja, and on the W. by a travesia, or desert country overgrown with stunted prickly trees, from San Juan. A sterile and thinly inhabited country lies on the south-east between it and San Luis. On the south it extends to the Pampas of Buenos Ayres. The low sterile tract in which the rivers Segundo and Primero are lost, and the Laguna Salados de los Porongos is situated, separates it on the east from Santa Fé. It has a population variously estimated at from 65,000 to 90,000. Cordova is much more fertile than the countries which surround it. Numerous rivers descend from the Sierra de Cordova, but all are lost in the desert, except the Rio Tercero, which, during part of the year, finds its way to the Carcarañal, which falls into the Paraná near Santo Espiritu below Santa Fé. This river would be navigable for six or eight months in the year, but for two small rapids, which however might easily be removed. The valleys within the Cordova Mountains, and those which extend along their sides, have a fertile soil, and maize and fruits are raised there in abundance, but the plains, as well as the declivities of the mountains, are only fit for pasture. Cattle and sheep constitute the principal wealth of the republic. Hides in large numbers and wool are exported to Buenos Ayres. At present the produce of this province is all sent to Buenos Ayres, but when steam navigation is established on the Paraná, the commercial intercourse will probably be largely carried on through Santa Fé. The province is ruled by a governor, assisted by a junta occasionally convoked; but the authority of the governor is in effect almost unlimited.

Cordova, the capital, is situated in 31° 26' S. lat.; it is built on the banks of the Rio Primero, in a narrow valley considerably depressed below the general surface of the country. This situation is in many respects disadvantageous, but it is thus sheltered from the north and south winds, which blowing alternately on the higher grounds produce sudden changes in the atmosphere which are injurious to health. The town contains about 15,000 inhabitants. The streets are regularly laid out, and the houses are built of brick, and better than in other towns in the interior; most of them have balconies. In the centre of the town is a spacious square, on one side of which is a neat town-hall, and on the other a fine cathedral. There are also ten other well-built churches of old date and chiefly Moorish in style; and one modern church erected in a very costly manner. The University erected by the Jesuits is on a scale of great magnitude, covering an area of 4 acres. In former times it was famous, being the principal college (the Colegio Maximo) of the order in this part of the world. It contained also a very important library, which on the expulsion of the Jesuits was sent to Buenos Ayres. The university is still maintained, but is now hardly better than a provincial college. There are two nunneries and two convents of Dominicans and Franciscans. A fine public promenade occupies a considerable space; it includes a square sheet of water of about 4 acres supplied by a running stream, which is surrounded by walks, well shaded by trees, and has in the centre a lantern-shaped temple. The Segundo which waters the town is in summer a shallow stream, but in winter becomes a deep and wide river; to preserve the town from the effects of its overflow a strong wall has been built, yet destructive floods still sometimes occur. Cordova was formerly the depôt of the European merchandise intended to be sent to Peru, but this branch of commerce no longer exists. There is a mint in the town. The only manufacture is that of leather. There are no foreigners in the town and scarcely any in the province of Cordova. Religious toleration is unknown. *Alta Gracia*, a neat town near the base of the Sierra de Cordova, contains nearly 3000 inhabitants.

COREA is a large peninsula on the eastern coast of Asia, whose sovereign is tributary to the emperors of China and Japan, but otherwise independent. The peninsula is surrounded E. by the Sea of Japan, S. by the Strait of Corea (which divides it from the Japanese island of Kiou-siou), and W. by the Hoang-hai, or Yellow Sea, which separates it from China proper. It extends from south to north from 34° to 40° N. lat., or about 420 miles; but the countries north of the

peninsula as far as 43° are also subject to the sovereign of Corea, so that the whole country from south to north may be 630 miles. Its width, lying between 124° and 134° E. long., varies from 100 to 200 miles. Its area may be about 90,000 square miles, or about the same as the area of Great Britain.

Corea appears to be a very mountainous country. On its northern boundary is the Chang-pe-shan, a high mountain range partly covered with snow, which separates the Coreans from their northern neighbours, the Manchoo. From this chain another branches off in a south-south-east direction, which traverses the whole of the peninsula as far as the Strait of Corea. Its highest part is near the shores of the Sea of Japan, towards which it descends with great rapidity. The numerous offsets to the west, which are less elevated and steep, contain between them large and well-cultivated valleys.

The largest rivers occur in the northern part of the country, where the *Thumen-kiang* rising in the centre of the Chang-pe-shan Mountains runs north-east, and towards its mouth east, to the Sea of Japan. Its banks though fertile are uninhabited. A belt of land 15 leagues in width along the northern border of the peninsula, in which direction alone it is joined to the mainland, is left uncultivated and uninhabited in consequence of the mistrustful policy of the government, which has long condemned this country to a system of exclusion from all external influence. The inhospitable coast that bounds the country in all other directions, and the jealous vigilance of the authorities, keep the population cooped up as it were in a prison. The *Yalu-kiang* rises near the source of the Thumen-kiang, and runs first west, then south. According to the Chinese geographers it falls into the Hoang-hai by twelve mouths. It is said to be navigable for junks 35 miles, and for barges about 180 miles.

The coasts of Corea are high and bold. There are few islands along the eastern shores, except in Broughton's Bay (39° 30' N. lat.), where they are numerous. In the Strait of Corea, and between the island of Quelpaerts and the southern coast, are numerous islands and rocks. Between 34° and 35° N. lat., 125° and 126° E. long., Captain Maxwell found the sea literally dotted with islands and rocks, which he called the *Corean Archipelago*, and the most south-western group Amherst Isles. Farther north (38° N. lat.) is another group called James Hall's Archipelago. These islands are rocky and high, but generally inhabited. They are rarely more than three or four miles in length. The largest, the island of Quelpaerts, south of the peninsula, is about 60 miles in circuit, and in the centre a peak rises upwards of 6000 feet above the sea.

Corea is a very cold country. For four months the northern rivers are covered with ice, and barley only is cultivated along their banks. On the eastern coasts fogs are frequent.

The productions of Corea include rice, wheat, millet, cotton, silk, hemp, ginseng, and tobacco. Cotton and silk are manufactured and supply articles for exportation.

Horses and cattle are plentiful on the mountain pastures. The former, which are small, are exported to China. In the northern districts the sable and other animals give fur. The royal tiger, which is a native of the country, is covered with a longer and closer hair than in Bengal. On the eastern coast whales are numerous. Gold, silver, iron, salt, and coals are noticed in the Chinese geography as obtained in Corea.

The inhabitants, who are of the Mongol race, resemble the Chinese and Japanese, but they are taller and stouter. They speak a language different from the Chinese and Manchoo, though it contains many Chinese words. They have also a different mode of writing it, though the Chinese characters are in general use among the upper classes. In manner and civilisation they much resemble the Chinese; they are likewise Buddhists, with the exception of a small number who have been converted to Christianity by French missionaries, who visit the country in disguise and at the risk of their lives. Education is highly valued, especially among the upper classes. They seem to have a rich literature of their own, but their language is very imperfectly known in Europe. The number of inhabitants is estimated at ten millions.

The sovereign of Corea sends an embassy with a tribute to the emperor of China every fourth year. The election of the king and his more important acts must be ratified by the emperor. The kingdom is divided into eight provinces.

King-ki-tao, the capital, which is a few miles north of a considerable river, Han-kiang, appears to be a large place, and is said to possess a considerable library. The name of the town is properly Kin-phu. The mouth of the river Tsing-kiang (between 34° and 35°), on the western coast, is said to have a very spacious harbour. *Fushan*, according to the Chinese geography, called by Broughton *Chosan* or *Thosun*, is a bay at the south-eastern extremity of the peninsula, opposite the Japanese island of Tsu-sima, at the innermost recess of which the town of *King-tsheu* is built, which carries on an active trade with Japan, and is the only place to which the Japanese are permitted to come. In industry the Coreans mainly excel in the manufacture of cotton cloth and cotton paper, both of which are brought in great quantities to Peking. They have attained considerable skill in working iron, as swords are sent, with other articles, to the emperor of China as tribute.

Europeans are not permitted to remain even a few days on any

part of the coast. The commerce of the country is limited to China and Japan. Commercial intercourse between China and Corea is carried on not by sea but by means of the narrow road which leads along the coast to the town of Fang-hoan, in Leao-tong. As the district from being uninhabited has become the haunt of numberless ferocious animals, the passage is much dreaded by travellers. Commerce therefore is principally carried on in winter, when the shallow Hoang-hai is covered with ice along its shores, which are more favourable to the transport of goods than the bad mountain roads. Besides the above-mentioned manufactured goods, gold, silver, iron, rice, fruits, oil, and some other articles are brought by this road to Peking. The commerce between Corea and Japan is limited to that between the island of Tsu-sima and the Bay of Chosan, and is carried on by Japanese merchants, who have their warehouses at each place. They import sapan-wood, pepper, alum, and the skins of deer, buffaloes, and goats, with the manufactured articles of Japan and those brought by the Dutch from Europe; they take in return the manufactures of Corea and a few other articles, especially ginseng.

(Broughton; Maxwell, in Ellis's *Journal of Lord Amherst's Embassy*; Basil Hall; Ritter, *Asien*.)

CORFE CASTLE, Dorsetshire, a small town, formerly a borough and market-town, in the parish and hundred of Corfe Castle, is situated about the centre of the isle or peninsula of Purbeck, in 50° 38' N. lat., 2° 3' W. long.; distant 24 miles E.S.E. from Dorchester, and 116 miles S.W. from London by road. Wareham station of the South-Western railway, which is 5 miles from Corfe Castle, is distant 126 miles from London. The population of the parish of Corfe Castle in 1851 was 1966. The living is a rectory, with the curacy of Kingston annexed, in the archdeaconry of Dorset and diocese of Salisbury.

The town of Corfe Castle consists of two streets; the houses are built of stone and roofed with tiles. The castle which gives name to the town was probably built in the 10th century by King Edgar. It is situated on a high hill. Portions of the structure are in the Norman style. Its stateliness and the strength of its position made it in former times a fortress of great importance. It was sometimes the residence of the West Saxon princes. Here King Edward the Martyr was assassinated by his step-mother, Elfrida (A.D. 978 or 981). King John in his war with the barons deposited his regalia in this castle for security; and Edward II. when he fell into the hands of his enemies, was for a time imprisoned within its walls. In the great civil war Corfe Castle was stoutly defended for the king by Lady Bankes, wife of Lord Chief Justice Sir John Bankes, the owner of it, with the assistance of her friends and retainers, and of a governor sent from the king's army. It however fell into the hands of the parliamentary forces by treachery in February 1645-6, and was by order of the Parliament dismantled. The ruins are extensive, and from their elevated situation form a very striking object. The castle is separated from the town by a ditch, now dry, which is crossed by a bridge of four very narrow high arches.

The parish church is a large and very ancient fabric, with many portions of Norman and early English architecture: it has an embattled and pinnacled tower of the 14th century, a large porch, and two buildings, one on each side of the church, which were formerly chapels, but are now applied to other purposes. The church was much damaged in the great civil war when the castle was attacked, A.D. 1646. Modern repairs and alterations have to a considerable extent destroyed the uniformity of the building. Kingston chapel, in the parish of Corfe Castle, was handsomely rebuilt by the late Earl of Eldon. The Independents have a large and well-built chapel in the town. There are here National and British schools.

Corfe Castle was a borough by prescription previous to the reign of Elizabeth, who bestowed on it a charter. The borough first sent representatives to the House of Commons in the reign of Queen Elizabeth. It was disfranchised by the Reform Act of 1832. Some of the inhabitants are engaged in the marble and stone quarries in the neighbourhood. The principal occupation is that of raising clay for the potteries.

(Communication from Corfe Castle.)

CORFINIUM. [ABRUZZO.]

CORFU. [IONIAN ISLANDS.]

CORIGLIANO. [CALABRIA.]

CORINTH (Κόρινθος), a city of ancient Greece, the capital of a small but wealthy and powerful district, was situated upon the isthmus which connects the northern part of Greece with the Peloponnesus. The Corinthian territory (Corinthia) was bounded N. by the Crisean Bay, N.E. by Megaris, E. by the Saronic Bay, S. by Argolis, and W. by the territories of Sicyon. The Phœnicians appear to have early formed a settlement on the Acrocorinthus. The city was built upon a level rock to the north of a steep and high mountain called the Acrocorinthus, which served as a citadel, and was included within the wall. (Strabo, Cusaub., p. 379.) Corinth had two ports; the nearer, Lechæum, on the Crisean Bay, was connected with the city by two parallel walls of 12 stadia in length each, which were partially destroyed by the Lacedæmonians B.C. 393. (Xenophon, 'Hellen,' iv. 4, § 13.) This harbour, which Colonel Leake conceives to have been for the most part artificial, is now nearly filled up; all that remains of it is a lagoon near the supposed site. (Leake's 'Morea,' iii., p. 234.) The

other port, Cenchreæ, on the Saronic Bay, does not appear to have been connected with the city; it was however a more considerable place than Lechæum, and contained several temples. (Pausan., ii. 2.) A few miles to the north of Cenchreæ was a small bay called Sôchœnus. Here was the narrowest part of the isthmus, and a kind of canal called the Diolœus, of which there are still some remains, was carried from the harbour of Sôchœnus to the eastern extremity of Port Lechæum, and ships were run ashore at one of these points and dragged to the other sea. This work existed in the time of Aristophanes ('Thesmophor.' 645); but in the Peloponnesian war it appears that they had a method of transferring naval operations from the Crisean to the Saronic Bay without dragging their ships across the isthmus. (Thucyd., ii. 93.) 'A little to the south of the Diolœus was a wall, which was always guarded when any danger threatened the Peloponnesus.

The old name of Corinth was Ephyra; and under this name it was one of the seats of the Æolian race. Even in the time of Homer it was called 'the wealthy' ('Iliad,' ii. 570); an epithet which it acquired, according to Thucydides (i. 13), from the commercial spirit of its inhabitants, occasioned by the favourable situation of the town, which threw all the inland carrying trade of Greece into its power; while the difficulty of weathering Cape Maleæ (which was proverbial) made it the emporium of most of the trade between Asia and Italy. (Strabo, p. 378.)

About thirty years after the Dorian invasion of the Peloponnesus (that is, about 1074 B.C.), Ephyra fell into the power of Aletes, the son of Hippotes, a Heracleid, who had slain a soothsayer on the passage from Naupactus, and had been compelled to separate himself and his followers from the army of the Dorians. The city then assumed the name of Corinth, or the Corinth of Jupiter (Müller, 'Dorians,' i. 5, § 8); and the Æolian inhabitants became a subject class, though not altogether deprived of their civic rights. The descendants of Aletes ruled Corinth for five generations with royal power; but at length a rigid oligarchy was substituted for the monarchical form of government, and the power was vested in prytanes chosen annually from the powerful Heracleid clan of the Bacchiadæ. The members of this clan intermarried only with one another, and consequently kept aloof from all immediate intercourse with their fellow-citizens, whom besides they did not treat with much forbearance. In the year B.C. 657, Cypselus, an opulent citizen of Æolian descent, putting himself at the head of the lower orders, overthrew the oligarchy without much difficulty, and assumed the sovereign power. Although he taxed and oppressed the Dorian caste so much that many of them were obliged to emigrate, he seems to have possessed the full confidence of the great mass of the citizens, and always reigned without a body-guard. His son Periander, who succeeded to his authority, occupies a very prominent place in the ancient history of Greece. He was much more despotic than his predecessor; he had a bodyguard of 300 men, and trampled at pleasure upon the rights of his countrymen. His reputation for wisdom (by which we must understand that practical wisdom which consists in governing men) procured him a place among the seven sages of Greece. Upon his death in B.C. 583, his power devolved upon his nephew Psammetichus, the son of Gordias, who after three years was deposed by the Lacedæmonians. The former aristocratical form of constitution was then restored, but doubtless it was less exclusive than the hereditary oligarchy of the Bacchiadæ, and Corinth remained an oligarchical state till the beginning of the 4th century B.C. In the Peloponnesian war, which was in some measure brought about by them, the Corinthians were staunch supporters of the Lacedæmonians, and the bitterest enemies of Athens. About B.C. 394 a democratical faction endeavoured to overthrow the aristocracy, and to unite Corinth with Argos, but without any permanent success. (Xenoph. 'Hellen,' iv. 4.) Timophanes re-established the monarchical form of government by means of the mercenaries whom he commanded; but he was soon removed by his own brother Timoleon by assassination. (Aristot., 'Polit.,' v. 6; Corn. Nepos, 'Timol.,' c. i.; Plutarch, 'Timol.,' iv.) Like the other states of Greece, Corinth felt the influence of the Macedonian power, and was garrisoned by Macedonians under Antigonus, but liberated by Aratus. (Pausan., ii. 8, § 4.) The Corinthians took the lead in the Achaean confederacy, and were at first allies of the Romans (Pausan., vii. 8, § 3); but at last the temptations held out by the wealth of the place, and the insults which the Corinthians had offered to the Roman embassy (Strabo, p. 381), led to the plunder and destruction of the town by L. Mummius, in B.C. 146, according to an express decree of the Roman senate. All the males were slain; the women and children were sold as slaves; and after the Roman soldiers had pillaged this the richest city in all Greece, it was at a signal given set on fire and reduced to ashes. (Liv., 'Epit.,' liii.) Many works of art were destroyed, but some of the finest pictures and statues were removed to Rome. (Strabo, p. 381.) Corinth was restored by Julius Cæsar about 100 years after its conquest by Mummius, and peopled with freedmen, who enjoyed the privileges of a Colonia. It soon rose again to be a populous and prosperous city, and when St. Paul visited it 100 years after it had been rebuilt by Julius Cæsar, it was the residence of the Proconsul of Achæa. Two of the epistles of St. Paul are addressed to the flourishing Christian church which he founded in Corinth. When Pausanias visited Corinth in the 2nd century of our era, there were still many fine buildings and other monuments of the

former splendour of the city. (Pausan., *l. i.*, § 7.) There now remains of ancient Corinth seven columns of a Doric temple, probably the oldest existing specimen of that style, an amphitheatre, and some Roman brickwork on the northern side of the bazaar of the modern town.

The colonies of Corinth were very numerous; with the exception of the colony that founded Potidea on the coast of Chalcidice, they were all sent out from Lechaum, and confined to the seas west of the isthmus. (Müller, 'Dorians,' *i.* 6, § 7.) The most celebrated were Syracuse and Corcyra.

Its wealth and the confluence of merchants from all parts favoured everything which ministered to the gratification of the senses; and both architecture and the other fine arts were, according to the testimony of the ancients, successfully cultivated in this wealthy emporium. (Pindar, 'Olymp.,' *xiii.* 25-31.) The citizens were addicted to luxury and sensual indulgence. The patron goddess of the city was Aphrodite, who had a splendid temple on the Acrocorinthus, where more than a thousand females under the name of Hieroduli, or temple-slaves, were kept for the service of strangers as a regular part of the worship of the goddess. In no other part of Greece is this institution of Hieroduli found to have existed: it was most probably established by the Phœnicians. The courtesans of Corinth were so exorbitant in their demands and obtained such high sums as often to ruin the merchants who visited the city. This circumstance gave rise to an ancient proverb. (Strabo, *viii.* 378; Horat., 'Ep.' *i.*, xvii. 36.)

The only fertile part of the Corinthian territory was the plain between the city and Sicyon, which partly belonged to the latter. The rocky sides of the mountains, and the stony and sandy plain of the isthmus, were unsuited for growing corn. The fountain Peirene, on the Acrocorinthus, was celebrated by the poets (Strabo, *p.* 379); but in the time of Hadrian the inhabitants were so little satisfied with the springs in the town, that they induced the emperor to supply them with water from the Stymphalus by means of an aqueduct 20 miles long. Corinth is now a small town of 2000 inhabitants, who carry on a small export trade in dried fruits, wheat, oil, honey, and wax from the port in the Bay of Corinth or Gulf of Lepanto. The modern name of the town, *Goritho*, is a corruption of the ancient name of the city. (Leake, 'Morea,' *iii.* 262.) The territory of Corinth united with Argolis, now forms a nome or department of the kingdom of Greece. The total population of the nome in 1852 was 105,243.

According to the fable, Bellerophon caught the winged horse, Pegasus, while drinking at the fountain of Peirene. Pegasus appears on the coins of Corinth and some of its colonies.

Coins of Corinth.

British Museum. Actual Size. Silver. Weight, old coin, 131 grains; the other, 132 grains.

The *Isthmus of Corinth* is a rocky sterile plain. On the northern side of it rise the mountains anciently called Gerania, and extending across the Isthmus from sea to sea. The mountains to the south of the Isthmus were called Onoion, which extend to the Saronic Gulf eastward; but the Acrocorinthus, an offset from it (separated from it however by a ravine), does not reach the sea on the western side. There is a level narrow space between the foot of the mountain and the sea, which was crossed by the long walls of the Lechaum. Besides the ravine already mentioned, the only other pass by which Corinth could be reached was along the shore at Cenchrea. Thus the long walls of the Lechaum, the Acrocorinthus with its citadel, and the walls of Cenchrea completely commanded the only three passes which led from the Isthmus to the Peloponnesus. In the mountains to the north there were three passes, the most celebrated of which, as being the shortest road from Corinth to Megara, lies along the shore of the Saronic Gulf, and bore the name of the Scyronian Rocks.

CORK, a maritime county of the province of Munster, and the largest county in Ireland, lies between 51° 27' and 52° 18' N. lat., and 7° 45' and 10° 18' W. long. Its greatest length from Youghal on the east to the mouth of the Kenmare River on the west, is 110 miles; and its greatest breadth from the Old Head of Kinsale upon the south to Charleville on the north, is 70 miles. It is bounded N. by the

counties of Limerick and Tipperary, E. by the county of Waterford, S. by the Atlantic Ocean, and W. by the county of Kerry. The area comprises 1,846,333 acres, of which 1,308,882 are arable, 465,889 uncultivated, 52,180 in plantations, 6515 in towns, and 12,867 under water. The indentations of the coast from Youghal to Kenmare give a coast-line of about 200 miles. The population of the county, exclusive of the city of Cork, in 1841 was 778,398; in 1851 it was 568,158.

Surface, Hydrography, Communications.—The chief mountain groups in Cork county may be considered as offsets of the main ridge which separates Cork from Kerry. This ridge, the southern extremity of which separates Bantry Bay from the river of Kenmare, runs north-north-east and south-south-west, and on the side towards Cork sends off numerous lateral elevations. Of these the two chief are the ranges north and south of the valley of the Lee, which river divides the county into two nearly equal portions. The southern ridge running through the peninsula between Bantry Bay and the estuary of the Kenmare River, is distinguished by the names of the Glengarriff, Caha, and Slieve Miskiagh, among which the most celebrated summits are the Sugarloaf, and Hungry Hill, with its magnificent cascade. The northern and most extensive range consists of the almost continuous groups of the Muskerry, Boggra, and Nagles Mountains, and stretches in a uniform direction from the Kerry boundary on one side of the county, to within a few miles of the borders of Waterford on the other. The principal elevation in this line is Cahirbarna, 2234 feet, near the boundary of Kerry. The Shehy group, which forms the southern boundary of the basin of the Lee, runs a much shorter distance from the main ridge; but the upland country of Kinalmeaky, into which it subsides, prolongs the elevation in a line parallel to the direction of the Boggra range across the entire extent of the county, from Dunmanway on the west to the high grounds above Cork and Passage on the east. Shehy Mountain has an elevation of 1769 feet. North and south of this central valley are the districts which form the basins of the Blackwater and the Bandon; the former included between the mountains of Limerick and Tipperary, and the Boggra groups; and the latter between the Shehy range and those elevations which rise southward towards the sea-coast. These three principal valleys are nearly symmetrically situated, and their respective rivers run very nearly parallel to one another. The bogs and waste lands lie among the mountain groups described; the remainder of the county is well tilled and productive, particularly along the banks and between the embouchures of the rivers.

Beginning from the east, the harbour of Youghal has a tolerable anchorage in six fathoms water without the bar, where vessels may wait the tide, which gives 20 feet of water on the bar at neaps. Three leagues south is a good anchorage and fishing-ground, in 5 to 12 fathoms water at Ring Point. From this the coast is rocky, with the exception of the extensive strand of Ballycotton Bay, to the entrance of Cork harbour four leagues farther west. This harbour is so commodious, says Smith, that it will admit the largest vessel at any time of the tide without striking sail, and has a land-locked anchorage in 10 fathoms water in some places, and in 7 fathoms water within a cable's length of the shore. On the shoalest part of the bar are 30 feet of water at ebb-tide. From this westward to Kinsale harbour the coast is rocky and dangerous. The harbour of Kinsale has 30 feet of water on the bar, and anchorage within in 7 fathoms; but it is not so capacious as that of Cork. There is also good anchorage in any depth of water on both sides of the promontory to the west called the Old Head of Kinsale. The Bay of Courtmaesherry, next west, is fit for vessels of 200 tons, but exposed. Clonakilty harbour is encumbered with a bar, on which are only 2 fathoms water at full sea, and vessels embayed here are in considerable danger. The harbour of Glandore has 14 to 30 feet of water in its channel, and a land-locked anchorage. Castlehaven Creek has safe anchorage in 14 feet, and Baltimore Bay pretty good in 6 fathoms. Baltimore is situated on the eastern side of an extensive bay, bounded on the east by Cape Clear Island, and on the west by Mizen Head; it contains the several minor bays of Baltimore, Roaring Water, Crookhaven and Innisharkin, in all of which merchant vessels may find anchorage. West from Mizen Head the Bay of Dunmanus runs inland 12 miles in a north-east direction, with 10 to 30 fathoms of water throughout, and no bar. Bantry Bay is 40 fathoms deep at the mouth, 26 miles long, and from 3 to 5 miles broad. Bear Island at its entrance protects it from the south-westerly swell, and affords the land-locked anchorage of Berehaven in 10 to 16 fathoms water, for an unlimited number of vessels. Farther up Whiddy Island incloses the minor bays of Bantry and Glengarriff, the latter much celebrated for the magnificence of its scenery: it is calculated that all the shipping of Europe could ride secure in this noble harbour. The boundary of the county runs through the mountainous peninsula stretching between Bantry Bay and the estuary of the Kenmare River. On the southern shore is the town and bay of Castletown, south-west from which about 7 miles on the northern shore is the Bay of Ballydangan near the copper-mines of Allihais. At the point of the peninsula is Dursey Island, a rocky spot, about 3½ miles long by 1 mile broad.

Facilities for water-carriage are confined to the coast: the inland navigation of the Bandon is very inconsiderable; that portion of the Blackwater which is navigable lies in the county of Waterford; and the traffic between Cork and the sea is more a harbour than a river

navigation. The only lakes in the county are two small but very picturesque sheets of water, near the source of the Lee, and some pools on the coast.

The great Southern and Western railway was completed in 1850. The total length of the line from Dublin to Cork is 164½ miles. The line is carried nearly parallel with the old mail-coach road to Limerick by the valley which separates the Nagles Mountains from the Boggra range. The Cork and Bandon railway gives a line of railway communication of 20 miles from Cork in the direction of the great harbours in the south-east of the county. [BANDON.] The Cork, Blackrock and Passage railway, 7½ miles in length, connects the city of Cork on the eastern side with the suburban districts adjoining the harbour and naval dépôt at Queenstown. The principal mail-coach routes have been superseded by the completion of the Great Southern and Western railway. The old road to Dublin, carried over the eastern flank of the Nagles Mountains by Rathcormack, unites the valleys of the Lee and the Blackwater from Cork to Fermoy. The road from Cork to Mallow, carried over the western flank of the same range, forms another line of communication between these valleys, and is used as the post-line to Limerick. Westward from Mallow to Millstreet, a distance of nearly 18 miles, the range of the Boggra Mountains formed an impassable barrier, until in 1823 permission was granted by government to make a road through the centre of this group at an expense of about 10,000*l.*, one-half to be levied by county presentments, and the other half to be defrayed out of the Consolidated Fund. The construction of this road saved the inhabitants of the valley of the Blackwater a distance of fully 20 miles Irish on every journey to and from the Cork market. It also supplies an easy means of transit for fuel to the low countries, both north and south. Before this road was opened the only means of procuring fuel from the upland bogs was on the backs of small horses, or of men and women. Other new roads have been made at the public expense within the county in the neighbourhoods of Clonakilty, Bandon, Skibbereen, and Courtmacsherry. A road from Castle Island in the county of Kerry, eastward, meets the new Boggra-road at its terminus on the Blackwater, by which a communication is opened between Castle Island and Mallow, shortening the distance from Castle Island to Cork by 22 miles. Another line connects this road with the post-line from Cork to Killarney, affording Killarney a direct communication through Mallow with Waterford. These two roads were completed in 1838, and are together 43 miles in length. A road has also been constructed by the Board of Works from Glengarriff to Kenmare. The ridge of mountain over which this road is carried is very precipitous towards Glengarriff, and the ascent resembles on a small scale some of the great passes of the Alps.

Climate, Geology, &c.—The climate is moist but genial in the south and east. The annual average of rain at Cork is about 38·26 inches. The wind blows between south and north-west for more than three-fourths of the year. The clay-slate and sandstone formation occupy the central area of the county, extending from Kerry to Waterford. Belts of carboniferous limestone occupy the vales of the Blackwater, the lower Lee, and the Bandon rivers. The Boggra and Nagles ranges consist of sandstone, which rock prevails throughout the district watered by the Lee. South of the Lee the slate-clay, on which the sandstone rests, crops out in longitudinal strata that have a uniform direction from north-north-east to south-south-west, and a prevalent dip to the south-east. This rock, varying from the hardest grit to clayey rubble, constitutes the whole of the southern portion of the county from the mouth of the Lee to the mountains of Bear and Bantry, where its elevations attain an altitude of above 2000 feet. Among these are some peaks of quartz formation, of which the most remarkable is the Sugarloaf, which rises over the Bay of Glengarriff. The veins which occupy many of the fissures of this rock abound in ores of iron, copper, lead, and manganese. The district north of the Blackwater is included partly in an extension of the central limestone plain, but chiefly in the Munster coal-field, which occupies an area of about 400 square miles in the north-west part of the county, forming a portion of the wild district above referred to. The coal of the district of the Blackwater is anthracite, or blind coal. The chief workings are at Clonbannon and Dromagh. There is abundance of iron-ore which could be made productive if coal could be had for smelting. While the county was well wooded iron works were carried on to a considerable extent. The principal copper mines of Ireland are situated at Allihais, at the extremity of the mountainous peninsula which separates Bantry Bay from Kenmare River. These mines give employment to about 1000 men. The ore contains from 55 to 65 per cent. of copper, and is valued at 8*l.* per ton. Specimens of asbestos have been found in the adjoining district of Berehaven. The soil of the coal district is cold, stiff, and moory. In the north-east and generally throughout the county wherever limestone abounds, it is warm and friable. Along the valley of the Lee is a red, crumbly, and heavy soil, which requires considerable manuring with lime or sea-sand. Throughout the schistose formations, south of the valley of the Lee, the earth is generally dry and sandy, requiring much manure to make it bear corn. Marl, fullers' earth, and clay for brick-kilns and potteries, are found in considerable abundance. The best cultivated parts of the county are the eastern portions of the basin of the Blackwater and the Lee, and the low district included between

their embouchures. The system of agriculture in these districts is good. There is a large resident proprietary, and every evidence of wealth and comfort.

Divisions, Towns, &c.—Cork county is divided into two ridings, for the purpose of holding general sessions of the peace. The baronies into which the county is divided are as follows:—*East Riding*—Barretts, Barrymore, Clondons and Clangibbon, Cork, Duhallow, Fermoy, Imokilly, Kerrycurrihy, Kinalea, Kinnatalloon, part of Muskerry East, Orrery and Kilmore, Kinsale, and Youghal Liberties. *West Riding*—Bantry, Bear, Carbery East and West, Courceya, Ibane and Barryroe, Kinalmeaky, Muskerry West and part of Muskerry East. The following towns are described in separate articles:—BANDON, BANTRY, CASTLETOWN BEREHAVEN, CLONAKILTY, CORK, DUNMANWAY, FERMOY, KANTURK, KINSALE, MACROOM, MALLOW, MIDLETON, MILLSTREET, MITCHELSTOWN, QUEENSTOWN, SKIBBEREEN, SKULL, and YOUGHAL. These are all, with the exception of Queenstown, the seats of Poor-Law Unions. CLOYNE and ROSS, which give title to a bishop, are also separately described. Of places of minor importance we select the following for a brief notice here, giving in each case the population returned in the Census of 1851:—

Ballincollig, population 789, situated on the Bride River, 6 miles W. from Cork city on the road to Macroom, is rather a military and police dépôt than a village. Here are extensive gunpowder mills, formerly conducted by the government, but now by a private company. There are large barracks for artillery and police. The headquarters of the police for the province of Munster are at Ballincollig. The village is very well built, and many of the houses are of the better class. The neighbourhood is thickly studded with villa residences. About a mile west from the village are the ruins of Ballincollig castle, said to have been built in the reign of Edward III. The remains of the square keep and an inclosed bawn or space formerly defended by fortifications, stand on a limestone rock rising out of the plain. *Ballintemple*, population 473, about one mile and a half E. from Cork, is noticeable as the site of a church erected by the Knights Templars in 1392. The churchyard is still used for interments, although the church has disappeared. *Ballylough*, population 432, about 3 miles N.W. from Mallow, contains some good houses, and has a neat and pleasing appearance. In the neighbourhood are Mount North, the seat of lord Lisle, and Lohort castle, the seat of the Percivals, earls of Egmont. The remains of Ballylough castle stand a little way from the village. *Ballycotton*, population 603, situated at the mouth of a rivulet on the west shore of Ballycotton Bay, 6 miles S. by E. from Castlemartyr, is inhabited chiefly by fishermen. There is here a station of the coast guard. Ballycotton Islands, at the southern headland of the bay, are frequented by great numbers of sea-fowl. *Ballyhooly*, population 419, about 10 miles N. by E. from Cork, pleasantly situated on the left bank of the Blackwater, contains a church, a Roman Catholic chapel, and two schools. The neighbouring district is well cultivated and presents some good scenery. Connamore house, the fine seat of the Earl of Listowel, is in the immediate vicinity. The remains of Ballyhooly castle, formerly one of the chief fortified residences of the Roches, with the parish church, and the remains of an old church, occupy the summit of a rock near the village. A fair is held on August 26th. *Ballynacorra*, population 823, is on the Middleton River, about a mile from the town of Middleton, of which it is the port. Extensive warehouses are here for storing grain and other agricultural produce, of which large shipments are made. The neighbouring district is fruitful, and has a pleasant appearance. *Blackrock*, population 460, besides 1186 inmates of the county jail, is situated on a peninsula which projects into the Lee River, about 3 miles E. from the city of Cork, of which Blackrock is properly a suburb. Numerous villa residences are clustered together in this village and its vicinity. The public buildings include the parish church, a Roman Catholic chapel, an Ursuline monastery, and Blackrock castle, originally built in the reign of James I., as a round tower to protect the river, and repaired and enlarged in 1722 by the corporation of Cork. *Butterant*, population 1531, is 137 miles S.W. from Dublin by the Great Southern and Western railway, on which it is a station, and 8 miles N.E. from Mallow on the River Awbeg. It was formerly a walled town, and a place of considerable ecclesiastical and feudal splendour. Two of the ancient castles remain, together with the ruins of the abbey finely situated on an eminence over the Awbeg. The Roman Catholic church is a handsome edifice of hewn limestone in the later English style. A barrack for infantry covers an area of 23 acres. There are here a fever hospital and a dispensary. Petty sessions are held. There are fairs in March, July, October, and November. *Carrigaline*, population 602, about 7 miles S.E. from Cork, at the embouchure of the Awbeg, River into an inlet of Cork harbour, although now an insignificant village was intended by its founder, the first Earl of Cork, to compete with Cork city, a project which was stopped by the rebellion and the earl's death. Near the church, which is a neat gothic structure, are some picturesque ruins of Carrigaline Castle. There are large flour-mills here. Petty sessions are held. A fever hospital of the Cork Union district is maintained in the village. Fairs are held on Whit-Monday, August 12th, and November 8th. *Carrigrohilly*, population 885, about 10 miles E. from Cork, on the road to Waterford, has a small church, a Roman Catholic chapel, and several schools. In

the vicinity are some remains of circular entrenchments, and numerous subterranean chambers or cellars. Fairs are held here in March, May, August, September, and November. Barry's Court, formerly called Castle Cloydubh, a lofty building in the square form, was originally erected in the 13th century, and was a place of considerable strength. In 1580 it was set fire to by the then proprietor, Lord Barry, to prevent it falling into the hands of Captain, afterwards Sir Walter Raleigh, who had orders to seize the castle. It has been repaired within the last few years, and is now inhabited. *Castletyons*, population 479, about 4 miles S. by E. from Fermoy, contains some remains of a Dominican friary. The linen manufacture is carried on. There are here a church and a Roman Catholic chapel. Six fairs are held in the course of the year. *Castlemartyr*, population 1800, about 5 miles E. from Middleton, once a parliamentary borough, is now only a village, but has a neat appearance. In the vicinity the Earl of Shannon's demesne of Castlemartyr, with the ruins of its ancient castle, its plain modern mansion, and its extensive plantations, add much to the interest of the scenery. There are also numerous villa residences in the neighbourhood. There are a fever hospital and a dispensary. The market-house belongs to the Earl of Shannon. Fairs are held on May 2nd and October 2nd. *Castletownroche*, population 983, pleasantly situated on the Awbeg, 6 miles below Doneraile, and 1 mile above the junction of the Awbeg with the Blackwater, 147 miles S.W. from Dublin by way of Buttevant, is a remarkably picturesque village. The ancient castle of the Lords Roche, from which it derives its name, stands on a rock rising abruptly from the river, and forms a conspicuous object in the surrounding landscape. It has been modernised, and is still inhabited. Petty sessions are held here, and fairs on May 25th, July 25th, and December 12th. Edmund Burke attended the village school when a boy, his father being a resident in the neighbourhood. *Castletownsend*, population 570, a bathing village, pleasantly situated on the western shore of Castlehaven, about 4 miles S.E. by E. from Skibbereen. The custom-house for the port of Baltimore is at Castletownsend, and there is a station of the coast guard. The parish church stands within the demesne of Castletownsend, adjoining the village. *Charleville*, population 2660, besides 2274 in the workhouse, hospital, and bridewell, 129½ miles S.W. from Dublin by the Great Southern and Western railway, on which it has a station, is a well situated, compact, thriving town. The principal street extends about a mile along the old mail-coach road from Cork to Limerick, and is wide and neatly built. The Roman Catholic chapel is large and handsome. The town, which is situated in the midst of a rich tillage country, owes its origin to Lord Broghill, son of the first Earl of Cork, who founded it as a purely Protestant borough. The great majority of the inhabitants are now Roman Catholics. Charleville formerly sent two members to the Irish Parliament, but was disfranchised at the time of the Union. The manufacture of blankets and leather is carried on to a small extent. Petty sessions are held. There are a station of the constabulary, a bridewell, a dispensary, and a fever hospital. Fairs are held on October 10th and November 12th. *Churchtown*, population 249, reduced from 638 in 1841, situated midway between Buttevant and Doneraile, about 142 miles S.W. from Dublin, is a large, neat village, with a handsome church. It is the property of the Earl of Egmont, who takes his title from a townland in this parish. This part of the county of Cork abounds in military and ecclesiastical remains. [KANTURK.] *CLOYNE*, which gives title to a bishop, is described in a separate article. *Courtmacsherry*, population 526, about 6 miles E. from Clonakilty, situated on the south shore just within the entrance of Courtmacsherry Bay, is the station of a fishery and possesses some trade. A good deal of corn is exported. Near the village is Courtmacsherry House, the marine villa of the Earl of Shannon. There is here a station of the coast-guard. *Doneraile*, population 1856, situated on the Awbeg, about 142 miles S.W. from Dublin, is a neat, small town, formerly the residence of the Lords President of Munster. It contains a church, a Roman Catholic chapel, a small convent, and a court-house. Petty sessions are held here. Fairs are held on August 12th and November 12th. Doneraile town gives title to the family of St. Leger. The ruins of Kilcoleman Castle, the residence of the poet Spenser, stand about 2 miles north of the town in a somewhat bleak situation on the declivity of the hill of Ballyorra. Recent investigation has shown that Spenser's wife was one of the St. Leger family ('Proceedings of the Royal Irish Academy,' 1850.) *Douglas*, population 758, about 2 miles from Cork, but regarded as a suburb of that city, is situated at the head of an inlet of Cork harbour. It has a sail-cloth manufactory and a ropework. Numerous handsome villas adorn the vicinity. *Glanworth*, population 869, is a large village, about 4 miles N.W. from Fermoy, situated on the Funcheon River, an affluent of the Blackwater, which runs nearly parallel to the Awbeg. It was at one time a corporate town of some importance. Near the village are the remains of a castle which appears to have been of considerable strength. A Dominican monastery formerly stood here. Besides the parish church, which is an old building, there are a chapel for Roman Catholics and several schools. Six fairs are held in the course of the year. *Innishannon*, population 520, situated on the left bank of the river Bandon, about 4 miles N.E. from Bandon, was formerly a place of importance, but is now a mere village, with a small trade in

linen. By the Bandon river vessels can come up to Innishannon from Kinsale harbour. Petty sessions are held monthly, and fairs on May 29th and October 3rd. A dispensary of the Bandon Poor-Law Union is stationed here. *Kildorrery*, population 497, a small post-town, situated near the right bank of the Funcheon River, 4 miles W. by S. from Mitchelstown. There are here a Roman Catholic chapel and a dispensary of the Mitchelstown Poor-Law Union. Petty sessions are held monthly, and fairs in May, June, September, and November. *Kilworth*, population 1185, about 2 miles N.N.E. from Fermoy, is situated near the left bank of the Funcheon River, at the base of the Kilworth Mountains, on the road from Clogheen to Fermoy, in a favourable situation for manufactures; but the great water-power here available has hitherto been only applied to flax-dressing on a small scale. The town consists chiefly of one long street, which contains several good dwellings. Besides the parish church, which is ancient, there is a Roman Catholic chapel. The market-house is a neat building. The river is crossed here by a bridge of six arches. There are some corn-mills. Several fine mansions are in the vicinity. Fairs are held six times in the year. *Liscarrol*, population 531, a mile west from Churchtown, is a poor village with the remains of a noble castle. The erection of the castle is ascribed to King John. It forms a quadrangle of 240 feet by 120 feet, and was flanked by four circular and two quadrangular towers. Sir Philip Perceval, the ancestor of the Egmont family, surrounded it with a fosse and covered-way in 1641. Petty sessions are held here, and there are fairs on May 1st and 31st, August 31st, and November 29th. *Monkstown*, population 484, situated about a mile S. from Passage, on the west shore of Cork harbour, opposite Queenstown, is an agreeable bathing place, containing several good residences. The parish church is a neat modern edifice, with a tower and spire. On an elevated site near the town stand the ruins of Monkstown Castle, erected by Eustace Gould in 1630. The name of the town was derived from a Benedictine monastery, founded here in the 14th century. Fairs are held in March, May, August, and November. *Newmarket*, population 1265, besides 556 in an auxiliary workhouse of the Kanturk Poor-Law Union, situated on the river Allua, about 4 miles N.W. from Kanturk, is, as its name implies, a market-town. It consists chiefly of two streets, containing several good dwelling-houses. In the town are the parish church, a Roman Catholic chapel, several schools, a fever hospital, and a dispensary. John Philpot Curran was a native of Newmarket, and received his earliest instructions at a small school in the town. Fairs are held on June 8th, September 8th, October 10th, and November 21st. *Passage*, population 2857, about 6 miles E.S.E. from Cork, is pleasantly situated on the west side of Cork harbour, opposite Great Island. There are here dock-yards. A church, a Roman Catholic chapel, and a Wesleyan Methodist chapel are in the town. Petty sessions are held here. Passage is much frequented as a bathing place, and there are numerous villas in the vicinity. *Rathcormack*, population 971, about 14 miles N.N.E. from Cork, on the left bank of the Bride River, consists chiefly of one street. Besides the parish church there are here a Roman Catholic chapel, a chapel for Methodists, several schools, a sessions-house, and a fever hospital. Petty sessions are held monthly, and fairs on August 12th and October 29th. Rathcormack had a charter of 33 Charles II., conferring the power to send members to Parliament. Ross, or Ross-CARBERY, which gives title to a bishop, is described separately. *Timo-league*, population 393, about 4 miles E.N.E. from Clonakilty, at the mouth of the estuary of the Arrigadeen River, is chiefly to be noticed for the remains of its once famous abbey, said to have been founded in the 14th century. There are also some vestiges of an old castle. Petty sessions are held monthly, and fairs four times in the year. *Watergrasshill*, population 651, about 9 miles N.E. by N. from Cork, is situated on the summit of the lofty tract of country which rises between the valley of the Lee and that of the Blackwater. The ground in the vicinity of the town is the highest under cultivation in the district. The general appearance of the surrounding district is bleak and barren. The town contains a small Episcopal chapel, a Roman Catholic chapel, and a dispensary. *Whitegate*, population 1228, about 5 miles S.W. from Cloyne, is situated on the east side of Cork harbour. Many of the inhabitants are employed in fishing. In the neighbourhood are several good mansions. Carlisle Fort, one of two fortifications by which Cork harbour is defended, stands near the village. There is here a station of the coast-guard.

Industry.—The linen and woollen manufactures at one time flourished in several towns of this county. Of late considerable efforts have been made to revive the linen manufacture. The growth of flax has been extensively promoted. Scutching-mills have been put up in various parts of the county, and an establishment was opened a few years ago at Drimoleague, near Skibbereen, for steeping the flax by an improved process. The cultivation of green crops has been considerably extended in consequence of the potato failure; and the condition of the southern districts of the county has been materially improved. The fisheries along the coast are important. The head-quarters of the various fishery districts are Youghal, Queenstown, Kinsale, Skibbereen, and Castletown. These districts comprise in all 389 miles of maritime boundaries, employing about 5000 registered fishing vessels, and about 25,000 men and boys.

Before the coming of the English, Cork was a separate kingdom, of which the princes were the Mac-Carthys. The ancient kingdom of

Cork included, besides the present county, a considerable tract in Kerry and Limerick. In 1172 Dermot MacCarthy, king of Cork, swore fealty to King Henry II., but broke his engagements, and the kingdom thus forfeited was bestowed by King Henry in 1177 on Robert Fitz-Stephen and Milo de Cogan. The city of Cork, with the cantred adjoining, was reserved to the king. Fitz-Gerald, the eighth earl of Desmond, a descendant of De Cogan, found himself in possession of almost the entire kingdom of Cork; but assuming to himself the right of levying separate exactions on the king's subjects, after the Irish manner, he was attainted of treason and beheaded at Drogheda, 15th February 1467. Gerald, the fifteenth and last earl, possessed territory to an amount almost unexampled in the history of private property in Ireland. His estates extended upwards of 150 miles throughout the counties of Waterford, Cork, Kerry, and Limerick, and comprehended an area of 574,628 acres, according to the rough estimate of those times, the calculation seeming to have reference only to profitable land. When Simnel and Warbeck endeavoured to engage the English people in favour of their pretensions, many of the Irish nobility who were of English descent left their estates in Ireland in order to render assistance. While they were absent in England the Irish returned from their fortresses and overran the new plantations.

On the breaking out of the northern rebellion in Elizabeth's time, Cork was considered the fittest place for an attempt in favour of the Catholic cause under the auspices of King Philip of Spain, to whom the country had been offered by Pope Gregory XIII. The principal Irish agent in bringing about the invasion was James Fitz-Maurice, the brother of the fifteenth earl. The war which ensued was predatory and sanguinary on both sides, and lasted till November 1583, when the Earl of Desmond, after losing all his castles, and being driven to lurk for months together in the woods, was put to death by one Kelly. The forfeited estates were divided into seigniories, and granted to English adventurers. Upwards of 20,000 acres fell to Sir Walter Raleigh, who had been active in the suppression of the rebellion. In 1602 Sir Walter Raleigh conveyed his proportion in Cork and Waterford for a small sum to Sir Richard Boyle, afterwards earl of Cork. On the breaking out of the rebellion of 1641 the English were generally successful in retaining the walled towns and castles. Lord Castlough had some successes on the other side in 1645, taking Mitchelstown, Liscarrol, Mallow, Doneraile, and various castles north of the Blackwater in this county; but these places did not long remain in his hands. Two important engagements took place in the county in 1642 and 1647, in both of which the Irish were defeated. About 1657 Lord Broghill began to agitate the question of the restoration, which event he was mainly instrumental in bringing about in 1660; he was subsequently created Lord Orrery, and advanced to the presidency of Munster. During the war of the Revolution this county was again the theatre of a desultory but sanguinary series of conflicts between the native Irish of the rural districts and the militia of British descent.

The antiquities of Cork county are chiefly military, and comprise some of the finest buildings of the kind in Ireland. The castle of Kanturk, built by M'Donogh, Prince of Duhallow, is a quadrangle of 120 feet by 80 feet, and about 70 feet in height. Lohort castle, built in King John's reign, is a massive keep 80 feet high. Liscarrol castle, of the same date, is already noticed. Blarney castle, built by Cormack M'Carthy in 1449, is still a fine ruin, though only one-fourth of the original building is now standing: the walls are 18 feet thick, and the great tower 90 feet high. The other castles still standing in the county are very numerous, and of great historical interest.

Cork county lies within the dioceses of Cork, Cloyne, Ross, and, to a small extent, in Ardfert and Aghadoe. Cork is the assize-town. The county jail, about three-quarters of a mile from the city, is considered the most perfect institution of the kind in Ireland. There are 18 bridewells in the other principal towns. Quarter sessions for the east riding are held at Cork, Fermoy, Kanturk, Kinsale, Mallow, Middleton, and Youghal; for the west riding at Bandon, Bantry, Clonakilty, Macroom, and Skibbereen. The county infirmary and lunatic asylum are at Cork: there are fever hospitals at Cork and 15 other towns, and 71 dispensaries in the county. Cork city is the head-quarters of the Cork military district: there are 17 barrack stations in the county. A convict establishment commenced in 1847 is maintained on Spike Island. The constabulary force numbers in all 647, including officers; in the east riding there are 12 districts with 79 stations; the west riding has 8 districts and 50 stations. The east riding has 19, and the west riding 33 stations of the coast-guard, including in all 29 officers and 246 men. In 1851 there were three savings banks in the county—at Cork, Fermoy, and Youghal. The amount owing to depositors on November 20th, 1851, was 303,728*l.* 1*s.* 7*d.*

The county was represented in the Irish Parliament by 26 members, of whom two were returned by the county, two by the city of Cork, and two each by the boroughs of Kinsale, Youghal, Bandon, Mallow, Doneraile, Rathcormack, Middleton, Charleville, Castlemartyr, Baltimore, and Clonakilty. With the exception of Cork, Bandon, Mallow, Kinsale, and Youghal, these boroughs, at the time of the Union, lost their privilege of representation. The representation in the Imperial Parliament is now confined to two members

for the county at large, two for Cork city, and one for each of the boroughs of Youghal, Bandon, Mallow, and Kinsale.

(Smith, *History of the County of Cork*; Cox, *History of Ireland*; *Ordnance Survey Map*; Thom, *Irish Almanac*.)

CORK, Ireland, a municipal and parliamentary borough, an episcopal city, a county in itself, and the seat of a Poor-Law Union, is situated in 51° 53' N. lat., 8° 20' W. long., distant 166 miles S.W. from Dublin by the Great Southern and Western railway. The population of the municipal borough in 1851 was 85,745, besides 4277 in the workhouse and other public institutions. The borough is governed by 16 aldermen and 48 councillors, one of whom is mayor; and returns two members to the Imperial Parliament. The public works are under the care of various bodies of commissioners. Cork Poor-Law Union comprises 28 electoral divisions, with an area of 169,828 acres, and a population in 1851 of 167,450.

The city is situated on the river Lee, about 7 miles above the expansion of that river which forms the land-locked harbour of Cork. The central part occupies the eastern half of an island about two miles in length and half a mile in breadth at the widest part, formed by the north and south channels of the Lee. The remainder of the city is built on the declivities of the river banks; the northern section extending to the distance of about a mile northward with a steep ascent along the leading road to Mallow, and the southern lying along a gentle slope parallel with the river. The name of the city (*Corcagh*) indicates the marshy nature of the site on which it is built. The city is lighted with gas, and well supplied with water. Among the public buildings in the insular part of the city are the custom-house, the commercial buildings, the county club-house, and the chamber of commerce. The city and county court-house, erected in 1835, at a cost of 22,000*l.*, has an octostyle Corinthian portico, surmounted by colossal emblematic figures of Justice, Law, and Mercy. The columns, which are 30 feet high and advanced 20 feet in front of the building, rise from a platform 7 feet above the level of the street.

From the island a fine approach to the city is afforded through Great George-street and along the Western-road. In the northern part of the city are the city jail, and extensive barracks. The church of St. Anne Shandon stands on the ascent of the hill, and as its tower rises 170 feet high, it makes a conspicuous appearance. On the south side of the river are the corn exchange, the lunatic asylum, the cathedral, the Queen's college, and the county jail. The cathedral is a plain oblong building, almost wholly of modern erection. A pointed doorway, and the tower, which is surmounted by an octagonal spire, are the principal portions of the old building remaining. The diocesan library stands to the east of the cathedral. On the west is the episcopal palace, and to the west of this, on a bold site overlooking the gardens and promenades of Mardyke, from which it is separated by the south channel of the Lee, stands the Queen's college. The northern front, extending 300 feet, exhibits a bold elevation in the later English style. An entrance tower, 70 feet high, and an examination hall, advanced beyond the line of the façade, are conspicuous features. The interior quadrangle is cloistered on two sides. The material of the building is gray limestone. Both branches of the river, with the exception of a portion of the southern channel, are quayed throughout the whole extent of the city. The river is crossed by nine bridges, of which the principal are St. Patrick's bridge, of three arches, leading to St. Patrick's street from the northern side of the river, and Anglesey bridge, of cast metal, opposite the corn exchange, with a drawbridge to admit vessels to the upper quays of the south branch of the river. A tract of 240 acres has recently been reclaimed from the bed of the river, and laid out in walks and carriage drives as a city park.

Besides the cathedral there are in Cork six parish churches and two chapels of ease, three Roman Catholic parochial chapels, four monasteries, and two nunneries, each having a chapel attached; two chapels for Presbyterians, four for Methodists, two for Baptists, one for Independents, and one for Quakers. Of the Roman Catholic places of worship, the most spacious is the united parish chapel of St. Mary's and St. Anne's, Shandon, which serves as the cathedral of the diocese. It is externally a plain building in the later English style, but very richly decorated in the interior. Brickfield chapel of ease is a handsome edifice in the Grecian style, with an elegant portico of eight columns of gray marble, and a Corinthian cupola surmounted by figures of the Apostles. St. Mary's chapel, on Pope's Quay, in the northern division of the city, has an Ionic portico of six columns. The Roman Catholic chapel on Charlotte's Quay, adjoining the South Mall, erected a few years back by the very Rev. Theobald Mathew, the celebrated advocate of Temperance, is a rich and striking specimen of the pointed gothic, built in gray limestone. The front has an open portico of three lofty arches, with a screen of rich tracery in the centre arch, forming a porch. The building consists of a nave and aisles, with flying buttresses. The spire and tower, which are of light and graceful proportions, rise to a height of 200 feet. The cost of the building exceeded 20,000*l.*, to which Mr. Mathew contributed 10,000*l.*

The literary and scientific institutions are, besides the Queen's College, the Royal Cork Institution, incorporated in 1807, for "diffusing the knowledge and facilitating the general introduction of improvements in arts and manufactures, especially in agriculture;"

the Cork Library Society; the Mechanics Institute; the Agricultural, Horticultural, and Cuvierian societies; and an Art-Union. The Cork Institution is established in the old custom-house, a large brick building on the northern branch of the river, where there is a library, an observatory, a museum of physical and experimental philosophy, and a gallery of casts from the antique. The casts in the museum of the institution were originally presented by King George IV. to the Cork Society of Arts. This society was for a time eminently successful, and numbers among its former pupils some of the most distinguished artists of the day in painting and sculpture, for which arts the Cork youths are considered to possess a natural genius. The former botanical gardens attached to the Cork Institution, situated on the south-eastern outskirts of the city, near the workhouse, were purchased by the very Rev. Mr. Mathew, and have been converted into a cemetery on the plan of that of Père la Chaise at Paris.

Of the charitable institutions the principal until the new Poor Law superseded it was the Foundling hospital, originally intended as a workhouse. The hospital derived its income from a tax of one shilling per ton on all coals that came into the harbour. This impost is now abolished. Skiddy's almshouses, Bertridge's charity, the Blue-Coat hospital, and Green-Coat hospital, are charitable foundations in which relief is extended solely to Protestants. There are also two infirmaries and a Fever hospital, two Lying-in hospitals, two Houses of Refuge for destitute females, a general dispensary, and a number of minor charities and benevolent institutions. A sum of 30,000*l.* was in 1833 bequeathed by a Mr. Lapp for the support of the aged Protestant poor of the city.

The river banks from a distance of several miles above the city to Cork Harbour, are richly planted and studded with villas. The scenery from Cork to Passage by the river is particularly fine, the banks on both sides being continuously occupied with the ornamental planting and pleasure-grounds of a series of villa residences. Blackrock Castle, a picturesque tower used by the corporation of Cork as conservators of the river, and serving as a lighthouse, is situated about four miles below the city on the southern bank of the river, and is surrounded by scenery of great luxuriance. Below Blackrock Point the Lee forms a sheet of water called Lough Mahon, which is crossed at its narrowest part by a ferry between Passage and Great Island, and three miles farther south expands into the noble land-locked harbour of Cork. The northern portion of the basin of which Cork Harbour proper forms only a portion, is occupied by Little Island, Foaty Island, and Great Island, separated from one another and (on all sides but the south) from the mainland by narrow estuaries. The expanse of deep water included between Great Island and the southern shore of the basin is from 2 to 3½ miles from north to south by from 2 to 6 miles from east to west. The entrance from the sea is 2 miles long and three-quarters of a mile broad, and is defended by Carlisle fort at the eastern entrance and Camden fort at the western entrance. Spike Island, Rocky Island, and Hawlbowl Island lie on the western side of the harbour, and are occupied respectively by a convict dépôt and strong fortifications, a powder magazine, and naval and ordnance stores and warehouses. On the south side of Great Island, overlooking the inner harbour, is Cove, now Queenstown. Here is unlimited anchorage for the largest ships. [QUEENSTOWN.] Within the last few years great improvements have been made in the navigation of the river, and vessels of 600 tons can now unload at the quays. Belonging to the port are 140 pilots, who are under the care of the harbour commissioners. The number and tonnage of vessels registered as belonging to the port on December 31st 1852 were:—Under 50 tons, 160 sailing vessels, tonnage 3672; above 50 tons 232, tonnage 41,608: steam vessels, under 50 tons 7, tonnage 214; above 50 tons 16, tonnage 4671. The number and tonnage of vessels which entered and cleared at the port during 1852 were:—Costwise, sailing vessels, inwards 1670, tonnage 135,657; outwards 1266, tonnage 84,465: steam vessels, inwards 249, tonnage 100,042; outwards 255, tonnage 102,145. Colonial, inwards 53 vessels, tonnage 14,388; outwards 75, tonnage 19,536. Foreign, inwards, British vessels 202, tonnage 39,675; foreign vessels 162, tonnage 37,938: outwards, British vessels 62, tonnage 12,494; foreign vessels 142, tonnage 33,608.

The school of St. Barr is supposed to have first drawn inhabitants to the locality. The city walls were built by the Danes in the 9th century, and afterwards repaired by King John. About 1620 Cork was counted the fourth city of Ireland, being inferior both to Waterford and Limerick. In 1690 it endured a siege conducted by the Duke of Marlborough, with a force of about 10,000 foot and 1200 horse, against which it held out for five days. The city has increased greatly since the beginning of the last century. The island was formerly intersected by numerous canals, which have been arched over from time to time, and now form the principal modern streets. The Grand Parade was thus formed in 1780; Patrick-street in like manner in 1783; and Nile-street in 1795. The South Mall, the best street in Cork, and Nelson's Place, had a similar origin. The insular appearance of the central part of the city is thus in great measure removed.

The enlargement of the city has been accompanied by the gradual draining and reclaiming of the adjoining marshes. These improvements were chiefly effected about 1720-30. The appearance of the city is somewhat marred by the practice of weather-slating the

street fronts of many of the houses. The stone generally employed in building is clay-slate of a dark colour.

A considerable amount of trade is carried on in Cork. The chief import trade is that of timber, of which the annual average is 15,000 tons. The principal articles of export are bacon, butter, corn, live stock, provisions, and linen. Cork butter holds a very high character in the market, chiefly owing, it is said, to the superior cooerage of the caaks. Manufactures of glass, metal castings, gloves, leather, and woollen cloth are carried on. There are numerous and very extensive distilleries and breweries, and a large manufacture of flour meal. The foreign and colonial trade is principally with Portugal, the Mediterranean, the Baltic, and Canada. The amount of customs duties in 1851 was 236,531*l.* The city is the assize town for the county of Cork and is on the Munster circuit.

The see of Cork is in the archdiocese of Dublin and Cashel. The chapter consists of a dean, chanter, chancellor, treasurer, archdeacon, and 12 prebendaries. The diocese stretches across the central district of the county of Cork, and includes the county of the city. It extends in length, from east to west 74 miles, and from north to south 16 miles. It contains 83 parishes, constituting 77 benefices. The foundation of the see is ascribed to St. Barr, about the beginning of the 7th century. It became united to Cloyne about 1464, and so continued till 1586, when together with Cloyne it was annexed to the diocese of Ross. In 1678, these dioceses were again divided, Cork and Ross going together, and Cloyne forming a separate diocese. By the Act 3rd and 4th Wm. IV. c. 37, called the Church Temporalities Act, these sees again became united, and the income of the bishop was fixed at 2498*l.* per annum.

(*Ordnance Survey Map*; Smith, *History of the County of Cork*; Lewis, *Topographical Dictionary*; Thom, *Irish Almanac*.)

CORNOUAILLES, a county in Basse-Bretagne, in France, of which Quimper-Corentin was the capital. It comprised the dioceses of Quimper and St. Pol-de-Leon, and is now divided among the departments of Côtes-du-Nord, Finistère, and Morbihan. In the time of Julius Cæsar this district was inhabited by the Curiosoliti and the Osismii. The name some derive from 'Cornu Galliæ' (extremity of Gaul), others from the English 'Cornwall,' whence they say a number of the ancient Britons emigrated to this part of Bretagne.

CORNUS. [AVEYRON.]

CORNWALL, an English county, forming the south-west extremity of the island of Great Britain. The form of the county approaches that of a right-angled triangle, of which a line about 70 miles long, drawn east-north-east and west-south-west from Penlee Point at the entrance of Plymouth Sound to the Land's End, may be regarded as the base; another line 42 miles long, drawn north-north-west and south-south-east from Penlee Point to the north-east corner of the county as the perpendicular; and a line 81 miles long drawn north-east and south-west from the last-mentioned point to the Land's End as the hypotenuse. Cornwall lies between 49° 56' and 50° 56' N. lat., 4° 7' and 5° 42' W. long. The area of the county, exclusive of the Scilly Isles, is 1365 square miles, being rather less than the area of the triangle above described. The population of Cornwall, including the Scilly Islands, was 355,558 in 1851, being 259 persons to a square mile, the general average for England and Wales being 307 persons to a square mile.

The only county with which Cornwall is conterminous is Devonshire, which bounds it E.N.E.; on all other sides it is surrounded by the ocean. The north-west coast is high and rocky. Tracing it from the border of Devonshire it runs south by west, and forms two very shallow bays (Bude Bay and Widemouth Bay), succeeded by the headlands Dazard Point, Castle Point, Penkennor Point, and Carnbeak. From Carnbeak the coast runs south-west and forms several headlands, Tintagel Head being the principal; and several small bays as far as Pentire and Stepper Points, near the mouth of the river Alan or Camel, the entrance of which forms the haven of Padstow. A few miles W.S.W. from these is Trevoze Head, the most prominent headland on this side of the county: this is succeeded by Constantine, Watergate, and Towan bays, Towan Head, Fistal, Cranstock, and Holywell bays, Penhale Point, Ligger or Perran Bay, and St. Ives' Bay, Gurnard's Head, Cape Cornwall, Polpry and Peden-Mean-Due Points, the last of which is less than a mile from the Land's End. The general direction of the coast from Trevoze Head to Cape Cornwall is south-west; from Cape Cornwall to the Land's End due south. Along this side of the county are scattered several islets and insulated rocks, but nothing that is worthy of notice. Off the Land's End are the Scilly Islands, a numerous and not unimportant group. [SCILLY ISLANDS.]

The coast from Land's End to Plymouth Sound is marked by bolder promontories and deeper bays, and has more frequent intervals of low and shelving beach. From the Land's End to Mount's Bay the coast forms a line convex to the ocean, broken by a number of small headlands with intervening coves. Mount's Bay takes its name from St. Michael's Mount, a remarkable insulated rock opposite the town of Marazion, and connected with the mainland by a causeway over the sands; Cuddan Point forms the eastern boundary of the bay. From Cuddan Point the coast runs south-east to the Lizard, the most southern point of England: and thence turning north-east forms the headlands of Innis Head, Black Head, Chynals Point,

Dranna Point, Nare Point, Rosemullion Head, and Pendennis Point, which last two form the extremities of Falmouth Bay. Between Nare Point and Rosemullion Head is the wide estuary of the Helford River. Between Pendennis Point and Zone or St. Anne's Point (the next important headland) is the wide estuary of the Fal, known by the name of Carriek Road, of which Falmouth harbour and St. Mawes harbour are branches. From Zone Point the coast still runs north-east to Greber Head, forming Gerrans, Verryan, Mewagissey, St. Austell, and St. Blassey bays, with the intervening headlands Pennare Point, Dodman or Deadman Point (379 feet high), Chapel Point, and the Black Head. From Greber Head the coast runs east to the Rame Head and Penlee Point (which is the entrance of Plymouth Sound), forming Looe and Whitesand bays. The rocks and islets along this coast are too unimportant to require notice.

Launceston, which has commonly been considered as the county town, is on the eastern border of the county; but Bodmin, which has a better title, is more central: it is about 210 miles W.S.W. from London in a direct line, or 234 miles by the road through Salisbury and Exeter.

Surface, Hydrography, Communications, &c.—From the central part of Cornwall, which is the highest, the land slopes towards the sea on each side. The whole surface of the county is irregular. The great post-roads pass over the central high ground, from which, being for the most part waste moorland, travellers are led to form a more unfavourable opinion of the soil than, taken altogether, it deserves; for in many parts it is pleasingly diversified by hill and dale; some of the valleys are beautifully picturesque, presenting corn and meadow land, wood, and water. On the north coast the land is generally high with short narrow valleys; on the south coast the valleys are wider. The central ridge approaches, on the border of Devonshire, the north-western coast; the streams that flow from its south-east side have consequently a longer course, and are the most considerable in the county. The height of some of the hills is considerable, but they have not generally striking or picturesque forms, except where they extend down to the coast and form abrupt headlands, as at Tintagel, Cape Cornwall, and the Land's End. The elevations which rise above 800 feet are:—Brown Willy, at the source of the river Fowey, 1368 feet; Rough Tor, near Camelford, 1296 feet; Sharp-point Tor, 1200 feet; Trewartha Tor, 1050 feet; Mennaclew Down, 1124 feet; Temple Tor, near Temple, 900 feet; Tober Tor, near the Jamaica Inn, 1127 feet, and several others of nearly equal height belong to the range of which Brown Willy is the highest point; Caradon Hill, north of Liskeard, 1208 feet; Kit Hill, on Hingston Down, near Callington, 1007 feet; Hensbarrow Down, north-west of St. Austell, 1034 feet; Cadon Barrow, near Tintagel, 1011 feet; Carnmarth, south-east of Rodruth, 849 feet; Carnmenelez, Carn-Menelis, or Carnbonellis, south of Redruth, 822 feet; and Carnminnis, south-west of St. Ives, 805 feet.

The principal rivers of Cornwall are the Tamer, with its tributaries; the Fawey, or Fowey; the Fal; the Alan; the Seaton; the Looe; the Hel, or Helford; and the Heyl. The *Tamer* rises by Moorwinstow, in the moors which form the north-east point of the county and extend into Devonshire, and flows south-south-east into Plymouth Sound, forming almost throughout its entire course the boundary between Cornwall and Devonshire. It has some small tributaries called the Deer, the Claw, the Werington, the Attery, the Lyd, and the Inny. Below the junction of the Inny the course of the Tamer, hitherto tolerably straight, becomes more sinuous, especially where it skirts the base of Hingston Down. The bed of the river then widens and it becomes an estuary, or tide-water. Near its mouth it receives the Tavy from Dartmoor forest, and the Lynher or St. German's River from the downs between Launceston and Bodmin. The whole course of the Tamer is about 59 miles; it is tidal for about 19 miles. The *Fawey*, or *Fowey*, rises on the east side of Brown Willy, to the right of the high road from Launceston to Bodmin. It flows south-south-east for several miles, and then turning westward receives on the right the rivers St. Neot's and Warleggan, besides a number of brooks: it then turns south, and passing Lostwithiel falls into the sea at the borough of Fowey. It is not navigable above the point to where the tide flows. Its whole length is about 30 miles; the tide flows about 6 miles up—formerly it flowed higher. The *Alan*, or *Camel* (that is, the Crooked River) rises near Davidstow, about 3 miles N.N.E. from Camelford, and flows south by west past Camelford, afterwards to the south-west, then north-west to Padstow, a little below which it falls into the Bristol Channel between Pentire Point and Trevoze Head, on the north-west coast. Its whole course is about 29 miles, of which about 8 miles are navigable. The mouth of the Camel forms a harbour for ships of 200 tons. The *Fal* rises in Tregoss Moor, near the high road from Bodmin to Truro, and flows south or south by west to Grampound and Tregony, receiving in its course the water of a number of brooks. From Tregony it flows south-west 5 or 6 miles into the Mopus Road, formed by the waters of St. Clement's Creek, which rises near St. Michael or St. Mitchell and flows south by west, and of the rivers St. Allen, Kenwin, and another, which meet at Truro just before they join St. Clement's Creek. From its junction with the Mopus Road the Fal flows southward into Carriek or Carreg Road, where it is joined by a river from the neighbourhood of Redruth. Falmouth Harbour is an inlet of Carriek Road on the west side; St. Mawes Harbour is another inlet on the east side. The

whole course of the Fal is about 20 miles, of which nearly half is tide-water. Carriek Road, with its inlets, is reckoned one of the finest harbours in Great Britain. The *Seaton* and the *Looe* are two small rivers rising not far from Liskeard and flowing south into the sea; the *Seaton* on the east and the *Looe* on the west of the town of Liskeard. The *Seaton*, which is the longer of the two, is rather more than 10 miles long. The *Looe*, which falls into the sea between the towns of East Looe and West Looe, is joined near its outfall by the Black Looe. The tide flows for a short distance up both these streams. Another river of nearly similar name (the *Loo*) which runs by Helston, forms a lake or pool immediately below that town. The *Hel*, or *Helford*, is a small river, remarkable only for its large estuary, which penetrates about 4 or 5 miles inland, nearly half the length of the river. The mouth of the Hel is between Nare Point and Rosemullion Point, near Falmouth. The river *Heyl*, which falls into St. Ives' Bay, is about as long as the Hel, and has also a large estuary. The estuary of the Hel forms a haven for vessels of 200 tons; that of the Heyl, owing to a bar at the mouth, is accessible only to sloops of not more than 100 tons burden.

Cornwall has three navigable canals. The Bude and Holsworthy Canal, part of the course of which is in this county, runs eastward from Bude Haven to near the channel of the Tamer, from which point the Bude and Launceston Canal branches off to the south-south-east to Launceston. The chief object of these canals is to facilitate the introduction of Welsh coal, and the carrying of shelly sand from the coast to the interior to be used as manure. The Liskeard and Looe Canal runs south from Liskeard to the estuary of the river Looe, and is designed to facilitate the transport of timber, coal, manure, and the mineral products of the district.

The mail road from London to Falmouth passes over a considerable part of the county, entering it by Poulston bridge, over the Tamer, not far from Launceston, and running south-west by Launceston, Bodmin, and Truro. Here, and farther south, several branch roads strike off and afterwards re-unite with the main road, which proceeds to the Land's End. Another road from London by Exeter and Tavistock crosses the Tamer at New bridge, and runs south-west by Callington, Liskeard, and Lostwithiel, St. Austell, and Grampound, to Truro. The mail-coach roads are very good.

Geology, Mineralogy, &c.—The rocks which predominate in Cornwall are among the lowest in the arrangement of the strata of our island, and belong to the primitive and transition classes. The high land which occupies the centre of this peninsular county, and extends from between Launceston and Bodmin on the north-east to the Land's End on the south-west, is composed of granite, which in several extensive districts rises to the surface. Occasional veins or shoots from this granite formation penetrate northward and southward into the superincumbent strata; but they do not generally extend far from the principal masses of granite; they are frequently insulated. The granite of Cornwall contains numerous metallic veins, both of copper and tin. It is liable to decomposition, to which cause is ascribed the existence of a tract of loose white kaolin or porcelain earth, some miles in extent, near St. Stephen's, between Bodmin and Grampound, and on the south side of the granite range: this kaolin is sent to Worcestershire for use in the porcelain manufacture. The decomposition of granite has probably formed those singular phenomena which were once generally regarded as Druidical relics, the Logan Stone, Cheese-wring, &c. St. Michael's Mount, in Mount's Bay, is chiefly composed of granite split into irregular masses. Granite is termed by the Cornish miners 'grouan.'

The rock commonly reposing on the granite is the 'killas' of the miner, the grauwaacke of the geologists. (De la Beche.) Grauwaacke, indeed, forms the principal rock of Cornwall. On the south or south-east side of the granite formation, the strata dip south-east at an angle of about 70 degrees: on the opposite side of the granite formation the dip is nearly north-east. The killas is traversed by veins or dykes of granitic and felspar porphyry, termed by the miners 'Elvan.' These dykes (or channels in the language of the miners) are rarely found in the granite; their general direction on the surface is, according to Mr. Greenough's Geological Map, and the Geological Map of the Ordnance Survey, north-east and south-west; they vary from a few fathoms to 50 and even 80 fathoms in thickness; and in some cases are continuous through a long tract of country. The metallic veins, both of tin and copper, commonly pass through them, but are for the most part narrower when in the Elvan than when in the superincumbent and subjacent rocks. Roofing-slate is quarried in the killas formation near Tintagel Head. The metallic veins which contain copper or tin, or both, run usually east and west, and penetrate both the granite and clay-slate; those which contain lead, silver, cobalt, or antimony, run north and south, with little exception, and are believed to be always in the clay-slate.

The Lizard Head is composed of mica-slate, which however occupies a very limited area; the neighbouring country is composed of hornblende and diallage rocks, but chiefly of serpentine. Near the Lizard are veins of soap-stone, which, when first raised, is so soft that it may be kneaded like dough, but becomes friable after being exposed to the air; it is used in the manufacture of porcelain. The serpentine incloses and passes into asbestos, and small quantities of native copper have been found in it.

Thin beds of limestone are found in Cornwall, alternating with killas, or grauwacke; it is of a blue colour, and contains veins of calcareous spar. Trappean rocks are associated in small quantities with the grauwacke, and also with the carbonaceous rocks, which form the north-eastern extremity of the county. Copper and tin are the most important minerals of Cornwall. The extent of the metalliferous veins as well as the depth to which they extend are unknown: no miner has yet seen the end or bottom of a vein. Their width varies much, from the thickness of a sheet of paper to 30 feet; but they are usually from 1 to 3 feet in thickness. The ores of copper or tin do not often occur together in the same vein at any great depth. If tin be discovered first, it sometimes disappears, after sinking 100 feet more, and is succeeded by copper; in others, tin is found to the depth of 1000 feet beneath the surface, almost without a trace of copper; if copper be first discovered, it is very rarely if ever succeeded by tin. It is seldom that either ore is found nearer to the surface than 80 or 100 feet. If a copper vein meets one of tin, it usually passes through it, and heaves it out of its course. The veins not metalliferous usually pass through the tin and copper veins, or lodes, as they are termed: these non-metalliferous veins have their course usually north and south.

The copper and tin mines, excepting some mines chiefly of tin near Callington, are south-west of the rivers Alan and Fowey. The chief mining district extends from St. Agnes on the north coast by Redruth to the neighbourhood of Helston and Marazion; and some mines are worked west of Marazion. St. Austell is in the centre of another but less extensive mining district near the south coast.

The lead-mines of Cornwall are not numerous, though the ore has been discovered in many parts of the county. Silver ores have been obtained from several mines in Cornwall, chiefly in lodes or cross courses in the grauwacke. In Herland mine, near Gwinnear, silver had in 1839 been raised to the value of 8000*l.*; at Dalcoath mine to about 2000*l.*; while at Wheale Duchy, near Callington, which is new granite, and at the 10 fathom level, a course of silver ores accompanied by native silver occurred for 3 fathoms in length, yielding about 200*l.* per fathom. (De la Beche.) Gold has been found in the tin streams. Iron ore is also obtained, and shipped to Wales. Zinc, antimony, cobalt, and arsenic are procured, as well as some other of the semi-metals. Freestone of different qualities is quarried.

The quantity of copper ore sold at the public ticketings during 17 years, 1833-49, amounted to 2,499,782 tons of 21 cwt., computed to yield in all 195,793 tons of fine copper; the total value in money being reckoned at 14,456,600*l.* These figures give a yearly average of 147,046 tons ore, 11,517 tons fine copper, and 850,388*l.* in money value. The average per centage of copper obtained during the whole period was $7\frac{3}{4}$; the highest average was $8\frac{1}{4}$ in 1849; the lowest was $7\frac{1}{4}$ in 1842. The ore is purchased by eight firms in South Wales; one house, that of Williams and Co., purchased in 1849 ore to the amount of 35,126 tons, and the value of 204,748*l.* The total amount of lead ore raised in Cornwall during the year 1848 was 10,494 tons; from which the quantity of lead smelted was 6614 tons.

In summing up his notice of the mineral produce of the district, Sir H. T. De la Beche observes, "If we estimate the value of the metals annually raised in Great Britain and Ireland at about 10,597,000*l.*, and consider that of this sum the iron amounts to 8,000,000*l.*, the value of the remaining metals would be 2,597,000*l.*, of which Cornwall and Devon would furnish about 1,340,000*l.*, or more than one half, leaving 1,257,000*l.* for the value of all the metals, with the exception of iron, raised in other parts of the united kingdom. The two great metallic products of this district are copper and tin: of the former it yields one-third, and of the latter nine-tenths of the whole supply of copper and tin furnished by the British Islands and all the countries of the continent of Europe."

(De la Beche, 'Report on the Geology of Cornwall, Devon,' &c. 'Transactions of Geological Society;' 'Transactions of Geological Society of Cornwall;' Boase, 'Treatise on Primary Geology;' Ordnance Survey; Greenough, and Society for Diffusion of Useful Knowledge Geological Maps.)

Climate, Soil.—Cornwall being situated between two seas, is more subject to variations of weather than most other counties; the mountains attracting the clouds, charged with moisture, which the prevalent west winds bring from the Atlantic. From this cause, the harvest is not in general so early as in the more inland counties, which are in a more northern latitude by two or three degrees. The soil of the mountainous districts is extremely barren and unproductive; but in a few of the vales a tolerably rich soil is found, well adapted to the growth of corn, roots, and artificial grasses. The substratum of the whole county being rocky, and slate being the predominating rock, the surface consists chiefly of an argillaceous earth produced by the decomposition of slate, mixed with various portions of vegetable matter accumulated in the course of ages. The soil is loose and porous. The most fertile lands are found from Endellion to St. Colombo, on the north coast, in the peninsula which terminates in the Lizard Point, the neighbourhood of Buryan and St. German's, the lands near the Fowey, and a great part of the hundred of Stratton.

The soil and climate of Cornwall are peculiarly favourable to the growth of potatoes, of which two abundant crops are sometimes produced in one season, an early crop taken up in June, and a second in

October. The principal cattle in Cornwall are of the Devonshire breed. The old Cornish breed, which was a small black mountain breed, is nearly extinct, as are likewise the small Cornish sheep: they have been superseded by better breeds.

The county is rather bare of trees. Many proprietors however have planted on a large scale; and some forest-trees rear their heads on many eminences, to the great improvement of the face of the country.

In the mining districts the land is naturally barren; but many spots are cultivated by the miners, to whom small patches of barren soil have been let at a low rent, on condition of their building habitations for themselves and families.

Divisions, Towns, &c.—Cornwall was formerly divided into seven hundreds—Conarton, Fawton, Pawton, Rialton, Stratton, Tibesta or Tibesterna, and Winneton or Winnenton. There are now nine hundreds: Stratton hundred and East hundred, on the east along the bank of the Tamer; Lesnewth and West hundreds, to the west of these; Trigg hundred, to the west of Lesnewth; Pyder and Powder hundreds, west of Trigg and West hundreds; and Penwith and Ferrier at the western end of the county.

The number of parishes in the county is about 205. The number of market towns is 36, namely:—St. Agnes, St. Austell, St. Blazey, Bodmin, Boscastle, Bossiney, Callington, Camborne, Camelford, St. Columb Major, St. Daye, Falmouth, Fowey, St. Germans, Grampound, Helston, St. Ives, Launceston, Liskeard, East Looe, West Looe, Lostwithiel, Marazion, St. Mawes, Mevagissey, Padstow, Penryn, Penzance, Polperro, Redruth, Saltash, Stratton, Tregony, Truro, Tywardreath, Wadebridge. The places printed in small capitals are noticed in distinct articles; the remainder, with the small sea-port town of Hayle, and a few of the more important villages, we notice here; the population is that of 1851.

St. Agnes, on the north-west coast, 26 miles W.S.W. from Bodmin, population of the parish 6674, being a decrease since 1841 of 1081, occasioned by the less prosperous state of the mines and by emigration. St. Agnes is a small town, in a district which contains numerous mines. The market is held on Thursday. There is a harbour at Trevenaunce, in this parish; the pilchard fishery has been established here since the beginning of the present century. There are Dissenting places of worship, and a Free school. Opie, the painter, was born at St. Agnes. St. Agnes Beacon is on a pyramidal hill near the town, 621 feet above the level of the sea; it is formed out of an ancient cairn or tumulus, and was used as a beacon during the alarm of invasion in the beginning of the present century.

St. Blazey, anciently called Landreth, 9 miles S. from Bodmin: population of the parish 3570. The town has increased of late in consequence of the prosperous state of the mines in the vicinity. St. Blazey was in 1845 made a perpetual curacy. The church has been rebuilt. There are in the town places of worship for Dissenters, and a National school. The public buildings are a market-house and a post-office. Near St. Blazey is the Treffrey viaduct, a remarkable granite structure, erected at the cost of the late Mr. Treffrey, carrying across the valley of Carmiers a railway and a stream for mining purposes. The stream flows in a passage under the roadway.

Boscastle (which name is a corruption of Bottreux Castle) is situated on a steep hill on the north-west coast, not far from Tintagel Head, 19 miles N. by W. from Bodmin: population of the parishes in which the town is situated, Forrabury 379, and Minster 479. Boscastle is a poor little place, but in a very romantic situation. It has a weekly market. There is a pier, to which vessels come with coals. The harbour is very much exposed to boisterous seas. Near the market-place are the remains of an ancient church or chapel. During summer the Boscastle fishermen capture numerous seals.

Callington, population of the parish 2146, is 22 miles E. from Bodmin. The situation of the town is low and unpleasant, at the foot of Hingston Down; the buildings, with the exception of the church, are mean and unimportant; the houses are chiefly arranged in one broad street. The church was erected or rebuilt about the middle of the 14th century, by Nicholas de Asheton or Assheton, one of the justices of the King's Bench, who was buried here. In the churchyard is an ancient sculptured cross. There are places of worship for Dissenters. A market is held on Wednesdays for corn and provisions. Several extensive mines are worked in the neighbourhood. Callington was the last town in Cornwall admitted to the right of sending members to Parliament, not having acquired that privilege till 1585. It was disfranchised by the Reform Act of 1832. Kit Hill (1067 feet high), which rises immediately above Callington, affords from its summit one of the finest views in the west of England.

Camborne, population of the town 6547, is 28 miles S.W. from Bodmin, in the midst of the mining districts. The town is neatly built. The church is a fine specimen of the granite churches of this county, built in the perpendicular English style; it has a tower, and contains a carved pulpit of wood, and an altar-piece of Sienna marble. There are places of worship for different classes of Methodists. The market, established in 1802, is considerable; it is held on Saturday; the market-house was built by Lord De Dunstanville.

St. Daye, population of the parish of Gwennap, in which the town is situated, 10,465, is 26 miles N.W. from Bodmin, and about 2 miles

E.N.E. from Redruth. It appears to have fallen much into decay: of late years it has recovered, owing to the extension of mining operations. There was formerly a chapel, which is said to have been much resorted to by pilgrims in former days, and from the resort of these pilgrims arose a market, which was afterwards given up. The market now held on Saturdays for butchers' meat and other provisions, was established some years since for the benefit of the miners. A new chapel was consecrated at St. Daye in 1828. There is near St. Daye a curious amphitheatre of rude construction, called Gwennap Pit, supposed to have been of British origin; it was selected by Wesley as a place for public preaching, and is still used by his followers at some of their anniversaries.

Fowey, population of the parish 1606, is on the right bank of the river Fowey, near its mouth, about 11 miles S. by E. from Bodmin. The scenery around this town is very picturesque. The rocks about Polruan, on the opposite side of the river, rise to a considerable height, and are broken into rude cliffs and bold promontories. At the mouth of the haven are the ruins of two square stone forts or blockhouses, one on each side, built in the reign of Edward IV. to protect the entrance. The harbour is commodious; it is now defended by two modern batteries, and by a fort called St. Catherine, which was built in the reign of Henry VIII. The town is built in a very straggling manner, the houses extend a considerable way along the haven, and the streets are so narrow and full of angles as to be almost impassable for carriages. Most of the buildings are of stone. The church is a spacious and lofty fabric of the perpendicular style. A chapel called St. Catherine's Chapel, which gave name to St. Catherine's Hill, existed here in Leland's time. There is a spacious market-house with a town-hall over it. A public walk overlooks the town and harbour. The chief business of Fowey consists in catching and curing pilchards, in which many vessels are employed. Fowey is a corporate town; the corporation consists of a mayor, recorder, eight aldermen, and a town-clerk. This town sent members to Parliament from the time of Queen Elizabeth; it was disfranchised by the Reform Act of 1832. There is a market on Saturday. There are two Free schools, and an almshouse for eight poor widows. The harbour is safe, and has excellent anchorage. The townsmen of Fowey acquired wealth by feats of war and piracy in the wars of Edward I. and III., and Henry V., and their wealth enabled them to increase the commerce of the town to a great extent. Fowey furnished 47 ships to the fleet of Edward III. before Calais, being more than any other port in England, and 770 men, a number second only to the number furnished by the port of Yarmouth. The French burnt the town in 1457. When peace was made between England and France in the time of Edward IV., the Fowey men still kept up hostilities, for which the king ordered their fleet to be confiscated. Fowey also distinguished itself against the Armada in 1588, and the fact is recorded by a painting in the church. Place House, the seat of the Treffrey family, is at Fowey.

Grampound, population of the township 588, is 17 miles N.W. by N. from Bodmin. The river Fal flows through the town, the greater part of which is to the east of that river, and consists of one main street on the declivity of a hill. A small chapel of ease and a granite cross are in the town. The market, which is small, is held on Saturday. Grampound is a corporation by prescription. It sent members to Parliament from the reign of Edward VI. until 1821, when it was disfranchised for bribery.

Hayle, population returned with the parishes of Phillack and St. Erth, in which it is situated, is a small town and port on the shore of the inner basin of St. Ives' Bay, about 5 miles S.E. from St. Ives. The principal object of interest is the iron-foundry, in which are cast cylinders of the largest size, not only for the mines in Cornwall but also for exportation. A large work of this kind was sent several years ago from Hayle to Holland, for the drainage of the Haarlem lake. There was formerly at Hayle a 'copper-house,' in which extensive smelting operations were carried on, but it is now found to be a cheaper method to carry the ore to Swansea to be smelted in the vicinity of coal-mines. Vessels of 200 tons burden can now enter the port of Hayle, in consequence of the erection of a breakwater, by which the sand has been prevented from filling up the harbour. Three steamers sail weekly between Hayle and Bristol.

East Looe, population of the chapelry 970, is on the left bank of the river Looe, which here falls into the sea, about 18 miles S.E. from Bodmin. It is built on a flat piece of ground between the river Looe and the sea, and is described as a labyrinth of short narrow dirty alleys, above which rises the low embattled tower of a little chapel of ease. On the land side rises a high steep hill. On the height above the town are numerous gardens, in which throughout the year the myrtle and the geranium flourish in the open air. East Looe is united with West Looe on the opposite side of the river by a bridge 141 yards long, but only 6 feet 2 inches wide. The inhabitants are chiefly engaged in the pilchard fishery. The harbour admits vessels of 100 tons, and is protected by a battery. There is a market on Saturday. The town was incorporated by Queen Elizabeth, and returned members to Parliament from the time of Elizabeth to the passing of the Reform Act of 1832, by which it was disfranchised. There is an Endowed Free school for teaching mathematics, especially those branches connected with navigation. East Looe united with

Fowey in sending a member to a council of trade held at Westminster in the reign of Edward I., and furnished 20 vessels and 315 men to the fleet of Edward III.

West Looe, population 746, is separated from East Looe by the River Looe. A chapel at West Looe dedicated to St. Nicholas has been converted into a guildhall. The market has been long discontinued. This place was incorporated by Queen Elizabeth; the corporation consists of 12 burgesses, including the mayor. It sent members to Parliament from the time of Edward VI., but was disfranchised by the Reform Act of 1832. Opposite the Looes is St. George's, or Looe Island, about 14 acres in extent; beyond it are some rocks, known as Rennie's Rocks; a rock between the island and the mainland is called Midmain.

St. Mawes, population of the parish of St. Just 1557, is situated on an arm of the Carrick Road, about 30 miles S.S.W. from Bodmin. It is a wretched little place, consisting of one street at the base of a hill near the sea, and containing a few houses inhabited by fishermen and pilots. There is here a chapel built by the marquis (now duke) of Buckingham, in 1812. A castle built by Henry VIII., nearly at the same time as Pendennis Castle, on the other side of the roadstead, but much inferior to it in size, is now used as a residence for the lieutenant-governor. The market on Friday is very small. St. Mawes returned two members to parliament from 1562 up to the passing of the Reform Act of 1832, by which it was disfranchised.

Mevagissey, population of the parish 2022 (a decrease of 288 since 1841 is ascribed to the ravages of cholera in 1849 and to a decline in trade), on the coast of the channel, on Mevagissey Bay, 17 miles S.S.W. from Bodmin. The inhabitants are chiefly dependent on the pilchard fishery. Ships of 100 tons may ride securely in the pool or basin of Mevagissey. The market, which is held by prescription, is on Saturday. So alarmed were the fishermen by the ravages of cholera in 1849, that they took their families in their boats to Fowey Haven. On this occasion the houses and streets of Mevagissey received the advantage of a thorough cleansing.

Padstow, population of the parish 2224, at the mouth of the river Alan, or Camel, which here forms a wide estuary, is 15 miles N.E. from Bodmin. The town is in a vale, adorned with gardens on each side, and the beauty of the situation is increased by the estuary, which, when the tide is up, presents a clear expanse of water apparently land-locked by the granite cliffs which form the banks. The harbour is the best on the northern coast of Cornwall, and, though the entrance is much obstructed by sand, is capable of receiving vessels of great burden. The streets are in general narrow, and many of the buildings antiquated; but the town has been much improved within the last half century by the erection of many new houses; the general roofing is a fine blue slate. There are an excellent pier, a custom-house, several quays and shipwrights' yards, and a workhouse, with a school-room over it. A steam-vessel plies between Padstow and Bristol. The church, which is in the perpendicular style, has been lately repaired and fitted with stained-glass windows. It contains a curious old font. In the time of Leland the town carried on a considerable trade with Ireland and Wales; the chief imports now are coals and iron from Wales, timber from Norway, and various goods from Bristol; corn, malt, and block-tin are exported. The market is on Saturday. There are here a small Endowed school, and day schools, established by voluntary subscription. The place appears to have had anciently the name of Adelstowe or Aldestowe, and in the Cornish language Lodenek.

Polperro, population of the town about 800, is on the coast between Plymouth and Fowey, about 16 miles S.E. from Bodmin. The situation of this little town is singularly romantic, the houses being on the side of two steep rocky hills, forming a very narrow valley, through which there runs a small river. The harbour will accommodate vessels of 150 tons; it is protected by a double pier. An extensive hook and line fishery is carried on; there is also a pilchard fishery; and some trade is carried on in coals, limestone, and grain. The market is held weekly on Friday. There are in the town Endowed Charity schools for boys and girls.

Saltash, population of the chapelry 1621, on the right bank of the Tamer, a little above its junction with the Lynher, 29 miles E.S.E. from Bodmin, is built on the ascent of a steep hill, the summit of which is crowned by a chapel of ease and the town or mayoralty hall. Beneath the town-hall is an open market-place. The principal street is at right angles to the river: a large proportion of the houses are of stone quarried in the rock on which the town stands, intermingled with others built of brick. Some of the houses are fronted with plaster, others with slate. Saltash is now chiefly inhabited by fishermen. Some trade is carried on in malt. The market is on Saturday. Besides the chapel of ease, there are Dissenting meeting-houses, and a Free school. Saltash was made a free borough in the reign of John or Henry III. The borough sent two members to parliament from the time of Edward VI.; it was disfranchised by the Reform Act of 1832.

Tregony, population of the parish of Tregony St. James, in which the borough is situated, 846. The boundaries of the town extend into the adjoining parishes. Tregony is situated on the left bank of the river Fal, 18 miles N.N.W. from Bodmin; it was formerly of some consequence, but it gradually decayed as Truro increased in importance. The houses are chiefly arranged in one long street on the side

of a hill sloping down to the Fal, over which there is a bridge. The parish church of Cuby is in the upper part of the town. The market is on Saturday. From the time of Queen Elizabeth two members were returned to parliament from Tregony until the borough was disfranchised by the Reform Act of 1832. Tregony is considered to have been a Roman station, *Canium* or *Voluba*.

Tywardreath, population of the parish 3287, situated about 5 miles S. by W. from Lostwithiel, has increased considerably within the last 30 years in consequence of the success of mining operations. A Benedictine priory formerly existed here. Besides the parish church, there are a National school, a post-office, and a market-house.

Wadebridge, population about 850, is situated at the head of the estuary and on both sides of the river Camel or Alan, about 6 miles N.W. from Bodmin, and 239 miles W.S.W. from London. The river Alan is here crossed by a bridge of 17 arches, which was erected in the time of Edward IV., chiefly through the exertions of the then vicar of Egloshayle, who also left an annuity to keep it in repair. In the town are a Proprietary Episcopal chapel, chapels for Wesleyan and Association Methodists and Independents, National schools, a library, and a savings bank. The market is held on Friday; fairs are held on May 12th, June 22nd, and October 10th. A railway from Wadebridge to Bodmin affords facilities for conveying the produce of the copper and iron mines for shipment at Wadebridge, and for carrying to the interior the imports received at the port, as well as sea-sand to be used as manure. Some corn is exported; the river is navigable for vessels of 150 tons burden.

The following are among the more important villages, with the population in 1851, and a few other particulars:—

Bude, written also *Budehaven*, and *Budeham*, population of the parish of Stratton, in which it is situated, 1696, is a small bathing village on the north-west coast, 14 miles N.W. by N. from Launceston. It is much frequented in summer. The formation of the canal from Bude to Launceston, commenced in 1819, has been productive of much advantage to the district. The canal has its outlet here into a shallow bay, in which a great accumulation of sand constantly takes place. At low water the farmers remove the sand in immense quantities to be used for manure. As much as 4000 horse loads has been carried off in one day. The carriage of sand to the inland parts of the county forms a considerable part of the traffic on the canal. From the heaviest seas the bay is sheltered by an embankment. In Bude village is the residence of Mr. Gurney, the inventor of the Bude light. *Kilhampton*, formerly written *Kilhamland*, population of the parish 1221, is near the border of the county, 16 miles N. by W. from Launceston. The extensive reservoir of the Bude Canal is partly in this parish. The parish church, an ancient structure, is said to be one of the finest in Cornwall. The south doorway is remarkable for its curious mouldings and numerous grotesque heads. In the church is a handsome monument to Sir Beville Grenville. The Rev. James Hervey, when curate of this parish, wrote here his 'Meditations among the Tombs.' *Landewednack*, population of the parish 430, 50 miles S.W. by S. from Bodmin. In this parish, which is the most southerly in England, the Lizard Point is situated. The church has a Norman doorway and inscribed front in good preservation. An ancient cross constructed of granite stands between the church and Lizard Point. On the coast are some magnificent caverns and bold and picturesque cliffs. *Millbrook*, population of the parish of Maker, in which it is situated, 2822, forms with Dodbrook in Devon one town. There is here a new district chapel. A portreeve is elected annually. From the summit of Maker tower an extensive and beautiful prospect is obtained. *Morwinstow*, population of the parish 1094, is situated on the coast, in the most northerly parish of the county. The church, which is a good-sized building, stands near the shore; its site commands an extensive sea-view. The cliffs here rise to the height of 420 feet; the coast is dangerous for vessels. *St. Neot*, population of the parish 1628, is 4 miles N.W. from Liskeard. The parish church contains some very fine specimens of stained glass, in restoring which the late Rev. R. G. Grylls of Helston laid out upwards of 2000*l*. The church was built in 1480: it is 116 feet long by 55 feet broad. It has a tower, which is 71 feet high. At the period of the Domesday Survey there was a college here called Neotstow. Dozmare Pool, an inland lake of about a mile in circumference, 890 feet above the sea, is situated on the moors at the northern extremity of the parish of St. Neot. This pool is regarded with superstitious fear by the country people, who have many legends respecting it. By a trench cut through a marsh at the western end of the pool, its waters now find their way to the river Fowey. Near the lake is a remnant of antiquity called the Four Hole Cross, on the line of road from Bodmin to Launceston. It is decayed and imperfect, two holes only now remaining. This is supposed to be one of the oldest crosses in Cornwall. *Perranzabuloe*, or Perran in the Sands, population of the parish 3114, about 20 miles S.W. from Bodmin, is chiefly remarkable for the successive engulfment in the sands of two of its churches. In 1835 the remains of the original parish church, supposed to have been embedded in the sand since the 9th century, were discovered, and a space around the building cleared. It is small, and of rude construction: it has been named St. Perran's Oratory. About a mile and a half from the present parish church is an amphitheatre, called Perran's Round, which has seven ranges of seats, and is apparently

capable of accommodating about 2000 persons. Here it is supposed important meetings were held, or games and plays performed for the amusement of the Cornish inhabitants in ancient times. During summer the village of Perran Porth is frequented by numerous visitors. *Stokeclimland*, population of the parish 2596, is 6 miles S. by E. from Launceston. The parish church is a fine old gothic building, and has a tower with 8 bells. Cider is made here. The mines are in a flourishing condition. In this parish is Kit or Kite Hill, the summit of Hingston Down, 1067 feet above the sea, one of the stations of the Trigonometrical Survey. On Kit Hill the Parliament of Tinnors, both of Devon and Cornwall, used to assemble in ancient times once in seven years. *Torpoint*, population of the parish of Antony 3201, a village of modern origin, at the south-eastern angle of the county. By a steam-bridge, plying every quarter of an hour during the day, communication is kept up with Devonport on the opposite side of the Tamer, distant about a mile. A chapel of ease was opened here in 1820.

Divisions for Ecclesiastical and Legal Purposes.—Cornwall was anciently a diocese by itself; the see appears to have been originally fixed at St. German's and thence removed to Bodmin, where it continued until it was united with the see of Crediton. Out of this union rose the see of Exeter, in the diocese of which Cornwall is now included. The limits of the county nearly coincide with those of the archdeaconry of Cornwall. The 'Census of Religious Worship' in 1851 gives the following return in reference to the county of Cornwall:—Places of worship—Wesleyan Methodist, 412; Church of England, 265; Bible Christian, 182; Wesleyan Association, 93; Primitive Methodist, 38; Independent 37; Baptist, 25; Society of Friends, 12; Roman Catholics, 7; Wesleyan Reformers, 6; others, 27; total number, 1104. The total number of sittings provided was 262,911. By the Poor-Law Commissioners the county is divided into 13 Unions: St. Austell, Bodmin, Camelford, St. Columb Major, Falmouth, St. Germans, Helston, Launceston, Liskeard, Penzance, Redruth, Stratton, and Truro. These Unions include 223 parishes and townships with an area of 836,092 acres, and a population in 1851 of 353,965; but the boundaries of the Unions are not strictly co-extensive with those of the county. Cornwall is in the western circuit. The assizes and quarter sessions are held at Bodmin. The county jail is at Bodmin, and another older county jail at Launceston, which is used at the assizes.

This county is however under a peculiar jurisdiction, which requires notice here—that of the Duke of Cornwall. The duchy of Cornwall was created in 1337 in favour of Edward the Black Prince, and settled by Act of Parliament on the eldest son of the king of England. The duke enjoyed large revenues, arising from the lordship of castles, boroughs, and manors, granted to him in Cornwall and Devonshire; the profits arising from the coinage of tin, and various other sources. The annual revenue on the average of the three years subsequent to the death of the Black Prince was 2493*l*. 7*s*. 3*d*.; the clear revenue in the 15th year of Henry VIII. amounted to 10,095*l*. 11*s*. 9*d*.; in the 44th year of Queen Elizabeth, in 1602, it had fallen to 4569*l*. 12*s*. 2*d*.; and at the publication of Messrs. Lysons' 'Magna Britannia' (1814), the gross amount was estimated at 22,000*l*., of which 8500*l*. arose from the tin-duty in the county of Cornwall, and 3500*l*. from the rents of manors, fines, &c. in the same county: the sources from which the remainder was derived are not mentioned. The tin-duty before the war of 1793 had been 14,000*l*. per annum. By an Act passed in the 1st and 2nd of Vic. cap. 120, in lieu of the old coinage duties, a customs duty of 15*s*. the cwt. for tin, and 10*l*. for every 100*l*. value of tin-ore is imposed.

The immediate government of the county was early vested in the Duke of Cornwall, who has still his chancellor, attorney-general, and solicitor-general, and his court of exchequer. He also appoints the sheriffs. The mining-trade is under the separate jurisdiction of the Stannary Courts; the Lord Warden of the Stannaries, and the Vice-Warden, are at the head of this jurisdiction, with a final appeal to the duke and his council. The four Stannary Courts are Foy More, Blackmore, Tywarnhaile, and Penwith and Kerrier.

An Act was passed in the 6th and 7th Wm. IV. cap. 106, entitled 'An Act for the better and more expeditious Administration of Justice in the Stannaries of Cornwall, and for enlarging the Jurisdiction and improving the Practice and Proceedings in the Courts of the Stannaries.' By section 4 of this Act, the equitable jurisdiction of the Vice-Warden is extended to all matters connected with the working of lead, copper, or other metal or metallic minerals within the county of Cornwall. By section 6, the Stannary Courts are consolidated, and are to be held before the Vice-Warden, who is to have the same authority that the stewards had. Other sections appoint the Vice-Warden's Court to be a Court of Record, and to be held at Truro. By the 2nd and 3rd Victoria, cap. 58, a Stannary Court's duty of one farthing in the pound sterling was imposed on tin and tin-ore.

Previous to the Reform Act Cornwall had the largest share in the parliamentary representation of all the English counties: up to 1821 it had sent forty-four members, namely, two for the county, and two each for 21 boroughs, none of them of any great importance, and some of them utterly insignificant. The county was represented in Parliament at the time of the first summons of Edward I., and in the latter part of that monarch's reign it returned two knights of the

shire, and representatives for six boroughs: to these were added seven others in the reign of Edward VI.; two in the reign of Mary; and six in that of Elizabeth. By the Reform Act the county was formed into two divisions, each returning two members: and various changes were made in the representation of the boroughs, making the number of members sent by the county only fourteen.

Natural Curiosities.—The granite rocks of Cornwall present in different places an appearance so singular, that they have been mistaken for the efforts of human art in its earliest and rudest stage. The Cheesewring occupies the highest ridge of a hill north of Liskeard, one of the hills which gradually decline from Brown Willy and Rough Tor, the highest parts of the county. The summits of all these hills are covered with granite cairns in different states of ruin, and their sides are strewn with boulders which have fallen from them. The Cheesewring is a pile apparently consisting of five stones piled one on the other, of which the upper ones are so much the largest as to overhang on all sides the lower ones, which form their base. The collective height of the whole pile is about 20 feet. The formation of this group is ascribed by Dr. McCulloch solely to natural causes. It is, in fact, the vestige of a much larger mass, the lateral parts of which have fallen away, not being so well poised as the singular part which yet remains. The granite of Cornwall is in general split by fissures, which tend for the most part to the horizontal or perpendicular; and by these fissures it is divided into cubical or prismatic masses. Where the rock rises above the surface, the influence of the atmosphere causes a gradual decay, by which first the angles formed by the fissures with the external face of the rock become rounded, then the surfaces in contact become separated, the masses originally angular acquire a curvilinear outline; and if the centre of gravity of the whole mass be high and far removed from the perpendicular of the fulcrum, the upper parts of the mass fall down, and, by the continuance of the disintegration, acquire the spheroidal form which the granite boulders often exhibit. If however the centre of gravity be in the perpendicular of the fulcrum, the mass retains its position, as in the case of the Cheesewring, or produces the phenomenon that will be next described.

The Logging (or, as it is commonly written, Logan) Stones are stones which are poised on a fulcrum, and which rock, when moved by an adequate force. The most remarkable of these Logging Stones is near the Land's End, on a peninsula of granite jutting out 200 yards into the sea, the isthmus still exhibiting some remains of the ancient fortification of Castle Treryn. The granite which forms this peninsula is split by perpendicular and horizontal fissures into a heap of cubical or prismatic masses. The whole mass varies in height from 50 to 80 or 100 feet; it presents on almost every side a perpendicular face to the sea, and is divided into four summits, on one of which, near the centre of the promontory, the stone in question lies. The general figure of the stone is irregular; its lower surface is not quite flat, but swells out into a slight protuberance, on which the rock is poised. It rests on a surface so inclined, that it seems as if a small alteration in its position would cause it to slide along the plain into the sea: for it is within two or three feet of the edge of the precipice. The stone is 17 feet in length, and above 32 feet in circumference near the middle, and is estimated to weigh nearly 66 tons. The vibration is only in one direction, and that nearly at right angles to the length. A force of a very few pounds is sufficient to bring it into a state of vibration, even the wind blowing on its western surface, which is exposed, produces this effect in a sensible degree. The vibration continues a few seconds. There is another Logging Stone at St. Just, and a third at Sithney, which has been thrown down; but this near the Land's End is the largest. This was displaced in a frolic a few years since, but was restored, though with great difficulty.

On the horizontal surface of the granite the action of water has formed excavations with rounded bottoms, occasionally circular in their outline, and as regularly spheroidal as if shaped with a turning-lathe. They are of various depths, and sometimes communicate with each other. The surface of 'the rock basin quoit' at Carn-brea is honeycombed by these hollows. In the parish of Constantine are two very singular monuments. One is a huge stone resembling an inverted cup or mortar, but not hollow, so regularly formed as to present the appearance of art. It is 30 feet in girth and 11 feet high, according to Dr. Borlase. The other monument is a vast stone perched on the points of two rocks, so that a man may creep under it; it is 33 feet long from north to south, which is its greatest dimension; the breadth from east to west is 18½ feet, and the thickness or vertical dimension is 14½ feet; the circumference is computed to be 97 feet, and the girth about 60 feet; it is estimated to weigh at least 750 tons. The top is honeycombed by rock basins similar to the rock basin quoit at Carn-brea. There are in Cornwall and the Scilly Isles other stones similarly supported; they are commonly designated by the name 'Tol-men,' that is, hole of stone. (Borlase, *'Antiquities of Cornwall.'*)

The cairns on Carn-brea Hill, near Redruth, and the Roche Rocks, a little to the left of the road from Bodmin to Truro, are of the Celtic period; they are formed of granite, and owe much of their picturesque form to natural causes.

History and Antiquities.—Before and at the time of the Roman

invasion, Cornwall was probably included in the territory of the two tribes, the Damnonii and the Carnabii. Ptolemaeus mentions only the former of these, whom he terms Dumnonii; and they seem to have occupied the south-eastern part, comprehending all the Channel coast. The Carnabii are not we believe noticed by any writer except Richard of Cirencester, who considers that they gave to the county the name which it had in the Latin of the middle ages, Cornubia. It is however more probable that the district gave name to the people, and that both Carnabii and Cornubia contain the Celtic root kern or corn, signifying a horn. The second part of the modern designation of Cornwall is derived from the Saxon Wealas, a name given to the Britons, some of whom, on the Saxon invasion, retired into the western part of the island, and maintained a long struggle for their national independence.

At an early period this part of the island was frequented by the Phœnicians of Gadeira (Cadiz), who came hither to procure tin, lead, and skins, but especially the first; in return for which they gave salt, earthenware, and copper goods. (Strabo, lib. iii. 175). It was probably from these Phœnicians that the western extremity of Britain, with the Scilly Islands, obtained the name of the Cassiterides ('tin islands'), from a root which, in some of the oriental tongues, as well as in Greek, denotes tin. The Greeks appear to have had some knowledge of those parts of the island where tin was wrought, before the time of the Roman conquest.

To this remote period we may refer some of the rude stone monuments which are still numerous in this part of the island; and to which are generally ascribed a Celtic origin. Rough blocks or obelisks standing in pairs, and supposed to be memorials of the dead, are found at Dryft, in the parish of Sancreet, between Penzance and the Land's End, and at Trewren, in Maddern parish, near Penzance. There are two stones at Bolleit in St. Buryan or Burian (also near the Land's End) which are a furlong apart, one 12 feet, the other 15 feet high. On the downs between Wadebridge and St. Columb are nine rude stone blocks or pillars placed in line, bearing north-east and south-west, and called the Nine Maids. The circles of stones are numerous in this county, and are generally known by the name of Dawns Men, that is, the stone dance. Boskeduan circle, in the parish of Gulval and Boscawen-ŋn in St. Buryan, are formed of stones placed at some distance from each other. Boscawen-ŋn has a stone in the centre fixed in the ground, but leaning far forward. Other circles are formed by stones not erect, but placed near each other, so as to form a kind of fence: such as Zenor Circle, between St. Ives and Cape Cornwall, and Kerris Roundago, near Penzance, an oval inclosure, with four stone pillars at one end, marking out a quadrangular space. All these are in the western part of the county. Near Liskeard are three circles, very near each other, formed by erect stones placed at some distance; several of the stones have been carried away, and others overthrown. This monument is locally named 'the Hurlers,' from a popular superstition in the district. At Botallack, in St. Just parish, near Cape Cornwall, are several stone circles intersecting each other: and on the hill Carn-Menelex in the parish of Wendron, between Redruth and Helston, is a stone circle, having in the middle of it a natural rock of four masses piled on each other after the manner of the Cheesewring. There are also in Cornwall several circles, which Dr. Borlase supposes to have been devoted to the purposes of an amphitheatre. They are called 'plàn an guare,' 'the plain of sport or pastime.' But some of these, at least, are more probably encampments than amphitheatres.

Various other antiquities may be noticed here as having probably had a British origin, though of uncertain date. There are several barrows, or tumuli, composed some of loose stones, others of earth, and others of stones and earth mingled. Some of these, on being opened, have been found to contain sepulchral urns; others in the Scilly Isles, have an outer ring or edge of large stones, and within a cavity formed by stone walls, with flat stones at the top, and the cavity covered with the mound of loose stones or earth. There are also several cromlechs, the top stones of which are in Cornwall called 'quoits.' The quoit of Lanyon Cromlech is 19 feet long and 47 feet in circumference; its thickness varies, being in some parts as much as 2 feet; it is raised so high that a man can sit on horseback under it. It has four upright stones, but one is too short to give it any support.

Among the smaller relics of antiquity may be mentioned the sepulchral urns dug up from some of the barrows; celts of both brass and stone; spear-heads and broken pieces of copper swords; lumps of fine copper, evidently designed for melting; and a considerable number of gold coins found in 1749 near Carn-brea Hill, in the neighbourhood of Redruth.

There are also in Cornwall several artificial caves or subterranean galleries, formed by walls of upright stones, with other stones laid across; some of the galleries extend 30 feet or even 60 feet in length. The upright stones, or obelisks, with inscriptions in the Roman character, and in the Latin tongue, must be referred to a period subsequent to the Roman invasion; and from their inscriptions or symbols, several must have been posterior to the introduction of the Christian religion. Other antiquities of British origin we must pass over.

The period at which Cornwall fell under the power of the Romans is not known. Dr. Borlase ascribes the conquest to Agricola; Dr. Stillingfleet to Vespasian. As however none of the Roman historians

who have recorded the affairs of Britain notice the conquest of Cornwall, or of the tribes inhabiting it, it is probable that it was not signalled by any great exploits. Some of the older antiquaries denied that Cornwall ever came under the Roman dominion; but apart from the improbability of the rich mines of this county escaping the notice, or being defended from the power of that people, the quantity of Roman coins and other Roman remains found in Cornwall shows that Cornwall shared in the general subjection of South Britain.

The geography of Cornwall during the Roman period is very obscure. Ptolemæus notices the headlands of Antivestæum, or Bolerium, supposed to be the Land's End; and Ocrinum, or Damnonium, supposed to be the Lizard: and Richard of Cirencester mentions also the Rame Head. Ptolemæus mentions the estuaries of the river Tamarus, which the name enables us to identify with the Tamer, and the Cenion, probably the Fal, which has the most remarkable estuary west of the Tamer. Of the towns of the Damnonii, mentioned by Ptolemæus, Voluba, or Voliba, has been fixed at Tregony, or Gram-pound, or perhaps at Wolverdon, where is a camp, probably Roman, on the Fal (the name of which has been supposed to be incorporated in the word Vol-uba), and at Lostwithiel, or elsewhere on the Fowey. Uxela, which some have fixed at Lostwithiel, is more generally regarded now as having been in Somersetshire. Tamare, fixed by Horsley at Saltash, is by others removed into Devonshire to Tamerton. To these towns, all mentioned by Ptolemæus, we may add on the authority of Richard, Cenia, whose name seems to connect it with the Fal, the Cenion of Ptolemæus, but which is nevertheless fixed by some at Condurra, on the river Hel, or Helford, where are the remains of a Roman camp; Musidum, or Musidunum, which is fixed near Stratton; and Halangium, supposed to be Carn-brea. Two if not three Roman roads enter Cornwall from Devonshire. One was the continuation of the great road which ran westward from Isca Dumniorum, or Exeter, and it is said may be traced on the downs west of Liskeard; it is conjectured to have proceeded westward by Lostwithiel, St. Austell, and Gram-pound (or Tregony) to Boswens, where is a Roman camp, near the river Heyl, which falls into St. Ives' Bay, and thence to Marazion, or rather to St. Michael's Mount, the presumed Ictis of Diodorus. The other road came from the north of Devon to Stratton, and is conjectured to have led towards Bude Haven, which was probably then a large and more important harbour. The existence of a third Roman road is doubtful. A road, probably British, the direction of which is marked by the occurrence of tumuli, runs from the Land's End, near Redruth, Michel or St. Michael's, and St. Columb, towards Stratton. Besides the places above mentioned, Launceston has been supposed to be a Roman station. Cornwall was included in Britannia Prima.

Upon the departure of the Romans Cornwall recovered its independence, which it maintained for a long time against the invading Saxons. The famous Arthur, whose history has been so distorted by fable as to cast a doubt over his existence, is generally reputed to have been a native of this county.

The continued and resistless pressure of the Saxons having driven westward those Britons who refused to bear the yoke of the invaders, Cornwall and Devonshire became the place of refuge to many. It was probably about this time that part of the superabundant population thus compressed into the extremity of the island took refuge in Bretagne, already colonised by their countrymen, and gave to a district there (Cornouailles) the name of the country they had left. The Cornish Britons and those of Wales appear to have recognised one supreme authority until the middle of the 7th century, when Cadwaladr, the last British sovereign, abdicated his throne, and went to Rome, where he died. Upon his death, A.D. 680, Ivor, son of Alain, king of Bretagne, was sent by his father with a powerful fleet to obtain the crown, and met at first with considerable success, defeating the West Saxons, and obtaining possession of Cornwall, Devonshire, and Somersetshire: he was however afterwards driven from the island by the West Saxon king Kentwin. From this period till the reign of Egbert the Britons were exposed to the constant hostility of the Saxons. During the reign of Egbert's successors little is known of the history of Cornwall until we come to the time of Athelstan, by whom the whole country, including the Scilly Isles, was reduced and incorporated with the now consolidated kingdom of England. From this time the provincial history of Cornwall offers little to interest the reader for many centuries. Some ravages of the Danes and some intestine commotions are the only memorable events. The attempt of Henry De la Pomeroy to seize St. Michael's Mount in order to support the rebellion of Prince John against his brother Richard I. is noticed under MARAZION.

Of the obscure and troubled period over which our historical notice extends Cornwall retains many memorials in the camps and earth-works, which are more numerous in this county than in any other. These are for the most part nearly round or oval, a form which induces us to refer them to any other than a Roman origin. They possibly were formed during the severe and protracted struggles of the Cornish Britons with the Anglo-Saxons. In many places of the coast a small promontory or portion of the cliff is inclosed by a rampart, or vallum, running from one edge of the cliff to the other, and strengthened on the land-side by a ditch. These, if situation be any clue to their origin, may be ascribed to the Danes. The space

inclosed is considerable; in one case (in the parish of St. Gorran, near Mevagissey) it amounts to 100 acres. Our space forbids a description of these works, and a mere catalogue would be useless.

The ruins of castles and of monastic establishments belong to a later period than the earth-works; but in these Cornwall is not remarkably rich. On the hills are remains of rude circular buildings called castles, the walls of which were formed of dry stones not joined with any cement: these must be referred to an early period; Dr. Borlase considers them to be of Danish origin. In the narrow part of the county west of Mount's Bay and St. Ives' Bay there are no less than seven of these castles, one of which, Chûn Castle, consists of an oval inclosure surrounded by a wall, which Borlase estimates to have been originally 15 feet high, or rather more; 8 feet thick at the present top, but thicker at the foundation; outside of this is a ditch 30 feet wide; and outside of this an outer wall, probably 10 feet high, and about 5 feet thick. The entrance, made intricate for the purpose of defence, is inclosed by walls running from the outer wall, on one side of the entrance quite to the inner wall, and on the other to within three feet of it: two other walls running from the outer to the inner wall serve with the entrance to divide the ditch into three parts. Round the outer wall is a ditch. The space inclosed by the inner wall is 125 feet from east to west, and 110 feet from north to south; it is divided into several compartments ranged round the inside of the wall. There is a well in the inclosure.

Of castles intended for residence as well as defence may be mentioned Karn-brê, or Carn-brea Castle, on Carn-brea Hill, near the Land's End. This is very small, scarcely 60 feet long by 10 feet wide, built upon a ledge of rock, whose uneven surface has caused great diversity in the level of the rooms upon the ground floor. Carn-brea Hill abounds with antiquities: there is an ancient camp of irregular form, some cairns, and other antiquities of rough stone. Tintagel Castle has been already noticed. [BOSSINEY.] For Launceston Castle, see LAUNCESTON.

Trematon Castle is on an eminence over the river Lynher, in the parish of St. Stephens, and not far from Saltash. It has a base-court surrounded by an embattled wall of irregular form, following the shape of the hill on which it stands, and pierced with loop-holes. The keep is on an artificial mound, at the north-east corner of the base-court, about 30 feet high: the walls of the keep are 30 feet high and 10 feet thick: it is nearly oval, and its inner dimensions are 66 feet by 52 feet. It has no windows in the outer wall. In the time of William Rufus this castle was held by the Valletort family. In the Cornish rebellion in 1549 (reign of Edward VI.) Trematon Castle was defended for a while against the rebels by Sir Richard Grenville.

Of Restormel Castle, in the parish of Lanlivery, near Lostwithiel, the only part now remaining is the keep, a building of large dimensions: it is on a steep mound formed out of a rocky hill, and has a deep ditch. The inclosure of the keep is an exact circle of 110 feet diameter within; it has walls 10 feet thick at the top: from the present floor of the ground-rooms to the top of the parapet is 34½ feet. The castles of Fowey, St. Mawes, and Pendennis are noticed elsewhere.

There are few remains of monastic buildings in Cornwall. The church of St. German's priory is described under ST. GERMAN'S. Monastic remains on St. Michael's Mount have been repaired and converted into a dwelling-house. [MARAZION.] Of the monastery of St. Benet, near Lanivet, there are considerable remains. The tower of the church is also standing. The chapel of St. Lawrence's Hospital, near Bodmin, remains. Morwinstow church, in the northern extremity of the county, and Kilhampton or Kilkhampton church, near Stratton, are very ancient, being wholly or chiefly of Norman architecture. Sheviok church, near St. German's, has some portions of early English and other portions of decorated English architecture.

In the war of the Roses the Cornish men seem to have taken the Lancastrian side, induced mainly by the influence of Sir Hugh Courtenay of Bocconoc and Sir John Arundell of Lanherne: they were present in the field at Tewkesbury, and it was in their country (at St. Michael's Mount) that the Earl of Oxford, one of the Lancastrian leaders, sought to make a stand after that fatal day. In the reign of Henry VII. (1495), they rose in rebellion on occasion of a tax levied to defray the expense of a war with Scotland. In 1497 the Cornish men were again in arms to support Perkin Warbeck, but the flight of that pretender caused the failure of the attempt. The change of the religious institutions of the county led to the change of the common language of Cornwall; the people, for the most part of British descent, with comparatively few Saxons settled among them, had retained a language of their own, a dialect of the Celtic. The introduction of the English church service paved the way for the gradual decline of the Cornish dialect. In the reign of Charles I. some aged people near Penryn were quite ignorant of the English language. In the early part of the last century the Cornish was still spoken by the fishermen and market women near the extreme southern point of the county. At present this ancient tongue is the study of the scholar and antiquary alone. A few manuscripts in it are extant; the most remarkable of which are some interludes partly written in the 15th century.

In 1595 Penzance and one or two places near it were burnt by the Spaniards.

In the great civil war of Charles I. and his parliament the Cornish men seem to have been on the whole in favour of the king. They distinguished themselves on the royalist side at the battle of Lansdowne and the siege of Bristol in 1643; and the king in reward of their loyalty wrote them a letter of thanks, which he ordered to be printed and published, and a copy to be read in every church and chapel in the county. In July 1644 the Earl of Essex marched into Cornwall at the head of the parliamentary forces and took possession of Launceston, Saltash, Bodmin, Lostwithiel, and Fowey; but being followed by the royal army under the king in person was forced to retreat to Fowey with his infantry, his cavalry having previously got clear off. From Fowey Lord Essex escaped with some other persons to Plymouth; but his infantry, 6000 in number, under Major-General Skippon, were forced to capitulate on September 2nd. In the autumn and winter of 1645 Charles II., then Prince of Wales, spent some time in Cornwall: in March 1646 he embarked at Pendennis Castle for the Scilly Isles upon the approach of the Parliamentarians under Fairfax, who, after defeating Lord Hopton at Torrington, entered Cornwall, forced the royalist cavalry to surrender, and acquired possession of the whole county. The royalist army had been disorganised by the disputes of their leaders. Pendennis Castle, one of the last places in England which held out for the king, surrendered in August 1646. The Scilly Islands had some time before been seized by the victorious party, and Prince Charles forced to flee, first to Jersey, and afterwards to France. In 1648 an attempt to raise forces for the king was defeated by Sir Hardress Waller. The Dutch made two attempts on the Cornish coast in the war between them and the Commonwealth, but were defeated in both. Since this period the local history of Cornwall presents little that is of general interest.

Cornwall is mainly a mining county. In 1851 the county possessed nine savings banks, at Bodmin, Falmouth, Helston, Launceston, Liskeard, Penzance, Redruth, Truro, and Wadebridge. The total amount owing to depositors on the 20th of November 1851 was 503,760*l.* 3*s.* 3*d.*

COROMANDEL COAST, originally Cholomandala, or, according to Major Rennell, the Sora Mandalum of Ptolemaeus, is the sea-board of the western side of the Bay of Bengal, extending from Point Calimere on the south, in 10° 18' N. lat. and 79° 56' E. long., to the mouth of the Kistnah on the north, in 15° 45' N. lat. and 80° 53' E. long. Along the coast from south to north are Nagore, Tranquebar, Cuddalore, Pondicherry, Madras, and Nellore; but throughout its whole extent, about 350 miles, forming part of the sea-board of the Carnatic, the coast does not afford any secure port or harbour, and owing to the prevalence of the surf it is difficult to effect a landing except by means of boats constructed for the purpose.

CORON (*Koroni*), a town in the Morea, on the west coast of the Gulf of Kalamata (called also Gulf of Koroni), the ancient Messenian Gulf. It appears to stand at or near the site of the ancient Colonides, while the town of Corone, of which Pausanias speaks as having been built by the Messenians when they were restored to their country by the help of the Thebans, would seem by the description which that author gives of its locality to have stood farther north on the same coast, near the spot where the village of Petalidhi now stands. Leake however makes Koroni occupy the site of Asino; Colonides he places at Kastolia, where are some ruins of ancient buildings; while the French commission places it on the Bay of Phœnicus to the north-west of Cape Gallo, the ancient Acritas. The present Coron is a place of some trade, and exports oil and silk, which are produced in the neighbouring district.

The town contains a large castle in tolerably good repair, in which the Turkish inhabitants used to reside before the Greek revolution, the Greek population then occupying the suburb called Varnsi. The roadstead is open and exposed to the south winds, but the bottom of the shore being soft sand, vessels driven upon it often escape without much damage. The town stands on a promontory surrounded by a fertile plain, which is divided from the district of Modon, on the west coast of the Morea, by a barren ridge which runs north and south through the peninsula to Cape Gallo. (Leake's 'Morea,' vol. i.)

CORRÈZE, an inland department of France, deriving its name from the river Corrèze, which falls into the Vézère, a tributary of the great river Dordogne. It extends between 44° 55' and 45° 44' N. lat., 1° 13' and 2° 22' E. long.; and is bounded N. by the departments of Haute-Vienne and Creuse, E. by those of Puy-de-Dôme and Cantal, S. by the department of Lot, and W. by that of Dordogne. The department is of irregular form; its greatest length from north-east to south-west is 64 miles, from east to west 51 miles. Its superficial extent is 2265 square miles; its population according to the census of 1851 was 320,864, which gives 141.66 to the square mile, being 33.05 below the average per square mile for the whole of France.

This department is formed out of Bas-Limousin, and consists of two regions of highlands and lowlands. The district that forms the east and north of the department, comprising the arrondissement of Ussel and the greater part of that of Tulle, is called La Montagne (the Highlands), from its being covered with the Auvergne Mountains or Mountains of Limousin, as they are called, which separate the waters that flow to the Loire from those that feed the Dordogne. Numerous offets from the Mountains of Limousin run in a southerly

and south-west direction into the interior of the department. These regions present caverns, ravines, torrents, cascades, high plains, and wild, bare, and barren summits, which rise in some places to the height of 4000 feet above the sea, and are covered with snow for several months in the year. The lower slopes are clothed with forests in which the chestnut thrives in favourable situations; the high plains and valleys produce some good pasture; but the general character of this portion of the department is extreme sterility, the shallow, cold, and hungry soils yielding but scanty crops of rye, oats, buckwheat, hemp, and flax. Neither grapes nor any other fruits ripen thoroughly except walnuts, and they are of a small size.

The south and south-west of the department, called Le Pays Bas, or the Lowlands, has a richer soil and a denser population. Here the vine and other fruit-trees generally flourish, and in addition to the cereal grains before mentioned, wheat, barley, and maize are produced. Horned cattle are reared in considerable numbers in the lowlands, sheep and goats on the mountain pastures. Among the wild animals are the wild boar, the wolf, and the fox; reptiles are very numerous, and among them several varieties of the adder. Birds, both native and migratory, exist in great numbers and variety. Throughout the whole department the climate is cold and damp; fogs are almost always hovering over the courses of the numerous rivers and the saturated soil of the lowlands; the nights even in the middle of summer are cool, and white frosts are very common. The habitations of the peasantry are for the most part wretched in the extreme.

In consequence of the extreme humidity of the climate the surface of the department, except when covered with snow, presents everywhere an agreeable verdure not very common in France. The Fauna of the department is extremely rich in grasses of different kinds, in odoriferous and umbelliferous plants, and in mosses, lichens, and fungi. Among forest-trees the principal species are chestnut, walnut, and in dry situations the oak. The fruit of the chestnut enters largely into the food of the people. The phenomenon of the spontaneous carbonisation of the chestnut-tree is not rare in this department. Horned cattle are generally used in the plough throughout the lowlands, where a good number of cattle are fattened for the Paris and other markets. The stock cattle of the department are recruited by importations from the departments to the southward, as the offspring of the native breeds soon degenerates. Sheep, on the contrary, improve in quality on the pastures of the department.

The Dordogne and its feeder the Chavagnon form the eastern boundary of the department for a considerable way, separating it from those of Puy-de-Dôme and Cantal. The Dordogne crosses the south-eastern angle of the department, and enters that of Lot near the point where it is joined by the Cère from the left bank. Its principal feeders within this department are the Diège, the Troussonne, the Luzège, the Doustre, and the Loyre, all of which rise in the north-east of the department and fall in on the right bank. [DORDOGNE.] The Corrèze, from which the department is named, rises in the mountains near Meymac, and, flowing south-west past Tulle and Brives, enters the Vézère on its left bank near the western boundary of the department. The Vézère drains the north and north-west of the department; it rises near Chavagnes in the arrondissement of Ussel, and runs south-west, past Treignac, Uzerche, and Larche, near which it enters the department of Dordogne; here continuing in the same direction, it passes Montignac, a few miles south-west of which it falls into the Dordogne on the right bank. The Haute-Vézère, a feeder of the Isle, rises in the west of the department near Lubersac. None of these rivers is navigable within this department. The department is crossed by 5 state and 5 departmental roads.

The department is rich in minerals, especially in coal, iron, lead, granite of different colours, porphyry, alabaster, &c.; but of this wealth little advantage is taken from want of facilities for transport. The iron and coal raised are chiefly used in the department. Fire-arms, leather, glass, bricks, coarse woollens, wax-candles, and nut-oil are the principal articles of industrial produce. A great number of fairs are held in the year, at which, besides the articles named, cattle, horses, mules, linen yarn, chestnuts, &c., are sold.

The whole surface of the department contains 1,449,624 acres. Of this area 302,566 acres are under various crops, 384,000 are capable of cultivation, 180,561 consist of natural grass-land, 406,082 of heaths and moors, 90,366 of woods and forests, and 37,569 acres are under vineyards, which yield 5,506,000 gallons of inferior wine yearly.

The department is divided into 3 arrondissements, which, with their subdivisions and population, are as follows:—

Arrondissements.	Cantons.	Communes.	Population in 1851.
1. Tulle . . .	12	118	138,111
2. Brives . . .	10	101	116,640
3. Ussel . . .	7	74	66,113
Total . . .	29	293	320,864

1. In the first arrondissement the chief town is *Tulle*, which stands on the Corrèze at a distance of 291 miles S. from Paris, in 45° 16' N. lat., 1° 46' E. long., and has 10,748 inhabitants, including the whole commune. The town, which is built on the slope of a hill, is

ancient and ill laid out: the houses are in general old and ugly, but some are remarkable for their gothic structure and sculptured ornaments. The most important buildings are the cathedral, the court-house, the departmental prison, and the theatre. The town is the seat of a bishop, has tribunals of first instance and of commerce, ecclesiastical and communal colleges, and a pretty promenade along the Corrèze, which is here joined by the Solane, and is crossed by several bridges. Tulle is a place of some manufacturing industry, and has a good trade in cattle and agricultural produce; but it is chiefly noted as the centre of a manufacture of fire-arms, which gives employment to above 1000 workmen in the town and neighbouring districts. On the hill above the town there is a high square tower said to be of Roman construction, and near the tower is the public cemetery. *Argentat*, a thriving commune and town on the right bank of the Dordogne, which is here crossed by a suspension-bridge, has 3197 inhabitants, who trade with Bordeaux in oak staves, corn, charcoal, and coal raised in the neighbouring mines. *Treignac*, on the left bank of the Vézère, has an ancient castle, a college, and some trade in wool, wax, cattle, sheep, &c. The population, including the whole commune, exceeds 3000. The manufactures are hats, stockings, and woollen yarn. About two miles above the town the Vézère, issuing from a narrow rocky defile, descends to a level 100 feet lower at a single bound. *Uzerche*, a pretty town farther down the Vézère, occupies a very picturesque site, and has a college and, including the commune, 3237 inhabitants. The houses are well built, covered with slates, and many of them are decorated with turrets.

2. In the second arrondissement the chief town is *Brives-la-Gaillarde*, which stands in a fertile valley on the left bank of the Corrèze, 19 miles S.W. from Tulle, and has 8413 inhabitants, including the commune. A circular avenue, formed of elms and bordered with pretty houses built of cut stone, surrounds the town, the interior of which disappoints the expectation thus raised, as the streets are narrow and irregular; but the houses in general are well and substantially built. The best buildings are the college, the church of St. Martin, the hospital (a house built during the English occupation of this part of France, which is decorated within and without with curious gothic sculptures), and the Belvédère Tower, from which there is a fine view of the town, the valley of the Corrèze, the vineyards, and wooded slopes of the vicinity. The town has an ecclesiastical seminary, trades in timber, wine, chestnuts, violet mustard, truffles, turkeys, wool, cattle, pigs, &c., and has manufactures of cotton-yarn, nut-oil, and wax-candles. Coal-mines are worked near the town.

Of the other towns we give the following, with the population of the communes in which they stand:—*Allassac*, 9 miles N. from Brives, population 4209, chiefly engaged in tillage and the culture of the vine. *Beaulieu*, on the right of the Dordogne, has 2513 inhabitants, and an old church which is decorated with very remarkable sculptures. *Donzac*, 6 miles N. from Brives, is prettily situated among vineyards and plantations of walnut, chestnut, and poplar trees: population 3250, employed in agriculture and in the slate-quarries near the town. *Jouillac*, on the western border of the department and near the lead-mines: population 2455. *Lubersac*, near the Haute-Vézère: population 3768. *Pompadour*, a small village near Lubersac, is noted for its castle, which was bestowed by Louis XV. on one of his mistresses, who took her title of marchioness from it. *Meyssac*, 12 miles S. from Brives, has 2591 inhabitants, who raise great quantities of walnuts. A little west of Meyssac is the village of *Turenne*, commanded by an ancient castle which belonged to the dukes of Aquitaine, the ancestors of Marshal Turenne, who took his title of duke from it. *Vigeois*, 8 miles from Brives, has paper-mills and 2508 inhabitants, including the whole commune.

3. In the third arrondissement the chief town, *Ussel*, is situated among mountains between the Dûge and the Sarsonne, which unite and fall into the Dordogne near Bort. It has a tribunal of first instance, a college, and 4233 inhabitants, who manufacture coarse woollens, canvass, nails, and leather, and trade in hemp, skins, wax, tallow, timber, oak staves, &c. *Bort*, a commune and town on the right bank of the Dordogne, has 2367 inhabitants; near this place is a hill called *Orgues-de-Bort*, which is composed of enormous basaltic columns. *Meymac*, in a pretty valley 10 miles W. from Ussel, has an hospital, an ancient church, and 3389 inhabitants, including the whole commune. *Neuvic*, 13 miles W. from Ussel: population 2918.

The department forms the see of the bishop of Tulle, is under the jurisdiction of the High Court of Limoges, but an assize court is held in Tulle. It is included in the 21st Military Division, of which Limoges is head-quarters.

(*Dictionnaire de la France; Statistique de la France; Annuaire pour l'An 1853.*)

CORRIE, LOUGH. [GALWAY.]

CORRIENTES, one of the Riverine provinces of the Argentine Confederation, South America, comprehends the northern portion of the peninsula formed by the rivers Paraná and Uruguay; the southern portion of the peninsula being occupied by the province of Entre Rios. The population is about 35,000.

The southern and eastern parts of the province are somewhat hilly, but the remaining and by far the greater part is low. About half the surface is covered with timber-trees, much of the wood being available for house and ship-building. Some thousand square miles

are covered with palm-trees, which are used for a great number of purposes. In the northern part of the province is the Laguna Ybera, which is in fact a vast marsh overflowed during the periodical risings of the Paraná. It feeds all or nearly all the rivers which rise in the interior of the province and fall into the Paraná on the one side or the Uruguay on the other. The soil of Corrientes is generally sandy, but produces excellent crops. Cotton, tobacco, rice, sugar, indigo, and other tropical productions flourish, yet little attention is given to them, partly owing to the scantiness of the population and partly to the general dislike of the peasantry for agricultural occupations. Besides the articles mentioned above, maize and barley, arrow-root, melons, sweet potatoes, and various tropical fruits are raised. The sugar-cane is at present only grown in order to extract molasses for distilling; the sugar consumed in the province is imported from Brazil. All kinds of crops suffer at times from visitations of enormous swarms of ants and locusts, which entirely devastate the district in which they appear. The chief employments of the inhabitants are the rearing of cattle and horses, there being a considerable extent of good pasturo land; sheep however do not thrive very well. Large numbers of hides are exported. Mechanical pursuits are entirely neglected. The province is well adapted for commerce, there being on the Paraná four places which serve as good ports, and three on the Uruguay. The opening of these rivers will doubtless prove of great benefit to Corrientes, but the traffic can only be fairly developed when the rivers are navigated by steam-vessels. The inhabitants are for the most part a mixed race of Indians and Spanish, and of indolent habits. The language spoken, according to Mr. Woodbine Parish, is "more Guarini than Spanish." There are exceedingly few foreigners in either the capital or the country parts of the province. Most of the peasantry possess 40 or 50 marcos, 30 or 40 cows, and from 100 to 200 sheep. The women are of more industrious habits than the men. They do a good deal of the agricultural labour, as ploughing, hoeing and attending to the crops, and reaping; make cheese for sale as well as home consumption; act as shepherds; and spin and weave both cotton and woollen cloths for summer and winter garments.

The government is almost entirely in the hands of a governor, who is elected by the Congress for a term of three years. The Congress consists of 15 deputies,—one from each of the 14 departments, except that of the capital, which returns two deputies. The revenue is derived chiefly from customs duties, and the church property which was seized by government during the civil wars. The army consists in time of peace of 1000 men, but during war all males between the ages of 14 and 60 are liable to serve. Indeed during the late war with Buenos Ayres a reserve corps was formed of 900 or 1000 women mounted on horseback, who are said to have proved of great service in some engagements with the army of Rosas. As was mentioned under ARGENTINE CONFEDERATION, Corrientes took a leading part in the revolt of the other provinces against the supremacy of Buenos Ayres, and entered into the engagements with foreign powers which led to the downfall of Rosas. The main incitement to these measures on the part of Corrientes was the determination of Rosas to enforce the closing of the Paraná and Uruguay against all foreign vessels; and Corrientes made the opening of the navigation of these rivers a leading object in all negotiations. The war between Buenos Ayres and the other provinces under General Urquiza, the governor of Corrientes, still continues (February 1854), but there appears to be a growing desire on both sides to bring it to a friendly termination.

Corrientes, the capital, population about 5000, is situated in 27° 27' S. lat., 58° 50' W. long., below the confluence of the Rio Paraná with the Paraguay; and stands on a considerable elevation. It is rather a well-built town, but contains few buildings of any consequence. The situation of the town is admirably adapted for commercial purposes, affording on the one hand every facility for inland intercourse; and on the other for carrying on the export and import trade with Buenos Ayres and with foreign states by the navigation of the Paraná. *Santa Lucia*, also on the Paraná, 29° S. lat., 58° 55' W. long., is the next important town in the province. It has some trade, but contains less than 3000 inhabitants.

The *Misiones*, which, according to the treaty between Brazil and Buenos Ayres, in 1828, was to constitute an independent republic, extend eastward from Corrientes, between the Paraná and Paraguay to the confines of Brazil. This fertile tract, which was very populous under the sway of the Jesuits, is now filled with depopulated ruins. It contained only about a thousand inhabitants in 1825; many of them perished in the following war and others emigrated, and it is now almost entirely depopulated.

CORROFIN, county of Clare, Ireland, a market-town and the seat of a Poor-Law Union, in the parish of Kilsboy and barony of Inchiquin, is situated on a small stream which unites the lakes of Taddon and Inchiquin, in 52° 56' N. lat., 9° 4' W. long., distant 7 miles N.N.W. from Ennis, and 119 miles W.S.W. from Dublin. The population of the town of Corrofin in 1851 was 994, besides 255 in the workhouse. Corrofin Poor-Law Union comprises nine electoral divisions, with an area of 61,386 acres, and a population in 1851 of 9852. Corrofin is pleasantly situated in the plain between the hills of Inchiquin and Burren. From Taddon Lake a series of lakes and connecting streams runs north-north-east towards Kilmaedagh.

The town contains a dispensary, and a station of the constabulary force. Petty sessions are held here, and there are two yearly fairs. In the vicinity are the ruins of a castle, formerly the residence of the O'Briens.

CORSEUL. [CÔTES-DU-NORD.]

CORSHAM, Wiltshire, a decayed market-town in the parish of Corsham and hundred of Chippenham, is situated in 51° 25' N. lat., 2° 10' W. long., distant 14 miles N.W. from Devizes, 97 miles W. by S. from London by road, and 98½ miles by the Great Western railway. The population of the parish of Corsham in 1851 was 3172. The living is a vicarage in the archdeaconry of Bristol and diocese of Gloucester and Bristol. The town of Corsham consists chiefly of one street of considerable length; the houses are built of stone. Near the centre of this street is a market-house erected in 1784. The parish church, dedicated to St. Bartholomew, is an ancient structure of mixed styles, and consists of a nave and chancel, with a tower and spire. The Independents and Baptists have places of worship. There are a Free school, a British school, almshouses, and several parochial charities. Previous to the general introduction of machinery into the woollen manufacture, spinning and weaving were carried on to a considerable extent in Corsham. The population is now chiefly engaged in agriculture. Fairs are held March 7th and September 4th for cattle.

CORSICA, or as the French call it, *Corse*, an island in the Mediterranean, about 180 miles E. from France, of which it forms a department, extends between 41° 21' 4" and 43° 41' 7" N. lat., 8° 32' 10" and 9° 33' 26" E. long. The northern part of the island consists of a mountainous projection, only 9 miles broad at its widest part, 23 miles in length, and terminating in Cape Corso (the ancient Sacred Promontory). From this point to the Strait of Bonifacio, the southern boundary of Corsica, the whole length of the island is 116 miles; its greatest breadth is 52 miles. The area is 3377 square miles, and the population in 1851 was 236,253, which gives 69·94 to the square mile.

A great number of small islands are scattered round the coast, the most important of which are Giraglia and Finocchiarolo on the north; Capraja, belonging to the king of Sardinia, on the north-east; l'Isle-Rousse or Isola Rossa, Gargalo, and les Iles Sanguinaires on the west; les Iles Cervicules and Toro on the east; and Razzoli, Maddalena, Santa Maria, Caprera, Sparagi, and Budelli in the Strait of Bonifacio.

The western coast is high, and indented by numerous gulfs and bays, many of which afford excellent harbours, though they are comparatively useless owing to the difficulty of communication with the interior. The principal bays on this coast are those of Porto, Sagone, Ajaccio, and Propriano; the chief harbours on the west coast are Santa Fiorenza, or St. Florent, Isola Rossa (Ile-Rousse), Calvi, and Ajaccio. The eastern coast is low, and presents a continuous line, broken only towards the north by the shore-lake of Biguglia, and near the southern extremity by the fine harbour of Porto Vecchio and the Gulf of Santa Manza. The low grounds along the east coast are unhealthy, but the greater part of the island is free from malaria. The best harbours are those of Bastia, Santa Manza, and Porto Vecchio (the ancient Portus Syracusanus). Here and there, in picturesque situations along the sea-shore, are seen a great number of towers, which were erected during the Genoese occupation of the island, and served to give notice by fire-signals of the approach of the Barbary cruisers, to whose incursions the island was in former times greatly exposed. On the south side of the island is the harbour and town of Bonifacio, which gives name to the strait between Corsica and Sardinia. The interior of the island presents a mass of mountains, broken by abrupt gorges, and inclosing many beautiful valleys, through each of which a torrent or a rapid brook hurries along; steep frowning precipices re-echoing the roar of the waters struggling past their base; and extensive forests, which present in their native luxuriance a rich contrast with the bare and rocky heights that here and there spring up above the general elevation of the ranges.

The principal mountain chain, the ramifications of which cover the greater part of the surface of the island, runs due south from Cap Corso to about 42° 37' N. lat.; it then turns west as far as Monte Grosso, which attains the height of 6500 feet above the sea. From this point it again runs south under the name of the Monti-di-Frontogna to the summit of Paglia-Orba, which is 8697 feet high; hence it turns south-east as far as the pass of Foce-di-Verde, near 42° N. lat., having passed its culminating point in Monte Rotondo (the ancient Mons Aureus), which reaches to the height of 9068 feet. From Foce-di-Verde its course is due south to its termination in the Strait of Bonifacio. The mountains of Corsica are composed chiefly of limestone, but the crystallised rocks, granite, porphyry, sienite, serpentine, &c. appear in the main chain and on the west coast. The summits are covered with snow for several months in the year. From this chain numerous rapid rivers run in all directions to the sea: the principal of them are the Golo and the Tavignano, both of which rise in the group of Monte Rotondo, and flowing eastward enter the sea, the former near the ruins of the ancient Mariana, the latter near those of Aleria; the Valinco, Talavo, Prunelli, Gravona, Liamone, and Valinco rise on the western side of this mountain chain, and flow westward to the sea. The forests, which clothe the mountain sides, consist chiefly of oak, larch, beech, chestnut, pine, cork, turpentine-tree, wild olive, &c. The vast extent of these forests and the magnitude and excellence of the timber which they produce, has been cele-

brated from very remote ages. But notwithstanding this advantage and the abundance of harbours on the west and south coasts, the rugged nature of the surface of the island rendered Corsica in ancient as it still does in modern times one of the wildest and least civilised portions of southern Europe. The higher part of the mountains produces pasture, in which aromatic plants abound; and on the very crest of the chain lakes are found well stocked with fish. On the mountain pastures during the summer the herdsmen feed their sheep, goats, and pigs, resting at night in some of the numerous caverns in the rocks. The climate is excellent, the temperature varying of course with the elevation; and the air, except in a few marshy districts on the east coast, is pure and healthy: on an average 237 days in the year are fine and clear, 18 are rainy, and 110 cloudy. The prevailing winds are the south-east and south-west, which sometimes blow with great violence. The cold in winter on the highlands is of course intense.

The surface of the island comprises 2,161,610 acres, of which 8514 are planted with olives, 24,427 with vines, 68,322 with chestnuts, 355,837 are under corn cultivation, 1090 are artificial meadows, 572,603 are covered with rocks and forests, 515,606 are natural grass land not susceptible of cultivation, and 14,551 are covered with waters. The remainder of the surface is overgrown with a dense tangled underwood, consisting of arbutus, cistus, laurel, myrtle, heath, broom, &c., and forming an almost impenetrable cover, called by the natives *maquis*, which is easily removed by burning; but if the land thus cleared be not kept in constant cultivation, it soon returns to its former state. The soil, except in the lower valleys where it is alluvial, is stony but fertile. Wheat, maize, and barley are the chief cereal grains. The yearly produce of wine is 6,600,000 gallons, some of which, especially that of Cap Corso, is of good quality, but in general it is carelessly made, ripe and unripe grapes being put indiscriminately into the wine-press. Of chestnuts, an important article of food, the produce is enormous. The chestnut tree is one of the most magnificent vegetable productions of the island. The mulberry is cultivated for the production of silk. The cotton-shrub, sugar-cane, indigo, tobacco, and madder are grown. The orange, citron, fig, almond, pomegranate, date-palm, and other fruit-trees flourish, and their produce is largely exported. The chestnuts and walnuts of the island are of the best quality and of the largest size. The forests abound in wild bees, and wax and honey are now as in ancient times important exports of the island. In ancient times the honey of Corsica was notorious for its bitter taste, owing to the bees (it is said) feeding on the box-trees, which rendered it unpalatable to strangers. The longevity of the inhabitants in ancient times was attributed to the abundant use of honey as an article of food.

Mules are the principal beasts of burden; horses and asses are small. Cows do not thrive, owing either to neglect or the nature of the pasturage; they give little milk, and their flesh is bad. Sheep and goats are very numerous, and are much prized for the delicacy of their flesh. The sheep are black, and generally have four, sometimes six, horns. The shepherds' dogs and stag and boar-hounds of the island are of very superior breed. Pigs are very numerous. Among the wild animals are foxes, wild boars, deer, hares. Partridges, woodcocks, snipes, guinea-fowl, pheasants, quails, &c. are very abundant. Eagles, vultures, and other birds of prey haunt the mountain summits. Reptiles are numerous; but the only venomous animal in the island is a black spider called *malmignate*, the bite of which is said to be mortal. Great quantities of tunny, pilchards, anchovy, and other fish are taken along the coast, and sent to the markets of Florence, Naples, and Genoa.

Iron, lead, antimony, black manganese, granite varying in colour from gray to red, porphyry, white marble, limestone, jasper, emerald, amianthus, &c. are found; but for the reasons stated above this mineral wealth lies comparatively useless. The granite of Corsica is of very fine quality. The Romans quarried it for architectural purposes, and obtained their chief supplies from the little islets a few miles from Bonifacio. There are several hot and cold mineral springs. Of manufacturing industry there is little. A little iron is manufactured from ore brought from the island of Elba, for no mines are worked by the Corsicans. The island has several oil and flour-mills, tanneries, and brick-works, two establishments for the manufacture of soap, and one for making glass. These articles, together with turnery, pitch and tar, and bad cheese, are almost the only industrial products. The commerce consists of the agricultural produce, and brandy, olive-oil, dried fruits, wax, salt fish, coral, ship-timber, myrtle-leaves, orange-flowers, lichen, tanned hides, goat-skins, deals, &c. No fairs are held in the island.

The island is divided into 5 arrondissements, which, with their subdivisions and population, are as follows:—

Arrondissements.	Cantons.	Communes.	Population in 1851.
1. Ajaccio	12	73	55,008
2. Bastia	20	93	70,288
3. Sartène	8	46	29,735
4. Calvi	6	34	24,390
5. Corté	15	110	56,830
Total	61	335	236,251

Towns.—The chief towns are those which give names to the several arrondissements. Of these Ajaccio and Bastia have been already noticed. [AJACCIO; BASTIA.]

Sartène, or *Sartena*, the seat of a tribunal of first instance, is situated in the southern part of the island on a hill-ridge between the valleys of the Vallée and the Ortolo, and has, including the whole commune, 2285 inhabitants. It is surrounded by old ruined walls, and contains many well-built houses. The land in the neighbourhood is very fertile in corn, chestnuts, oil, and wine.

Bonifacio, a fortified sea-port town on the south coast of the island, gives name to the Strait of Bonifacio, which divides Sardinia from Corsica. The narrowest part of the strait, between Longosardo in Sardinia and the southernmost point of Corsica, is about seven miles across. At the east entrance of the strait are several clusters of islands. Near the Corsican coast is the island of Cavallo; and between that and Maddalena on the Sardinian side is Santa Maria, with several other islets and rocks, which make the Mediterranean sailors in general avoid passing through the strait. The land on both sides of the strait is mountainous. The town is built on a level rocky peninsula in the strait 180 feet above the sea, 20 miles S. from Sartena, 45 miles S. from Ajaccio, and has 3135 inhabitants, including the whole commune. It originated in a fortress built by a Pisan nobleman named Bonifacio in 830. The Genoese seized the fort in 1195, and thus gained a footing on the island. The town and fortifications are reached from the suburb built along the port by a very steep ascent. It is badly supplied with water. The harbour is formed by a natural inlet of the sea, sheltered by the limestone rocks on which the town is built, as by a mole; the entrance for about 500 yards is open to the south-west; it then runs from west to east for about 1400 yards with a mean width of 150 yards. The principal buildings are the churches of Santa Maria Maggiore, erected by the Pisans, and richly decorated with marble and porphyry; the church of San Domenico, a gothic structure, formerly belonging to the Templars, and erected in 1343; the church of San Francesco, which dates from the close of the 14th century; the fine barracks built by the French government in 1775; and the arsenal, which is the largest in the island. The neighbourhood of the town is very fertile in corn, fruit, and pasture. In the islands in the strait are seen the granite quarries worked by the Romans, who seem to have neglected the mines of the island. The force of the sea has formed many large and beautiful caverns near the town.

Porto Vecchio, a small fortified sea-port town of about 2000 inhabitants, is situated at the head of a wide deep bay, which forms one of the finest and safest harbours in Europe. The bay is everywhere of great depth, and affords room enough for the largest fleets. During the summer and autumn Porto Vecchio is an unhealthy place; the malaria from the marshy district round it forces the inhabitants temporarily to desert it for the healthy highlands. A good deal of salt is made at salt-works near Porto Vecchio.

Calvi, a small place on the west coast important for its fortifications, is situated on a peninsular rock at the head of the Bay of Calvi, in 42° 34' 7" N. lat., 8° 45' 53" E. long.: population 1746. The rock is occupied with a strong citadel which commands the harbour, but is itself within cannon reach of a hill called Mozzello, on which there is a small fort. The citadel and the part of the town adjacent to it are surrounded by strong walls built of blocks of granite. The rest of the town is built along the shore. The harbour of Calvi is deep and well sheltered. The town was always faithful to the Genoese during their occupation of the island. The English took Calvi after a stout resistance in 1794, but it was recovered by the Corsicans in the following year. The old palace of the Genoese governors is now converted into barracks. The trade of Calvi has decayed greatly, its commerce being transferred to *Isola Rossa*, or *Ile-Rousse* (as the French call it), which is situated a few miles to the north-east of Calvi, and is named from the red granite rock of which the island is composed, and which abounds along this coast. In the 16th century the Genoese joined the rock to Corsica by a bridge, and erected a tower upon it for the defence of the coast against the Moorish corsairs. In 1760, when the Genoese held only the coast towns and the Corsicans were masters of the interior of the island, Pascal Paoli erected some buildings on the *Isola Rossa*, in order to carry on trade and to have communications with foreign countries. The place soon increased and became the chief emporium for this part of the island. The French surrounded the town with walls, and built a mole to give greater security to the harbour, which is deep enough for the largest vessels: population, 1500. **Algajola**, a small place on the coast between Calvi and *Isola Rossa*, was formerly the residence of the Genoese governor of the province of Balagne, which included the north-west of the island.

Corté, formerly the 'patriot' capital of Corsica, is an ill-built fortified town nearly in the centre of the island, a few miles north-east of Monte Rotondo. It stands on the left bank of the Tavignano at its junction with another mountain stream, the Restonica, and has a tribunal of commerce and above 4000 inhabitants, including the whole commune. The town is built on the eastern slope of a hill above a lovely valley laid out in gardens, vineyards, and olive-grounds, and dotted with country houses. It is abundantly supplied with good water by means of an aqueduct nearly three miles in length. The citadel, the court-

house (in which the apartment occupied by Paoli is shown), and the barracks are the most remarkable buildings.

Of other places the following in the arrondissement of Bastia may be mentioned:—**Borgo**, a small place on an eminence between the Golo and the Bevinco, not far from the ruins of Mariabà, deserves mention as the scene of the last victory gained by Paoli and the Corsicans over the French in 1768. **Luri** is beautifully situated on the eastern side of the projection of Cap Corso, in a rich well-cultivated valley, screened by mountains and watered by a rapid stream which is at times a furious torrent. A wide avenue extends from the town to the sea, which is three miles distant: the road is protected from the torrent by a stout wall. The church of Luri is handsome; in the interior are five marble altars. **Rogliano**, near the extremity of Cap Corso, has 1525 inhabitants; they have many vague traditions about Seneca, who probably spent part of his exile hereabouts. **St.-Florent** (Santa Fiorenza), prettily situated at the head of the bay of the same name, and at the extremity of a rich valley, is a small town inclosed by a wall, and further defended by a strong tower. The harbour is shallow, fit only for fishing smacks, but well sheltered. St.-Florent is a few miles west from Bastia. It is an unhealthy place during the summer and autumn in consequence of the marshes near it.

The only roads in the island are the following:—One from Bastia to the village of Santa Fiorenza on the west coast, crossing the mountains by the pass called Bocca San Antonio: a second runs south from Bastia, then up along the left bank of the Golo, which it crosses a few miles north of Corté; having passed through Corté, it gains the western side of the mountain chain by the fortified pass of Bocca di Bogognano, and, running along the right bank of the Gravona, terminates at Ajaccio: and a third, which coincides with the preceding for a few miles south from Bastia as far as the river Bovinco; having crossed this river, it runs along and within view of the east coast all the way to Bonifaccio, where it turns north-west, and passing through Sarterne and Olmeto, terminates at Ajaccio. The other roads are mere tracks.

The island is called *Kurnos* by Herodotus (i. 165; vii. 165); later writers call it *Korsia* and *Korsica*. The last seems to have been the native name, and was that adopted by the Romans. The earliest inhabitants appear to have come from Liguria. The Phocæans founded the city of Alalia on the eastern coast, B.C. 564. The Tyrrhenians, and after them the Carthaginians, made themselves masters of the island. In B.C. 259, it came under the power of the Romans, who took Alalia or Aleria, which was afterwards colonised from Rome and became the principal city of the island under the Roman empire. Its ruins exist about half a mile from the sea, though it was a sea-port in the time of the Romans. At the decline of the Roman empire the island was seized by the Goths, who held it till the 8th century, when they were dispossessed by the Saracens. In the reign of Pope Gregory VII. it was annexed to the Holy See, by which it was given first to the Pisans, and in 1297 to Jayme II., king of Aragon. The Genoese, after many previous unsuccessful attempts, conquered the island in 1481, and, notwithstanding the joint efforts of Henri II. of France and the Turks in the 16th century to deprive them of it, held it till 1755. In this year the Corsicans, headed by General Paoli, shook off the yoke of the Genoese. The latter, in 1768, resigned their claims to the island in favour of the French, who, after a desperate resistance from the patriots, subdued it in 1769. On the breaking out of the French revolution in 1793, the patriots, commanded by Paoli and assisted by the English, swept the French from the island, which was then placed under the protection of the British crown; but in 1796 the French again appeared, and drove out the English in less than six weeks. Since then, with the exception of a short occupation by the English in 1814, the island has remained annexed to France, and this annexation was confirmed by the Treaty of Paris in the last-mentioned year.

The island forms the see of the Bishop of Ajaccio, is under the jurisdiction of the High Court of Bastia and of the University of Ajaccio, and forms the 17th Military Division, of which Bastia is headquarters. It is now incorporated with France, of which it forms a department.

The Corsican is frugal and indolent. The peasant labours little; the listlessness of the herdsman's employment seems preferable to a calling which would render more exertion necessary; and of such labour as there is the burden is thrown upon the women. One predominant characteristic of the islanders is the spirit of jealousy and revenge which divides the inhabitants of most of the villages of the interior into hostile parties or tribes. The love of personal independence makes the Corsican prefer to be the executioner of vengeance for his own wrongs, and assassination was until lately of frequent occurrence. These blood feuds have been greatly checked by the government of Napoleon III. Robbery is not uncommon, the central part of the island being infested with brigands. Gendarmerie and troops are posted in detachments over the island, for the purpose of preventing these outrages. The dress of the peasantry of the interior is simple: it consists, for the men, of a short jacket, breeches, and gaiters, all of chocolate-coloured cloth; a neat pointed black velvet cap, or a coarse woven cap of the same colour as the rest of their dress, with perhaps a sort of cowl which goes over the head, or

is allowed to hang at the back of the neck. They generally carry a loaded musket, and have commonly a stiletto concealed about them, though this is prohibited by the French authorities. There are few peculiarities in the dress of the women: those in the neighbourhood of Ajaccio frequently wear a large round straw hat; those near Bastia have the head covered with a sort of veil, like the Italian peasantry. The villages are chiefly built on eminences: the houses are mere huts of four walls covered with a rude roof, and many of them have only one opening, serving for door, window, and chimney. Some are built of unwrought stone, and have a second story, the ascent to which is not by a staircase, but by a ladder. The fire, when one is lighted, is in the centre of the room. The furniture consists of stools, benches, and tables of the rudest construction. They use a pine stick for a flambeau or candle. These particulars apply only to the villages of the interior. The religion is the Roman Catholic.

(*Dictionnaire de la France; Annuaire pour l'An 1853.*)

CORTÈ. [CORSIKA.]

CORTONA, an episcopal city in Tuscany, in the province of Arezzo, 15 miles S. by E. from the town of Arezzo, is built on the slope of a high and steep hill facing the south, and commands a splendid view of the fertile Val di Chiana and of the Lake of Perugia, the ancient Trasymene. Its origin is lost in the remotest antiquity. Dionysius says that it was originally an Umbrian city, that it was seized by the Pelasgians. Virgil, no mean antiquarian, speaks of the city under the name of Corythus, and immortalises the old legend of its foundation by Dardanus. ('Æneid' iii. 167, vii. 206.) It seems to have been the central stronghold of the Pelasgians and Etruscans. Its walls which still remain are of the structure called Cyclopean or Pelasgic, consisting of large polygonal stones put together without cement. About the middle of the 5th century of Rome we find Corythum allied to the latter, and it remained faithful to its alliance during the second Punic war, when Hannibal ravaged its territory before the battle of the Lake Trasymene. Little is known of its subsequent history, except that according to Dionysius it received a Roman colony most likely in the time of Sulla. History is likewise silent about Cortona, after the fall of the empire, until the end of the 12th century, when it appears as an independent municipal community, like most other Italian cities at that time, having its consuls, and its council composed of nobles and head traders. The city became an episcopal see in the early ages of Christianity, but in the 13th century the bishop of Arezzo claimed spiritual jurisdiction over it. It was repeatedly at war with its neighbours of Arezzo, who plundered the town, and raised the castle in 1258. It afterwards became subject to a powerful family called Casali, who assumed the title of Vicars General and Lords of Cortona for nearly a century. In 1409 the citizens being dissatisfied with their lord, called in the Neapolitan troops of King Ladislaus, who put to death Casali, took possession of Cortona, and then sold it two years after to the Florentines for 60,000 golden florins. From that time Cortona has remained subject to Florence.

The city with its suburbs contains 5000 inhabitants. It still gives title to a bishop. Its territory is very fertile, especially in wine, corn, olive and mulberry-trees. The high road from Florence to Perugia passes near Cortona.

The cathedral, built in the 11th century, has some good paintings, and a fine basso-relievo of the Roman time. The other churches and convents are also rich in paintings. There is a diocesan seminary for clerical students, a college kept by the fathers of the Pious Schools, a conservatorio for female education, kept by nuns, and a drawing school. The Academia Etrusca, founded here in 1726, has published several volumes of memoirs on Etruscan antiquities, and has a library with some valuable manuscripts, and a museum. There is in the suburbs a remarkable Etruscan monument, supposed to have been a sepulchre, of similar construction to the city walls; it is named Tanella di Pitagora, Cortona being confounded with Crotona, the residence of Pythagoras.

CORUNA (in English commonly written *Corunna*), a city and seaport of Spain, capital of the modern province of Coruña, one of the divisions of the ancient province of Galicia, is situated in 43° 22' N. lat., 8° 21' W. long., 42 miles N. by E. from the city of Santiago. The population in 1845 was 18,840. The city is built partly on the eastern side of a small peninsula or headland, and partly on the isthmus which joins the peninsula to the mainland. It consists of an upper town and a lower town. The upper town occupies the peninsula; it is the more ancient, and contains two old parish churches. The lower town occupies the isthmus, having on one side the Bay of Coruña, and Orsan Bay on the other. The lower town, formerly called the Pescadería, or Fish-market, is comparatively modern, and is well built, mostly of granite. The two principal streets are wide, well paved, and handsome. The houses are furnished with balconies. The town contains a court-house, custom-house, theatre, arsenal, and barracks. It is defended by a citadel, and is otherwise sufficiently fortified to resist an assault, but is commanded by some heights to the southward near the walls. The Bay of Coruña forms the harbour, having the entrance between San Diego Point and

the headland on which the upper town of Coruña is situated. The river Mero enters the bottom of the bay by a ria, or estuary. The harbour is of great extent, has deep water, and is very safe. The inhabitants are chiefly occupied by the herring and pilchard fisheries on the coast, and there are some manufactures of linen and woollen goods, hats, cordage, sail-cloth, and cigars. Ship-building is also carried on. North of the town on an elevation of the headland is the Tower of Hercules, an ancient Roman structure, probably a pharos, now converted into a modern lighthouse; it is of a square form, 92 feet high, and the walls are more than four feet thick.

Coruña was founded by the Phœnicians, and was afterwards taken by the Romans, who called it *Ardobricum Corunium*. The Spanish Armada was refitted here in May, 1588, and 130 ships mounting 2630 guns sailed out of the harbour in June in order to make the conquest of England. The French army under Soult was here repulsed by the British army under Sir John Moore, who then received his death-wound, Jan. 16, 1809; his body wrapped in a military cloak was interred the same evening by the officers of his staff in the citadel of Coruña.

(*Ford, Handbook of Spain; Napier, History of the Peninsular War.*)

CORVO. [AZORES.]

CORWEN, Merionethshire, a town and the seat of a Poor-Law Union, in the parish of Corwen and hundred of Edernion, is situated on rising ground on the right bank of the river Dee, in 52° 58' N. lat., 3° 20' W. long.; distant 12 miles N.E. by E. from Bala, and 194 miles N.W. by W. from London by road. The population of the parish in 1851 was 2069. The living is a sinecure rectory and a vicarage in the archdeaconry of Montgomery and diocese of St. Asaph. Corwen Poor-Law Union contains 15 parishes and townships, with an area of 65,900 acres, and a population in 1851 of 15,409.

Corwen is a small but neat town; its situation above the river imparts to it a pleasant appearance, and also contributes to its salubrity. The town is supplied with water. Corwen is regarded with interest by the Welsh as the scene of two victories over the English, one in 1165 by Owen Gwynedd over Henry II., and the other by Owen Glyndwr over Henry IV. In the vicinity of the site of Corwen a British or Welsh post existed: it consisted of a circular wall a mile and a half in circumference on the summit of a steep hill, and a circular habitation now in ruins within the inclosure. The parish church, a neat cruciform building, stands in a picturesque situation immediately at the foot of a rocky precipice, forming part of the Berwyn Mountains. The Calvinistic and Wesleyan Methodists, Baptists, and Independents have places of worship. There are a parochial school for 150 children, and a reading-room. Corwen possesses an endowed hospital for widows of clergymen.

(*Parry, Cambrian Mirror; Cliffe, Book of North Wales; Land We Live In*, vol. iii.; *Communication from Corwen.*)

COS (Kôs), an island in the Archipelago, belonging to Turkey, the modern name of which is *Stanco*, or *Stancio*. It lies in the mouth of the Gulf of Ceramus; its principal city, which was immediately opposite to Halicarnassus, was destroyed by a great earthquake in the Peloponnesian war. (Thucyd., viii. 41.) This city was, in very ancient times, built on the other side of Cape Scandarium (which points up the gulf), and was called *Astypalæa* (Old Town). The new capital, called *Cos*, was not large, but well built and picturesquely situated. (Strabo, p. 657.)

Cos was colonised from Epidaurus at a very early date (Herod., vii. 99), as is indeed sufficiently shown by the worship of Æsculapius, which prevailed in such a remarkable degree both at Epidaurus and in Cos. (Pausan., iii. 23, § 6.) A school of physicians was attached to the temple of Æsculapius; the great collection of votive models in which made it a kind of museum of anatomy and pathology. (Strabo, pp. 373, 657.) A similarity of origin and religion induced the Coans to form a league with Halicarnassus, Cnidos, and the Rhodian Tripolis; and the confederacy celebrated the Triopian rites on a promontory of that name near Cnidos. (Herod., i. 144.) Cos subsequently came under the rule of the Athenians and of the Romans. The emperor Claudius made it a free state, and Antoninus Pius rebuilt the city of Cos after it had been destroyed by an earthquake. The ancient constitution of the island seems to have been monarchical. The wines, ointments, and purple dyes of Cos were famous throughout Greece. The climate is delightful. (Leake, 'Morea,' ii. 429.) Hippocrates, Apelles the painter, and Ptolemaeus Philadelphus were natives of Cos.

Cos is 23 miles long and about 65 round. It is generally mountainous on the south and west, but there is a large tract of level fertile land towards the north and east. The population is about 8000, composed of Turks and Greeks. The island maintains its ancient reputation for fertility. The chief products are corn, cotton, silk, wine, fruits, &c. The city of Cos still exists. An unhealthy lagoon marks the position of the ancient harbour; near it is a Turkish castle, which Christian travellers are not permitted to enter. In the walls are some elaborate sculptures. The harbour of Cos is much frequented by merchant vessels.

COSENZA. [CALABRIA.]

COSFORD, a hundred in the south-western division of the county of Suffolk, which has been constituted a Poor-Law Union. The hundred of Cosford is bounded N. by the hundred of Thedwestry; E. by the hundreds of Bosmere and Claydon, and Sampford; S. by the river Stour, which forms here the boundary between the counties

of Suffolk and Essex; and W. by the hundred of Babergh. The boundaries of Cosford Poor-Law Union are much more extensive than those of the hundred; the Union contains 28 parishes and townships, with an area of 48,135 acres, and a population in 1851 of 17,791.

CÖSLIN, or KÖSLIN, a division of Pomerania in Prussia, comprising the eastern part of that province, is bounded N. by the Baltic, along which it extends for above 100 miles; and E. and S. by the province of West Prussia. It has an area of about 5468 square miles; is divided into nine minor circles, and contained at the end of 1849 a population of 448,516. The surface is a level, occasionally broken by slight elevations, and rising into sand-hills near the Baltic. There are considerable woods and forests. The division is watered by the Rega, Persante, Wipper, Stolpe, and numerous other streams; it has many lakes, but none of any considerable dimensions: several of them lie along the shores of the Baltic, and are separated from them by narrow spits of sandy soil, through which some of them find an outlet. Agriculture and grazing are the chief pursuits; to these must be added the manufacture of woollens, cottons, ribbons, leather, iron-ware, glass, paper, tobacco, &c. Amber is obtained all along this coast.

Köslin (formerly Cholin), the capital of the division, and of the principality of Cammin, is about 5 miles from the Baltic, and situated on the banks of the Niesenbocke, or Nosebach, which falls into the shore lake of Jasmund; in 54° 12' N. lat., 16° 10' E. long., and has about 9000 inhabitants. The town, which is above a mile in length, stands at the foot of the Gollenberg, from which it is supplied with fresh-water. It is well-built, surrounded with a wall, and has four gates and three suburbs. It was formerly the residence of the bishops of Cammin, and is now the seat of provincial administration and of the superior courts of judicature. It has a gymnasium and a training school, and manufactures of Russia leather, linens, woollens, hosiery, and tobacco. The market-place contains a statue in freestone of Frederick William I., who rebuilt the town after its destruction by fire in 1718. On the Gollenberg is a monument commemorative of the Pomeranians who fell in the campaigns of 1813, 1814, and 1815.

Among the other towns are *Colberg*, already noticed [COLBERG]: *Stolpe*, another walled town of about 9000 inhabitants, situated on the river Stolpe, which is navigable, and has a harbour at its mouth in the Baltic, 12 miles below the town. The town has a castle, manufactures of woollens and linens, and some trade in amber and fish. *Rügenwalde*, 18 miles N.E. from Köslin, is situated near the mouth of the Wipper, and has a population of about 4000, who are engaged in the manufacture of linen, broadcloth, sailcloth, and spirits. The town is frequented as a watering place. It has a castle, baths, two hospitals, a small harbour, and docks for building coasting craft. *Neustettin*, 40 miles S. from Köslin: population, 4000. *Belgard*, 15 miles S.W. from Köslin (population, 3300), is the seat of a forest board, and has an old castle.

COSNE. [NIEVRE.]

COSSAKS, a people inhabiting those parts of the Russian empire which border Turkey, Tartary, Mongolia, and China. The name is derived it is said from the Tartar word *Kasak*, or *Kaisaka*, signifying light-armed mercenary horsemen. They were for a long time known by the Caucasian appellation of *Tsherkassi* (or *Circassians*), and to this day the capital of the Don Cossaks is called *Tsherkask*. As to descent they appear to be of the native Russian race, intermixed with Tartars and Calmucks. Russian forms the basis of their dialect; but there is a considerable admixture of Polish, which is explained by their residing long on the frontier of Poland and serving under the Polish kings. The first mention made of them is about the time of the downfall of the Tartar dominion in Europe, and they seem to have sprung up in southern Russia out of the remains of that dominion. There, amalgamating with the natives and fugitives from all parts, they formed a kind of military republic, and gradually extended their power to the Bug and Dnieper, building towns and villages and waging war against the Turks and Tartars. For the purpose of defence they were classed into the married and unmarried, of whom the latter devoted themselves exclusively to the profession of arms, and to plunder. They fortified themselves in their headquarters (called a 'Setch,' from which females were excluded) on an island of the Dnieper, called *Korlitzkoi-Ostrof*. The married men lived at some distance from the spot in villages, between the Dnieper and Bug. When an emergency arose they elected a chief, called *attaman*, or *hetman*, whose authority terminated with the cessation of the emergency. They furnished troops at their own cost to the Voivodes of the Ukraine. In 1570 they accompanied Ivan IV. of Muscovy on his victorious campaign against the Turks, and on their return left a colony at the mouth of the Don. In 1580 the Cossaks are first mentioned as distributed into 'pulks,' or regiments, on the occasion of their defending *Tshegrin*, in Poland, against the Tartars, under the command of *Ostafy Dakiewitch*. In 1592 *Stephen Bathory*, the king of Poland, divided their forces into 10 regiments of infantry and 2000 horsemen, the latter receiving pay out of a tax levied upon the rebel peasantry. He also appointed an *attaman* or *hetman* as chief over them, and his successors endeavoured on all occasions to interpose them as a barrier against the incursions of the Tartars of the Crimea and Budjak, and hence arose their implacable enmity to the Turks and Tartars. The encroachments made on their rights by *Sigismund III.* gave rise to a long series of contentions, which ended

by *Chmielnitzk*, their *attaman*, seeking the protection of Russia in 1654, in whose service they still remain.

Their troops are almost wholly composed of cavalry. The Cossaks form the irregular troops of Russia, and some of them are enrolled in regiments of the guards and the line. Territorially they are established in the basin of the Don and all along the southern border of Russia, where they form a military cordon from the Black Sea nearly to the Sea of Okhotsk, protecting the empire against, or extending it on the side of, the *Circassians*, *Kirghiz*, and other *Tartars*, *Mongols*, and *Chinese*. The area and population of the principal Cossak settlements in European Russia are as follows (the *Ukraine Cossaks* are for the most part settled and are not here given):—

	Area in Square Miles.	Population in 1846.
Tschernomorski, or Black Sea Cossaks	14,561	124,100
Don Cossaks	62,276	704,300
Asowien Cossaks	116	6,000
Ural Cossaks	25,223	55,000
Total	102,179	889,400

Besides the settlements indicated there are colonies of Cossaks on the Russian side of the Lower Danube, in the Caucasus, in *Astrakhan* and *Orenburg*, and along the frontiers of *Siberia* and *China*; but we have no means of stating the extent of their territory or the number of the population. The Cossaks also form the bulk of the troops employed in *Siberia*. The following table gives an approximation to the number of men afforded by this warlike people to Russia in ordinary times:—

	Regiments of Cavalry.	Men.	Pieces of Artillery.
Don Cossaks	58	42,000	112
Danubian	2	1,700	—
Tschernomorski	12	9,000	32
Caucasian	13	16,000	21
Uralian	12	7,500	—
Orenburg	10	7,500	24
Siberian frontier	9	6,500	21
Chinese frontier	—	1,000	—
Astrakhan	3	2,000	8
Total	121	93,200	224

The Cossaks of the Caucasus besides the 9000 cavalry above given furnish also 9000 infantry, and in the Siberian towns 24 battalions of 1000 Cossaks each are stationed, making the total of this force employed in the empire in time of peace 126,200. One half of this force is always kept in readiness for service; the other forms the reserve: the whole however may be called out at once, and the strength of the regiments may be augmented at the emperor's pleasure. Every Cossak between the ages of 18 and 40 is liable to perform military duty. Each regiment is drawn from one or more 'stanitzas,' or districts, and every Cossak is required to supply himself with a horse, arms, and equipments. The young are called out first, and men of advanced age are retained as the reserve unless they volunteer for field duty. In time of war the period of service is unlimited; in time of peace it is confined to three years. The *Tschernomorski Cossaks*, who are attached to the corps stationed in the regions of the Caucasus and Georgia, are almost incessantly in active service. The nominal dignity of *Hetman-general* of all the Cossaks is vested in the *Czarowitz*, or heir-apparent to the Russian crown. The Cossak receives no pay but when on active service. The dress of the soldiery is a short vest in the Polish style, large trousers of deep blue, and a black sheepskin cap. Their arms consist of a long spear, sabre, musket, pair of pistols, and a whip with a leather thong, which they apply to their enemy's as well as their charger's back. They are mostly members of the Russo-Greek Church, and are a purely military people.

The Cossaks are of middle stature, strongly built, and able to endure great fatigue. They have chestnut-coloured hair, blue eyes, and wear the beard long. On service they sleep in the open air; learn almost at a glance the nature of the ground over which they have to march; fall suddenly on fugitives or isolated detachments, and vanish as rapidly before a strong and organised force; for expertness in plunder they are unequalled, and pity is unknown among them. They elect their own officers, with the exception of those of superior rank; these are named by the government. They all bear long lances, which they handle dexterously. They are excellent horsemen: their horses are small, lively, and very hardy. The Cossak regiments which form part of the Imperial guards are of course well clothed and armed; but the other regiments are in general wretchedly equipped, and their miserable condition stimulates them in time of war to acts of rapacity and barbarism which render them the terror of every country they invade. The Cossaks afford great support to the operations of a regular army by harassing the enemy's flanks and cutting off his supplies. They are paid only whilst on active service.

On the termination of hostilities they return to their homes, and resume their usual industrial or agricultural employments. Among themselves they are all equal, and all distinctions that existed during the campaign are effaced. In return for their service in time of war, of their manning the forts along the southern border of the empire, and the Cossaks have some small liberty of internal government, the right of fishing, hunting, making brandy, and collecting salt in the salt-lakes and marshes of the steppes; they also hold a very considerable territory.

The *Cossaks of the Ukraine* are descendants of emigrants from Red Russia, who about the middle of the 14th century sought a place of refuge on the lower Dnieper from the Poles and Tartars. Soon after these settlers were joined by other Russians who fled from the yoke of Poland, and their descendants formed a kind of military republic, which in course of a short time occupied the territory between the Dnieper, the Dniester, and the Bug. Here they built towns and villages, whence they made frequent incursions upon the Tartars. The kings of Poland looked upon them as auxiliaries, and granted them lands and several privileges. In the reign of Stephen Bathory their capital was Trekhimirow, and their hetman's authority extended as far as Kiev. In the 17th century, as stated above, being ill treated by the Poles they devoted themselves to the service of the Czars, and were then able to muster a force of 60,000 men. Baturine became the residence of their hetman, and Kiev, Poltava, Tchernigov, and seven other towns became head-quarters of as many regiments, all settled along the Dnieper. Pressed for room they sent out thence colonies to Bielgorod and the vast steppes between the Dnieper and the Don. Thus arose the Slobode Cossaks, of whom there were five regiments; the original stock from whom they sprung were long distinguished as the Zaporogh Cossaks, from their living with respect to those beyond the Cataracts (Porogh) of the Dnieper. Both these divisions of the Ukraine Cossaks bore arms, sometimes for the Poles, sometimes for the Russians, and were not content with either. In the reign of Peter the Great their hetman endeavoured to shake off the yoke of Russia by joining Charles XII. Peter punished the Cossaks as rebels; and from this time the hetman-in-chief was a creature of the Russian court till the office was entirely suppressed by Catharine II. The Cossaks of the Ukraine have lost in a great measure their military organisation, and with the exception of a few privileges they differ little from the rest of the Russians: they number about 900,000. When France invaded Russia in 1812 however they equipped at their own expense 18,000 cavalry.

The *Zaporogh Cossaks*, established on the islands and along the left bank of the Dnieper, formed a very turbulent republic. Their capital was a Setch, or collection of huts built of wood and clay and surrounded by a kind of rampart. Here on new-year's day meetings were held to divide the hunting-grounds and fisheries, to elect chiefs, and to organise the plundering excursions for the year. Russia disliked such free-minded neighbours, and took advantage of their revolt to Charles XII. to inflict such cruelties upon them as drove them into Turkey. Soon tired of their Turkish masters they, with the permission of the empress Anne, returned to Russia and built a new Setch; but their habits of brigandage and their dislike of discipline continued so strong that the Russians destroyed their new Setch, and the inhabitants once more entered Turkey, where Catharine II. finding them dispersed through the Crimea gave them leave to settle in the Isle of Taman and along the Kuban and the eastern shores of the Sea of Azof. She gave them also the privilege of choosing their hetman, of fishing, and of making brandy, on condition of guarding the frontier against the Circassians. This was the origin of the Tschernomorski, or Black Sea Cossaks, whose chief town is Ekaterinodar. They extend along the Kuban and to the foot of the Caucasus. They clothe themselves in sheepskins, and live on fish, game, and the produce of their flocks; but their rich men go richly clad, and have large numbers of horses and cattle.

The *Cossaks of the Don* had for their capital a town called Rasdora, which was situated at the northern mouth of the Don. Towards the end of the 16th century they admitted among them several Russian settlers, and in the beginning of the 17th century some of the Circassian Zaporoghs joined them. A town was built on the Don, which was named Tschorkask from the latter, and became the capital of the Don Cossaks. From this town they carried on their forays against Azof, the Turks, and the Tartars of the Crimea. The republican government, which has always been the characteristic of the Cossaks, was here administered with some regularity. The country was divided into nine stanitzes, or districts, each of which annually elected its local hetman and administered its own affairs independently. In a popular assembly the hetman-in-chief proposed matters for public deliberation, and the people gave their decision. Russia, alarmed at these democratic institutions, placed the Cossaks under a military chancery, presided over by a hetman in name, who is appointed by Russia, and is at the same time civil and military governor. Indeed the Russians have succeeded in getting the appointment of the hetman in nearly all the Cossak tribes, and the office is now filled in all instances by a Russian officer. The capital of the Don Cossaks, which soon became a flourishing town, was destroyed by fire in 1744; a new town, also called Tschorkask, was built in 1805, but though it is a pretty large place it has not superseded old Tschorkask, owing to the favourable

situation of the latter for trade upon the Don. These are the only towns in their territory. The Don Cossak territory is divided into above a hundred stanitzes: such of the population as have adopted a settled life live in hamlets on the lands of the nobles entirely separated from the stanitzes, which are inhabited by Cossaks only. The Don Cossaks have the right of hunting, fishing, and making brandy (which rights are generally enjoyed by all the Cossaks) in return for military service. They also rear vast numbers of horses and cattle.

From the Don Cossaks have sprung the Cossaks of the Terek, the first settlement of which was established on that river by Peter the Great; the Grebenski Cossaks who were driven out of Russia for their robberies on the Volga, and settled among the Caucasian Mountains; and the Cossaks of Astrakhan, who are descended from the regiments sent to defend the frontier against the Tartars.

A part of the horde driven by the Russians from the Volga marched eastward under Yermak or Yermolai-Timofief in 1575 and subjugated a large portion of Siberia, and by their arms Russia extended her sway over the whole of north-eastern Asia. Many of the Siberian Cossaks have become peasants; the rest still maintain their military organisation, and like the Don Cossaks inhabit a series of stanitzes, each commanded by its local hetman.

The *Ural Cossaks* are also descended from those of the Don, and were originally part of the horde driven on account of their robberies from the Volga by the Russians in the latter half of the 16th century. They are a very mixed people however, as they have admitted into their number Turkomans, Kaluiks, Persians, Kirghiz, and others whom the fortune of war has put into their hands. Their country is a wild steppe, barren except in a few spots, and where the inundations of the Ural fertilise it. They cultivate gardens and the vine to some little extent, and the increase of population compels them to attend to agriculture; but their chief wealth consists in their vast flocks of sheep and in the sturgeon fisheries of the Ural, which were granted to them by the Czar Michael Feodorowicz. Wool and sheep they export in return for manufactured and other goods. Like all the other Cossaks they have lost their liberties; they are subjected to a military chancery in which their hetman presides, but which is directed by the military governor of Orenburg. Peter the Great was the first who abrogated their republican constitution. They often revolted and suffered much in their endeavours to regain them. Under Catharine I. they stooped to petition for a restoration of their ancient privileges, and obtaining nothing they again revolted and joined the famous Pugatschef, who represented himself to be Peter III. In the cause of this cruel and unprincipled leader they suffered dreadfully, and at last betrayed him to the Russians. Nevertheless their old liberties were not restored; their artillery was taken from them, their popular assemblies were suppressed, and a Russian garrison was stationed in their stronghold of Jaik. From Jaik they had hitherto taken their distinctive name, but henceforth they were to call themselves 'Cossaks of the Ural.' They were allowed to retain their lands and the exclusive right of fishing. Their chief town, Uralsk, is situated near the confluence of Tschagan with the Ural.

COSSAIR, a town of Egypt on the west coast of the Red Sea, in 26° 7' N. lat., 34° 21' E. long., is about 100 miles E. by S. from Kenneh on the Nile in Upper Egypt. The caravans which trade with Arabia proceed from Kenneh to Cosseir through the sandy desert east of the Nile; the track about two-thirds of the way from Kenneh crosses a rocky ridge, on the east side of which a valley opens leading to the coast of the Red Sea where Cosseir is situated. Several springs or wells are found on this track. The Atami Arabs live in this part of the country and escort the caravans between Kenneh and Cosseir. Cosseir is defended by a citadel; although there is no harbour at the place it is the chief medium of communication between Egypt and Arabia. From Cosseir vessels cross over to Jidda, the port of Mecca, or to Yambo, the port of Medina. Cosseir is composed of a small assemblage of poor dwellings, the resident population of which amounts to about 1600; but there are large storehouses where the caravans deposit their goods. About 6 miles N.W. from the modern town is the village of old Cosseir.

COSSIMBAZAR. [MOORSHEDEABAD.]

COSTA RICA, Republic of, the most southern state of Central America; occupies the western part of the table-land which divides the plains of Panama from those of Nicaragua. It lies between 8° and 11° N. lat., 82° 30' and 86° W. long. On the S.E. it is bounded by the republic of New Granada, from which it is divided by a line extending from Poina Burica (about 83°) north by east, to a point a little west of the lagoon of Chiriqui; on the N. it is bounded by the republic of Nicaragua, from which it is divided by the Rio San Juan from its mouth in the Caribbean Sea to the point where it issues from Lake Nicaragua, and west of that by the southern extremity of the lake itself, and thence westward by an imaginary line about 11° N. lat., to Salinas Bay on the Pacific Ocean. On the E. Costa Rica is bounded by the Caribbean Sea; on the W. by the Pacific Ocean. Its extreme length is about 260 miles, its average breadth about 80 miles. The area is about 17,000 miles: the entire population 100,174.

Coast-line, Surface, &c.—Both the eastern and western coasts have a general north-western and south-eastern-direction, but they differ considerably in character. Along the Caribbean Sea the coast is

bordered by a narrow plain, is little indented by creeks or bays, and affords no large or secure harbour. Port Matina (10° 20' N. lat.) at the mouth of the river of the same name, though small and far from safe, is the best harbour on this coast: it serves as the port of Cartago, and is occasionally visited by vessels from the West Indies. The western coast is much more broken. At its southern extremity is the wide open Golfo Dulce, the low shores of which are much indented by the numerous streams which fall into it. Farther north is Port Mantas, and beyond that is the bay formed by the Rio Estrella: neither of these appears to be used by shipping. More important is the Gulf of Nicoya, which is some distance northward. It has a wide open entrance turned to the south-south-west, but becomes narrower inland. It affords good shelter for shipping, is about 70 miles in length, and contains several islands. Punta de Arenas, on the eastern side of the gulf, is one of the best harbours on this part of the Pacific for vessels not drawing more than 10 feet of water. The Punta de Aronas is the port of San José, the present capital of Costa Rica. One other good harbour occurs on this coast, Punta Culebra, which is formed by the rocky headland called Punta Catalina.

The surface of Costa Rica comprises for the most part a table-land with an elevation of upwards of 2000 feet above the level of the sea. From the range of the Cabezares Mountains in Veragua, east of the plain of Chiriqui, which connects the table-lands of Veragua [NEW GRANADA] and Costa Rica, there stretches a considerable number of mountain peaks, many of them of considerable height, and a large part of them volcanic. Some of them attain an elevation of 10,000 feet; the Volcano of Cartago is said to be 11,480 feet high. Towards the Caribbean Sea the descent is for the most part abrupt, but terminating from 20 to 30 miles from the sea, between which and the bases of the hills is a low, level, and marshy tract, covered with forests and subject to floods. Towards the Pacific the descent is more gradual; while the high land advances much nearer to the sea and descends to it in a series of terraces. A continuous range of volcanic hills extends from the north-western corner of the table-land of Costa Rica around the western side of the Lake of Nicaragua. The north-eastern extremity of the country subsides gradually into the plain of Nicaragua.

The only important river of Costa Rica is the San Juan, which is common to it and Nicaragua. It issues from the south-eastern extremity of the Lake of Nicaragua, and from that point to its outlet in the Caribbean Sea forms the boundary between the republics of Costa Rica and Nicaragua. It is a considerable stream and is navigable for some distance, but a large portion of its course is shallow or obstructed by sand-banks and rapids. From its commencement in Lake Nicaragua to its mouth, the distance following the windings of the river is 70 geographical miles. The width varies from 100 to 400 feet. The difference of level between the Lake of Nicaragua and the Caribbean Sea is 121 feet. It is by means of this river and the Lake of Nicaragua, with a canal from the lake to the Pacific Ocean, that it has been proposed to form the Nicaragua line of communication between the Atlantic and Pacific Oceans. At present the San Juan is only navigated by flat-bottomed barges. [NICARAGUA.]

The other rivers which enter the Caribbean Sea are very numerous, but all have very short courses, and none of them is navigable. The principal are the Matina, the Purissima, and the Tortuga. The great want of the state is a ready communication with the Atlantic, and this it is said might be met by forming a road about 66 miles long, from San José to the Sarapéqui, a feeder of the San Juan, and by improving the navigation of those rivers, thus enabling the produce of the republic to be shipped at the port of San Juan de Nicaragua. The rivers which fall into the Pacific have all a short course. The Estrella, the Arcua, and the Baranca are among the more important. Several small lakes occur on the table-land.

Climate, Soil, and Productions.—The climate of Costa Rica is on the whole more regular and healthy than in other parts of Central America. There are a dry season, which commences in November and lasts until April, and a wet season which occupies the remainder of the year. The thermometer rarely rises above 85° or falls below 65°. In the rainy season thunderstorms of a very severe description are frequent.

The soil is of varied quality, but in many parts very fertile. On the more elevated districts there are few forests, but on the lower declivities, and especially along the eastern coast they are very abundant. A good deal of timber, especially Brazil wood, mahogany, and cedar is exported.

Around the town of Cartago and on the western and north-western parts of the country, wheat is cultivated to some extent. Maize is grown much more extensively, and is exported somewhat largely to Chili and Peru. Coffee is however the staple: it is of fine quality, and meets with a ready sale. Tobacco is raised to some extent on the table-land both for home consumption and exportation. Sugar is an important article in the agriculture of Costa Rica: it is chiefly grown on the western side of the country, and exported from Punta de Arenas. Cacao, indigo, &c. are also grown. All the articles peculiar to intertropical regions are produced abundantly except cotton, the vine, and cochineal, which are destroyed by the heavy rains. Agriculture however, though it is upon its agricultural produce that

Costa Rica is chiefly dependent, is in a very backward state, and the capabilities of the soil are very far from having been made fully available. The most common fruits are apples, pears, peaches, &c. Of vegetables the leguminous kinds, as peas, beans, lentils, &c., are the most common. There are some good pasture lands, and along the San Juan cattle forms an important part of the wealth of the country. Horses and mules are bred, but not in large numbers. Swine are raised in the low districts. Sheep are tolerably abundant on the table-land. Poultry are bred in great numbers.

Fish are very plentiful along the coasts and in the rivers. In the Gulf of Nicoya pearls and the pearl-shells are obtained; also a shell-fish which yields a purple dye.

Several metals are said to exist, but gold is the only one which is worked. The most important gold mines are those of Aquacte not far from the Gulf of Nicoya and Real del Monte. Coal is reported to have been found, but it is not worked.

The manufactures are confined to the coarser articles of home consumption. They consist chiefly of coarse cotton goods, common hats, coarse earthenware, furniture, wooden utensils, &c. The commerce appears to be steadily increasing. The exports consist of coffee, of which 150,000 cwts. were exported in 1848; hides, about 10,000 annually; with mahogany, cedar, Nicaragua wood, sarsaparilla, mother-of-pearl, and a small quantity of pearls. Grain, fruit, drugs, cattle, and poultry, and various miscellaneous articles likewise form a part of the exports. The total annual value is estimated at upwards of a million dollars. The imports amount in value to about three-fourths of the exports. The exports are chiefly made in British vessels. All the shipments are made from the Pacific ports, and mostly from Punta de Arenas. The exports are chiefly to the northern states of Central America, Chili, Peru, and the West Indies. The imports from Great Britain consist principally of cotton goods, woollens, hardware, and other dry goods. Crapes and other China goods are brought largely in American vessels, as well as coarse stuffs. Silks, brandies, and trinkets are brought from France; wines from Spain. A commercial treaty was made with England in 1850.

Divisions, Towns, &c.—Costa Rica is divided into six departments—San José, Cartago, Heredia, Alajuela, Guanacaste, and Punta de Arenas. The only towns of any importance are the capital, San José; Cartago, the former capital; and Alajuela and Villa Vieja on the western coast.

San José, the capital of the republic, population about 16,000, stands on the elevated table-land, 9° 46' N. lat., 84° W. long. Its site is said to be 4500 feet above the level of the sea. It is a modern city, having grown up since the declaration of independence; and though the seat of the government, legislature, and courts of justice, as well as of the bishop, it has no buildings of any beauty or importance. It is however a busy commercial town. It communicates by a cart-road 72 miles long with its port, *Punta de Arenas*, which is also a thriving place, being the principal port of Costa Rica.

Cartago stands at the base of the Volcano of Cartago, about 16 miles E. by S. from San José: population about 5000. It was once the capital of Costa Rica, and a place of some commercial as well as political consequence, but in both respects it has given way to San José. In 1841 it was almost entirely ruined by an earthquake, which destroyed seven out of its eight churches and nearly 3000 houses. It has never recovered from the calamity.

Alajuela, population, including the surrounding district, about 10,000, stands nearly midway between San José and Punta de Arenas, and is a place of some trade. A good deal of sugar is raised in the vicinity. *Villa Vieja*, about 7 miles W. from San José, is likewise a place of some trade. Curridabat, Assari, Paraiso, Heredia, Barba, and Esparza are other towns of more or less consequence.

Government, &c.—The government is in the hands of a president elected for six years, and a legislative assembly consisting of 12 deputies elected for three years. The revenue, derived principally from a duty on tobacco and spirits, land sales, stamps, &c., amounts to about 120,000 dollars. The state has no debt either foreign or domestic, and it has happily enjoyed internal and external peace for several years. The chief court of justice is the Tribunal of San José, which is presided over by seven judges. The militia consists of 5000 men, of whom 200 are called upon at a time to form the army on duty.

The white inhabitants of the republic are relatively more numerous in Costa Rica than in the other republics of Central America: the ladinos, or mulattoes, are also numerous. They are chiefly settled on the western side of the table-land. The eastern side of the country is occupied by the Indians, who number about 10,000. The Roman Catholic is the established religion, but other forms of worship are permitted. The church is presided over by the Bishop of San José.

During the Spanish occupation of this part of America, Costa Rica formed a part of the kingdom of Guatemala. After the declaration of independence by the Spanish American colonies, September 1821, it remained for a short time united to the Mexican kingdom of Iturbide; but when the new federal union of the United States of Central America was established in 1823 after the model of the United States of North America, it formed one of the united states. On the dissolution of this short-lived union, Costa Rica became an independent republic, and has so continued ever since.

(Haefkins, *Central America*; Byam; Baily, *Central America*, &c.)

COSTROMA, a province in the eastern part of Russia in Europe, forming a portion of Great Russia, and situated between 57° and 59° N. lat., 40° and 48° E. long. Its area is about 31,655 square miles: the surface is in general level, and the soil productive; the northern parts of the province are full of swamps, and the southern sandy. The Volga enters Costroma a little above Yaroslaf, in the south, and traverses it in a north-westerly direction: the Costroma and Unsha, or Ounya, as well as the Votluga, which fall into the Volga on its left bank, drain the northern, eastern, and southern districts. There are several lakes; the largest, that of Galitsch, near the town of that name, is about 10 miles long and 5 miles broad; and the Tshuklonea, farther north, is upwards of 5 miles in diameter. The inhabitants are active agriculturists; though they import wheat, they grow more rye than they consume, together with much hemp and flax. The land is full of large forests, which are principally crown property. The bear, lynx, wolf, and fox are common. Little attention is paid to the breeding of cattle, but the fisheries are carried on vigorously, and yield salmon, sturgeons, &c., in large numbers. There are considerable manufactures in the province, particularly of linens, woollen cloths, cotton, Russia leather of superior quality, brandy, and mats; the majority are established in and about the capital. The population of the province was estimated in 1846 at 1,054,600. Two-thirds of the rural population are vassals of the nobility, who are the great land proprietors. In summer great numbers of mechanics leave their homes in quest of subsistence in other quarters. The province contains ten circles. It is an eparchate, or bishopric, styled the Eparchate of Costroma and Galitsch. The revenue derived from the province amounts to about 150,000*l.* sterling in the year. The principal towns, besides Costroma, the capital, are Galitsch (about 6500 inhabitants); Makariow, the town next in importance to Costroma for its trade (3000); Yurgowetz-Powolskoi (2600); Sol-Galitzkaja (3500); and Kinischna (2500).

COSTROMA, the seat both of the civil government of the province and of the military government of Costroma and Vladimir, is agreeably situated at the confluence of the Volga and Costroma, or Kotorosla, in 57° 45' N. lat., 41° 12' E. long., about 325 versts (about 217 miles) N.E. from Moscow. It is said to have been built in the year 1152, and was united to the grand duchy of Moscow by Ivan Vassiljewitsh I. A wall of earth, which has been converted into walks, surrounds it. The upper part of the town covers a height, on the summit of which stands a cathedral, a handsome edifice, surrounded by trees and showy buildings. Below this upper town, and above the lower town, is another quarter, built entirely of stone; and along the high banks of the Volga runs the third quarter, consisting of a long line of neat houses of wood and stone, relieved by the trees and gardens interspersed between the buildings. Costroma contains upwards of 50 churches and chapels, and two wealthy and spacious monasteries. One of these establishments, that of Ipatskoi, founded in 1330, is celebrated as having been the spot from which the Czar Michael Fedorovitsh Romanoff, the founder of the present dynasty, emerged in 1613 to assume the sceptre of Muscovy. The Bishop of Costroma has his residence in this monastery, which is inclosed with a stone wall. There is a Tartar suburb and mosque outside the walls. Costroma is an affluent and thriving town; it contains about 14,000 inhabitants. There are here a bell-foundry, and manufactures of linens, Prussian-blue, sealing-wax, soap, leather, bells, &c. Costroma has several periodical fairs.

CÔTE-D'OR, a department in France, is bounded N. by the department of Aube, N.E. and E. by the departments of Haute-Marne and Haute-Saône, S.E. and S. by those of Jura and Saône-et-Loire, and W. by those of Nièvre and Yonne. It lies between 46° 55' and 48° 3' N. lat., 4° 2' and 5° 29' E. long. Its length is, from north to south 77 miles, from east to west about 70 miles. The area of the department, according to the official returns of 1851, is 3382.65 square miles; the population in the same year was 400,297, or 118.33 to a square mile, being 56.38 below the average per square mile for the whole of France.

Côte-d'Or is one of the four departments formed out of the old province of Bourgogne, and comprises the districts of Auxois, Auxonnais, Nuyton, Beaunois, and La Montagne. The surface is crossed by a chain of hills which forms the connecting link between the Cévennes and the Vosges Mountains, and separates the basin of the Seine from that of the Saône. Leaving the Cévennes at the source of the river Dheune, which forms part of the southern boundary, the chain runs north-east to within a short distance of Dijon, where it is crossed by the road from Paris to Geneva, and by the Paris-Lyon railway; from this point it tends to the north-north-east, and joins the plateau of Langres (on the borders of Haute-Marne), which is connected at its north-eastern extremity by the Faucilles Mountains with the Vosges. That portion of the chain which extends from the neighbourhood of Dijon to the Dheune is properly called Côte-d'Or or 'Golden Slope,' in allusion to the richness, delicacy, and value of the wines produced on its eastern and southern declivities; but the name has been extended to the whole range, and hence to the department itself. From the southern extremity of the range, a chain runs north-west under the name of the Morvan Hills, and forms part of the watershed between the Seine and the Loire.

On the north-western slope of these mountains are the transverse

valleys of the Aube, the Ource, and the Seine, separated from each other by wooded hills. Farther south is the valley of the river Armançon, which rising in the angle between Côte-d'Or and the Morvan Hills, flows north-west to the Yonne, a feeder of the Seine. From the southern slope of the Morvan Hills the Arroux flows south-south-west to join the Loire. The Ouche rises in the Côte-d'Or opposite the source of the Armançon, and flows north-east to Dijon, and thence east by south on its way to the Saône. The eastern slope of the Côte-d'Or stretches towards the Saône, which flows through a longitudinal valley of great extent and fertility, and is navigable. At a little distance from the crest of the main chain the slope breaks up into ranges of calcareous hills, which however soon sink down into the valley of the Saône. Several rivers of short course and small volume enter the Saône from the right bank.

The Canal-de-Bourgogne, or Canal-de-l'Est as it is also called, has the greater part of its length in this department. It leaves the Saône at St-Jean-de-Losne, and is carried by a tunnel 2 miles long through the mountains south-west of Dijon; from this point it runs first south-west along the right bank of the Ouche, then turning north-west it reaches its summit level at Pouilly, beyond which it runs along the Armançon to its junction with the Yonne in the department of Yonne. The Canal-du-Rhône-au-Rhin commences in this department, also in the Saône, a little above St-Jean-de-Losne. By means of these canals, and by the Saône and the Canal-du-Centre (which leaves the Saône at Châlon) the department has water communication with the Mediterranean, the German Ocean, the English Channel, and the Bay of Biscay. The department is also traversed by nine state and fifteen departmental roads; and by the railroad from Paris to Lyon, which has a considerable part of its length in this department, passing through Montbard, Dijon, Nuits, and Beaune. A railway is projected to run south-east from Dijon through Dôle to Salins near the Swiss frontier.

The valleys and plains of the department are fertile, especially in the east and south, and they present a great variety of culture. The fields are very generally inclosed by hedges. Wheat, maize, rye, barley, and oats are raised in large quantities, so as to afford a considerable surplus for exportation. Hemp, flax, oleaginous plants, fruits, mustard, and all kinds of kitchen vegetables, are extensively cultivated. The ground is tilled in the plains by the plough, in which oxen and horses are used; but on the hills spade-culture is the system universally prevalent. A large portion of the department is laid out in grass-land. Considerable numbers of horses, sheep, and cattle are reared. Asses are partially used in farm labour. Pigs are very numerous. Bees are carefully tended, and a good deal of honey is made. Game and fish are plentiful. But the most important source of wealth to the department is its vineyards, especially those of the Côte-d'Or properly so called. This favoured district is divided into two parts—the Côte de Nuits or Côte Nuitonne, extending from Dijon to Nuits; and the Côte Beaunoise, from Nuits to the Dheune. The former is famous for its red wines, the most renowned of which are those called Romanée, Vougeot, Chambertin, Richebourg, and Nuits; while the latter produces both red and white wines, which for flavour, delicacy, and perfume are not surpassed in the world; but they do not bear transport so well as those grown on the Nuitonne slope. Among the red wines of the Beaune slope the most famous are those called Volnay, Pomard, Beaune, La Peyrieure; and among the white, Meursault, Montrachet, and Goutte-d'Or. Besides these famous Burgundy wines, a good deal of wine resembling Champagne is manufactured in the department and sold as such. The annual produce of all the vineyards of the department amounts to 11,836,000 gallons. The Paris-Lyon railway, which skirts the eastern base of the Côte-d'Or south of Dijon, passes several of the most celebrated of these vineyards.

The department ranks the first in France with respect to the extent of its forests, in which oak, beech, and elm are the principal trees. The upper part of the Côte-d'Or mountains are covered with forests. The chestnut does not flourish. The extent of forest-land however is greatly diminished within the last fifty years, in consequence of so much timber being cut down to make charcoal for smelting purposes. The climate is bracing, pure, and healthy; the cold is sometimes very great in winter. The maximum summer heat is 86° Fahrenheit. The whole area amounts to 2,164,899 acres. Of this surface 1,129,530 acres are capable of cultivation, 155,608 are meadow and grass-land, 65,166 are under vineyards, 616,864 are covered with woods and forests, and 14,848 with orchards, nurseries, and gardens.

Iron, coal, marble, millstones, limestone, gypsum, potter's-clay, &c. are found. The iron-mines, which lie chiefly in the mountains in the north-east of the department, are amongst the most productive in France; the ore is converted into malleable iron and steel at 88 blast-furnaces and foundries chiefly by means of charcoal near the mine-mouth. There are 292 factories of various kinds in the department, the products being linen, woollen cloth, blankets, cotton and woollen yarn, beet-root sugar, brandy, vinegar, paper, seed-oil, beer, leather, and earthenware. The commerce of the department consists in the agricultural and industrial products already named, and in wool, hides, timber, oak-staves, hay, fuel-wood, nails, and whetstones. About 400 fairs are held annually.

The department is divided into 4 *arrondissements*, which, with their subdivisions and population, are as follows:—

Arrondissements.	Cantons.	Communes.	Population in 1851.
1. Dijon	14	267	151,331
2. Beaune	10	202	124,206
3. Châtillon-sur-Seine	6	116	54,075
4. Sémur	6	113	70,685
Total	36	728	400,297

1. In the first *arrondissement* the chief towns are DIJON (the capital of the department) and AUXONNE. Among the other towns, all of which are small, the following may be named as they give names to cantons:—*Fontaine-Française* has blast-furnaces, breweries, and potteries; near it Henri IV. defeated the Duke of Mayenne in 1595. *Is-sur-Tille*, on the Ignon, has iron-works and a worsted factory. *St.-Seine-l'Abbaye* owes its origin to the abbey founded here by St. Seine in 536, and has one of the finest churches in the department. *Selongey*, on the Venette, a feeder of the Saône.

2. In the second *arrondissement* the chief town is BEAUNE. The other towns are:—*Arnay-le-Duc*, near the left bank of the Arroux, which is a place of some manufacturing industry, with a college and 2511 inhabitants. *Nuits*, a first-class station on the Paris-Lyon railway and a pretty little town 9 miles N.E. from Beaune, has 3175 inhabitants, who manufacture cloth, leather, and paper, but are chiefly engaged in the culture of the vine. *Seurre*, in a plain of great fertility on the left bank of the Saône, which has a college, oil and flour mills worked by steam, tanneries, a shawl manufactory, boat-building yards, and 3612 inhabitants, who trade with Alsace and Switzerland in corn, charcoal, wine, hay, &c. *St.-Jean-de-Losne*, on the right bank of the Saône, which trades in similar produce, and has a tribunal of commerce and 2134 inhabitants. *Meursault*, 5 miles by railway S. from Beaune; *Nolay*, the birth-place of Carnot; and *Pouilly*, near the source of the Armançon, are small places which give names to cantons.

3. In the third *arrondissement* the chief town is Châtillon-sur-Seine, the capital of La Montagne, which stands on the Seine, in a hilly country, and has tribunals of first instance and of commerce, a college, and 4866 inhabitants, including the whole commune. It is a well-built improving town, with clean well-paved streets. It formerly consisted of two towns separated by arms of the Seine. One was called Bourg, the other Chaumont; each was inclosed by its own wall and ditches, and further defended by a castle: the castle of Chaumont was called Châtelot, and still remains. The town-hall, which is surrounded with public gardens; the court-house, established in the old Carmelite convent; the church of St. Nicholas, which dates from the 12th century; the church of St. Vorlé; and the castle of Chaumont, which is surrounded by a fine park traversed by the Seine, are the most remarkable buildings. The town has a library of 7000 volumes; blast-furnaces and iron-foundries; paper-mills; tanneries; breweries; corn, fulling, and bark mills, and brandy distilleries; it is a place of active commerce, being the centre of a very important iron district. The early dukes of Bourgogne usually resided in Châtillon. *Aignay-le-Duc*; *Laignes*, at the source of the Laigne, a feeder of the Seine; and *Recey*, on the Ource, are small places which give names to the other cantons, and, like most of the villages in this *arrondissement*, have iron-foundries and blast-furnaces.

4. In the fourth *arrondissement* the chief town is Sémur or Sémur-en-Auxois, which is built on a granite rock on the left bank of the Armançon, 35 miles W. from Dijon, and has 4355 inhabitants. The town, which is well built, is divided into three quarters—the Bourg, the Donjon, and the Château; and has four squares and three handsome promenades. The church, built in 1065 by Robert I., duke of Bourgogne, is the most remarkable building; it contains many antiquities, and has been classed among the historical monuments of France. The town has a college; a library of 15,000 volumes; a small theatre; and manufactures of cloth, serge, woollen and cotton yarn; besides tanneries, bark and fulling mills, &c. In the environs, which are very pretty, the Armançon forms several cascades. *Montbard*, the birthplace of Buffon, at the junction of the Canal-de-Bourgogne and the Brenne, a feeder of the Armançon, is a first-class station on the Paris-Dijon railway, and a place of some trade: population, 2215, including the whole commune. *Saulieu*, the birthplace of Vanban, 17 miles S. from Sémur, is a walled town with a tribunal of commerce, a college, and 2922 inhabitants, who trade in corn, hemp, wool, timber, fuel-wood, charcoal, oak-staves, &c. *Flavigny*, east of Sémur; *Vitteaux*, a pretty little town on the Brenne; and *Précigny-sous-Thil*, on the Serein, a feeder of the Yonne, give names to the other cantons.

The department forms the see of the Bishop of Dijon, is under the jurisdiction of the High Court and University of Dijon, and is comprised in the 7th Military Division, of which Besançon is headquarters.

(*Dictionnaire de la France; Annuaire pour l'An 1853.*)

CÔTENTIN, or COTANTIN, an old district in France, which now forms the greater part of the department of Manche. It is identical with the ancient *Constantinus Pagus*, which took its name from its capital, *Constantia*, now Coutances. Côtentin is a peninsula, extending

northward from the neighbourhood of Granville into the English Channel, by which it is bounded on the north, the west, and east; on the south lies the district of Avranchin. It is watered in the south by the Souille and its feeders, in the north by the Douve, and in the east by the Vire, which divides it from Bessin and the Bocage, which are now included in the department of Calvados. The strata are chiefly of granite and clay-slate, and the soil is fertile in grain and pasture. Much butter is made, and many horses of good breed are reared: poultry is abundant. The quantity of woodland is not great; there are no vineyards, but cider is made in considerable quantity. Hemp and flax are grown. The chief towns of Côtentin are—Coutances, the capital, Cherbourg, Granville, and Valognes. [MANCHE, Department of.]

CÔTES-DU-NORD, a department in the north of France, is bounded N. by the Bay of St.-Malo, an inlet of the English Channel, E. by the department of Ille-et-Vilaine, S. by that of Morbihan, and W. by that of Finistère. It lies between 48° 2' and 48° 53' N. lat., 1° 53' and 3° 35' W. long. Its greatest length is from east to west 76 miles, the breadth from north to south varies from 25 to 50 miles. The area according to the cadastral returns of 1851 is 2659 square miles. The population in 1851 was 632,613, giving 237.91 inhabitants to the square mile, which is 63.2 above the average population per square mile for the whole of France.

The department comprises the old diocese of St.-Brieuc and a part of the diocese of St.-Malo (now forming the *arrondissement* of Dinan), which belonged to Middle Brotagne, and of almost the whole of the diocese of Tréguier, and a small portion of that of Quimper, which geographically and politically were dependencies of Lower Brotagne. It takes its name from its position on the 'northern coast' of France.

The coast line (which is very irregular), reckoning all its windings, is about 150 miles in length, and presents to the sea a bold wall of granite rocks, which inclose numerous bays and harbours, and form several bold headlands. The principal bay is that of St.-Brieuc. Of the headlands or points the following succeed each other from east to west:—Pointe St.-Cast, Cap Frehel, Pointe d'Herquin, Pointe-de-Port-de-Pomme (these two are at the extremities of the Bay of St.-Brieuc), Pointe de Plouaze, Pointe de Minar, Pointe de Milfant, Pointe du Sillon, and Pointe de Chien. The coast is studded with small islands and rocks; Ile d'Embier is near the Pointe de St.-Cast, Les Verdelots in the Bay of St.-Brieuc, the Ile St.-Rouvi and the Iles de Brehat between the Pointe de Milfant and the Pointe du Sillon, the Ile d'Er between the last point and the Pointe de Chien; the Ile de Guclat, Ile Thomé, the Iles Melban, Platte, Riouzei, and the others of the group called Les Sept-Iles (the Seven Islands), Les Triagons, the Ile Molenes or Molenoc, and Le Taureau, are to the west of Pointe de Chien.

A district called 'La Cincture Dorée,' or the Golden Belt, which extends along the coast and about 8 or 10 miles inland, is of great fertility, producing large quantities of wheat, barley, hemp, flax, clover, and all kinds of table vegetables. Sea-weed, which is found in great abundance on the sands at the foot of the rocks on the sea-shore, is commonly used for manure in this district.

The Armoric Hills, which cross the middle of the department from east to west, have a breadth from north to south of about 16 miles, and in their culminating point, Mount Menez, reach a height of about 1200 feet. From their highest summit these hills are sometimes called the Menez Mountains, sometimes also, in consequence of their barren hilly aspect, they are called Montagne Noires, or Black Mountains. The Armoric Hills are in general barren and stony; they are broken by narrow gorges here and there, and send forth numerous spurs to the north and south, which sink gradually down into two hungry sandy plains, the northern one of which extends to the southern border of the Golden Belt.

In the interior of the department, where the farmers have neither sea-weed nor lime to manure their land, agriculture is in a very backward state, and the people are steeped in poverty and misery, which are increased by the decay of the linen trade. Here rye and oats are grown; draught horses, horned cattle of inferior breed, and goats are reared; a good many sheep are kept, but as they are chiefly pastured on heathland they are small, wretched, and feeble in the extreme. The cider apple-tree is extensively cultivated throughout the department, to the neglect of all other trees. Among the Armoric Hills there are some good forests; but in general the range presents large tracts overgrown with broom, gorse, holly, evergreens, and other unproductive shrubs.

Among the wild animals of the department are wolves, foxes, badgers, roebucks, and wild boars; hares and rabbits are numerous; along the coast and in the adjacent islands the number of land and sea birds is prodigious. The deep-sea fishery affords employment to a great number of hands, and several vessels are fitted out from the coast towns for the Newfoundland fisheries, so that the department furnishes a large number of experienced seamen to the French navy.

Iron mines are worked, and a good deal of pig and bar iron is manufactured. Lead also is found; slates and granite are quarried. In the iron furnaces the ore is smelted and converted into malleable iron generally by means of charcoal; where coal is used it is imported from England or Belgium. Salt is made at several places on the coast.

The linen manufacture, introduced in the 15th century by the Baroness de Quintin, a Flemish lady, has since continued the staple trade of the department, and though it has declined of late years it is still considerable. Its former importance may be estimated from the returns for the year 1836, when the number of weavers employed amounted to 8539, who produced in that year 8,358,000 yards of linen cloth, representing a money value of 11,144,000 francs. Linen forms the clothing of the poorer classes of the population both winter and summer; and it is largely exported to Spain and South America. Other articles of export are cattle, horses, tallow, salt butter, honey, wax, &c. About 425 fairs are held in the year. The number of wind and water-mills amounts to 1822, of iron furnaces to 20, and of factories of various kinds to 460. Druidical remains and old feudal castles are numerous in this department and in all parts of Bretagne.

The principal river is the *Rance*, which rising in the south-east of the Armoric Hills, sweeps round to north-east through a gap in the range, and passing St.-Jouan-de-l'Isle, Evran, and Dinan (where it begins to be navigable), enters the sea at St.-Malo. By means of the *Rance*, the *Vilaine*, and the *Canal-de-l'Ille-et-Rance*, which, running from Dinan to near Rennes, unites these rivers, the inland communication between the English Channel and the Bay of Biscay is completed. The *Aven* and the *Blavet*, which flow through the department of Morbihan, and the *Meu*, a feeder of the *Vilaine*, rise in the southern slopes of the same range. The rivers that flow into the English Channel are famous for lovely scenery; they are short and unimportant, except that at their mouths they generally form commodious harbours for small craft, and are navigable at high water a few miles inland. The chief of them, besides the *Rance*, are the *Guer*, the *Trioux*, the *Leff*, the *Gouet*, the *Evron*, the *Guessan*, and the *Arguenon*. The coast district north of Lannion and Tréguier, and watered by the *Guer* and the *Jaudy*, is the chief scene of the exploits of King Arthur according to the Breton romance writers. The department is traversed by 7 royal and 14 departmental roads.

The surface of the department measures 1,701,738 acres, of which 1,016,576 are more or less capable of cultivation, 134,716 are natural pasture-land, 320,346 are heath and moorland, 13,770 are under orchards, nurseries, and gardens, and 100,177 are under woods and forests.

The department is divided into 5 arrondissements, which, with their population and subdivisions, are as follows:—

Arrondissements.	Cantons.	Communes.	Population in 1851.
1. St. Brieuc	11	97	180,275
2. Dinan	10	91	118,328
3. Loudéac	8	53	92,590
4. Lannion	7	63	111,737
5. Guingamp	10	73	126,683
Total	47	379	632,613

1. In the first arrondissement the chief town is *St.-Brieuc*, which is noticed under BRIEUC, St. Of the other towns those that follow give names to cantons. The population given is that of the commune. *Châtelaudren*, W. of St.-Brieuc, is a small well-built town on the road to Morlaix. An elliptical walking-ground occupies the site of the ancient castle which gave name to the town, and which was demolished by Jean V., duke of Bretagne: population, 1400. *Lamballe*, a pretty town surrounded by old walls (population, 4206), stands on a hill above the *Gouessau*, and is said to be in the territory of the Ambiliati, mentioned by Julius Caesar ('Bell. Gal.' iii. 9). There is an old castle of the dukes of Penthièvre here, with a fine promenade attached to it. *Lamballe* has a library; it is famous for its manufacture of parchment. The church of Notre Dame, situated on the top of the hill, was originally the castle chapel. *Lanvollon*, a little north of Châtelaudren, is a market-town with some curious old wooden houses, one of which dates from 1559: population, 1500. *Moncontour*, S.E. of St.-Brieuc, has linen and sail-cloth manufactures, and tanyards, and a population of 1678. *Paimpol*, at the mouth of the *Trioux*, has a good harbour, a tribunal of commerce, a naval school, and 2100 inhabitants. This town is built on the slope of a peninsular projection composed of clay-slate, and more than 200 feet above the sea. The isthmus that joins it to the mainland is flooded at spring-tide. The harbour is the best along the coast from St.-Malo to Morlaix. The quays are good and lined with pretty houses. Below the town on the shore are the fine ruins of the Abbey of Notre Dame de Beauport. Ship cordages, cotton-yarn, leather, beer, and salt are the chief industrial products of Paimpol. It trades in corn, hemp, flax-seed, flax, honey, wax, butter, fresh and salt fish, Norway timbers, &c. *Pléuc*, 15 miles from St.-Brieuc, has 5343 inhabitants, who trade in yarn, hemp, butter, and cattle. *Plouha*, near the coast, is situated on a hill, at the intersection of seven roads, which form as many streets, and has a population of 4818. The parish church, a large and ancient structure, stands in the centre of a vast cemetery planted with cedars; the spire rises to the height of nearly 300 feet. On the sea-shore is the chapel of St.-Eugénie. There is a large Druidical stone near the town. *Quintin*, in a pretty valley on the *Gouet*, has several fine linen factories, blast furnaces, iron foundries,

and paper-mills. It is the seat of a tribunal of commerce, and has 4112 inhabitants. The town-house and the old cathedral are remarkable buildings, the latter especially so, in consequence of all the pillars that support the roof being some feet out of the perpendicular. Behind the choir are five beautiful chapels. There are some Druidical remains near this town.

2. In the second arrondissement the chief town is *Dinan*, which stands on a steep hill on the left bank of the *Rance*, has a tide harbour for vessels of 90 tons, a tribunal of first instance, ecclesiastical and communal colleges, and 7732 inhabitants, including the commune. The town, which is surrounded by walls and entered by four gates, is generally ill built and ill laid out; the houses are mostly of wood. The church of St.-Sauveur, in which the heart of Bertrand du Guesclin is deposited, the church of St.-Malo, the old citadel now used as a prison, and the gate-entrances of the town are the most remarkable structures. Sail-cloth, linen, calico, woollens, leather, pottery, and sugar are manufactured; there is also an active trade in timber, planks, seeds, slates, Norway deals, salt, &c., by the *Canal-de-l'Ille-et-Rance*. Dinan is much frequented for its mineral waters. A steamboat runs daily to St.-Malo and back; the passage down the *Rance* is most picturesque. The population given with the following towns is that of the commune:—*Broons*, the birthplace of Bertrand du Guesclin, to whom a monument has been lately erected on the ruins of the castle of Lamotte-Broons: population, 2504. *Corseul* is built among the ruins of an ancient town, and is said to take its name from the Celtic *Curiosolites*: it has 4236 inhabitants. There are many fragments of ancient buildings here. The ruins of the castle of Montafilan cover a large space. *Evran*, on the *Canal-de-l'Ille-et-Rance*, is a place of some trade, with a population of 4163. *Ploubalay* has a population of 2536.

3. In the third arrondissement the chief town, *Loudéac*, 30 miles S. from St.-Brieuc, has a tribunal of first instance, a consultative chamber of manufactures, a college, and 6229 inhabitants, who manufacture iron, paper, and linen, and trade in slates, cider, &c. This town is the centre of a large linen trade. The other towns are—*Mur*, near the left bank of the *Blavet*, population, 2767; *Plouguenast*, near the *Lié*, population, 3622; *Merdrignac*, 18 miles from Loudéac, has iron foundries, and a population of 2894; and *Uzel*, on a hill above the *Oust*, has a consultative chamber of manufactures, and 2100 inhabitants.

4. In the fourth arrondissement the chief town, *Lannion*, an ill-built place near the mouth of the *Guer*, has a tide-harbour, a tribunal of first instance, a college, and 6075 inhabitants, who trade in deals, Bordeaux wine, colonial produce, corn, and the productions of the department. The following places give names to cantons; the population given with each is that of the commune: *La-Rochelle-Derrien*, formerly famous for the ancient castle of the counts of Penthièvre, which is often mentioned in the old tales of chivalry, is a small place 12 miles from Lannion. *Lezardieu*, at the mouth of the *Trioux*, which is here crossed by a wire suspension-bridge, has 2934 inhabitants. *Perros-Guirec*, on the coast, has a safe tide-harbour, sheltered by the *Isle of Thomé*, and contains a population of 2365. *Plestin*, in the north-western angle of the department, has 4355 inhabitants, who trade in iron, coal, timber, corn, &c., by the little harbour of *Toul-an-Héry*, about a mile and a quarter distant. *Plouaret*, a little S.E. of Plestin, has 5241 inhabitants. *Tréguier*, on the river *Tréguier* (which is formed by the junction of the *Guindy* and the *Jaudy*, and is navigable for 9 miles from its mouth), is a well-built place, with an excellent deep harbour and roadstead: it has 3382 inhabitants, who are engaged in fishing and in the coasting trade. The town is built on the slope of a hill facing the sea. The old cathedral, which has been classed among the historical monuments of France, is a handsome gothic structure surmounted by a tower, and adorned with numerous sculptures. The adjacent cloisters are the largest and most elegant of those structures in France. They were built in 1461, and are pierced by 50 noble arches. In them are five stone sarcophagi, containing the remains of personages unknown. The cloisters and the space they inclose are now used as a market. The bishopric of Tréguier (*Trecorem*) was founded in the 5th century; it was united to the see of St.-Brieuc. The tide rises 19 feet at neaps and 36 feet at springs in the harbour of Tréguier.

5. In the fifth arrondissement the chief town *Guingamp*, on the *Trioux*, was formerly one of the most considerable places in the county of Penthièvre. It is situated in a vast plain 21 miles W.N.W. from St.-Brieuc, and was once surrounded by walls, part of which remains. There are several good buildings in the town, which has a tribunal of first instance, and 6718 inhabitants, who manufacture linen, leather, hats, twine, &c., and trade in iron, brandy, wine, and the produce of the department. Amongst the other towns the following are given as they give names to cantons: the population however is that of the communes:—*Bégard*, N.W. of Guingamp: population, 3821. *Belle-Ile-en-Terre*, a small place near the *Guer*, in the centre of an iron district, has several important blast furnaces and foundries: population, 1740. *Bourbriac*, S. of Guingamp (population, 4114) trades in cattle and farm produce. *Plouzel*, 15 miles from Guingamp: population, 3107.

The department forms the see of the Bishop of St.-Brieuc, is under

the jurisdiction of the High Court of Rennes, and is included in the 16th Military Division, of which Rennes is head-quarters.

COTTENHAM. [CAMBRIDGESHIRE.]

COUCY. [AISNE.]

COURCELLES. [HAINAULT.]

COURLAND, Kurland, or Kourland, one of the Baltic provinces of Russia in Europe, is composed of the former duchies of Courland and Semigallia, of the old bishopric of Pilten, and of Polangen, a district of Samogitia. It was until 1795 a possession of the Polish crown. Courland is bounded N. by the Baltic Sea, the Gulf of Riga, and the province of Livonia; W. by the Baltic Sea; S. by the province of Wilna, and Prussia; and E. by the provinces of Vitepsk and Minsk. Its area is 10,490 square miles; the population in 1846 was estimated at 553,300.

The surface towards the sea-coast is level, and presents a sandy plain about Mitau, Windau, and Goldingen, but its general character is undulating. It is intersected by two ranges of heights, one of which runs parallel with the Düna or Dwina, while the other takes a more westerly direction, and spreads its arms out in various directions. The most elevated points are the Huningberg, an agglomeration of sand, which is about 450 feet high, and the Silberberg. The coast is partly flat, and partly lined with sand-hills. The most northerly point is the dangerous promontory of Domes-Nüts, which is a continuation of the Blue Mountains, and stretches out between the Baltic and the Gulf of Riga. Two-fifths of the soil are covered with forests or underwood, and a considerable part by moors of peat; nearly 15,000 acres are covered with marshes, or occupied by the 300 lakes and ponds and 118 small streams and rivulets, which render the climate of Courland, though not unhealthy on the whole, raw, moist, and foggy. The largest of these lakes is the Usmaiten (in the western district of Goldingen, and about 15 miles north-north-east from the town of Goldingen), which has an area of 34 square miles; that of Sausken is 10 miles long, and nearly 2½ miles broad. The shore-lake of Angersk or Angersskoe is properly a bay or 'haff' of the Gulf of Riga, with which it communicates by a channel in the narrow tongue of land that bounds it on the east. This lake is famous for the quantity and quality of the amber found upon its shores. The principal river is the Düna, which skirts the eastern boundary of Courland, and of which the Aa or Buller-Aa, one branch of which flows into it by a north-westerly course from the Livonian frontier, is a tributary. Besides these two rivers, Courland is watered by the Windau (which, entering it from the province of Wilna, takes a northerly course, forms a fine cataract near Goldingen, and falls into the Baltic at Windau), the Libau, the Treider-Aa (which passes Mitau), the Anger, Bartau, &c. The Windau is connected by a canal with the Niemen. There are sulphurous springs at Smoden, Baber, and Baldauen.

The soil of Courland is in general light and sandy, and rendered productive only by constant manuring; it is most productive on the side towards Livonia. In the moors and morasses blocks of granite are occasionally found imbedded. Agriculture is the principal occupation of the inhabitants, who raise large quantities of rye, barley, and oats, but less in proportion of wheat, and still less of peas and beans. Rye, which is the principal grain crop, grows very fast. It is sown in the end of April and reaped in July at night, as the dew then close the ears and prevent the heavy grain from falling out as it would do by day. After the harvest the grain is dried in a kind of oven in one end of a large building called 'rige,' the other end serves for a threshing-floor. The corn is thus rendered firmer, drier, and less liable to worms. This practice of drying corn by fire before threshing it is common also in all the neighbouring provinces of Russia. The crops of grain are more than adequate to the consumption.

Flax and hemp are extensively cultivated, and of excellent quality the seed of the first, which is sown in June, yields a crop in eight weeks. A little tobacco is raised, and some fruit is produced; the ordinary sorts of vegetables are grown everywhere. Courland has not sufficient pasture land to make the rearing of cattle a common occupation. Horses and horned cattle are of inferior kinds, and the sheep yield but an indifferent quality of wool. The value of the fisheries along the coast is not important. The supply of game is abundant. The extensive forests are in general situated on marshy ground, and consist principally of pine, fir, birch, beech, alder, oak, and elm. The forest land covers one third of the area of the province. Large pines and oaks are said to be scarce now, owing to the immense consumption in the houses, ovens, baths, distilleries, and in the manuring processes of the province. Of minerals, Courland contains small quantities of bog-iron, lime, and gypsum. It has also coal and marble, but they have not hitherto been turned to much account. Amber is thrown up on the coast. The bear, which was formerly common in Courland, has quite abandoned the province. Wolves, foxes, elks, hares, and deer are found.

The population is of the same extraction as the Lithuanians, from

whom the native Courlanders differ in no other respects than that they are more advanced in civilisation, and use a slightly varied dialect. Independently of these native Courlanders there are several thousand Livonians, Lithuanians, Jews, Germans, Krewincks (a race of Finnish descent), Russians, and Poles, scattered throughout the province. The inhabitants are mostly Lutherans. The Jews number about 10,000; many of them are inn-keepers and small shop-keepers.

The land belongs principally to the Courland nobility, who are either Germans or Poles; they are possessed of peculiar rights, such as their own civil jurisdiction, exemption from taxation, and from military service. These rights, where not in direct opposition to the Russian laws, were confirmed to them when the partition of 1795 transferred their country to Russia. Courland, like all the other Baltic provinces, is divided (with the exception of the land near the great towns) into estates varying in size from 15 to 100 square miles, which are never divided but descend entire, population and all, to the eldest son. The number of these estates in the province is about 126. The residence of a nobleman called a 'Hof' is usually built on a hill or on the bank of a river. Besides a dwelling-house of large extent, the establishment includes a building for domestics, stables, mills, breweries, inns, distilleries, &c., often amounting to twenty or thirty buildings, surrounded by gardens, parks, woods, and corn-fields. The peasants reside at some distance from the Hof, in little communities called 'gosinde'; to each of these a piece of land is attached, which the serfs cultivate for their own profit. The towns are mostly inhabited by individuals of German extraction; they are free, and quite independent of the nobility. The peasant, though by law no longer bound to the soil (he may after half a year's notice quit the estate), yet in consequence of his being almost always in debt to his lord he is virtually a serf in the strictest sense, and in vassalage either to the nobility or the burgesses; he has no property which he can call his own, may be forced from the estate after half a year's notice from his lord, and is subject to the chastisement of his owner.

The wants of each estate are mostly supplied by the serfs themselves, part of whom are brought up to mechanical arts; the peasant makes his own clothing, furniture, and domestic utensils, and constructs his own humble dwelling; he buys no manufactures. There is a vast number of brandy distilleries, the only species of industrial establishments worth naming in the whole of the province.

Courland is under the general direction of the governor-general of the Baltic provinces, and the administrative duties devolve upon a civil governor, resident at Mitau; both are subordinate to the executive at St. Petersburg. The ecclesiastical affairs of the Protestants are conducted by the consistory of Mitau; the Roman Catholics and Greeks together possess but 19 churches, which are subject respectively to the Bishop of Samogitia and the Bishop of Pskof.

Courland is in general administered according to its own laws and usages; but in regard to fiscal and military affairs, it has been placed on the same footing as the other provinces of the empire. Dorpat is the university for this province; the only high school is the gymnasium at Mitau. The nobility assemble at diets, and have a permanent committee at Mitau. The province is divided into head-captaincies, and each of these into two captaincies, besides the district of Pilten. Courland Proper, or the northern parts, contain the captaincies of Tuckum, of which Tuckum (about 1300 inhabitants) is the capital; and Goldingen, of which Goldingen, with about 2400 inhabitants, is the capital. Semigallia, the southern part, is divided into the captaincies of Mitau and Seelburg; of the latter Jakobstadt on the Düna, with about 1800 inhabitants, is the capital. The district or bishopric of Pilten lies in the south-west, and is named from Pilten its former capital, which has about 600 inhabitants. This district is also known by the name of Hasenpoth, which is derived from that of the largest town in it, now become the capital; it has about 1100 inhabitants.

Mitau, the capital of the province of Courland, is situated in a flat marshy district on the left bank of the Treider-Aa, in about 56° 39' N. lat., 23° 43' E. long., and has about 10,000 inhabitants. The town is walled, well built, and from its favourable situation on a navigable river it is a place of considerable traffic. The houses are chiefly constructed with wood, which is painted green or reddish brown. The Gymnasium above mentioned as the most important of the few educational establishments of the province, has a library of 25,000 volumes. The town has also a casino, or club-house, which is patronised by all the Courland nobility. The most interesting building in the town is the old castle of the dukes of Courland, which is surrounded by canals from the river, and was built by Marshal Biron, the favourite of the empress Anne. Louis XVIII. resided in this castle for some time when travelling under the title of Count de Lalle. There are coaches daily from Mitau to Riga. The walls of the town inclose large gardens. The streets are not well paved. Mitau contains nine churches, a synagogue, an observatory, and two public libraries; it has manufactures of linen, leather, and soap.

Courland has two shipping ports, Libau and Windau, both situated on its western coast. Libau is the principal shipping port of the province. The harbour, formed by a salt lagoon, has a bar across the entrance, but admits vessels of 12 feet draught at all times; larger vessels are loaded or unloaded one or two miles from the town by lighters. The imports are chiefly salt, coals, mill-stones, machinery

herrings, sugar, and other colonial produce; the exports consist of flax, hemp, corn, calf-skins, salt meat, hides, bristles, bones, timber, tallow, deals, &c. Ship-building and manufactures of various kinds are actively carried on: the population of Libau is about 10,000. *Windau* stands at the mouth of the river *Windau*, down which a great deal of timber, the most important article of export, is floated: the population of *Windau* is over 2000. The inland trade is monopolised by the Jews.

COURSAN. [AUDE.]

COURTENHALL. [NORTHAMPTONSHIRE.]

COURTRAI (in Flemish *Kortryk*), a fortified and manufacturing town of West Flanders, in Belgium; 75 miles W. by railway (through Malines and Ghent) from Brussels; 32 miles by railway S. from Bruges; stands in 50° 49' N. lat., 3° 18' E. long., and has 21,500 inhabitants. The town occupies both banks of the river *Lys*, by means of which and by canals it has water communication with the principal towns of Flanders. The river is crossed by an old bridge flanked with towers. Courtrai existed in the time of the Romans under the name of *Cortoriacum* (afterwards written *Curtricum*), and as early as the 7th century enjoyed the privileges of a municipal city. The fortifications were begun in 1290; the castle was built in 1385 by Philip the Bold, duke of Burgundy. The works were enlarged and perfected chiefly by the French, who built the citadel in 1647. The Flemings in 1302, commanded by John count of Namur, defeated a French army under the Count of Artois near to Courtrai. After the battle about 700 gilt spurs were gathered on the field from the slaughtered French, and hung up as a trophy in the church of the convent of Groenangen, now destroyed. This circumstance caused the battle to be called the Battle of Spurs. A small chapel built in 1831 a little outside the Ghent Gate marks the centre of the field of the Battle of Spurs. The town was taken by the French successively in 1643, 1646, 1667, and 1683, and was restored to Spain by the peace of Ryswick. The French destroyed the fortifications in 1744; in 1793 they obtained a victory over the English near the town, of which they took possession a few days afterwards, and constituted it the capital of the department of the *Lys*.

The streets of Courtrai are wide and clean; the houses are well built. The town contains several fine buildings, among others the town-hall, the churches of St. Martin and of Notre Dame. The town-hall, a gothic edifice erected in 1526, stands in the market-place: it is disfigured by a modern front. The interior contains two remarkable carved chimney-pieces, representing the Virtues and the Vices, in bas-relief. St. Martin's church, originally founded by St. Eloi the apostle of Flanders about A.D. 650, is remarkable for its lofty tower, which commands a splendid view of the surrounding country, and for its beautiful tabernacle of carved stonework in the richest gothic style. The church of Notre Dame is a gothic structure founded in 1238 by Baldwin, count of Flanders and emperor of Constantinople. It has been modernised however and lined with marble. It contains Vandyck's celebrated painting of the Elevation of the Cross. Both these churches are decorated with paintings and sculptures of more than ordinary excellence.

Courtrai contains an exchange, a college, and two asylums for orphans. A great part of the working population is employed in spinning flax and in weaving and bleaching linen and damask. The fine linens known under the name of Courtrai cloth are made in the surrounding districts, and sold unbleached in the weekly market held in the town, where the pieces are finished and prepared for sale to the consumers. A vast quantity of the finest flax is grown in the plain around Courtrai for the supplies of the manufactories of the town and for export. There are large bleaching-grounds in the neighbourhood. The waters of the *Lys* are said to possess very superior bleaching qualities. The dyers of Courtrai imitate with success the colour known as Turkey red. Thread-lace and silk-lace are among the other industrial products. The earliest of the cloth manufactures of Flanders was established at Courtrai in 1260.

(*Dictionnaire Géographique de la Province de la Flandre Occidentale*; *Statistical Papers of the Belgian Government*; *Handbook of Belgium and the Rhine*.)

COUSERANS, LE, or, as it was written in the last century, CONSERANS, a district of the former province of Gascoigne in France, was bounded E. by the county of Foix, N. and W. by the district of Comminges, and S. by the Pyrenees, which separate it from the province of Catalonia in Spain. It is a mountainous district; and is watered by several feeders of the Salat, which carries off the whole drainage of the district into the Garonne. Couserans is now included in the department of Ariège. [ARIÈGE.]

The district derives its name from the *Conсорани*, or *Consuarani*, one of the tribes of Aquitania or Narbonensis mentioned by Pliny. They are not noticed by Cæsar. Their chief town, *Austria*, or *Conсорани*, assumed from one of its bishops its designation of St. Lizier. [ARIÈGE.] Upon the downfall of the Roman empire Couserans came successively into the hands of the Visigoths and the Franks. In feudal times it ranked first as a county, afterwards as a vice-county. The bishopric in which this district was comprehended originated probably about the end of the 5th century: the bishop was a suffragan of the archbishop of Auch. St. Lizier was elected bishop about 698, and died 742.

COUTANCES. [MANCHE.]

COVENTRY, Warwickshire, a city, a municipal and parliamentary borough, manufacturing town, and the seat of a Poor-Law Union, in the hundred of Knightlow. Although in Warwickshire, it formed (until recently) along with some adjacent villages a separate county. In 1842 an Act of Parliament was passed which incorporated Coventry with the county of Warwick; and in 1843 an order in council was issued, which formed Warwickshire into two divisions, the Warwick

91 miles N.N.W. from London by road, and 94 miles by the London and North Western railway. The population of the municipal borough in 1851 was 36,208; that of the parliamentary borough was 36,812. The borough is governed by a corporation consisting of 10 aldermen, one of whom is mayor, and 30 councillors; and returns two members to the Imperial Parliament. Coventry is divided into two parishes—St. Michael's, a vicarage, and St. John's, a rectory; they are in the archdeaconry of Coventry and diocese of Worcester. The Coventry Poor-Law Union is co-extensive with these two parishes.

Coventry is a place of great antiquity, but its origin is involved in obscurity. In the reign of Edward the Confessor, in 1044, Earl Leofric, a powerful lord of the large territory of Mercia, with his wife, the Lady Godiva, founded at Coventry a magnificent Benedictine monastery. The capacious cellar of the monks still exists, measuring 75 yards in length by 5 yards in breadth. After the Conquest the lordship of Coventry came to the earls of Chester. Leland and other writers speak of the walls, gates, and towers by which the city was defended, and of its streets, which were well built of timber. The walls were demolished by Charles II. in consequence of the active part taken by the citizens in favour of the parliamentary army. During the monastic ages Coventry had a large and beautiful cathedral. At the Reformation it was levelled to the ground by order of Henry VIII. Coventry was the seat of a Parliament held by Henry IV. in 1404, and of another by Henry VI. in 1459. It was the scene of the famous meeting for trial by battle between the Duke of Norfolk and the Duke of Hereford, afterwards Henry IV.

From an early period Coventry was renowned for its exhibition of pageants and processions; and in the monastic ages it was remarkable for the magnificent and costly performance of the religious dramas called mysteries. Accounts are extant of these solemn shows as early as 1416. They were performed chiefly by the Gray friars, on moveable street-stages on the day of Corpus Christi. The subjects were the Nativity, Crucifixion, Doomsday, &c., and the splendour of the exhibitions was such that the king and the royal family, with the highest dignitaries of the church, were frequently present as spectators. An ample and exceedingly interesting account of these Coventry Mysteries will be found in a 'Dissertation on the Pageants or Dramatic Mysteries antiently performed at Coventry, and other Municipal Entertainments,' by Thomas Sharp, 4to., 1825. The plates in this work are extremely interesting, and the facts are valuable as illustrative of the state of society at that period. The following work also contains much curious information: 'The Pageant of the Company of Sheremen and Taylors in Coventry, as performed by them on the Festival of Corpus Christi, with other Pageants at Coventry, on the Visit of Henry VI. and his Queen in 1455; of Prince Edward in 1474; of Prince Arthur in 1498, &c.; with the Verses recited in Character on those Occasions.' By W. Reader, Coventry. Other writers give descriptions of the costly pageants exhibited to Henry IV., Henry VII., and several other kings. Coventry was the favourite residence of Edward the Black Prince. Here also Queen Elizabeth delighted to see 'The game of Hock Tuesday,' which represented the destruction of the Danes by the English in 1002. The peculiar predilection of the people of Coventry for pageantry is still displayed in the notorious processional show at the great fair on the Friday in Trinity week, when many thousands assemble to see the representative of Lady Godiva. The legendary origin of this singular exhibition is as follows:—Earl Leofric had subjected the citizens of Coventry to a very oppressive taxation, and remaining inflexible against the entreaties of his lady for the people's relief, he declared that her request should be granted only on the condition that she should ride naked through the streets of the city; a thing which he supposed to be quite impossible. But the lady's modesty being overpowered by her generosity, and the inhabitants having been enjoined to close all their shutters, she partially veiled herself with her flowing hair, made the circuit of the city on her palfrey, and thus obtained for it those privileges which it from that time forth enjoyed. The story is embellished with the incident of Peeping Tom, an inquisitive tailor, who was struck blind for looking out as the lady passed. A figure styled his effigy is still to be seen protruded from an upper window in High-street, adjoining the King's Head tavern. In Gough's edition of Camden's 'Britannia' (vol. ii. p. 346) it is stated that Mathew of Westminster, who wrote in 1307, that is, 250 years after the time of Leofric, is the first who mentions this legend, and that many preceding writers who speak of Leofric and Godiva do not notice it: a similar legend is said to be related of Briavel's Castle. The Coventry procession, as at present exhibited, began only in the reign of Charles II., in 1677; it consists principally of St. George of

England on his charger; Lady Godiva, a female who rides in a flesh-coloured dress, with flowing hair, on a beautiful gray horse; then follow the wool-combers, knights in armour, Jason, Bishop Blaize, &c., all in showy dresses, with a great profusion of gay ribands, plumes of feathers, and accompanied by numerous bands of music. The whole of the city companies used, before the passing of the Municipal Corporations Reform Act, to accompany the procession. Many strong efforts have been made to suppress the unseemly exhibition, but hitherto without success.

The town is situated on a gentle eminence, rising in the middle of a valley which runs east and west. The river Sherbourne and the Radford brook unite within the town. For sanitary purposes the city is under the management of a Local Board of Health. The best streets are tolerably well paved. The town is lighted with gas.

The chief buildings of Coventry are the churches. There are three ancient churches, of which St. Michael's is by far the most remarkable for architectural beauty and ornament. It was originally built in 1133, in the reign of Henry I., and was given to the (Benedictine) monks of Coventry by Ranulph earl of Chester, in the reign of Stephen. The spire rises out of an octagonal base upon the tower, to an elevation of 303 feet from the ground. In the tower is a fine peal of 10 bells. The length of the entire structure is somewhat above 300 feet, and the breadth 104 feet. The interior is lofty and finely ornamented with rows of clustered pillars and arches, with a roof of curiously carved oak, and numerous windows of ancient coloured glass. It has been recently repewed. The organ in St. Michael's church is said to be one of the best in the kingdom. Trinity church is a gothic edifice, but heavier and less elegant than St. Michael's. The height of its spire is 237 feet. The Earl of Shrewsbury furnished a splendid stained glass window to this church in 1834. The building has been recently cased with stone on the west end and the north side. St. John's is a plain cruciform structure, founded by the Merchant's Guild in the reign of Edward III. Three churches have been built within the last twenty years. Christ church, erected in 1832, was built from a design by Rickman; attached to it is the fine old tower and spire of the Gray Friars church. The others are St. Peter's, built in 1841, and St. Thomas's, built in 1848. There are in Coventry four places of worship for Independents, and one each for Wesleyan and Primitive Methodists, General and Particular Baptists, Quakers, Unitarians, and Roman Catholics. Two other chapels are used by various denominations. The Roman Catholic church, rather a superior example of modern gothic architecture, was erected in 1843.

The Free school is a richly endowed institution founded by John Hales in the reign of Henry VIII. Here Sir William Dugdale and several other eminent men were educated. The income is about 950*l.* per annum; and the school has two fellowships at St. John's College, Oxford, one at Catherine Hall, Cambridge, and six exhibitions at either university. The head master is also rector of St. John's; the second master is lecturer of St. John's. There are six Endowed schools—the Bablake school, founded 1560, having a revenue of about 900*l.* per annum, at which 50 boys are received at about 11 years of age, clothed, educated, and apprenticed; Baker, Billing, and Crow's school, founded 1690, at which 50 boys are clothed, educated, and apprenticed; this school is under the management of trustees, chiefly of the Unitarian persuasion: the Blue-Coat Girl's school, which educates and defrays part of the expense of clothing 40 girls; Bayley's school, founded 1703, at which 40 boys are educated; Southern and Craner's school, at which between 30 and 40 children are educated; and Fairfax's school for 40 boys. There are National, British, and Infant schools. The Roman Catholics have a school near to their chapel. The Government School of Design, commenced in 1843, has been found of great benefit to Coventry in connection with the riband manufacture. There are a mechanics institute, a library belonging to the Religious and Useful Knowledge Society, a subscription library, and a savings bank.

One of the richest and most interesting vestiges of the ornamental architecture of the 15th century in Coventry, and perhaps in England, is a capacious building called St. Mary's Hall, erected in the reign of Henry VI. The principal room is 63 feet by 30 feet, and is 34 feet in height. Its grotesquely-carved roof of oak, the gallery for minstrels, the armoury, the chair of state, and especially the great painted window facing the street, help to furnish a vivid idea of the manners of the age in which Coventry was the favourite resort of princes. A tapestry made in 1450, measuring 80 feet by 10 feet, and containing 80 figures, is a curious and beautiful specimen of the drawing, dyeing, and embroidery of that period. This hall is the property of the corporation, and is used as a council-chamber and for civic festivities. In the market-place a richly-ornamented gothic cross, considered to be one of the finest in the country, erected in the 16th century, was taken down in 1771. It was hexagonal, 57 feet high, with 18 niches filled with statues of saints and kings. The hospital in Gray Friars-lane is very ancient, and richly ornamented with carved oak. The building called the 'Mayor's Parlour' is of the 16th century: it is used for judicial purposes.

In addition to the buildings already noticed, may be named the County Hall, a stone edifice erected in 1785, and the Drapers' Hall, which is elegantly fitted up for assemblies and other public entertain-

ments; the jail; the Coventry and Warwickshire Hospital; the Provident Dispensary; a convent of the Sisters of Charity; barracks, &c.

Besides the patronage of many important appointments, the corporation had formerly the distribution of charitable funds amounting to 7300*l.* per annum. The following are the principal institutions of this kind, which in Coventry are very numerous: Sir Thomas White's Charity, founded in the reign of Henry VIII., produces annually between 2000*l.* and 3000*l.*; the Bablake Men's Hospital, of which an income of about 1500*l.* is devoted to the maintenance of poor and aged men, was founded by the will of Thomas Bond in 1506; the Bablake Boy's Hospital has an income of about 940*l.*, appropriated to the maintenance and education of young and poor boys. Besides these, there are 12 other considerable charities, and several minor ones. The Coventry Union-house contains some remains of the White Friars monastery, afterwards the seat of the Halo family.

The city is surrounded by about 1000 acres of Lammas and Michaelmas lands, and 246 acres of common land, over which the freemen of the city (about 3500 in number) and some few other persons have long possessed peculiar privileges, which have interfered with the appropriation of these lands for the general weal of the community.

In the time of the Edwards and Henrys the tradesmen of Coventry were famed for their affluence. In 1448 they equipped 600 armed men for the public service. Until the war between England and France in 1694, the staple manufacture was woollens, broadcloths, and caps; and previous to 1580 there existed a famous manufacture of blue thread; the water of the small river Sherbourne, which passes through the city, being an excellent monstroom for dyeing this colour. During the 18th century there was a flourishing manufacture of tannies, camlets, shalloons, calimancoes, gauzes, &c., but it is no longer continued. At present the staple manufactures are ribands and watches. The riband manufacture was introduced about 1730, and is supposed now to give employment to about 6000 persons in the city; it is said that 20,000 are employed in riband-weaving in Coventry and the neighbouring towns and villages. The weaving has hitherto been almost entirely performed by the hand-loom, and the weavers are in general a poor class, but steam factories are probably now superseding the loom at the workmen's dwellings. The leaders of the trade are not the manufacturers, but a comparatively small number of wholesale firms in London and Manchester, whose agents attend at Coventry. Gimp and other trimmings are also made in Coventry, and there are large establishments for dyeing silk. The making of watches has been carried on here probably as long as the riband manufacture.

There are several guilds, or incorporated trading companies, some of which are possessed of considerable property, which they spend in charity and festivities.

The local position of Coventry is favourable for commercial operations, being nearly central between the four greatest ports of England—London, Bristol, Liverpool, and Hull; possessing great facilities of water communication by the Coventry and Oxford Canal, which opens into the Grand Trunk navigation, and having one of the main roads from London to Birmingham passing through its streets. The London and North-Western railway passes close to the town; and there are two branch lines, one turning northward to Leamington and Warwick, and another to Nuneaton.

(Dugdale, *Antiquities of Warwickshire*; *History and Antiquities of Coventry*; Reader, *New Coventry Guide*; *Communication from Coventry*.)

COWBRIDGE, Glamorganshire, a market-town and borough, and conjointly with Bridgend the seat of a Poor-Law Union, in the parish and hundred of Cowbridge, is situated on the little river Daw, or Thaw, on the road between Cardiff and Swansea, in 51° 28' N. lat., 3° 27' W. long., distant 12 miles W. by S. from Cardiff, and 173 miles W. from London. The population of the borough and parish of Cowbridge in 1851 was 1066. The living is a curacy annexed to the vicarage of Llanblethian, in the archdeaconry and diocese of Llandaff. The town is governed by a mayor and two bailiffs, appointed in terms of a charter renewed in the time of Charles II. The borough is contributory to Cardiff in returning a member to the Imperial Parliament. Bridgend and Cowbridge Poor-Law Union contains 52 parishes and townships, with a population in 1851 of 23,369.

Cowbridge is a neat, cheerful town, consisting chiefly of one street, which is of considerable width. The town was at one period walled, and had three gates, one at each end of the main street, and another, which is still standing, on the south side of the town. The parish church is an ancient and commodious building. The Wesleyan and Welsh Methodists and Baptists have places of worship in Cowbridge. The Grammar school, an old foundation, connected with Jesus College, Oxford, through an endowment of Sir Leoline Jenkins, has an income from endowment of 20*l.* a year, and had 77 scholars in 1852. The school is free to five scholars, called pensioners, who receive 6*l.* a year for four years at school, and are eligible for exhibitions at Jesus College: ten other boys are admitted as free scholars. There are a National school, a mechanics institution, and a reading-room. The market day is Tuesday: a market is also held on Saturdays for provisions: five fairs are held in the course of the year.

(Cliffe, *Book of South Wales*; *Communication from Cowbridge*.)

COWES, WEST, Isle of Wight, Hampshire, a town in the parish of

Northwood and hundred of West Medina, is situated in 50° 45' N. lat., 1° 18' W. long., distant 4 miles N. from Newport, and 78 miles S.W. from London. The population of the town of West Cowes in 1851 was 4786. There are two livings, which are perpetual curacies in the archdeaconry and diocese of Winchester.

The town of West Cowes is situated on elevated ground on the left bank and at the mouth of the river Medina. Henry VIII. built a castle at this place, and from that period the rise of the town is probably to be dated. The castle, which has a crescent-shaped battery, stands at the entrance of the harbour. The streets are narrow and inconvenient, but their position on the slope of the hill on which the town stands produces a picturesque and pleasing appearance. The upper part of the town is the most recently built, and contains many good houses and villas. Being much resorted to in summer for sea-bathing, there are numerous hotels and lodging-houses; there is also an assembly-room.

As Cowes is the port of the island and the point of communication with the mainland by way of Southampton, there is necessarily a large amount of traffic carried on in the place. Cowes is the head-quarters of the Royal Yacht squadron, which has a club-house here; the annual sailing-match of the squadron usually attracts numerous visitors from a distance. There is constant communication with the mainland by steam-vessels.

Cowes harbour affords a safe and convenient haven. On December 31st, 1852, there were registered as belonging to the port of Cowes 119 vessels under 50 tons, with an aggregate burden of 2967 tons, and 51 vessels above 50 tons, with an aggregate burden of 5597 tons; and one steam-vessel of 21 tons. During 1852 there cleared inwards and outwards at the port of Cowes the following vessels, namely:—Constantwise, inwards, 146 vessels, 54,375 tons; outwards, 427 vessels, 10,295 tons; colonial and foreign, inwards, 55, tonnage 3638; outwards, 58, tonnage 3923; steam-vessels, inwards, 2, tonnage 2934; outwards, 2, tonnage 2133. Ship-building has been long carried on at Cowes, which has acquired celebrity for the construction of quick-sailing craft: of this the yachts made for the Royal Yacht squadron are examples.

East Cowes, on the opposite shore of the Medina, may be regarded as a suburb of West Cowes: it is a small place, with several well-built houses, and is in considerable repute as a resort for bathing during the summer. The custom-house is in East Cowes. A large mansion, in a so-called gothic style, built by Nash, the architect of Buckingham Palace, as a residence for himself, is called East Cowes Castle. Osborne House, the marine residence of her Majesty, is a short distance from East Cowes.

(*The Land We Live In*, vol. ii.; *Parliamentary Returns*.)

COXWOLD. [YORKSHIRE.]

CRAKOW (Krakow), a part of the old kingdom of Poland, now of the empire of Austria, which from 1815 to 1846 existed as an independent republic under the protection of the states of Austria, Russia, and Prussia. Previous to 1809 Cracow was incorporated with Austria. By the Partition Treaty of 1809 it formed with western Galicia the Grand Duchy of Warsaw. At the Congress of Vienna in 1815 the three powers not being able to agree as to which of them should have Cracow, formed it into a republic, guaranteeing the perpetual neutrality and inviolability of its territory, except in case of its harbouring offenders against any of the protecting powers. When the Polish insurrection occurred in 1846, the insurgents seized the city of Cracow, but were dispossessed thereof and effectually crushed by the united forces of the three powers, who decreed on Nov. 16, 1846, that the territory of the republic should be re-incorporated with Austria; and this was done accordingly.

Cracow is in the north-eastern part of Central Europe. It lies between Austrian Galicia, Prussian Silesia, and the south-western part of Russian Poland, along the left bank of the Vistula, and contains an area of about 496 square miles. The surface consists of an undulating plain, broken by low hills and woods, and extends to the Vistula, which forms its southern boundary towards Galicia. The Vistula, which is the chief river of Cracow, receives within the confines of the territory the waters of several small rivers, and becomes navigable under the walls of Cracow. There are neither canals nor lakes in the country; at Krzeszowice there are warm sulphurous springs. The climate is moderate, though not genial enough to ripen the grape; it is however salubrious and agreeable, and milder than in the other parts of Poland. The soil is rich, but produces scarcely more grain than is sufficient for the consumption of the inhabitants. The vegetables and fruits are excellent. Its chief productions are corn, pulse, flax, wax, and honey. Oxen, sheep, swine, game, and fish are abundant. Coals, iron, marble, freestone, clay, &c. are found. The quantity of wood is inconsiderable.

Cracow contains only two or three manufacturing establishments, the chief of which are the ironworks of Krzeszowice. The peasantry spin and weave their own cloth, and there is little trade except in the capital. The population is about 146,000, of whom probably nine-tenths are of Polish extraction; the remaining tenth being almost all Jews. The principal towns are Cracow, the capital, Chrzanow, and Krzeszowice. Chrzanow is situated on the river Chechlo, about 27 miles W.N.W. from Cracow. There is a considerable trade. The population, about 4000, are chiefly Jews. *Krzes-*

zowice, where are extensive iron-works, is a station on the Cracow and Breslau railway, about 20 miles from Cracow.

CRAKOW (in Polish, Krakoo), the chief town of the territory of Cracow in the Austrian empire, is situated at the foot of Mount Krakus, or Wawel (699 feet above the level of the sea), in the delightful and extensive valley of the Vistula, and on the left bank of the river, at its confluence with the Radeva; in 50° 4' N. lat., 19° 50' E. long., distant about 158 miles S.S.W. from Warsaw. It is inclosed by three hills; the St. Bronislava, on which a monument 150 feet high, has been erected, in memory of Kosciuszko; the Krakus, or Wawel, and the Wanda. It is united to the town of Podgorze by a bridge of rafts.

Cracow is surrounded with promenades, which have replaced the old ramparts. It consists of three distinct quarters, Cracow, Stradom, and Kazimierz, which last lies on an island in the Vistula, and is joined to the rest of the town by a bridge. It is the residence of the Jews, who have here a synagogue. The suburbs are likewise of some extent. The space between the city proper and the suburbs is laid out as a public garden with promenades. The site of the public garden was formerly occupied by fortifications.

This ancient capital of Poland, where its kings were crowned and buried, received its name from Krakus, duke of the Poles and Bohemians, or White Chrobatia, who is said to have founded Cracow about A.D. 700. It was wrested from the Moravians by Ziemowit, the Bohemian, and was taken from the Bohemians in 999 by Boleslaus the Great, who raised it to the rank of the capital of Poland. Its ancient limits were far more extensive, and its population about double the present amount. It had a flourishing commerce, and its numerous lofty towers and buildings still give to it, in the distance, the appearance of a large and handsome city; but this impression is destroyed on entering its dark, narrow, and deserted precincts. The town is however clean, and has a very spacious public square, surrounded with low miserable shops.

The cathedral of Cracow is a beautiful specimen of gothic architecture, and the finest in Poland; it was destroyed by fire, and rebuilt by Nauker, bishop of Cracow, in the year 1320. Here the kings of Poland were crowned, and its numerous chapels recall the events of the history of this kingdom, from Boleslaus to Kosciuszko. It has 50 altars, above 20 chapels, and contains the tombs of most of the Polish monarchs, of Casimir, John III., Sobieski, St. Stanislaus, whose remains are inclosed in a silver coffin, Prince Poniatowski, Kosciuszko, and Dombrowski, &c. There is a statue by Thorwaldsen of Count Vladimír Potocki, who was killed before Moscow in 1812. The archives and library preserved in this edifice contain many valuable manuscripts. Its bell, the largest in Poland, was cast in 1520.

The castle, called the Königsburg, on Mount Wawel, a very spacious gothic structure, the first building of which was, it is said, the work of Krakus about the year 700, suffered by two great conflagrations. It was restored to its pristine splendour by Augustus II. of Poland. It was fortified by Dumourier in 1768, and repaired when in possession of the Austrians, who converted it into barracks. Its subterranean vaults, which are excavated in the mountain, were formerly the depository of the royal regalia. Of the 76 churches which Cracow once contained, only 46 are now devoted to the purposes of divine worship. The finest of these are St. Mary's, which is second only to the cathedral, the church of St. Stanislaus, which is the oldest church in the city, the Protestant church of St. Martin, and many magnificent convents. The Episcopal palace is a spacious building of modern construction, with an historical museum for Sarmatian remains. The old town-hall is a quadrangular, tower-like structure, evidently built for defensive purposes. The Roman Catholic university, which was founded in 1364 by Casimir the Great, and in 1780 assumed the title of Schola Regni, is the oldest university in Poland. It contains a library of about 30,000 volumes, chiefly old books, and a collection of 5000 manuscripts, principally on theology; an observatory, situated in the suburbs of Wessola, and a cabinet of natural history. Cracow possesses also a gymnasium, in which 446 pupils are instructed under 23 professors, a school of arts, an academy of painting, a Piarist college, and normal and various elementary schools, several hospitals, an orphan asylum, &c. Under Sigismund I. Cracow had 80,000 inhabitants; in 1718 they had dwindled down to 24,556; the number of inhabitants is now about 48,000, of whom about one-fourth are Jews. There are no manufactures, except a few of cloth and woollens. The trade, which is principally in the hands of the Jews, is not extensive, although Cracow is the chief depôt of Hungarian wines, salt, and wax, and the central point of commerce between Poland, Galicia, and Hungary. In the neighbourhood of Cracow are extensive salt-mines.

Near the town is Lobzoff, a summer residence of the former kings of Poland, built by Casimir the Great. Cracow is connected by railway with Warsaw, Berlin, and Vienna, and by electric telegraph with Berlin and Vienna.

CRAIL, Fifeshire, Scotland, a royal burgh in the parish of Crail, is situated on the south-east coast of the county, in 56° 16' N. lat., 2° 37' W. long., about two miles S.W. from Cape Fife Ness, and about 30 miles N.N.E. from Edinburgh. The population of the burgh in 1851 was 1247. It is governed by two bailies and seven councillors,

one of whom is provost; and, with Cupar-Fife, St. Andrew's, Kilrenny, the Anstruthers, and Pittenweem, returns one member to the Imperial Parliament.

Crail was made a royal burgh by Robert the Bruce, in 1306. The town consists of two good streets and a few lanes. It possesses a small and shallow harbour, which is frequented by a few boats. The old church is a pleasing specimen of pointed architecture. Besides the parish church there are a Free church, a United Presbyterian church, the Parochial school and a Burgh school. Near the burgh, and on a cliff on the coast are traces of a castle said to have been inhabited by David I. In A.D. 874, Crail was the scene of a skirmish with the Danes, who are believed to have built a wall or ridge from the ocean to the Frith of Forth, inclosing a part of this parish; a portion of the wall remains, and is known as 'the Dane's Dyke.' Stone coffins have been discovered in the parish. Freestone is found in all parts of the parish of Crail. Fireclay bricks and chimney cans are manufactured; the coals consumed are imported.

The parish of Crail, the south-eastern angle of the county, is sometimes called the east 'nook,' or nook, of Fife. The Isle of May, in the Frith of Forth, about 6 miles S.E. from the harbour of Crail, is reckoned as an outlying part of the parish. It is about a mile long and nearly as broad, and is situated in 56° 1' N. lat., 2° 32' W. long. A few cattle and sheep are fed upon it, and a long haired kind of rabbit is found on the island. A lighthouse with a fixed light, visible at a distance of 21 miles, was erected in 1843-4.

CRANBORNE, Dorsetshire, a borough and market-town in the parish and hundred of Cranborne, is situated in 50° 55' N. lat., 1° 54' W. long.; distant 31 miles N.E. from Dorchester, and 93 miles S.W. by W. from London. The population of the parish of Cranborne in 1851 was 2737. The living is a vicarage with two curacies annexed in the archdeaconry of Dorset and diocese of Salisbury.

Cranborne is situated near the head of the small river Allen. The town contains some good houses. The country around is pleasant and fertile. The parish church, which was formerly the church of a religious house founded here about the close of the 10th century, is a commodious structure; it has a tower of the perpendicular style. The pulpit is of wood, richly carved, erected on a stone base. The population of Cranborne is chiefly engaged in agriculture. The market, held on Thursday, is small; two fairs and one great cattle market are held in the course of the year. On Castle-hill are the remains of an ancient circular fortification.

(Hutchins, *Dorsetshire*; *Communication from Cranborne*.)

CRANBROOK, Kent, a market-town and the seat of a Poor-Law Union, in the parish and hundred of Cranbrook and lathe of Scray, is situated in 51° 6' N. lat., 0° 32' E. long.; 30 miles S.W. from Canterbury, and 48 miles S.E. from London. The population of the town in 1851 was 1652. The living is a vicarage in the archdeaconry of Maidstone and diocese of Canterbury. Cranbrook Poor-Law Union contains 6 parishes and townships, with an area of 40,205 acres, and a population in 1851 of 13,069.

Cranbrook is the principal town in the Weald of Kent. It consists chiefly of two streets, the main street being about half a mile long. The houses are irregularly built; the streets are paved, and lighted with gas, and the sewerage is good. Cranbrook was at one time the centre of the clothing trade introduced by the Flemings who were induced to settle here in the time of Edward III. It is now a mart for the agricultural produce of the neighbourhood. A large amount of business is transacted in hops. The market-house is in the main street; the market, which is held on Wednesday, is chiefly for corn and hops. A market for cattle is held once a fortnight. Fairs are held on May 30th and September 29th. The parish church, a handsome and commodious edifice, in the perpendicular style, is situated on a small eminence near the centre of the town. The Baptists, Independents, and other Dissenters have places of worship in the town. Queen Elizabeth's Free Grammar school, for the gratuitous education of the sons of persons residing in the parish, has an income from endowment of 600*l.* a year, and had 36 scholars in 1852, of whom 18 were on the foundation. At Dence's school 16 boys, nominated by the trustees, are gratuitously taught; there is also a National school for boys and girls. Petty sessions are held monthly. In Cranbrook parish are the ruins of Sissinghurst, a fine mansion, which being used as a place of confinement for French prisoners in the last century, received the name of Sissinghurst Castle.

(Hasted, *Kent*; *Communication from Cranbrook*.)

CRAONNE. [AISNE.]

CRATO. [ALEMTEJO.]

CRAYFORD. [KENT.]

CRÉCY. [AISNE; SOMME.]

CREDITON, Devonshire, a borough and market-town, and the seat of a Poor-Law Union, in the parish and hundred of Crediton, is situated in a valley on the banks of the small river Creedy, in 50° 47' N. lat., 3° 40' W. long.; distant 8 miles N.W. from Exeter, 180 miles S.W. from London by road, and 202 miles by the Great Western and Exeter and Crediton railways. The population of the town of Crediton in 1851 was 3934. The living is a vicarage in the archdeaconry and diocese of Exeter. Crediton Poor-Law Union contains 29 parishes and townships, with an area of 88,050 acres, and a population in 1851 of 21,727.

The manor of Crediton belonged at an early period to the bishops of Devonshire. A collegiate church is said to have existed here in the time of the Saxons. This church was made the cathedral church about 910; about 1040 the diocese of Crediton was enlarged by the addition of that of St. German's, which included Cornwall: in 1050 the see was removed to Exeter. The present parish church was formerly collegiate: it is cruciform, and the principal part of the building is late perpendicular. The tower, which rises from the intersection of the cross, is 100 feet high. The lady chapel is now used as a Grammar school. In the parvise is a library, chiefly theological, the bequest of a former vicar. There are places of worship for Baptists, Independents, Wesleyan Methodists, Plymouth Brethren, and Unitarians. National schools are supported partly by an endowment, but chiefly by subscriptions: about 60 of the children receive clothing from the institution. An infant school is supported by voluntary contributions. The Free Grammar school, founded by charter of Edward VI., is endowed out of the tithes, with 100*l.* a year. The number of scholars in 1852 was 30. Each scholar pays 3*l.* a year head money. The school possesses 3 exhibitions of 60*l.* each, tenable for 4 years at either university. There are a mechanics institution, a public library, and a news-room.

Crediton sent representatives to the Parliament held at Carlisle in the time of Edward I. On the rise of the woollen manufacture in this part of the country, Crediton became one of the most important seats of that branch of industry. Hand-loom weavers now make some cloth in their own houses for manufacturers at Exeter and North Tawton. The principal occupation is shoe-making, which employs several hundred people. Crediton has at various periods been considerably injured by conflagrations. The town is divided into two parts, the East Town and the West Town. It is governed by a portreeve elected annually. Petty sessions and a county court are held. Under the provisions of an Improvement Act obtained in 1836, commissioners were appointed, whose jurisdiction includes the town and suburbs. A commodious market-place has been erected in the High-street. The town is lighted with gas. The market day is Saturday. Fairs are held in May, August, and September, and a great cattle market is held in April. Among the vestiges of ancient buildings may be mentioned St. Lawrence's chapel, at the west end of the town, with the remains of windows of triple lights in the early English style; it is now used as cottagers' dwellings.

(Polwhele, *Devonshire*; Murray, *Handbook of Devon*; *Route Book of Devon*; *Communication from Crediton*.)

CREFFELD, or KREFFELD, the chief town of the circle Crefeld, in the Prussian province of Düsseldorf, stands in a low marshy situation, in 51° 20' N. lat., 6° 32' E. long., about 10 miles by railway N.W. from Düsseldorf, and has about 23,000 inhabitants. The town is well and regularly built, and being encircled by gardens and country seats is one of the prettiest spots in this part of Germany. The town contains a Roman Catholic church, two Protestant churches, a synagogue, and a Mennonite chapel, an orphan asylum, hospitals, a house of correction, and a school for deaf-mutes. The manufactures to which Crefeld is indebted for its prosperity are silks and velvets; they are carried on both in the town and its immediate neighbourhood, and afford employment to upwards of 6000 hands. More than 900 hands are employed in the manufacture of ribands. The other branches of manufacture are cotton-yarn, woollen cloths and kerseymeres, flannel, stockings, linen, hats, gloves, thread, sewing and embroidering silk, pins, sugar, spirits, tobacco, soap and starch, iron and copper wares, leather, and felt hats. The trade of Crefeld is brisk and extensive, particularly in its own products; it has three good fairs in the course of the year.

CREIL. [OISE.]

CREMA. [LODI.]

CREMNITZ (properly *Kremnitz*), a mining town in Hungary, situated in a narrow gloomy valley closed in by seven high hills, is situated in about 48° 42' N. lat., 18° 53' E. long., and has 5000 inhabitants. It is a royal free town, and the place where the earliest mines in the kingdom were opened. The inner town contains the castle and only a few houses besides, but its suburbs are extensive. The population is mostly German and Slavonian; they derive their subsistence from the adjacent mines. Among the buildings of note are the archiepiscopal residence, the principal church with two lofty richly-gilt steeples and a coppered roof, built by the townsmen in 1461, four other churches, the chancery mint, town-hall, royal gymnasium, Roman Catholic high school, royal hospital for the miners, an hospital for the townspeople, and a convent. It is the seat of a subordinate board of mines, and here the Cremnitz ducats are coined. The royal mines in the neighbourhood produce gold (esteemed the finest obtained in Europe) and silver; and employ between 800 and 1000 workmen. The waters of these mines contain a large quantity of sulphate of iron. The smelting and washing works, which are supplied with excellent machinery, smelt not only all the ores found here but what the Schemnitz and Kieselbach mines yield. The produce of the Cremnitz mines has greatly fallen off of late years, amounting to no more than 15,000 marcs of silver and 250 marcs of gold annually. The town contains two paper-mills, manufactories of earthenware and red lead, and a vitriol factory. The town is supplied with water by an aqueduct.

CREMO

N. by the province of Parma, and W. by the Adda, which separates it from the province of Lodi. Its greatest length is about 45 miles, and its breadth about 15 miles; it contains 523 square miles, and had according to the returns of 1851 a population of 204,558. The surface is level, and the soil very fertile, yielding wheat, rice, maize, wine, oil, and flax. The white mulberry-tree is extensively cultivated for the production of silk. Cheese, wax, and honey are important articles of produce. Horses, horned cattle, and pigs are numerous. Although great facilities exist for irrigating the grounds, in consequence of the Po and the Oglio flowing within embanked channels considerably above the level of the adjacent soil, yet the system of irrigation does not prevail nearly to such an extent as in the Milanese. The chief manufactured fabrics are silks, calicoes, and linen; cream of tartar is prepared. The embankments of the Oglio and the Po require constant vigilance, and are kept in repair at considerable expense, in order to prevent the disasters that would occur from the inundations to which these rivers are subject. The principal towns besides CREMONA are:—*Casal Maggiore*, on the left bank of the Po, a place of some commercial importance, with a population of 5000; *Pizzighettone*, a strong fortress on the Adda, which has a population of 4000, including the suburb of Gerra, on the right bank of the Po; and *Castellone*, in the north-west of the province, which has 4000 inhabitants. Pizzighettone was originally built in 1125 as a defence against the Milanese. Francis I. was detained here after the battle of Pavia. It is defended by a bastioned wall and ditch, and entered by two gates. Elementary education is universally diffused among the inhabitants of the province.

CREMONA, the capital of the province of Cremona, and a bishop's see, is situated 45 miles S.E. from Milan, on the north bank of the Po, and is surrounded by walls flanked with towers and wet ditches. A navigable canal which joins the Oglio to the Po passes through the town. The Po is navigable for large boats from Cremona to the sea. The town, which is well built, with regular and wide streets, is five miles in circumference, and has a population of about 37,000. Cremona has many good buildings, such as palaces and churches, all of which are adorned with frescoes and paintings by native artists, the most noted of whom are Boccacino and the two Campi. The façade of the cathedral, which is a gothic building, is ornamented with curious sculptures representing the signs of the zodiac and the rural labours of the various seasons. The interior is rich in paintings and sculptures; some of the latter are by Sacchi, a Cremonese artist of the 13th century. The other remarkable churches are San Nazario, which contains some master-pieces of the brothers Campi, San Pietro al Po, Sant' Abbondio, San Lorenzo, Santa Pelagia, Santa Agatha, and Santa Margherita, which is attached to the episcopal seminary and was built under the direction of Girolamo Vida. The Circumcision in the church of Santa Margherita is by Giulio Campi, and is said to unite the beauties of Raffaello, Titian, and Correggio. At Santa Pelagia are two inscriptions in honour of Girolamo Vida, a distinguished prelate of the age of Leo X., who was a native of Cremona. The town-house in the great square, the Campo Santo near the Duomo, the new market, the theatre, and some of the gates of the town are worthy of notice. But the famous Torrazzo, or belfry-tower, ending in a spire, which is one of the loftiest in Italy, is the wonder of Cremona. It stands close to the Duomo, but detached from it; there are about 500 steps to ascend up to the bells. The spire is a conspicuous object for many miles around in the plains of Lombardy. About a mile outside of the town is the church of San Sigismondo, rebuilt in the 15th century as it now stands by Francesco Sforza I., duke of Milan, who married here Bianca Visconti: it consists of a nave surrounded by twelve chapels, and is adorned by fine paintings and bas-reliefs. There are in Cremona several private galleries of paintings. Cremona is the residence of the delegate or governor of the province. It has civil, criminal, and commercial courts, a lyceum, a gymnasium, a school of the fine arts, and several infant schools. It is also the first city in Italy where infant schools were established in 1829 through the exertions of a priest named Aporti. There are also holiday schools at Cremona and in various parts of the province, in which boys above twelve years of age who have left the elementary schools receive instruction, especially in the branches of knowledge connected with the mechanical arts, drawing, &c. These schools are open at certain hours on Sundays and other holidays which are kept in Catholic countries.

Cremona carries on a considerable trade in agricultural produce by means of the Po and the various canals communicating with that river. It has manufactures of silks, cottons, porcelain, earthenware, and chemical products. It was formerly celebrated for its violins and musical strings, which branch of industry was hereditary in families, the most famous of which was the family of the Amati, who flourished from 1704 to 1739, and whose instruments are still in great repute. The high road from Milan to Mantua and Venice passes through Cremona. A large fair is held in the town at the end of September in each year.

Cremona was in the territory of the Galli Cenomani. It was colonised B.C. 219 by the Romans under the consuls T. Sempronius

and P. Cornelius, who at the time when Hannibal was marching against Italy (Tacitus, 'Hist.' iii. 34) settled 6000 men in Cremona as a place of defence against the Gauls and other enemies from the north. In the following year it afforded shelter and winter quarters to Scipio after the battle of Trebia. It was besieged by the insurgent Gauls led by Hamilcar, but held out till the arrival of L. Furius, who routed the Gauls in a great battle under the walls of Cremona B.C. 200. A colony of 3000 new families were settled in the city B.C. 190, and henceforth relieved from the pressure of wars it soon became a populous and flourishing town. In the civil wars of the triumvirate it took the side of Brutus, and was consequently plundered by the soldiers of Octavianus, who divided its fertile fields among his veterans, the former owners being driven away, a calamity pathetically alluded to by Virgil ('Ecl.' i. 3; ix. 28). Virgil was born at Andes, between Cremona and Mantua, and according to Donatus received his early education in Cremona. In the war between Vitellius and Vespasian the citizens sided with the former, upon which the victorious army of Vespasian under Antonius Primus having entered the town plundered and burnt it. Tacitus ('Hist.' iii. 15-34) has given a fearful account of that catastrophe. The only building that escaped the conflagration was the temple of the goddess Mefitis, or Mephitis, whose worship shows that the low marsh lands about Cremona were unhealthy in ancient as they are in modern times. Cremona was rebuilt by Vespasian, but it never recovered its former prosperity. After the fall of the empire it was taken and a second time utterly destroyed by the Lombard king Agilulfus A.D. 605. In the middle ages however it had risen again to prosperity and became a large and populous city. It suffered severely at the hands of Frederick Barbarossa, was afterwards distracted by the Guelph and Ghibeline factions, had its petty tyrants, and at last fell under the dominion of the Visconti of Milan. The only remains of antiquity at Cremona are a few inscriptions, one of which refers to the worship of Mephitis, mentioned by Tacitus.

CRÉPY. [AISNE.]

CRESSY, or CRÉCY. [SOMME.]

CREST. [DRÔME.]

CRETAN SEA. [ÆGEAN SEA.]

CRETE. [CANDIA.]

CREUSE, an inland department of France, deriving its name from one of the rivers by which it is watered. The department is of a compact form, approaching to oval, having its greatest length north-west and south-east 68 miles, and its greatest breadth at right angles to the length 50 miles. It lies between 45° 39' and 46° 26' N. lat., 1° 24' and 2° 36' E. long., and is bounded N. by the departments of Indre and Cher, E. by those of Allier and Puy-de-Dôme, S. by Corrèze, and W. by Haute-Vienne. The area, according to the cadastral returns of 1851, is 2150 square miles, and the population, according to the census taken in that year, was 287,075, or 132.88 to the square mile, being 41.83 below the average population per square mile for the whole of France.

The department is formed out of the districts of Combrailles and Haute-Marche, and small portions of the Limousin and Berri. The surface is almost entirely covered with hills, and contains no valleys or plains of large extent. A great portion of the eastern boundary is formed by that offset of the Auvergne Mountains which separates the basin of the Cher from that of the Allier, while the southern boundary is formed by the crest of another range that forms the watershed between the Loire and the Dordogne. [CORRÈZE.] From the mountain mass in the angle between these two ranges, a chain runs due north into the centre of the department, whence it turns north-east, separating in its whole length the waters of the Cher from those of the Creuse. Another chain, springing from the mountains on the southern border, runs for a considerable way along the western bank of the Creuse, and then diverges into numerous lines of hills which cover the west and north-west of the department. The spaces between these ranges of mountains and hills are in many instances occupied by isolated or irregularly grouped elevations, which are locally called 'puys,' and of which the basalt and scoria found near them clearly attest the volcanic origin. The mountains generally consist of granite and clay-slate; none of them rise to any great height, perhaps not more than 660 feet at most above the general level of the department; but it must be remembered that the department of Creuse is on the watershed between the Gironde and the Loire. Many of their crests are naked and barren, but their sides are clothed with forests of timber-trees and chestnuts. The valleys are narrow, and each of them is watered by a clear stream or river flowing over a gravelly bed. The situation of the department on the northern slopes of the Auvergne Mountains, and the extent of surface covered with mountainous plateaus, rivers, and ponds, render the climate cold, moist, and variable. A great deal of rain falls; storms are frequent; the winter is long and rigorous; autumn is the only fine season.

The River Creuse, which gives name to the department, springs from the mountains on the southern border, and flows through a narrow valley first northward as far as Aubusson, and thence north-west, dividing the department into two nearly equal portions. Entering the department of Indre, it passes Argenton, a little below which it turns west as far as Le-Blanc, where, resuming its original

north-western direction, it divides for several miles the departments of Vienne and Indre-et-Loire, passes Guerche and La-Haye, and enters the Vienne on the right bank a few miles north-west of the latter town. Its whole length is about 130 miles, only 51 of which are navigable. It is subject to floods, which frequently rise to the height of 30 feet in the narrow valley drained by it in this department; but in summer it is in many places almost dry. The western slope of the department is drained by the Maude and the Thorion, feeders of the Vienne, and by the Gartempe and the Sedelle, feeders of the Creuse. The eastern part is drained by the Cher (which has its source here) and its tributary the Tardes, which is itself fed by the Vouize. The *Petite-Creuse* rises in the department of Allier, a little beyond the eastern border of Creuse, and flowing west at the base of a range of hills which stretches along the northern boundary, enters the Creuse on the right bank near the north-western angle of the department. None of these rivers is navigable in this department; loose timber is floated down most of them.

The department contains 1,376,007 acres, of which area 592,560 acres are capable of cultivation, 327,036 acres are natural pastures, 81,840 acres are covered with woods and forests, and 297,300 acres consist of wild moors covered with heath, gorse, fern, and broom. Rye is the chief object of cultivation; buckwheat, oats, potatoes, and turnips are also raised. Agriculture is in a very backward state; the consumption exceeds the produce. The best land is in the basin of the Cher in the east of the department; in the other parts the soil is poor. Chestnuts, walnuts, and cherries are very generally grown; the canton of St.-Feyre is famous for its apples. Horned cattle and horses are numerous, but small in size; the sheep are much esteemed for their flesh, but they are small, and their wool is bad. Great numbers of pigs are reared, and when fattened these animals form the most important export of the department. Asses and mules are commonly used as beasts of burden. Honey of good quality is gathered, and game is plentiful. The farms are in general divided by quickset hedges, in which are planted trees of different kinds, so that the country has in many parts a very pleasing appearance. The spring and summer pasture on the hills is particularly good.

Iron, copper, manganese, antimony, and lead are found; coal mines are worked; granite and building stone are quarried, and potter's clay of good quality is raised. The department is famous for the manufacture of tapestry and carpets. Coarse calicoes, worsted and cotton yarn, leather, and paper are also made. Great numbers of the inhabitants emigrate yearly, and are to be met with in most parts of France, as stone-masons, tilers, sawyers, hemp and wool combers, flax-dressers, carpenters, &c. A large part of the human hair supplied to the hairdressers of the capital comes from this department, the young women generally bartering their hair for silk handkerchiefs, shawls, and other articles of dress temptingly exposed for sale at the doors of the perruquiers' shops during fair-time. About 275 fairs are held in the year. Roadway accommodation is afforded by six state and nine departmental roads, the total length of which is 496 miles. The department contains several hundreds of wind and water-mills, one iron foundry, 57 factories of different kinds.

The department is divided into four arrondissements, which, with their subdivisions and population, are as follows:—

Arrondissements.	Cantons.	Communes.	Population in 1851.
1. Guéret	7	77	98,286
2. Aubusson	10	113	106,616
3. Bourgueuf	4	49	42,673
4. Boussac	4	57	39,497
Total	25	296	287,072

1. In the first arrondissement the chief town is *Guéret*, formerly the capital of Haute-Marche, but now of the department of Creuse. It is situated on the slope of a hill between the Creuse and the Gartempe, and has a tribunal of first instance, a college, public library, and 4446 inhabitants, including the whole commune. *Guéret* has some trade in cattle and butter. It grew up around a monastery built here in A.D. 720. The town became the residence of the counts of La-Marche who fortified it and built a castle here, part of which still remains. Charles VII. occupied the castle in his war against the Dauphin, afterwards Louis XI. *Guéret* has neat clean streets, in which are several fountains. Among the other towns the most important are the following: the population given is that of the commune. *Ahun*, 10 miles N. from *Guéret*, in a district famous for cattle and dairy produce, and near a large coal-field, has 2212 inhabitants. *Bonnat*, in which there are several Roman remains, has a population of 2830. *Salagnac*, on the left bank of the Gartempe, has 2801 inhabitants. *La-Souterraine*, an ancient town on the Sedelle, takes its name from a large cavern near it, in which there is a stream that turns a mill; it has linen factories, and 3092 inhabitants. *St.-Vaulry*, 6 miles N.W. from *Guéret*, has a population of 2522.

2. Of the second arrondissement the chief town is *Aubusson*, which stands on the Creuse in a wild rocky defile, 20 miles S.E. from *Guéret*; it is an ill-built but improving town, with a tribunal of first instance, and 5196 inhabitants, who manufacture carpets, tapestry, coarse woollens, and calicoes. The town also has woollen and cotton

yarn factories, dye-houses, and tan-yards. The town of *Aubusson* sprung up in the 8th century round a strong castle, part of which still remains bearing marks of Roman construction. The lord of the castle afforded protection to a party of Saracens who escaped from the defeat of Abderrahman by Charles Martel (A.D. 732); they settled here, and established the wool-dyeing and tanning trades, to which the town owes its prosperity. *Évaux*, formerly the capital of Pays-de-Combrailles, stands in a well-cultivated plain between the Cher and the Tardes; it is a walled town, and has a population of 2698. In a narrow valley about half a mile north of the town are hot springs and baths, which appear from some constructions about them to have been known to the Romans. The two hottest springs, called *César's Wells*, have a temperature of 152° Fahr. There are several other springs here, the temperature of the coldest is indicated by 86° Fahr. These waters are frequented from May to the end of September; they are used both as drink and for baths, and are advantageous in cases of muscular rheumatism, old ulcers, scrofulous tumours, and all cutaneous diseases. *Felletin*, on the right bank of the Creuse, is an ancient town with a college and 3814 inhabitants, who manufacture cloth, coarse cottons, excellent carpets, worsted, paper, leather, &c. *Chenerrailles*, 10 miles N. from *Aubusson*, formerly a fortified town, now a small place of 1100 inhabitants, deserves mention on account of the great number of Roman remains, funeral urns, and medals found near it.

3. The third arrondissement takes its name from its chief town *Bourgueuf*, which is prettily situated on an eminence near the left bank of the Thorion, and has a tribunal of first instance, some paper and porcelain factories, and 3095 inhabitants. In the priory of *Bourgueuf*, which was then a commandery of the Knights of St. John of Jerusalem, *Zizim*, the elder brother of the Sultan *Bajazet II.*, found an asylum. A lofty tower, solidly built with cut stone, is said to have been erected by that prince, and is called by his name. There is a large coal-field near *Bourgueuf*, and some iron mines are worked. *Royère*, 10 miles from *Bourgueuf*, has a population of 2451. *Bénévent* (formerly called *Segunzelas*), and *Pontarion*, near which are extensive caverns and the remains of a Roman bridge over the Thorion, are small places that give names to the other cantons.

4. The fourth arrondissement is named from *Boussac* or *Boussac-Ville*, once an important fortress situated in a mountain gorge at the junction of the Veron and the Petite-Creuse. The town stands on a steep rock and is surrounded by walls flanked with towers. It is commanded by an old castle situated on the summit of a lofty rock above the Petite-Creuse. This castle is still in good repair, and its ramparts and towers form perhaps the most interesting structure of the kind in the department. Near *Boussac* is *Boussac-Bourg*; the united population of the two places is 2212. *Chambon*, in the fork between the Tardes and the Vouize, which meet below the town, has a tribunal of first instance, some Celtic and Roman remains, and 2125 inhabitants. According to *Baruillon* in his '*Recherches Historiques sur le Département de la Creuse*,' *Chambon* marks the site of the chief town of the Cambiovienses, named in the '*Peutinger Tables*.' *Auzance*, in a marshy district near the source of the Cher and *Chatelus*, W. of *Boussac*, are villages which give names to the other cantons.

The department of Creuse, together with that of Haute-Vienne, forms the see of the Bishop of Limoges. It is comprised in the jurisdiction of the High Court of Limoges, and belongs to the 21st Military Division, of which Limoges is head-quarters.

(*Dictionnaire de la France; Annuaire pour l'An 1853.*)

CREUTZ. [CROATIA.]

CREUZNACH, properly KREUZNACH, a town in the administrative government of Coblenz, in the Prussian province of the Rhine, is situated on the banks of the Nahe, which is here traversed by a stone bridge, in the centre of a rich and delightful country, in 49° 51' N. lat., 7° 53' E. long., 40 miles S. from Coblenz, 6 miles S. from Bingen, and has about 9000 inhabitants. It is supposed to have been the site of a Roman castrum. It is built in the old style, without any regular plan, and the streets are narrow and crooked; it has two Roman Catholic and two Protestant churches, a synagogue, a gymnasium, and an hospital. The town has some trade in corn, wine, cattle, salt, flax, &c., and manufactures of leather, woollen cloth, brandy, tobacco, snuff, and soap. There are important salt-works close to the town on the banks of the Nahe. The environs of the town abound in beautiful scenery and interesting sites. *Kreuznach* has recently risen into great repute as a watering-place.

CREWE, Cheshire, a town in the parish of Coppenhall and hundred of Nantwich, is situated in 53° 5' N. lat., 2° 25' W. long., distant 24 miles S.E. by E. from Chester, 166 miles N.W. from London by road, and 157½ miles by the London and North-Western railway via Trent Valley. The population of the town of *Crewe* in 1851 was 4491. The living is a perpetual curacy in the archdeaconry and diocese of Chester.

The town of *Crewe* owes its erection entirely to the formation of the London and North-Western line of railway. The inhabitants consist chiefly of persons in the employment of the railway company, with their families. The houses and shops are well built; the streets are wide, and the footpaths are laid with asphalt. The town is lighted with gas, and well supplied with water, a powerful steam-pump supplying at once the engines in the extensive workshops of

the company, the locomotive engines, and the houses in the town. The water intended to be used by the inhabitants passes through two filtering processes before reaching the houses. Baths are also provided at a cheap rate. The town of Crewe has a council for the management of the affairs of the community; two-thirds of the council are elected by the workmen and inhabitants, and one-third by the directors of the railway company. A church has been erected by the company: the Wesleyan, Primitive, and New Connexion Methodists, Independents, Scotch Presbyterians, Baptists, and Roman Catholics have places of worship. Schools for boys, girls, and infants have been provided by the company, and a library and a mechanics institution are supported by subscription. Medical attendance and medicine are secured for the workmen and their families on payment of a small weekly rate, the highest charge (that for a married man with a family) being 2d. per week. A field in the neighbourhood is used for cricket-playing. The railway station at Crewe is very spacious. From this place branch off five lines of railway, affording ready means of communication with all parts of the country. The workshops and machinery of the North-Western Railway Company at Crewe are on a very extensive scale. Railway carriages and locomotive engines are manufactured and repaired. The number of carriages of all kinds maintained at Crewe amounts to about 700, of which 100 at a time are usually under repair. Crewe Hall, the seat of Lord Crewe, is in Crewe township, about one mile from the railway station.

(Head, *Stokers and Pokers*; *Communication from Crewe*.)

CREWKERNE, Somersetshire, a market-town in the parish and hundred of Crewkerne, is situated in a valley watered by the rivers Parret and Isle, in 50° 47' N. lat., 2° 47' W. long., distant 46 miles S. by W. from Bristol, and 132 miles S.W. by W. from London. The population of the town in 1851 was 3303. The living is a perpetual curacy in the archdeaconry of Taunton and diocese of Bath and Wells.

At the time of the Domesday Survey, Crewkerne belonged to the king; the name was then written Cruche. The market-house stands in a spacious market-place in the centre of the town. The streets are paved; the houses are in general well built, and the town is lighted with gas. The parish church is cruciform, and has an embattled tower rising from the intersection of the nave and transepts. The Methodists, Baptists, and Unitarians have places of worship. The Free Grammar school has an endowment of about 300*l.* a year, and several exhibitions, which are open to the competition of the scholars. The number of scholars in 1851 was 56. There are Day and Infant schools, of which two have small endowments. The principal manufacture of Crewkerne is that of sail-cloth and sacking; some dowls and stockings are also made. The market, chiefly for corn, is on Saturday: a fair is held annually on September 4th.

CRICH, Derbyshire, a town formerly possessing a market, in the parish of Crich, and hundred of Morleston and Litchurch, is situated in 53° 5' N. lat., 1° 27' W. long.; distant 12 miles N. from Derby, and 126 miles N.N.W. from London by road: Ambergate station of the Midland railway, which is near Crich, is 142½ miles from London. The population of the parish of Crich was 3670 in 1851.

The town is built on a lofty limestone hill. The parish church, from its position, is a very conspicuous object: it is an ancient structure, and its lofty spire serves as a landmark for miles around. The Wesleyan and Primitive Methodists and General Baptists have places of worship. There are a National school and a lending library. The inhabitants are chiefly engaged in working lead-mines, in quarrying of limestone, and in burning it to lime. Frame-work knitting is carried on in dwelling-houses. Attempts have been made on several occasions to revive the market formerly held at Crich, but these attempts were unsuccessful. Two fairs for cattle and pedlery are held in the course of the year. From Crich Cliff are obtained views of scenery of surprising extent and varied beauty.

(*Land We Live In*, vol. iii.; *Communication from Crich*.)

CRICKHOWELL, Brecknockshire, a market-town, and the seat of a Poor-Law Union, in the parish and hundred of Crickhowell, is picturesquely situated on the river Usk, in 51° 52' N. lat., 3° 8' W. long.; distant 13 miles S.E. from Brecknock, and 157 miles W. by N. from London. The population of the parish of Crickhowell in 1851 was 1408. The living is a vicarage in the archdeaconry of Brecon and diocese of St. David's. Crickhowell Poor-Law Union contains 10 parishes and townships, with an area of 44,198 acres, and a population in 1851 of 21,674.

Crickhowell is nominally a borough. The parish church is of early English style, erected about the 14th century; the side aisles are modern. The Wesleyan Methodists, Welsh Calvinistic Methodists and Baptists have places of worship. There are three parochial church schools, a dispensary, and a savings bank. A county court and petty sessions are held in the town. The town-hall has underneath it the market-house. The market-day is Thursday; five fairs are held in the course of the year.

Crickhowell is much resorted to by tourists in the summer. In the upper part of the town is a fine gatehouse of the time of Henry VII. There are some remains of Crickhowell Castle, erected by Edward I. In the neighbourhood are Llangattock Park, a residence of the Duke of Beaufort, and Glanash Park, the seat of J. Bailey, Esq., M. P. Druidical remains have been found near the

town. A cairn was recently discovered at Llangattock Park, in which were found human bones and charcoal, also several coins of the reign of Constantine.

(*Communication from Crickhowell*.)

CRICKLADE, Wiltshire, a parliamentary borough, formerly a market-town, and conjointly with Wootton Bassett the seat of a Poor-Law Union, is situated in a level tract of country on the right bank of the Thames, in 51° 38' N. lat., 1° 50' W. long.; distant 26 miles N. by E. from Devizes, 84 miles W. by N. from London. The population of the parish of St. Mary in 1851 was 431, that of St. Sampson was 1475; the population of the parliamentary borough (which includes a large agricultural district) was 35,503. The borough returns two members to the Imperial Parliament. The livings, a vicarage and a rectory, are in the archdeaconry of Bristol and diocese of Gloucester and Bristol. Cricklade and Wootton Bassett Poor-Law Union contains 14 parishes and townships, with an area of 44,348 acres, and a population in 1851 of 11,406.

Cricklade appears to be a place of considerable antiquity. The ford over the Thames was often contested in the Saxon times. In the year 905 the town was plundered by the Danes, and Canute in 1016 crossed the river here with his army. A priory was founded here in the reign of Henry III. The hospital, supposed to have belonged to the priory, now affords dwellings for the poor. The parish church of St. Mary is ancient; some portions are of Norman architecture; a gothic cross with canopied niches stands in the churchyard. The church of St. Sampson's parish is a spacious cruciform edifice. It has a lofty embattled tower surmounted with pinnacles, and highly ornamented with niches and pedestals. Three chapels for Dissenters are in the town; and two National schools are supported by voluntary contributions. There are several parochial charities. A weekly market formerly held on Saturday has long been discontinued: a market for cattle held on the third Tuesday of every month is well attended. Petty sessions are held. Cricklade has sent representatives to Parliament since the reign of Edward I. The Thames and Severn Canal passes near the town, and a branch canal passes through it, forming a junction at Swindon with the Wilts and Berkshire Canal.

(Hoare, *Wiltshire*; *Communication from Cricklade*.)

CRIEFF, Perthshire, Scotland, a manufacturing town beautifully situated near the left bank of the river Earn, in 56° 23' N. lat., 3° 48' W. long.; distant 17 miles W. from Perth, and 50 miles N.W. from Edinburgh. The population of the town in 1851 was 3824.

Crieff is built on a rising ground at the foot of the Grampians, and is much resorted to in summer by invalids for its mild climate. The houses are in general well built. There are two churches of the Establishment, and chapels for United Presbyterians, the Free Church, Scottish Episcopalians, English Episcopalians, and Roman Catholics. The town is well supplied with water, and lighted with gas. The town-house, in which is the jail, has a spire. There are a savings bank, a subscription reading-room, three public libraries, a mechanics institution, a Freemasons-hall and a Weavers-hall. Several fairs are held at Crieff in the course of the year. In addition to the parish school there is an academy called Taylor's Institution, endowed by Mr. Taylor of Cornton, and founded about ten years ago.

A curious old cross stands near the town-house. Cotton goods and a slight linen fabric called Silesias are manufactured at Crieff. A considerable number of the inhabitants are weavers for Glasgow manufacturers. There are a woollen-mill and a tan-works. Tambour-working and other similar occupations are pursued by the females. Over the river Earn is a handsome bridge of four arches, which connects Crieff with the village of Bridgend. In the vicinity of Crieff is Glen Almond, the strath or vale of the Almond, much admired for its scenery. Trinity college, in connection with the Scottish Episcopal Church, and under the management of its prelates, was opened in Glen Almond in 1847. There are a public school department and a theological students department. In 1852 there were 12 students in the theological classes, and 63 scholars in the public school. Various bursaries or exhibitions have been founded for the students. The extensive parks of Drummond Castle and Ochertyre are within view of the town.

(*New Statistical Account of Scotland*; *Communication from Crieff*.)

CRIMEA, or KRIM TARTARY, the ancient *Taurica Chersonesus*, a peninsula in the south of European Russia, lies between 44° 20' and 46° 10' N. lat., 32° 40' and 36° 30' E. long., and forms the southern part of the government of Taurida. The peninsula of Crimea forms a quadrilateral figure, the sides of which are respectively directed to the north-east, north-west, south-west, and south-east, and the angles to the cardinal points. At the northern angle it is connected with the continent by the isthmus of Perekop, which is about twenty miles in length. From the eastern point a small peninsula stretches out between the Sea of Azof and the Black Sea, terminating on the west shore of the Strait of Yenikalé. On three sides the Crimea is inclosed by the Black Sea; on the north-east it is washed by the Sea of Azof. Its area may be about 8600 square miles. At Perekop (called Or Kapi by the Tartars), at the northern end of the isthmus, there still remains a strong rampart erected by the Turks, which extends from the Black Sea to the Siwash or Putrid Sea, an arm of the Sea of Azof. It consists of a deep trench about 12 fathoms wide

and 25 feet deep, and of a double wall built of freestone, which however has been somewhat injured by the effects of time. Five batteries are erected along this line. Perekop stands on or near the site of the ancient *Taphros*, which took its name from the 'trench' or fosse which in the remotest times formed part of the defences of the isthmus.

The isthmus of Perekop and three-fourths of the peninsula (being the northern part) form an arid plain or steppe, which is occasionally diversified with deeper spots of ground or hollows. The soil for the most part consists of sand or sand combined with clay. Towards both seas there are numerous salt-lakes, some of which are from 15 to 20 miles in circuit. The plain declines imperceptibly towards the sea, and is destitute of water and wood; but in some parts it is clothed with a grass sward. There are here very few inhabitants.

The south-eastern shores a mountainous tract extends from Chersonese to Kaffa; hence to the Strait of Yenikalé it is hilly. The mean width of this tract is about 20 miles, and its whole extent probably about 2000 square miles. That portion of this region which is to the west of the harbours of Sevastopol and Balaklava forms a peninsula called by the Greeks the *Heracleotic Chersonesus*, from having been colonised by settlers from *Heracleia* in Asia Minor. From Cape Khersonese the country gradually rises in a sloping plain, occasionally diversified with hills. The coast presents an interesting appearance, the hill-slopes being occupied by numerous Tartar villages, vineyards, and country seats. Among the mansions scattered along this coast the principal are Livadia, the seat of Count Potocki; and Alupka, the residence of Count Woronzoff. Alupka is a mansion of palatial splendour, built under the superintendence of Mr. Hunt, an Englishman, from the designs of Mr. Blore. To the east of Balaklava the heights attain the elevation of mountains, which run like an immense wall from that town to Alushta. The coast here consists of cliffs generally several hundred feet in height, and forming numerous headlands and dreadful precipices. At a distance of from one to two miles from the coast the mountains attain a height of 2000 feet and upwards. From this rapid slope a few torrents descend, the beds of which are filled by heavy rains or the melting of the snow. The summit of the mountains consists of extensive flats, which sometimes extend several miles. These mountain table-lands, called by the Tartars '*Yailas*,' are only visited by them during hot summers on account of the rich pastures which they supply for cattle; some of them are covered with snow till the latter end of May. North of the *Yailas* the mountains gradually descend, forming numerous but narrow lateral ridges, which inclose delicious and sometimes wide valleys. The ridges by degrees sink down into hills, which terminate in the northern plain.

West of Alushta is the Babugan *Yaila*, which is nearly as high as the Chatyr-Dag, or Tent Mountain, which stands to the north-east of it and is separated from it by a considerable depression. A like depression occurs on the east, and divides the Chatyr-Dag from Temirdshi *Yaila*, which is much less elevated. Thus the Chatyr-Dag with its flat summit appears like an immense table, and on that account is probably called by Strabo *Trapezia* (vii. 309, Casaub.). On its flat summit rise several eminences like tents, from which the name is derived which is given to the mountain by the Tartars. These summits, which rise 5040 feet above the level of the sea, are the highest mountains in the Crimea. The Chatyr-Dag and the eastern chain, which extends to Kaffa from the Temirdshi *Yaila*, are more distant from the coast than the western chain, and a number of small streamlets descend from the heights and drain some fine valleys along the sea-coast. Towards Kaffa the mountains decrease in elevation, and terminate about a mile from the western shores of the open bay on which that town is built.

The country between the Bay of Kaffa and the Siwash or Putrid Sea is a plain very slightly undulating, but eastward of Kaffa the surface presents considerable variety of elevation; near the shore of the Strait of Yenikalé at Kertsh the country is traversed by several ridges running nearly south and north, on which numerous craggy points rise to 300 or 400 feet above the sea. Near Kertsh, and between it and Yenikalé, the peninsula terminates with a rocky though not an elevated shore. This peninsula between the Black Sea and the Sea of Azof is remarkable for its mud volcanoes, of which Pallas particularises the hill called *D'shtube*, situated nearly in its centre. In some parts naphtha or petroleum is found.

From the western end of this peninsula, at the point where Arabat is situated, extends in a north-north-west direction a narrow strip of land which divides the Siwash or Putrid Sea from the Sea of Azof. It is on an average hardly 300 yards wide, upwards of 70 miles long, and very low; it consists towards the south of shelly sand, in which some scattered plants thrive with luxuriance, but farther on the soil exhibits only common sand, more or less consolidated, and of a saline nature. It contains several small salt-lakes, and along its low beach heaps of salt are thrown out by the sea. This narrow tongue, called the isthmus of Arabat, is divided from the Nogay-Steppe by a narrow strait called the Strait of Icnitshe or Tonke, and is inhabited only by a few innkeepers: the peasants of Eastern Russia bring provisions along this tract to Kaffa, and take back fish.

Numerous rivulets descend from the northern declivity of the mountains and form several rivers, as the Katschka, Alma, and

Salghyr, all of which have very broad beds, though in summer they contain very little water and run slowly; but when the snow melts on the *Yailas* they become rapid, broad, and deep rivers.

The winters are cold and the summers hot. In very severe winters the mercury sometimes sinks 9° below zero, and not only the whole Sea of Azof, together with the Strait of Yenikalé, but also a great part of the Bay of Kaffa is covered with ice strong enough to support men on foot and on horseback. The climate is so unsettled, that it often varies six or eight times in twenty-four hours. The winds are very variable, and bring rain from the west and south-west, mild air and frequent mists from the south, serene dry weather from the east, and cold from the north. In spring the weather is settled, the heat moderate and refreshing, and the nights cold and serene; there is seldom any rain, especially during the prevalence of violent east winds, in which case, unless a considerable fall of rain happens in April and May, an unproductive harvest frequently follows. In summer the thermometer frequently rises to 100° and even 102°. On the same day however it falls sometimes 20 or even 30 degrees. Droughts frequently prevail for several successive years, and dry up the wells and brooks. Few summers pass in which the verdure on the hills is not parched up. Thunder-storms rarely occur, but when they do they are tremendous and sometimes accompanied by hail-stones and destructive water-spouts. In spring and summer rainy weather seldom continues so long as twenty-four hours. In autumn bilious fevers prevail. Cold days occur in the middle of October, and are generally accompanied with night frosts, but afterwards the weather again becomes pleasant, and frequently continues mild till December and January.

The crops cultivated in open fields are wheat, rye, barley, oats, maize, spelt, millet, chick-peas, flax, and tobacco. In the gardens are raised melons, water-melons, cucumbers, gourds, artichokes, cabbages, onions, garlic, leeks, broccoli, celery, parsley, carrots, and red beets. The numerous and extensive orchards in the valleys produce pears, apples, quinces, plums, cherries, peaches, apricots, almonds, medlars, figs, pomegranates, mulberries, and nuts. Some of these trees grow also wild on the declivities of the mountains. The forest-trees, which cover a great portion of the declivities of the mountains, especially on the northern side, are oak, beech, elms, poplars, lime-trees, maples, ash, and pines (*Pinus maritima*). Honey of excellent quality is obtained. Much attention has been paid to the cultivation of the vine. The wine however is inferior to that produced in Hungary and France. Of the camel with two humps there are several thousands in the country. Great attention is paid by the Tartar noblemen to the breeding of horses. Those of the mountainous districts are small, but uncommonly hardy and sure-footed. The horned cattle are of a middling size in the plains, but small in the mountains. There are three varieties of sheep, all of which have a long tail, which for half its length is overgrown with fat and covered with coarse wool. One variety, which pastures on the plain lying along the Black Sea between Koslow and Perekop, produces the celebrated Crimean lamb-skins, of which more than 30,000 are sometimes annually exported to Poland and Germany. Of black lamb-skins more than 50,000 or 60,000 are annually exported. The mountain sheep are smaller, but celebrated for their soft fine wool.

Sturgeons are taken on the shores of the Sea of Azof, in the Strait of Yenikalé, and in the Bay of Kaffa. Caviar is made, and a little isinglass. Salt, the only mineral that is abundant, is found at the bottom of the salt lakes during the summer heat. Salt in great quantities is exported to Southern Russia, and much is also shipped to Anatolia and Turkey from the ports of Kertsh, Kaffa, and Koslow.

The population of the Crimea is about 200,000. More than two-thirds of its inhabitants are a mixture of Mongols and Turks, and are called Tartars. Those who live on the plain show in their features their Tartar origin; but those in the northern valleys display a strong mixture of Turkish blood, especially the noblemen ('*innurses*'), in whom the Tartar features are entirely obliterated. Besides the Tartars, Russians and Germans are found, who have been transplanted in modern times as colonists; and Greeks, who seem to have always formed a portion of the population, but have considerably increased in latter times.

In the interior, at the northern extremity of the hilly country, is the town of *Simferopol*, or *Akmesheh*, the capital, not far from the sources of the river Salghyr, with 8000 inhabitants. The town contains a cathedral, several churches, mosques, barracks, an hospital, a Tartar school, and many good dwellings. The houses are in general painted green, and adorned with rows of columns. About 26 miles E.N.E. from Simferopol is the town of *Karasubazar*, with 15,000 inhabitants, and some manufactures of morocco leather, candles, soap, pottery, and tiles. It contains a Greek church, two Roman Catholic churches, and a synagogue. Considerable trade is carried on. A weekly market and an annual fair are held. In the mountains is the town of *Baktchesarai*, the ancient residence of the Khans of the Crimea. [BAKTCHESARAI.]

The most frequented harbours are on the south-western coast. *Koslow* or *Eupatoria*, with 7000 inhabitants, mostly Tartars and Jews, a fine mosque, a Tartar school, an hospital, and a custom-house; exports salt to Anatolia and Turkey. *Sevastopol*, formerly *Akthiar*, is the principal station of the Russian fleet in the Black Sea. Only vessels of war are admitted to the port. Including the soldiers and

marines forming the garrison the population is about 30,000. The town possesses a fine cathedral. There are here five extensive docks, constructed for the Russian government by Colonel Upton the distinguished civil engineer. The centre dock will accommodate a first rate ship of the largest size: two docks are for 74-gun ships, and two for frigates. The five docks occupy two sides of a quadrangular basin. Into this basin ships are introduced by three locks, each having a rise of 10 feet, so that the surface of the water in the basin is 30 feet above the level of the sea. The bottom of each dock is 3 feet above the sea level. Water is supplied to the dock basin by a canal from the Tcherney-Ruilka (the Black River). A reservoir is connected with the canal for the purpose of supplying the docks in case of the failure of water in the rivulet. The ground over which the canal passes is rough and uneven; and the works include an embankment, three aqueducts, and two tunnels. The docks are constructed of freestone and granite, the granite being employed at the gates and where extra pressure is likely to be felt. The capstans and all the machinery of the locks are of English manufacture. Three forts, named respectively Alexander, Constantine, and Nicholas, defend the approach, the entrance, and the interior of the harbour. The expense of the works was about five or six millions of rubles. With the exception of the docks, the fortifications, and the cathedral, there is little to notice about Sevastopol. The town is (or was recently) undefended on the land-side. Sevastopol possesses a very fine harbour. The depth of water will allow the largest line-of-battle ships to lie close to the shore. In winter the Russian fleet is laid up here, and the crews go into barracks. A short distance east from Sevastopol is Inkerman, at which are several chapels and chambers cut out of the freestone rocks. These chambers are said to have been used by the Arians as a place of retreat from persecution. There is a good carriage road from Sevastopol to Baktchisarai. BALACLAVA and KAFFA are described in separate articles. On the Strait of Yenikalé is Kertsh or Kiertsch, a thriving place, with about 4000 inhabitants. There is here an interesting museum containing a large collection of medals, Greek vases, gold ornaments, and other antiquities dug up from the tumuli in the vicinity of the town. The museum includes also a few Roman remains. Kertsh roads are generally crowded with shipping, as vessels proceeding to the Sea of Azof must perform quarantine here. Kertsh is a free port. It exports salt, corn, hides, salted fish, and caviar. In its neighbourhood are the extensive ruins of the ancient town of Panticapæum, once the residence of Mithridates. Yenikalé, at the entrance of the strait, is a small fortress, with 1700 inhabitants, who are almost all of Greek descent. Alushta, on the south-east coast, at the eastern extremity of a pass which leads across the Chatyr-Dag from Simferopol, has become a commercial town of some importance. In the time of the Genoese it was a populous place, and under the Byzantine emperors it was the seat of a bishop. There was a large fortress here built by the emperor Justinian. The town however has little to show except the ruins of former grandeur. The neighbourhood of the Chatyr-Dag renders the scenery peculiarly interesting. The fortress of Perckop, on the isthmus, has 900 inhabitants, many of whom are Jews. In the fortress are a palace, barracks, a mosque, and a Greek church.

Manufacturing industry is confined to the preparation of leather and morocco in Baktchisarai, Karasubazar, and Koslow, and to cutlery and saddlers' and shoemakers' work at Buktchesarai. In some places coarse earthenware is made. The Greeks in the neighbourhood of Kaffa extract soda from saline plants.

The chief exports of the Crimea by sea are salt, wheat, soda, butter, and hides: the imports, raw and manufactured cotton of different kinds; silk stuffs of various patterns and in the eastern fashion; wines of the Archipelago and the Strait of Constantinople; brandy, Turkish leaf-tobacco, and a variety of fresh and dried fruits. To Russia are sent, chiefly by the way of Perckop, salt, gray and black lamb-skins, sheep's and bullocks' hides, wool, camels' hair, leather, hare-skins, wines, walnuts, fruits, together with the dry fruits imported from other parts, and fish. The imports are grain, provisions, iron, and different manufactured goods of Russia.

The Greeks became early acquainted with this peninsula, probably soon after the Ionian Greeks and especially the inhabitants of Miletus had begun to form settlements on the northern shores of Asia Minor, about six centuries before the Christian era. Panticapæum is called by Strabo a colony of the Milesians. Besides this place they built Theodosia, now Feodosia or Kaffa, and some other places on the peninsula forming the west side of the Strait of Yenikalé. They preferred this part of the peninsula, from its containing a large tract fit for agriculture, and producing very rich crops—Strabo says thirty times the seed. It was at one time considered the granary of Greece, especially of Athens, whose territory being of small extent and of indifferent fertility, was unable to maintain its great population by its own produce. At one time Athens annually imported from the Crimea between 300,000 and 400,000 medimni of grain, as Demosthenes informs us, in his Oration against Leptines (c. 9). Strabo says, that in one year the Athenians received 2,100,000 medimni from Theodosia, but the text is evidently corrupt. [BOSPORUS; BYZANTIUM.] (Strabo, vii.; Pallas; Oliphant; Lyall, *Travels in Russia*; Captain Jones, *Travels in Norway, Sweden, Finland, Russia, and Turkey*.)

CRINAN CANAL, Argyshire, a canal connecting the Lochgilp

branch of Lochfyne with the Sound of Jura, and constructed for the purpose of enabling vessels of small burden to dispense with the rather dangerous passage round the Mull of Cantyre. The project of forming this canal was first started about sixty years back with the co-operation of the then Duke of Argyll. Sir John Rennie having surveyed the ground and reported favourably an Act of Parliament was obtained, a company was formed in 1793, and the works were forthwith commenced. The canal was opened in 1801. The canal although not more than 9 miles in length has been of great service to the coasting trade of the west of Scotland and the Highlands; the original shareholders of the canal company however have never received any return for the outlay of their capital. The number of locks in the Crinan Canal is fifteen; the average breadth is 24 feet, and the depth of water 10 feet; if found necessary 12 feet depth of water could be maintained. Since 1818 the canal has been under the management of the Commissioners of the Caledonian Canal, with the navigation of which it is intimately connected; together these canals form an important portion of the inland passage between Glasgow and Inverness. Vessels of 200 tons burden can pass through the Crinan Canal.

CROATIA (Horvath Orszag), a former province in the south of Austria, now forms with Slavonia a crownland of that empire. It lies between 44° 5' and 46° 25' N. lat., 14° 20' and 17° 25' E. long., and extends in a north-easterly direction from the shores of the Adriatic to the banks of the Drave and Save. It is bounded N. by Lower Styria and Hungary, E. by Slavonia, S. by Turkish Croatia and Dalmatia, and W. by Illyria and the Adriatic. The whole crownland is divided into six palatinates, which are named from the chief town in each, and of which the area and population, according to the cadastral returns and census of 1850 and 1851, are as follows:—

Palatinates.	Area in Square Miles.	Population in 1851.
Agram	1936	234,540
Fiume	476	86,810
Kreutz	658	82,446
Varasdin	990	201,624
Essegg	2030	102,456
Posega	951	67,574
Total	7041	868,456

Besides the area here given, a wide zone, comprising no less than 7500 square miles and containing a population of 670,655 under a military form of government, extends along the south of Croatia and Slavonia, and constitutes a part of the defensive barrier which Austria has established against Turkey under the name of the Military Frontier. Under this head [MILITARY FRONTIER] the peculiar institutions of this district and its towns will be noticed, but the present article contains a notice of the physical character of the whole crownland.

Croatia is divided into two distinct parts by the Save, which receives the Kulpa and the Unna on its right bank and the Illova on the left. To the north of the Save the surface presents some rather extensive plains, bounded N. by the Reka Mountains, an offset of the Carnic Alps, of no great elevation, which here forms the watershed between the Save and the Drave. Between the Reka Mountains and the Drave, which separates the crownland from Hungary, the country is level. Near the eastern boundary, between the Illova and its feeder the Longa, there is a mountain mass called Mount Garik, which is but slightly connected with the Reka Mountains on the north, and rises to about 2500 feet in height. The principal rivers of the country have been already named; they are all navigable with the exception of the Illova, and all of them are subject to floods which inundate the plains through which they flow, and in some places form large marshes.

Besides the principal rivers just named, Croatia is watered by many other rivers and streams, most of which rise within its confines; such as the Krapina, Korana, Odra, &c., nearly all of which flow into the Drave or Save; the Zernanya and Fiumara, which fall into the Adriatic.

Many of the valleys, especially on the southern ridge, are entirely closed, and the streams which traverse them not having a vent, find their way to different rivers by subterraneous channels, and often inundate the surrounding country. Some of these valleys are inhabited by a half-savage race, and abound in picturesque waterfalls. The Szluinchicza forms above forty beautiful cascades.

South of the Save the country is very mountainous. The Julian Alps enter the crownland on the west and terminate in Mount Kleck (nearly 7000 feet high), whence the Kapella Mountains run from north-west to south-east, connecting the Julian with the Dinaric Alps, which separate Croatia on the south-east from Bosnia. The highest parts of the Kapella Mountains and of one of its principal offsets to the eastward called Pliassivitzza, do not exceed 5800 feet above the sea level. The eastern and north-eastern parts of these mountains are furrowed by innumerable dells, ravines, and valleys, traversed by rapid streams, all feeders of the Kulpa. About

Carlstadt, where many of these tributaries join the Kulpa, the country is level; it is tolerably level also between Carlstadt and Agram, and along the lower Kulpa, which joins the Save a little east of Petrinia, a town of the Military Frontier with about 5000 inhabitants.

Southward from Mont Kleck another and somewhat loftier and steeper range runs at but a little distance from the Adriatic shore: in the northern part this range is called the Merzavoditza Mountains, and further south to the river Zernagna, where it terminates, the Velibitch or Wellibitz Mountains. The two ranges just noticed as springing from Mont Kleck, inclose a high cold plateau of considerable extent, watered by the Licca, the Gaczka, and other streams, which have no visible outlet, but lose themselves in the limestone rocks of which all the mountains noticed are principally composed. The road called Luisen-Strasse, which runs from Carlstadt to Fiume, crosses the barren region of the Karst, as the mass of the Julian Alps north of Mont Kleck is locally called. The limestone range traversed by the road is bare, rugged, and barren; the hills are scored by ravines, the surface is strewed with shattered fragments of rock, and the rocky plateau is everywhere penetrated with funnel-shaped hollows like craters. The land here is little cultivated, owing to the poverty of the soil. In the Karst, and all along the high plateau between the Kapella and the Velibitch Mountains, the fearful Bora rages with all its fury, sweeping everything before it; large stones, carriages, and passengers are sometimes swept by it over the precipices that flank the Luisen-Strasse. The engineering works along this road, the zigzags, terraces, and slopes cut out of the rocks, are not inferior to anything of the kind on the great roads over the Alps. On the southern side of the mountains it passes down to Fiume by a terrace or shelf cut in the eastern side of the precipice that forms one of the walls of the ravine of the Fiumara. This ravine is called the Porta Hungarica, or 'Gate of Hungary.'

The greater part of the mountains consists of limestone, with various kinds of beautiful marble, porphyry, serpentine, &c., which furnish excellent materials for building; all the bridges and parapets of the Luisen-Strasse, and most of the houses at Fiume, Segna, and Porto-Ré, are constructed with this stone. The most common is a blackish-gray marble, which emits a fetid smell on being rubbed. Croatia contains many mineral springs. Its minerals comprise copper, iron, lead, coal, and salt; gold is obtained from the sand of several of the rivers, especially the Drave.

The climate of Croatia varies considerably in different parts. The southern and more sheltered districts, and the narrow tract between the Merzavoditza Mountains and the Adriatic coast, from Fiume to Segna, enjoy an Italian climate, and produce the olive, fig, grape, and almond. Here the vintage takes place in August, but in the western highlands beyond the Kulpa the harvest does not commence till the end of August or beginning of September, when the snow begins to fall, which does not melt till April or May. On the higher summits it frequently lies the whole summer. But even in the southern regions the winter is very severe, owing to the vicinity of the high Alps. Several islands in the Gulf of Quarnero lie off the coast of Croatia; the principal of them are—Veglia, Arbe, Cherso, Lussini, and Pago. Between the islands and the mainland stretches the long narrow channel of Morlacca.

The scourge of this country is the wind called Bora, which blows from the north or north-east, and generally sets in between seven and eight A.M. and ceases at four or five P.M. It is accompanied by excessive cold, and blows with such violence that large stones are rolled by it to a great distance.

The eastern and northern parts of Croatia, which are more level and less mountainous, and especially the parts watered by the Drave and Save, are very fertile in various kinds of grain, particularly barley, maize, and oats; the soil is also very favourable for fruits, among which the Damascene plum furnishes the favourite drink of the Croats. Croatia has immense forests of oak and beech, and the great rivers just named in many parts of their course roll along under the shadow of primeval forests. Flax, hemp, and tobacco are only grown in sufficient quantity for domestic consumption. The vine is cultivated, and a good deal of wine is made. Horticulture and gardening are very little attended to; the same may be said of the rearing of horned cattle and horses, except in the palatinates of Agram and Warasdin. The flocks are neither numerous nor of choice breeds. Considerable herds of swine are reared, for which the forests afford plenty of food. The fisheries of the rivers are very productive; much wax and honey are collected. Only a very small portion of the inhabitants is engaged in manufactures, and these are of the rudest description. As Croatia does not raise more produce than suffices for its inhabitants, its commerce is chiefly confined to the transit trade. Besides the great road already mentioned, a road runs from Carlstadt to Agram and to Laybach in Illyria; another, the Josephine, leads to Segna on the Adriatic, whence a road runs along the Litoral (or narrow strip of land that intervenes between the Morlacca channel and the mountains) to Fiume. South of Segna the mountains lie close upon the coast, and the road runs into the interior on the eastern side of the Velibitch Mountains down to the valley of the Kerka, in Dalmatia; it then turns to the coast and terminates at Zara. Through Warasdin there is a road up the valley of the Drave to Klagenfurt.

The inhabitants are Roman Catholics and Greek Catholics. The former are under the Bishop of Agram, and the latter have their own bishop, who resides at Creutz. The public system of education is that of the national schools, which are divided into elementary, head, and normal. There are two gymnasia at Agram and Warasdin, and a superior academy or college at Agram, which has also a seminary of theology for candidates for orders in the Roman Catholic and Greek-Catholic Church. Although brought into more regular discipline by the Austrian government, the Croats still retain their taste for war. Those who live at some distance from the Turkish frontiers have adopted more industrious habits. Their untutored state is accompanied by many traits of virtue and generosity, and great fidelity to their sovereign. Notwithstanding their revolt against Austria in 1755, on account of certain innovations, their despair was indescribable when they found themselves united to France in 1809. Their dwellings are merely large barns, without either window or chimney, where the family and the swine lodge under the same roof.

Slavonia, the eastern part of the crownland, is separated from Hungary by the Drave and the Danube, from Turkey by the Save, and it has the Illova on part of the western frontier towards Croatia. The territory thus bounded is divided into two parts, the province of Slavonia, and the Slavonian Grinzland, or Borderland. The province of Slavonia is divided into the two palatinates of Posega and Esseg or Eszek; the latter includes the former county of Sirmia. A chain of high mountains coming from Croatia traverses the country. Where this chain enters Slavonia the valleys are narrow, but they gradually become more open, and form near Posega a wide plain bounded by lofty mountains, which is called the Posega Valley; but at the eastern frontier of this palatinate the branches of the mountains again join in one principal chain, reaching the height of 2500 feet, which covers all the northern part of the county of Sirmia. This chain is covered with vast forests. The remaining part of Slavonia consists partly of fertile eminences planted with vines and fruit-trees, and partly of beautiful and extensive plains. But as many tracts of land on the Save and Drave are very low, they are subject to be frequently overflowed, and there are several large and small pieces of stagnant water and extensive marshes near those rivers. Along the right bank of the Danube there are forests in many places; and the course of the Save is densely shrouded with them. These forests contain a vast quantity of excellent oak timber. The country produces corn of all kinds, hemp, flax, tobacco, and great quantities of liquorice. There are whole forests of plum-trees; chestnut, almond, and fig-trees are likewise common, and the white mulberry abounds. Slavonia is rich in useful domestic animals. The horses are small, and sheep are not numerous. Of wild animals, the bear, wolf, fox, polecat, and vulture are common. Swarms of mosquitoes and other troublesome insects are bred in the marshes, and a long continuance of southerly winds sometimes brings locusts. The only minerals of which there are considerable quantities are sulphur, limestone, coal, salt, and iron. It may be said that there are no manufactures in Slavonia. The peasant makes all his farming implements—his cart, his plough, &c.; and his wife and daughters weave cloth and knit stockings for the family. In so fertile a country agriculture and the breeding of cattle are the most profitable occupations of the inhabitants. The culture of silk is flourishing. The quantity of wine produced is very large; the county of Sirmia, where the vine was planted in the 3rd century by the soldiers of the emperor Probus, alone produces about 6,000,000 gallons annually. The wines, both red and white, are spirituous, and not well-fitted for export. The exports are corn, tobacco, spirits distilled from plums, raw silk, honey, wax, liquorice, gall-nuts, madder, raw hides, oak staves, hoops, salt, oil, and fruit; oxen and swine are exported in large numbers. The trade is chiefly with Austria and Turkey. The chief imports are iron, salt, and oil. Steamboats ply on the Drave, Save, and Danube.

The Croatian language is a dialect of the Slavonian; it resembles the Bohemian and Moravian, and bears a great affinity to the Polish.

Towns.—In the palatinate or county of Agram the chief town is AGRAM, the capital of the crownland, and the residence of the Ban or Viceroy, and of the commandant of the Military Frontier. *Carlstadt*, or *Karlovecz*, at the junction of the Kulpa and the Korana, 34 miles S. by W. from Agram, has 4400 inhabitants. It is strongly fortified, and further defended by a baronial castle. Besides the fortress there is an outer town and a suburb. The three roads to Fiume, Segna, and Karlopago on the Adriatic, and the Kulpa, which is navigable from this town, facilitate the communication with the rest of the crownland. Carlstadt has an active transit-trade, some good public buildings, and manufactures of rosoglio. At the junction of the Kulpa with the Save are the remains of an old Roman town, *Siscia*, now called *Alt-Sizek*.

In the palatinate or county of Warasdin the chief town is *Warasdin*, which stands about two miles from the right bank of the Drave; it is surrounded by walls, is well built, and contains many fine edifices, among which are several churches, a synagogue, county-house, and a bishop's palace. The town has a gymnasium, several schools, and a population of 9000. Good wine and tobacco are produced in the environs.

In the palatinate or county of Krentz or Creutz, lying east of the two preceding, the chief town is *Creutz*, which stands between the *Lunga* and the *Glogovnicza*, feeders of the *Sava*, 30 miles N.E. from *Agram*; it is the seat of a Greek-Catholic bishop, and has above 3000 inhabitants. *Kopreinitza*, in the valley of the *Drave*, is strongly fortified, and has 3200 inhabitants.

In the palatinate of *Fiume*, formerly called the *Litorale*, the chief town is *Fiume*, the principal port of the crownland, which is described in a separate article. [FIUME.]

Of the palatinate or county of *Posega*, which comprises the west of *Slavonia*, the chief town, *Posega*, stands on the *Orlawa*, a feeder of the *Sava*, and has a gymnasium, and 7000 inhabitants. Tobacco, silk, and wine are the chief products of the *Posega Valley*.

The palatinate of *Esseg* includes the former counties of *Verovicz* and *Sirmia*. The county of *Verovicz* occupies the northern slope of the *Reka Mountains*, extending along the right bank of the *Drave* to its junction with the *Danube*. Its chief town is *Essek*, or *Ezek*, which is noticed in a separate article. [ESZEK.] *Diacovar*, S. of *Eszek*, a small place of about 3000 inhabitants, and the seat of a bishop; *Verovicz*, or *Veröcze*, in the north-west of the province, is a market-town, with a castle, and a population of 3200; and *Dallja*, or *Dallya*, a village on the right bank of the *Danube*, with about 3000 inhabitants partly engaged in the sturgeon fisheries; are the only other places worth mentioning.

In the county of *Sirmia*, which lies east of the other two, and is traversed by the chain of hills that forms part of the watershed between the *Danube* and the *Sava*, the soil is very fertile, except in the mountains south of *Karlowitz*. It contains the towns of *Vukovar*, at the mouth of the *Vuko*, population 6000; *Illok*, or *Ujlak*, a steam-packet station farther down the *Danube*, here a mile wide, population 3500; *Kamenitz*, 2 miles from *Peterwardein*, population about 2000; *Ireg*, in a fine wine country on the south slope of the *Karlowitz Mountains*, population 5000; *Ruma*, 5 miles S. from *Ireg*, 38 miles W. by N. from *Belgrade*, on a small affluent of the *Sava*, population 6200.

A small portion of *Slavonia* stretches north of the *Danube* along the right bank of the *Theiss* to the point where this latter river is joined by the *Franzens Canal*. This district is noticed under the head *MILITARY FRONTIER*. The towns *Karlowitz*, *Peterwardein*, and *Senlin* will be given also under that head or in separate articles.

The ancient inhabitants of *Croatia* were the *Pannonians*, after the conquest of whom by *Augustus* it became a province of *Illyria*. The *Goths* took possession of it A.D. 489, then the *Avars* or *Abares*, and in 640 the *Croatians*, a tribe of the *Wends* from *Bohemia*, who were anciently called *Horvather*, *Hrovathes* or *Chrobates*, settled in it, and gave their names to the country. They subdued the former inhabitants of *Illyria* and *Noricum*, and being reinforced by bodies of their countrymen, they founded the *Duchies* (or in their idiom 'Zupanics') of *Carinthia*, *Friuli*, *Liburnia*, or *Croatia Proper*, *Jadra* in *Dalmatia*, *Slavonia*, &c. These small states submitted to *Charlemagne*, but they generally allied themselves with the Greek emperors, although they continued to acknowledge the supremacy of the *Church of Rome*. Their first archizupan of whom history makes mention is *Crescimer*, who lived in the 10th century, and whose son, *Dircislav I.*, took the title of king of *Croatia*, which then extended also over the western part of *Dalmatia* and *Bosnia*; its capital, called *Biograd*, appears to have been situated on the shores of the *Adriatic*, according to some at the place called by the *Venetians* *Zara Vecchia*; other authorities fix upon the modern *Biograd*, *Belligrad*, or *Bielgrad*, on the small river *Pliva*, as its site. Towards the year 1100 *Croatia* was incorporated with *Hungary*.

After the middle of the 15th century it suffered greatly from the incursions of the *Turks*, but the *Croatians* being a warlike people, ravaged in their turn the *Ottoman territories*, and returned to their villages laden with spoils. *Croatia* was afterwards annexed to the *Austrian empire*, and together with *Slavonia*, *Dalmatia*, and some parts of *Hungary*, was governed by a special board at *Vienna* under the common title of *States of Illyria*. More recently *Croatia* has preserved the name only of a kingdom, having been incorporated with *Hungary*. Since the insurrectionary movements of 1848 *Croatia* has been severed from *Hungary*.

CROMARTY, Scotland, a parliamentary burgh, market-town, and port, in the parish of *Cromarty*, in the united counties of *Ross* and *Cromarty*, is situated in 57° 41' N. lat., 4° 3' W. long., on a low peninsula on the south side of the *Frith* of *Cromarty*, near its entrance from the sea; it is about 16 miles N.E. from *Dingwall*, the county town, and about 180 miles N.W. from *Edinburgh*. The population of *Cromarty* in 1851 was 1988.

Cromarty was anciently a royal burgh, but was disfranchised in 1672, and accounted only a burgh of barony. It now unites with *Kirkwall*, *Wick*, *Dornoch*, *Tain*, and *Dingwall*, in returning one member to the *Imperial Parliament*. The affairs of the burgh are managed by a town council consisting of six members. The town is irregularly built, exhibiting in its older streets and lanes the homely *Flemish* style of architecture characteristic of the old towns of the north. The chief buildings are a plain parish church, a *Gaelic chapel*, and a town-house; the last a substantial building with a hall in the upper story and a

prison in the lower, and surmounted by a dome or clock-tower. There are places of worship for the *Free Church* and the *United Presbyterians*. In the parish are some remains of ancient chapels. The harbour, formed by a pier, is near the extremity of the point on which the town stands. Vessels of 400 tons can come up to the quay. There are a hempen-cloth manufactory and a brewery. A considerable trade is carried on in salt provisions. Some of the population are engaged in the herring and white fishery. Ship-building is carried on. There are a weekly corn-market on Tuesday, and fairs in April, August, October, and November. At the mouth of the *Cromarty Frith*, and not far from the town, is *Cromarty Point*, a headland on which stands a light-house with a fixed light. The north and south headlands at the entrance of the *Frith* are known as the 'Sutors of *Cromarty*.'

(*New Statistical Account of Scotland*.)

CROMARTYSHIRE. [ROSS AND CROMARTY.]

CROMER. [NORFOLK.]

CROMFORD. [DERBYSHIRE.]

CRONSTADT (*Kronstadt*), a town, fortress, and port, in the Russian government of *St. Petersburg*, is built at the south-eastern extremity of *Cotlin-Ostrov*, an island in that part of the *Gulf of Finland* called the *Bay of Cronstadt*, 16 miles from the mouth of the *Neva*, 21 miles W. from the city of *St. Petersburg*, in 59° 59' 46" N. lat., 29° 46' 38" E. long., and has in summer a population of about 55,000, including the garrison and the marine. During the winter months, from November to April, the port is ice-bound and nearly deserted. The island of *Cotlin-Ostrov*, formerly called *Rétouzari* by the *Finlanders*, is 7 miles in length and about 1 mile in breadth. At the entrance of the harbour, on an island opposite the citadel, lies the fortress of *Cronschlott*, built by *Peter the Great*. The passage between this fortress and *Cronstadt* is 2000 paces in width, and has ample depth for the largest vessels. *Cronstadt* is the great naval station of the Russian fleet and the harbour of *St. Petersburg*. All vessels proceeding to that port are searched here, and their cargoes sealed, and such as are too large for the shallow waters of the *Upper Neva* unload their cargoes at *Cronstadt*, and transport them in smaller craft.

The town, which is built in the form of an irregular triangle, is strongly fortified on all sides. It has three harbours lying to the south of the town, all strongly defended by ramparts and bastions. The outer or military harbour, which is a rectangle, is entirely surrounded by a massive and strongly fortified mole, and is capable of containing, besides smaller vessels, above 35 ships of the line. The middle harbour is intended for the fitting-out and repairing of vessels. The hulls are generally built at *St. Petersburg* and brought here for equipment. It contains the slips, a powder-magazine, a manufactory of pitch, tar, &c. The third and innermost harbour, which has space for 1000 vessels, and runs parallel with the middle harbour, admits only merchantmen, for which there is besides an excellent roadstead immediately outside of the port, which is defended also by the citadel, constructed on a rock in the middle of the *Bay of Cronstadt*. All these harbours are well secured, but in consequence of the freshness of the sea-water no vessels can be preserved in them above twenty years. They are besides detained a great part of the year by the ice in the *Bay of Cronstadt*, which usually prevents vessels from entering after November, or leaving before the end of April, or sometimes even later. Vessels are repaired and built in the large canal of *Peter the Great*, which runs directly into the town between the middle and merchant's harbour, and receives ten large ships at once. The basin is 2160 feet long, and 26 feet deep. It is built with granite, and by means of a steam-engine can be laid dry in two days, and filled again by means of sluices in six hours. Near it are the various docks, in which ten ships can be repaired at once; the foundry, which supplies annually 1200 tons of bombs, balls, &c.; the admiralty rope-walk; tar-works; and excellent wet-docks. By the new *Catharine Canal*, commenced in 1782, which is 1880 fathoms long, government vessels are enabled to take their stores, munition, &c. directly from the store-houses. The quays of the canals and of the three harbours are all constructed of granite on a very grand scale; they were erected by the emperor *Nicholas*. The town is very regularly built, and contains many fine, straight, and well-paved streets, and several public squares. The houses however, with the exception of those belonging to government, are chiefly of one story, and built of wood. There are five Russian churches, one Lutheran, one Anglican, and one Catholic church.

The *Bay of Cronstadt* is shallow, the average depth hardly reaching 12 feet, and the bar at the mouth of the *Neva* has not more than 9 feet upon it in ordinary times.

The city has three gates, and is divided into two parts, the *Commandant* and *Admiralty quarters*, which are subdivided into four districts. Between the *Peter's* and *Catharine Canal* is the old Italian palace built by prince *Menschikof*, who took this island from the *Swedes* in 1703. It is at present occupied by the school for pilots, a large establishment, where above 300 pupils are educated for the naval service, and 20 for the merchant service. The naval hospital is a large and well-regulated institution, with accommodation for 2500 patients, and a separate building for officers of the navy. Among other public buildings may be mentioned the admiralty,

exchange, custom-house, barracks, and the house of Peter the Great, where he resided for some time. In the exception of a few old castles, which have been left in his own hands, there are no remains of the former capital.

The permanent population of Cronstadt, exclusive of the garrison, the pupils of the naval school, workmen, and sailors, perhaps does not exceed 5000. The inhabitants derive their chief support from the fleet, trade, and shipping. The town presents an appearance of great bustle and activity during the summer, but in winter all is dead and stagnant. The bay is then entirely frozen, and its surface is for six months covered by great rocks marked out by signs, and leading to the capital and other places on the Gulf of Finland.

The town and port were laid out and the buildings far advanced by Peter the Great, who founded Cronstadt in 1710, but it did not receive its present name ('The Town of the Crown') until the year 1721. At the northern extremity of the island are Fort Alexander and the Battery of St. John; the latter is built on piles.

CRONSTADT (*Kronstadt*), the capital of a county of the same name in Transylvania. The county lies immediately north of the Carpathians, which separate it from Wallachia, and is watered by the Alt and its feeder the Burze, whence the county is also called Burzenland. The Burzenland is in that part of Transylvania called 'the land of the Saxons'; its surface is traversed by the lofty chain of the Buteschescht, an offshoot of the Carpathians, which reaches in its highest summit an elevation of above 8000 feet. The climate is extremely cold in winter. The valleys and lower slopes of the mountains are well adapted for agricultural purposes. All sorts of corn and pulse, maize, millet, flax, hemp, fruits, &c. are grown. Among the minerals are gold, silver, porcelain-clay, &c. Game, fish, and bees abound. Horned cattle are very numerous. The mountain sides are clothed with fine forest timber. The population is about 100,000, composed of descendants of German settlers, Hungarians, Wallachs, Greeks, Armenians, and some Kallibassi.

The capital, Cronstadt, the largest and most populous town of Transylvania, is also called Krühnen, Krünne, and Krohne, and in ancient records Brassó. It stands near 45° 36' N. lat., 25° 33' E. long., 70 miles E.N.E. from Hermannstadt, in a narrow valley, inclosed by mountains, at an elevation of 1896 feet above the level of the sea. It is defended by a strong castle on the bank of the Farkas. The inner town, which has the form of a rectangle, is well built, and surrounded with towers, walls, and ditches; it contains about 615 houses, and has a population composed entirely of Saxons or their descendants. It was built in the beginning of the 14th century, when it was called Corona. There are three suburbs, the Altstadt, the Bolounya or Brassovia, and the Upper Town, or Bolgár, which consists of 1500 houses partly built on hills amidst orchards and gardens, and inhabited chiefly by Wallachs. Including these suburbs, Cronstadt has above 3400 houses and about 36,000 inhabitants. The inner town has 5 gates, 6 principal streets which are straight and regular, and a spacious market-place with 2 fountains. Among the chief buildings are the Protestant church, a striking edifice erected in 1383 in the gothic style. It is 112 paces long, 59 paces broad, supported by 22 Tuscan columns, and surmounted by a tower 138 feet high, in which is a bell 6½ tons in weight. The Roman Catholic church of St. Peter and St. Paul was built in the Italian style in 1766-82. The remaining buildings of note are the town-hall, in the market-place, with a handsome tower; the old Lutheran church of St. Bartholomew; the Gymnasium; and the great mart, or Kaufhaus, which was erected in 1545. This mart was until lately the general place of rendezvous for German, Hungarian, Armenian, Greek, Turk, Wallach, Jew, Gipsy, and Bulgarian traders, who assembled here to expose their goods, while Turkish money-changers were seated outside and around the market-place for the exchange of Austrian and Turkish coins; but the trade of Cronstadt has recently much declined.

Cronstadt contains a Lutheran gymnasium with a library, a town-hall, barracks, two Greek and two Roman Catholic churches, a Calvinistic church, a Roman Catholic high school, a military academy, a normal school besides various elementary schools, two hospitals, a house of correction, and a house of industry.

The inhabitants manufacture linens, cottons, coarse woollens, stockings, and woollen hobbins. There are a paper-mill and two wax-bleaching grounds. Cronstadt was the first place in Transylvania where a paper-mill and printing-press were established; the earliest works issued from the latter were the 'Augsburg Confession' and the writings of Luther.

Cronstadt carries on a considerable transit trade in Austrian and Turkish produce; cattle and wine from Wallachia; manufactured goods; corn, salt, &c.

CROOKED ISLANDS. [BAHAMAS.]

CROOM, county of Limerick, Ireland, a small town and the seat of a Poor-Law Union in the barony of Coshma, is situated on the river Maigue, in 52° 32' N. lat., 8° 43' W. long., distant about 11 miles S.S.W. from Limerick. The total population in 1851 was 1357. Croom Poor-Law Union contains 20 electoral divisions, with an area of 83,328 acres, and a population in 1851 of 27,209. The town is very ancient, and derives its name from Croom, the Celtic god of thunder. There are some Druidical remains and a ruined round tower in the neighbourhood. At Croom is an old castle of the Fitzgeralds, which

was built by the Duke of Devonshire, and is now represented by the Duke of Devonshire. The motto 'Croom-a-bee' (Croom for ever) has been usually repaired, and is now inhabited. There are here a bridewell and a public house. Fairs are held on May 3rd, June 22nd, September 1st, and December 5th.

CROON, [CALABRIA.]

CROTON, or CROTONA. [CALABRIA.]

CROYDON, [SURREY.]

CROYDON, Surrey, a market-town and the seat of a Poor-Law Union, in the parish of Croydon and hundred of Wallington, is situated on the river Wandle, in 51° 22' N. lat., 0° 5' W. long., 9 miles S. from London by road, and 10 miles by the London and Brighton railway. The population of the town of Croydon in 1851 was 10,260. The parish is under the management of a Local Board of Health. The living is a vicarage in the archdeaconry of Maidstone and diocese of Canterbury. Croydon Poor-Law Union contains 11 parishes and townships, with an area of 33,559 acres, and a population in 1851 of 31,901.

The name Croydon, which in Domesday Book is Croinedone, appears to be derived from the locality of the town on the edge of the chalk (*croie*, chalk, and *dune*, hill). The situation, from its contiguity to the Banstead Downs, is pleasant and healthy. At the Norman Conquest the manor of Croydon, with a royal palace, was given to Lanfranc, archbishop of Canterbury. This palace during a long period was a chief residence of the succeeding primates. It was built of timber, and was in 1278 in its original state. No part of the present structure is older than the 14th century, and large portions of it were rebuilt by archbishops Wake and Herring. In 1780 it was sold and became a calico manufactory, and the gardens were used for bleaching grounds; to which use the buildings and grounds are still applied. The old chapel is now used as a school of industry for girls. The present summer residence of the Archbishop of Canterbury is three miles and a half from Croydon, at the mansion in Addington Park, which stands on the site of a hunting seat of Henry VIII. On a hill towards Addington is a cluster of twenty-five tumuli; and on Thunderfield Common is a circular encampment inclosing with a double moat an area of two acres. Gold coins of Domitian, Valentinian, and other Roman emperors have been found in the neighbourhood.

The town of Croydon consists of a principal street about a mile in length, forming part of the main road to Brighton, the houses in which are rather neat and well built; and of an 'old town,' which lies on the west of the main street, and consists of a few narrow streets of mean houses. The town-hall and the jail are commodious and substantial stone buildings; the barracks have extensive accommodation for artillery. The parish church of St. John's, erected in the 15th century, is one of the largest and finest churches in the county. It is built of freestone and flint, with a lofty embattled tower at the west end, surmounted with pinnacles. The interior contains several magnificent monuments of the archbishops there interred; those of Sheldon and Whitgift may be especially noticed. Two other churches have been recently erected. The Independents, Baptists, Wesleyan Methodists, Quakers, and Roman Catholics have places of worship. There are National, British, and Infant schools; a literary and scientific institution with a library; a dispensary; and a savings bank. There are several ancient charitable foundations, the principal of which are the hospital or almshouse of the Holy Trinity, built by Archbishop Whitgift in 1596, and well endowed, for the maintenance of 34 decayed housekeepers; and a school for girls, founded by Archbishop Tennyson. The East India Company's College of Cadets, at Addiscombe House near Croydon, has 14 professors and masters, and about 140 students. The summer assizes are held at Croydon alternately with Guildford. A county court is held in the town. Saturday is the market-day; fairs are held on July 6th and October 2nd. The October fair is noted for the sale of walnuts. Shirley Park, the residence of Lord Eldon, is in the neighbourhood of Croydon.

(Manning, Surrey; Brayley, Surrey; Lysons, Environs of London; Communication from Croydon.)

CRUMLIN. [ANTRIM.]

CRUZ, SANTA. [SANTA CRUZ.]

CRUZ, VERA. [VERA CRUZ.]

CSONGRA'D, a market-town in Hungary, gives name to a county, and is situated on a neck of land opposite the confluence of the Körös and Theiss, in 46° 43' N. lat., 20° 9' E. long. It is well-built, and had in 1845 about 14,000 inhabitants, who live chiefly on the produce of their vineyards, rearing cattle, and trading with other parts of Hungary. The old castle is fallen into complete decay. The county court is now held at Szegedin.

CTESIPHON, a large city of Assyria, situated on the left bank of the Tigris, 18 or 20 miles from the present Baghdad, was the winter residence of the kings of Parthia. (Strabo, p. 743 c; Tacitus, 'Ann.' vi. 42.) They preferred Ctesiphon in the winter on account of the mildness of the climate; in summer they resided at Ecbatana or in Hyrcania. The town appears to have been founded by Vardanes, but who he was or when he lived is unknown. (Ammianus Marcellinus, xxiii. 20.) It was a place of little consequence however till the establishment of the Parthian empire, and it then rose to eminence on the decay of the neighbouring city of Seleucia. Ammianus ascribes the embellishment of the city to Pacorus, son of Orodes. It

long remained a place of considerable importance, especially after the restoration of the Pagan empire under the Sassanids. It was taken by the emperor Severus, A.D. 195, and its walls have been very large, for Severus carried off 200,000 pounds of gold. Its walls rendered it a strong place down to the time of Gallienus. Its later history is unknown. Near the ruins some remains, called *Tak Kera*, or Arch of Khosrow, are described by Ives and other travellers, and which is supposed to have formed part of a palace of one of the Sassanids. The name of the city is now called by the Arabs *Al Madain*.

CUBA is the largest of the islands which constitute the Columbian Archipelago, and now the most important colony of Spain. The most eastern point, Cabo Maysi, is in $74^{\circ} 11'$ W. long., and the most western, Cabo San Antonio, $84^{\circ} 58'$ W. long. Cabo de Cruz, the most southern point, is $19^{\circ} 47' 16''$, and Cabo de Guaneros, east of Matanzas, the most northern point, $23^{\circ} 9' 27''$ N. lat. The length of the island from Cabo Maysi to Cabo San Antonio, along the curved line, is 793 miles. It is widest near the meridian of 77° , where between Punta Maternello on the northern coast, and the mouth of the Rio de la Magdalena, near the Pico Tarquino, it is 127½ miles across. Between Puerto Principe and the Havana, which tract comprehends about four-fifths of the island, it is only 52 miles wide on an average. The western extremity is still narrower, the isthmus between the Havana and the port of Batabano being only 28 miles across. The area of Cuba alone is 42,383 square miles; and the islands which are inclosed within the numerous reefs that surround it have an area of about 1000 square miles. The population according to the latest census, 1841, was 1,007,624; of whom 418,291 were whites, 88,054 free-coloured persons (mixed races), 10,974 coloured slaves, 64,784 free negroes, and 425,521 negro slaves.

Coast-line, Surface, &c.—The coast-line of Cuba is above 2000 miles, but hardly one-third of it is accessible to vessels; the remainder is surrounded by banks, reefs, and rocks. The coast from Cabo de Cruz to Cabo de Maysi is quite free from danger; and that from Cabo Maysi to Punta Maternello has only a few rocks. At Punta Maternello commence the numerous keys of the Old Bahama Channel, which extend for more than 300 miles to Punta de Icaicos. In this part, or more precisely opposite the Cayo Cruz and Cayo Romano, the Old Bahama Channel is narrowest, being only from 15 to 20 miles across. Between the keys and Cuba is an open sea, which may be navigated by small vessels. From Punta de Icaicos to Bahia Honda, west of Havana, the coast is again free from keys and rocks. To the west of Bahia Honda commences the series of shoals and rocks called Los Colorados, which extend to Cabo San Antonio. Thence to Punta de Piedras or Llana Punta, the high coast is free from shoals and rocks; but the keys and shoals commence again to the west of the Isla de Pinos, and extend to Cabo de Cruz, under the names of Jardinillos, Cayo Breton, Cayos de Las Doce Leguas, and Bancos de Buena Esperanza. Only the coast between Cochinos Bay and Puerto Casilda, near Trinidad, forms an exception, being free from banks and rocks. In the Bay of Xagua, about 30 miles east of the Jardinillos, a spring of fresh-water is said to rise in the sea with such force that boats cannot approach it without danger. It is visited by the manati. In the sea between the northern coast of Cuba and the Florida Reef, the Gulf Stream commences, but here its current is not strong, and sometimes is hardly perceptible.

Only the south-eastern part of Cuba, that which lies between Cabo de Cruz, Cabo Maysi, and the town of Holguin, is mountainous. This mountain group is called Sierra or Montañas del Cobre (Snake Mountains), and probably in its highest parts rises more than 7200 feet above the sea. On the southern coast the Pico Tarquino also rises to a considerable height. From the Pico Tarquino group a chain of hills of moderate elevation runs in a west-north-west direction, between Puerto Principe and Villa Clara, approaching at first nearer to the southern, but afterwards more to the northern shore. To the north-west of Trinidad stand the Lomas de San Juan, which terminate in peaks and needles, and rise to about 1800 feet above the sea. The elevations of the hills seem to decrease as we advance westward. To the west of the meridian of Matanzas there is only one summit that attains 1200 feet. In this part the surface of the island is slightly undulating; rising in general only to from 250 to 350 feet above the sea. Along the southern coast large tracts of low country occur. The whole space between Batabano and Xagua is nothing but a low swamp, which extends three or four miles inland.

There are no rivers of any size or importance in Cuba. Some are navigable a few miles inland for small boats; others are used for irrigating the adjacent fields. The internal traffic, formerly greatly impeded by the badness of the roads, has been much facilitated by the introduction of railways, of which there are now nearly 900 miles in operation.

Geological Character.—Calcareous rocks of varied kinds and quality are the prevalent and characteristic formations of the island. But granite occurs in the south-eastern part; and schistose rocks occur about the middle of the northern coast. Carboniferous strata are found at the western end of the island. Clays and clay-slates are met with in several places.

Of the metals, copper is that which appears to be of most value. In the Eastern Intendencia, where it is now worked largely by

English capitalists, it has hitherto proved most profitable. The ore has been found near Matanzas, Cienfuegos, Villa Clara, and elsewhere. Gold has been found in the Sierra del Cobre, and in many of the mountain streams. Lead, said to be rich in silver, has been discovered. Coal is worked in the neighbourhood of Havana, and occurs in some other places. Marble of much beauty is quarried; and crystal, flint, and clay of a kind very serviceable for the arts, are obtained.

Climate, Soil, and Productions.—Cuba partakes to some measure of the climate of the temperate zone, as is proved by the sudden changes in temperature. It is, however, in some respects, resembles the United States. Humboldt mentions a change of 10 degrees in the course of three hours. The mean annual heat at the Havana is 77° , that of the hottest month (July) 84° , and that of the coldest 70° : the thermometer rarely rises to 94° , or sinks to 55° . In the interior of the island thin ice is formed after the long prevalence of northerly winds, at places about 300 feet above the sea. No snow is ever known to fall, either on the Lomas de San Juan, or on the Sierra del Cobre. Hailstorms are rare; they occur only once in fifteen or twenty years, and always with south-south-westerly winds. Hurricanes are less frequent in Cuba than in Jamaica and the other Antilles. Sometimes none occur for six or eight years. They vent their fury more on the sea than on the land, and happen, as in Jamaica, more frequently on the southern than on the northern coast. They occur mostly in October, but sometimes in August and September. But Cuba, though not often experiencing their ravages, is exposed to the boisterous north winds (los nortes), which blow particularly during the cold months. The division of rainy and dry seasons is not applicable to this island. No month of the year is free from rain, but the greatest quantity falls during May, June, and July. Earthquakes frequently occur.

The soil throughout the island is mainly formed from the decomposition of calcareous rocks, and is generally of very great fertility. The cereals of Europe are little cultivated in any part of Cuba, and a great quantity of flour is consequently imported from the United States for the consumption of the white inhabitants. The slaves and people of colour live principally on manioc, yams, bananas, maize, rice, potatoes, sweet potatoes, &c. The articles raised for consumption and exportation are chiefly sugar, coffee, tobacco, with some cotton, cocoa, and indigo. Oranges, lemons, pine-apples, and various other fruits are largely grown. As immense tracts are not cultivated, but only used as pasture ground, the number of cattle is very great, it is said nearly a million and a half; hides form an article of exportation, but dry meat (tasajo) is imported from Venezuela. The surface under cultivation probably does not exceed one-twelfth: the uncultivated part contains large prairies or savannas, on which the cattle pasture, but the greatest part is overgrown with large forest-trees, some of which supply excellent timber for ship-building.

Commerce.—About 1780 the exportation of Cuban produce amounted to little more than two millions of Spanish dollars in value. In 1842 the exports had increased to upwards of 26 millions of dollars, and the increase has since been still greater. The chief articles of export are sugar, coffee, and tobacco. In 1760 the produce of sugar and coffee together amounted to 5 millions of pounds: in 1847 the quantity of sugar exported alone amounted to 575,232,000 lbs., and the subsequent removal of the sugar duties in England has greatly stimulated this branch of Cuban commerce. Of leaf and cut tobacco and cigars the quantity annually exported amounts to several millions of pounds. Of coffee the present average exportation is upwards of 35 millions of pounds annually. Cotton is also a considerable article of export. The other exports are molasses, rum, cocoa, mahogany, cedar, hides, fruit, &c.

The chief articles of importation are provisions, particularly flour, rice and maize, butter and cheese, tasajo and hams, and salted fish and cod. Brandy and the wines of Spain, France, Portugal, and Germany also form a considerable branch of importation. As Cuba has no manufactures besides those of sugar and cigars, with a small quantity of rum, it imports to a large amount cotton stuffs, woollen goods, linens and silk stuffs, hardware, mill-work, and machinery.

The total amount of customs duties received in 1850 was 6,729,685 dollars; in 1851 it was 8,462,834 dollars.

Within the last few years England from holding but a subordinate has risen to take a leading share in the commerce of Cuba, or at least in its export trade; America still holds the first place in the import trade. Spain comes next to England and the United States. Having lost all her colonies on the continent of America she endeavours to turn to advantage her possession of Cuba, to which she sends her wines, oil, and fruits. The Hanseatic towns of Germany exchange their manufactured goods (linens, paper, glass, &c.) for sugar, coffee, and tobacco. France sends great quantities of wines and some manufactured goods; and Italy sends oil, olives, and fruits.

The total value of the exports from Cuba averages about 7,000,000l.; that of the imports is generally somewhat greater. The value of the imports into Cuba from the United States in 1853 is stated to have been 6,552,582 dollars; that of the exports 12,076,408 dollars. The value of the imports from Great Britain into Cuba in 1851 was 1,164,177l.; in 1852 it was 1,033,396l. The chief English imports in 1851 were:—Linen goods, 369,181l.; cotton goods, 345,549l.; woollen

goods, 38,525*l*.; hosiery, 38,100*l*.; silks, 19,168*l*.; machinery, 79,290*l*.; iron and steel (unwrought), 68,826*l*.; hardware and cutlery, 47,288*l*.; brass and copper manufactures, 27,249*l*.; earthenware, 28,255*l*.; oil, 20,035*l*.; beer and ale, 14,349*l*. The chief exports to Great Britain in 1851 were:—Sugar, 830,385 cwts.; molasses, 222,177 cwts.; rum, 51,096 gallons; tobacco (unmanufactured), 472,769 lbs.; manufactured tobacco and cigars, 272,505 lbs.

HAVANNA is by far the most important commercial town. Matanzas, Santiago, and some other places also carry on a considerable export and import trade.

Cuba, as we have already mentioned, has no manufactures. These of cigars and sugar, which are carried on upon an extremely large scale, and of rum, which is prepared only to a limited extent. The Cuba cigars, and especially those of Havana, have as is well known the highest value in the market, and the manufacture employs a very large number of hands. We do not however possess any reliable details of recent date.

Divisions, Towns, &c.—The island is divided into three intendencias, the titles of which sufficiently indicate their relative positions; they are as follows (the population of the towns is that of 1841):—

1. The Western Intendencia comprises an area of above 10,300 square miles, and contains numerous tobacco, sugar, and coffee plantations, and a great deal of pasture land, on which large quantities of cattle are reared. Besides the capital, HAVANNA, it contains the towns of *Guanabacoa*, on the other side of the Cay on which Havana is built, with about 9000 inhabitants; and *Matanzas*, or *San Carlos de Matanzas*, which contained 18,991 inhabitants. Matanzas is next to Havana the most important commercial town in the island. The town is well built and the harbour is well sheltered. The sugar exported from Matanzas averages nearly 4 million dollars in value. Molasses, rum, brandy, and coffee are also exported. To this intendencia belongs the *Isla de los Pinos*, 900 square miles in extent, with a mountain on it rising to more than 8000 feet high. It contains from 200 to 300 inhabitants; fine forests, in which much mahogany is cut; and valuable marble quarries.

2. The Central Intendencia has an area of upwards of 17,100 square miles, has many plantations of sugar and coffee, and breeds large herds of cattle. It is the most fertile portion of the island, especially about Santo Espiritu, and has greatly increased in population and agriculture since the ports have been opened to foreign commerce. The most populous places are inland, namely, *Santa Clara*, with 6132 inhabitants, and *Santo Espiritu*, with 9184 inhabitants. The capital, *Santa Maria de Puerto Principe*, population 24,034, is also at some distance from the shore, but carries on a considerable commerce by means of its port Nuevitaa. It is the seat of the supreme court of justice for all the Spanish colonies in America. There are besides, on the northern coast the harbour of *San Juan de los Remedios*, with 4313 inhabitants; and on the southern *Trinidad de Cuba*, with 12,718 inhabitants, and *Fernandina de Xagua*.

3. The Eastern Intendencia has an area of above 14,800 square miles: it has a large number of coffee and sugar plantations, but breeds much fewer cattle than either of the other intendencias. *Santiago de Cuba*, the ancient capital, has a good harbour and 24,753 inhabitants. The town is well built, the houses are chiefly of stone, and the streets are wide. It is the seat of the archbishop and of the governor and authorities of the intendencia, and contains a cathedral, several churches, convents and schools, a college, and an hospital; but the public buildings, as well as the dwelling-houses, were greatly injured by a severe earthquake which occurred August 20, 1852 and several succeeding days. There are also three other harbours, which are much frequented by vessels: *Manzanillo*, north-east of the Cabo de Cruz, population 3299; *Baracoa*, population 2605, near Cabo Maysi, from which a considerable quantity of tobacco is exported; and *Gibara*, farther west. Gibara is the port of Holguin, a small town in the interior.

Government, Laws, &c.—The civil and military government of the island, subject of course to the authorities in Spain, is entrusted to a captain-general. In civil matters however the eastern and central intendencias are presided over by governors, who are nearly independent of the captain-general, whose civil jurisdiction is mainly confined to the western intendencia. There are also military chiefs of the three intendencias, but they are directly subordinate to the captain-general. The laws are administered by a royal court ('real audiencia'), which has the superior jurisdiction in all civil and criminal cases; by provincial 'ayuntamientos'; and in the country districts by a kind of police courts.

The revenue averages upwards of 12 millions of dollars. About three-fifths of it are derived from customs duties, which are levied at a fixed ad-valorem rate on almost all articles imported, and on the principal articles exported. The remainder is derived from the sale of crown-lands, stamps, lotteries, tithes, licences, &c. The average expenditure does not exceed 8 million dollars: the surplus receipts are transmitted to Spain.

Religion, education, and morals are invariably spoken of by travellers as being in a very low state. The church has its prelates, and other dignitaries, and is supplied with an ample number of priests, but they appear to be very generally capable of great improvement, both in learning and conduct. There are in the island two

colleges, various literary societies, and elementary schools; but these last are neither sufficiently numerous nor well enough conducted to be adequate to the duty of instructing the juvenile population.

The aborigines who inhabited Cuba in the time of Columbus were annihilated before the year 1560, though the Spaniards settled in this island only in 1511. The present population consists of whites, negroes, and mixed races. Their relative numbers have been already given. For a long period Cuba has been notorious for the extent to which the trade in slaves has been carried on in its several ports. The English government, after long continued efforts, at last succeeded, about the middle of 1853, in inducing the Spanish government to pledge itself to adopt measures for the suppression of the slave-trade in Cuba; but it would seem, if the most recent accounts from America (received March 1854) are to be depended upon, that though the captain-general appears to be anxious for its suppression, the trade is still carried on with scarcely the pretence of an effort being made by the local governors to check it.

The population is very unequally distributed over the island, nearly four-fifths of which are very thinly inhabited, especially the southern coast, except the country between Xagua and Trinidad, and that which is east of Cabo de Cruz; there are also large tracts in the interior which are only used as pasture-ground, and contain hardly more than two individuals to a square mile. The most populous portion is between the lines from Bahia Honda to Batabano, and hence to Matanzas, where nearly the half of the whole population is concentrated, and where perhaps there are 70 or 80 persons to each square mile.

The political importance of Cuba rests even more than on its extent and productions on its position with respect to the common routes of navigation. This route is marked out by the trade-winds and the Gulf Stream. Vessels returning to Europe from Jamaica, or the coast of South America, by sailing directly eastward, have to contend against the united force of winds and currents, and are scarcely able to make either the Windward or Mona Passages, which are situated respectively at the western and eastern extremities of the Island of Hayti. They are therefore under the necessity of doubling Cabo San Antonio and proceeding to Europe by the Gulf Stream. Thus the possession of Cuba gives an absolute control over the trade between Europe and all countries lying about the Caribbean Sea and the Gulf of Mexico, and consequently a great portion of the United States of America. The maritime powers have for many years seemed to hold a tacit agreement to leave Spain in the possession of Cuba, because, being the least powerful of them all, there could be no apprehensions of any attempts on her part to interrupt the free navigation of these seas. An influential party in the United States has however declared the acquisition of Cuba to be a prominent feature of its foreign policy, and to this policy the present president of the United States, in his Inaugural Speech, in 1853, gave official countenance.

Cuba was discovered by Columbus on his first voyage in 1493; in 1511 the Spaniards formed the first settlement: since that time the island has remained in their possession. In 1762 the English took the Havana, but it was restored to Spain by the peace of 1763.

(Humboldt; Ramon de la Sagra; Turnbull; *Real Sociedad Economica de la Habana*; *Memorias*; *Parliamentary Papers*, &c.)

CUCKFIELD, Sussex, a market-town and the seat of a Poor-Law Union, in the parish of Cuckfield, hundred of Buttinghill, and rape of Lewes, is situated on the old road between London and Brighton, in 51° 0' N. lat., 0° 8' W. long.; 13 miles N. from Brighton, 38 miles S. from London by road, and about 40 miles by the London and Brighton railway. The population of the parish in 1851 was 3196. The living is a vicarage in the archdeaconry of Lewes and diocese of Chichester. Cuckfield Poor-Law Union contains 15 parishes and townships, with an area of 59,485 acres, and a population in 1851 of 15,607.

Cuckfield is a neat clean-looking town. The church is spacious and handsome, of early English and decorated styles. It has an embattled tower with a lofty spire, and contains numerous monuments. In Cuckfield are chapels belonging to Independents and Baptists; also a National school and a savings bank. The workhouse has been recently rebuilt on an enlarged scale. The market is held on Friday. Fairs for cattle and horses are held on the Thursday in Whitsun-week and September 16th. Stone for building purposes is quarried near Bolmere and elsewhere in the parish. Leigh Pond, by Hurstperpoint, covers an area of more than 40 acres.

(Dallaway, *Sussex*; Horsfield, *Sussex*; *Communication from Cuckfield*).

CUDDALORE, a town in the Carnatic province, on the western shore of the Bay of Bengal, in 11° 44' N. lat., 79° 50' E. long., is built on both sides of the Pannair River. The houses on the left bank are modern, and many of them handsome. The streets on the right bank of the river, called the Old Town, are many of them spacious, and contain many good residences.

Cuddalore was taken from the French by the army under Colonel Coote in April, 1760, and remained under the government of the Nabob of Arcot until April, 1782, when it was taken by the Raja of Mysore, assisted by a body of French troops. In June, 1783, the town was attacked by a British force under General Stuart, which suffered great loss in attempts to carry the place by assault. The last

of these attacks, in which the besiegers lost 600 men, occurred only two days before the arrival of the news of peace having been concluded between France and England: this event of course put an end to hostile operations. Cuddalore, with the remainder of the province, came into possession of the English by treaty in 1801, and has continued. [CARNATIC.]

(Rennell, *Memoir*; Mill, *History*.)

CUDDAPAH, or Kirpa, a corruption of the Sanscrit word *Cripa*, mercy. This division of the Balaghat territory, ceded to the English by the Nizam in 1800, is situated between 15° and 16° N. lat., and between 77° and 80° E. long. [BAFAGHAUTS.] Cuddapah has been constituted a collectorate by the English, and contains seven subdivisions, namely, Cuddapah, Cummum, Dupaud, Gandicotta, Gurrumcondah, Punganoor, and Sidout: each of these subdivisions is named after its capital town. Throughout this collectorate, saltpetre, soda, and common salt are found abundantly, and to this cause it is owing that, except in the rainy season, the water is generally brackish.

The town of *Cuddapah*, in 14° 32' N. lat., 78° 54' E. long., stands 507 feet above the level of the sea, on both sides of the river Cuddapah, a small stream which rises in the hills to the south-east of the town, and is 153 miles N.W. from Madras, and 220 miles N.E. from Seringapatam, travelling distance. This town was long the capital of an independent Patan state, and so continued for some time after the destruction of the kingdoms of the Deccan. The palace of the former nabobs has been converted into a court of justice and a prison. In the country surrounding the town a considerable quantity of sugar is made. The celebrated diamond mines of Cuddapah are about 7 miles north-east of the town, on both sides of the Pennair River. These mines have it is said been worked for several hundred years with various success. The places in which diamonds have hitherto been found consist either of alluvial soil or of rocks of the latest formation. The mines are pits of small depth. Dr. Heyne, who carefully examined these mines, has given in his statistical tracts the following description of one:—"The uppermost, or superficial stratum, consists of sand or gravel mixed with a small proportion of loam. Its thickness scarcely exceeds a foot and a half. Immediately under it is a bed of stiff blueish or black mud, similar to what are seen in places that have been inundated; it is about five feet thick and contains no stones. The diamond bed comes next, and is easily distinguished from the incumbent bed by the great number of large rounded stones which it contains. It is about two feet or two and a half feet thick, and is composed of large round stones, pebbles, and gravel connected together by clay." The contents of this bed are washed out and then carefully examined several times. At first the large stones are picked out; in the subsequent examinations the smaller gravel is carefully turned over by hand, while the persons employed "watch for the spark from the diamond, which invariably strikes the eye."

Cummum, the capital of the subdivision of that name, is in 15° 37' N. lat., 79° 10' E. long., 56 miles N.W. from Ongole. *Dupaud* stands in 15° 58' N. lat., 79° 23' E. long. Dupaud division, which is traversed by the Gondigam River, contains copper ore of good quality. The town and fort of *Gandicotta* are in 14° 51' N. lat., 78° 23' E. long., 43 miles N.W. from the town of Cuddapah. This was formerly considered a place of much strength; it is now of but little importance. There is a diamond mine in the neighbourhood. *Gurrumcondah*, near the verge of the Eastern Ghats, is situated in 13° 46' N. lat., 78° 34' E. long., about 130 miles N.W. from Madras. The district is well watered by several mountain streams, and is very productive. *Punganoor* is a fortified town, in 13° 21' N. lat., 78° 3' E. long., 47 miles N.W. from Vellore. *Sidout* is a fortified town, in 14° 30' N. lat., 79° 2' E. long., 12 miles E. from Cuddapah. It is surrounded by high stone walls in good repair, within which are ramparts; the fort is commanded by some of the neighbouring hills. It was taken by Hyder, who carried away the family of the nabob, and placed them in confinement. The town has much declined in population since the occupation of the country by the English, and the removal of the government offices to Cuddapah. The entire population of the collectorate of Cuddapah does not probably much exceed one million. The great bulk of the inhabitants are Hindoos.

(Rennell, *Memoir of a Map of Hindustan*; Heyne, *Statistical Tracts on India*; *Parliamentary Papers*.)

CUENCA. [CASTILLA-LA-NUEVA.]

CUERS. [VAR.]

CULLEN, Scotland, a royal and parliamentary burgh and sea-port in the parish of Cullen, on the northern coast of Banffshire, in 57° 42' N. lat., 2° 50' W. long., about 13½ miles W. from Banff. The population of the parliamentary burgh in 1851 was 1697, that of the royal burgh was 3165. The town is built on the western acclivity of a hill which slopes to the margin of the sea, and is nearly in the centre of the Bay of Cullen. The burgh is governed by 19 councillors, including a chief magistrate, three bailies, and a dean of guild; and with Elgin, Banff, Inverury, Kintore, and Peterhead, returns one member to the Imperial Parliament.

Cullen consists of two parts, the New Town which stands on an elevation, and the Sea Town or Fish Town, which is situated on the shore and inhabited chiefly by fishermen. In New Town the houses

are good and the streets are regularly laid out and lighted with gas. The Sea Town is a collection of mean irregularly built houses. The harbour is good, though the depth of water at the pier head is only 8½ feet at neap tides. A few vessels belong to the port varying from 40 to 100 tons. Besides the parish church, which is of considerable antiquity, there is another church of the Establishment, and a Free church. The Cullen hotel is a large building, to which are attached the assembly-room, a court hall, used for the sheriff and Justice of Peace courts, and the council chamber of the burgh. One third of the inhabitants of the town are engaged in the fisheries. The deep-sea fishing for cod, skate, and ling commences in February and ends in May. The June fishings are for haddocks, which are dried into speldings; the herring fishing occupies July and August. In the bay is a salmon fishery. The principal imports are coals, salt, and staves, with barley for distillation at a distillery in the neighbourhood; the exports are herrings, dried fish, oats, and potatoes. Boat building is carried on to a considerable extent. There is a parochial library. Cullen was erected into a royal burgh by Robert the Bruce, though traditionally its corporation privileges are said to be derived from Malcolm Canmore. The town was burned down in 1645 by Montrose. The Earl of Seafield is landlord of the whole parish.

(*New Statistical Account of Scotland*.)

CULM, or **KULM**. [MARIENWERDER.]

CULMBACH (Kulmbach), a walled town in Upper Franconia, in the north of Bavaria, is situated in a fertile and agreeable country on the left bank of the White Main, in 50° 5' N. lat., 11° 27' E. long., and has about 5000 inhabitants. It is a well-built town, with three churches, a Latin school, hospital, infirmary, several breweries, potteries, earthenware manufactory, tile-works, tanneries, &c. In the neighbourhood much potter's clay is raised; and on a mass of rock close to the town stands an old castle, the Plassenburg, at present used as a house of correction, the prisoners in which are employed in weaving carpets and coarse woollens, and spinning yarn. The out-works of the castle were razed by the French in 1808. Culmbach is a station on the railway from Nürnberg to Hof. It is 24 miles N.E. from Bamberg and about the same distance E. from Lichtenfels, both of which are on the same line.

CULROSS, Perthshire, Scotland, a royal burgh in the parish of Culross, is situated on the northern shore of the Frith of Forth, in 56° 4' N. lat., 3° 37' W. long., 23 miles N.W. by W. from Edinburgh, and 6 miles W. from Dunfermline. The population in 1851 was 605. The burgh is governed by two bailies and seven councillors, of whom one is provost. Culross, with Stirling, Dunfermline, Inverkeithing, and South Queensferry, returns one member to the Imperial Parliament.

The town consists of a few irregular streets, the houses in which are built on the face of the hill rising from the shore. At the time of its erection into a royal burgh by James VI. (James I. of England), in 1588, the town was very prosperous owing to coal-works in the neighbourhood, the produce of which was exported to Holland. The manufacture of 'girdles,' or iron plates, for baking oaten cakes, of which Culross had a monopoly by patent, was also a flourishing trade, but it has been superseded by the cheaper productions of the Carron iron-works. Some of the inhabitants are employed in the cotton and linen manufactures. There is a small pier for fishing and passage boats, which cross the Forth to Borrowstonness.

The abbey or monastery of Culross was founded in 1217, and considerable remains of it still exist. The former chapel of the abbey now forms the parish church. It is a cruciform building, with a massive western tower, and stands in a commanding situation in the higher part of the town. At the east end of the town are the ruins of St. Mungo's Chapel, near which it is said the saint was born. Of the former parish church some ruins still remain in the parish burial-ground. The town-house is an old building. Culross parish is separated from Perthshire by a part of Clackmannanshire, and is politically united to Clackmannanshire and Kinross-shire. There are two clergymen in the charge, which is collegiate. An endowed school is in the burgh, in addition to the burgh school and the parish school.

CUMÆ (Kúμν), an ancient town on the coast of Campania, about 10 miles W. by N. from Naples, which has been long since totally ruined. Strabo describes it as a joint colony from Chalcis in Euboea and from Kumé in Æolis, named after the latter but always styled as a colony of the former. It is certain that it was one of the earliest Greek colonies on the coast of Italy. A colony from Cumæ originally founded Zancle, afterwards Messene, in Sicily (Thucyd. vi. 4), in the 8th century B.C. Cumæ seems to have rapidly attained great wealth and importance through its maritime trade, and at the period of its greatest prosperity, about B.C. 700—500, it was the first city in this part of Italy, and had extended its sway over the greater part of Campania. The Etruscans are said by Dionysius to have sent an army against Cumæ, which however was defeated near the banks of the Volturnus. Athenæus (xii.) describes from older writers its former splendour and the wealth of its citizens. According to Livy (viii. 23), the people of Paleopolis (afterwards Neapolis) were also a colony from Cumæ. The story of the Sibylline books being offered to Tarquin, attributes them to a Sibyl or prophetess who at some remoter period resided at Cumæ. The same Tarquin the Proud, after vain attempts to recover his sovereignty, died at Cumæ, where he had

sought an asylum under Aristodemus, who had come from Macedonia and driven away by the Macedonians, had come to Cumæ and usurped the sovereign power. Aristodemus was taken in B.C. 426 by the Samnites, who pillaged it, drove the native inhabitants or sold them as slaves, and settled a colony in the city. From this time Cumæ ceased to be a Greek city, and became a second-rate Campanian town. At the end of the Latin war Cumæ was included in the general peace with Capua and other towns of Campania. (Livy, viii. 14.) During the second Punic war Cumæ was still independent and had its own senate, which, instead of siding with Hannibal like the Campanians, took part with Rome, and by its timely information to the consul Sempronius Gracchus enabled him to surprise the Campanians while offering their sacrifices, and to kill a great number of them. Upon this Hannibal hastened from his camp on Mount Tifate to attack Cumæ, which was defended by Gracchus, who repulsed the Carthaginians with great loss. (Livy, xxiii. 35, 37.) Cumæ gradually declined from its former importance owing to the superior attractions of Baiæ. Juvenal ('Sat.' 3) speaks of it as comparatively depopulated. Under the empire Cumæ was celebrated for the manufacture of red earthenware. It suffered afterwards in the wars between the Goths and Narses, who availed himself of the Sibyl's grotto to undermine the citadel, without however effecting the capture of the fortress, although he destroyed or disfigured the Sibyl's abode. Cumæ was at one time a bishop's see, but the town being completely destroyed by the Saracens at the beginning of the 13th century the see was incorporated with that of Naples. The town lay partly on the hill which is rocky and steep, and partly on the sea-shore. There are the remains of an amphitheatre in the plain towards the south. The Temple of Apollo stood in the Acropolis on the hill which is now called Rocca di Cumæ. The ground is here strewn with prostrate columns, capitals, and fine marble slabs with Greek inscriptions, half-covered with aromatic herbs, wild flowers, and the leaves of the vine-trees, which grow here luxuriantly. A farm-house on the hill is still called the House of the Sibyl, and the people pretend to show her baths, which are now converted into wine-presses, and her grotto, which is an excavation in the rock (on which the citadel of Cumæ stood) leading to several subterraneous galleries half-filled with rubbish, and said to extend as far as Averno and Bais. Many statues have been found in this neighbourhood. From the summit of the rock there is an extensive view extending on one side over the wide expanse of the Mediterranean, and on the other over the lakes of Fusaro, Licoli, and Patria, and the lowlands of the coast as far as Gaeta; while to the east the Mons Gaurus separates it from the coast of Pozzuoli and the Bay of Naples. The plain is strewn with the ruins of temples, villas, baths, and sepulchres. Many farm-houses are scattered about, for the country is fertile though unwholesome in summer. The road from Pozzuoli to Cumæ passes under a fine arch or gateway, inclosed between two rocks, through which the road has been excavated. This arch, probably a work of the Roman period, is now called Arco Felice. Petronius Arbitr, the discarded favourite of Nero, put himself to death at Cumæ in the manner related by Tacitus. ('Annal.' xvi. 19.) Excavations made at different periods have brought to light numerous architectural fragments, statues, and vases, many of them of the best period of art. The Prince of Syracuse has recently been most assiduous in exploring the ground, and he disinterred many 'wonders of art' in 1853. Among them is mentioned a temple of Diana, 345 palms in length, the architecture and embellishments of which are said to equal anything that remains of the Parthenon. In the same year more than 150 tombs of the necropolis of the ancient city were explored, and a variety of antiquarian treasures, such as vases, rings, articles in coloured glass, &c., were found. These interesting discoveries are described in the correspondence of the 'Athenæum' for 1853.

CUMANA. [VENEZUELA.]

CUMANIA, or KUMANIA, *Great and Little*, two privileged districts in Hungary.

Great Kumania lies between 47° and 47° 40' N. lat., 20° 30' and 21° 10' E. long., independently of a small district on the right bank of the Körös, and another on the left bank of the same river. The whole surface is a low plain, containing an area of about 424 square miles, one half of which is a swampy bog. The upper part was reclaimed to a great extent by the construction of an immense dam in the year 1786. Such portions of the soil as admit of cultivation are extremely productive, and yield plentiful crops of wheat, barley, melons, &c. The meadows and pastures afford excellent fodder and hay, and the rearing of cattle is carried on extensively. The land is full of bulrushes, which, with straw and dung, supply the place of fuel. The inhabitants are a robust race, very fond of rural pursuits. There are no large landed proprietors, or feudal lords, as in most parts of Hungary; the people have independent jurisdictions of their own; and used to send representatives to the Hungarian Diet. *Great Cumania* contains one market-town (*Kardaszog Uj Szállás*, 47° 20' N. lat., 20° 55' E. long., which has about 11,100 inhabitants, and is a thriving mart for the grain, fruit, wine, and cattle, which the exuberant fertility of the surrounding country enables the people to raise) and 5 villages.

Little Cumania, situated south of the preceding, and on the right bank of the Theiss, consists of two large and three small tracts of country. The larger tracts adjoin the county of Csongrád on

the east, and the counties of Bács and Csongrád on the south; their northern boundary is the county of Pesth; two small tracts lie to the east of them, the one, next to the county of Heves, consisting of two *prædia*, or privileged settlements; and the other, of *Lataháza*, with its small territory and two *prædia*, on the Danube, between Katskény and Bugyi. With the exception of a few sand-hills, the whole of Little Cumania is a complete level. Its area is altogether about 1008 square miles, and its population about 53,000. The country is full of swamps and sheets of water, but has no running streams. A great part of the surface is occupied by these swamps, or with sand; but the available surface contains fine tracts of rich loam, and is fertile in grain. Besides grain, Little Cumania produces tobacco and melons; cattle, sheep, and horses are reared on its pastures. The Palatine of Hungary is the immediate governor both of Great and Little Cumania; the chiefs of districts, and justices of circles, are subject to his authority. The people of Little Cumania are as independent, robust of make, and rich, as their brethren in Great Cumania. Little Cumania contains 3 market-towns, 5 villages, and 37 *prædia*. The towns are *Halas*, on the banks of the Halastó, a large sheet of water, in 46° 36' N. lat., 19° 32' E. long. It has a population of about 10,000, and a considerable trade in grain and wine. *Pelegyháza*, between Ketskémét and Szegedin, has 12,970 inhabitants, and is embellished with a handsome edifice, where the Cumanians have their courts of justice and keep their archives. Near this place several Roman urns have been dug up. There is an extensive traffic here in grain, fruit, wine, and cattle. *Kun Szent-Miklós* lies on the Baker, to the south of Pesth, and has about 4300 inhabitants.

CUMBER. [DOWNSHIRE.]

CUMBERLAND, one of the northern counties of England, lies between 54° 11' and 55° 12' N. lat., and 2° 17' and 3° 37' W. long. It is bounded N. by the Solway Frith and Scotland, S. by Westmoreland and Lancashire, E. by Northumberland and Durham, and W. by the Irish Sea. The extreme length of the county is about 74 miles, and its greatest breadth 34 miles. Its area is 1565 square miles. The population of Cumberland in 1841 was 178,038; in 1851 it was 195,492, being an increase of nearly 10 per cent.

In consequence of the cultivation of extensive commons and waste lands, the aspect of the county has been completely changed. Within the last sixty years more than 250,000 acres have been inclosed. Many of the commons which previously afforded only a scanty pasturage to a few half-starved sheep and cattle, are now covered with fertile corn-fields and profitable herbage, and have hawthorn fences, good roads, and commodious farm-buildings.

Surface, Hydrography, and Communications.—The east and south-west parts of the county are very mountainous, rugged, and uneven; the north and north-west parts are low and flat, or gently undulating. Hills, valleys, and ridges of elevated ground occupy the inland part. To a traveller, the mountainous district in the south-west is the most interesting. This part contains Saddleback, Skiddaw, and Helvellyn, and the lakes of Ullswater, Thirlmere, Derwent-water, and Bassenthwaite. This magnificent assemblage of lofty mountains and beautiful lakes annually attracts tourists from all parts of the kingdom, from the continent, and from America. Several of the other districts, though not mountainous, are hilly, and present an endless variety of landscape; some of the valleys are traversed by rivers, and afford perhaps a greater variety of delightful scenery than any other county. Besides the lakes already mentioned, there are several of smaller size, equally celebrated for their diversified and picturesque scenery. Buttermere, Crummock-water, Lowes-water, Ennerdale, Wast-water, and Devock-lake, are frequently visited by travellers in their excursions. There are also several mountain-tarns, or small pieces of water, the chief of which are Over-water, not far from Uldale; Burn-moor-tarn, at the head of Miterdale; Tarn Wadling, near High Heskett; Talkin-tarn, in the parish of Hayton; and Martin-tarn, in that of Wigton.

The following is a tabular view of the principal lakes of Cumberland:—

Lakes.	Nearest Market-towns.	Length in miles.	Breadth in miles.	Depth in feet.	Height in feet above the sea.
Ullswater . . .	Pearlith	9	1	210	460
Thirlmere . . .	Keswick	2½	1	108	473
Derwent-water .	Keswick	3	1½	72	222
Bassenthwaite .	Keswick	4	1	68	210
Buttermere . .	Keswick	1½	½	90	
Crummock . . .	Cockermouth	3	½	132	200
Lowes-water . .	Cockermouth	1	½	64	
Ennerdale . . .	Whitehaven	2½	½	80	
Wast-water . .	Ravenglass	3	½	270	160

All the lakes are well stocked with fish, particularly with trout, pike, and perch. Ullswater, Ennerdale, Crummock, and Buttermere contain char. Tarn Wadling produces some of the finest carp in the kingdom. There are several picturesque waterfalls, of which the following are the principal, with their respective situations and heights:—

Seale Force, near Buttermere	180
Barrow Cascade, two miles from Keswick	134
Lowdora Cascade, near Keswick	100
Sour Milk Force, near Buttermere	90
Alrey Force, Gowbarrow Park	80
Nunnery Cascade, Croglin	60

The following are the names and altitudes of the principal mountains, and the districts in which they are situated:—

		Feet.
Scaw-fell (high point)	Eskdale	3166
Helvellyn	Keswick	3053
Skiddaw	Keswick	3022
Bow-fell	Eskdale	2911
Cross-fell	Alston	2901
Pillar	Wast-water	2893
Saddleback	Keswick	2787
Grasmere-fell	Keswick	2750
High Pike	Hesketh New Market	2101
Black Comb	Duddon Mouth	1919
Dent Hill	Egremont	1110
Scilly Bank	Whitehaven	500

The offsets of the western or Skiddaw range of primitive and transition mountains extend within five miles of Carlisle, and four miles of Wigton. Those of the secondary (Cross-fell, or Penine chain) do not reach quite so far north as Tindale-fell, near Brampton.

The principal rivers in Cumberland are the Eden, the Esk, the Derwent, and the Duddon. The *Eden* enters the county on the south, where it unites with the Eamont, runs to the east of Penrith, and passes Kirkoswald, Arncliffe, Corby, Warwick-bridge, and Carlisle, receiving in its progress the Croglin and the Irthing on the right bank, and the Peteril and the Calder on the left bank. The Eden discharges itself into the Solway Frith, near Rockliff, where it forms a fine estuary. The scenery along the course of the Eden in this county, which is about 35 miles, is very varied and beautiful. The mansions and pleasure-grounds of Skirwith Abbey, Eden Hall, Nunnery, Arncliffe, Low House, Corby Castle, Warwick Hall, and Rickerby, adorn its banks. The *Esk* enters Cumberland from Scotland, and passes Kirk-Andrews and Netherby, flowing through a beautiful valley in a south-west direction to Longtown. After receiving the Liddell, which rises in Scotland, and for about eight miles forms the boundary between Scotland and Cumberland, and the Linc, which is formed by the junction of two streams arising near Christenburgh Crag, called Black Line and White Line, it falls into the Solway Frith near Rockliff Marsh. Its course in this county is about 10 miles. The *Derwent* takes its rise from Sparkling-tarn, among the crags at the head of Borrowdale, passes through Styhead-tarn, and forms the lake of Derwent-water, at Keswick, where it is joined by the Greta. It then pursues its course to Bassenthwaite and Cockermouth. At Bassenthwaite it forms Bassenthwaite-water, and at Cockermouth it receives the Cocker. After running about 33 miles and passing many pleasant seats and villages, it falls into the sea near Workington. The *Duddon* rises on Wrynose-fell, near the junction of Cumberland with Westmoreland and Lancashire, and in its course to the sea of about 20 miles, forms the boundary between Cumberland and Westmoreland. The Duddon discharges itself into the sea at Duddon Sands.

Of the smaller rivers the following may be named:—The *Sark* runs between Cumberland and Scotland for about six miles near Solway-moss, and finds its way into the Solway Frith. The *Wampool* rises in Brocklebank-fells, at Dockray joins the Wiza, and runs past Gamblesby to the sea, which it enters near Kirkbride. The *Waver* has its origin in Brocklebank and Caldbeck-fells, and takes a similar course to the estuary. The *Ellen* rises from Caldbeck-fells, and enters the sea at Maryport after a course of about 18 miles. The *Nent* rises in the south-eastern extremity of the parish of Alston, and joins the South Tyne near the town of Alston. The *South Tyne* has its source in a swamp or bog-ground about 7 miles E. by S. from the summit of Cross-fell, and a little below Alston enters Northumberland. The *Tees* rises in the same swamp, about a mile from the source of the South Tyne, and for nearly four miles forms the boundary between Cumberland and Westmoreland. The larger rivers abound with salmon, trout, brandling, and various other kinds of fish, and the smaller streams with trout and eels. Salmon-fishing commences in the Eden, January 1st; in the Solway Frith and Esk, March 10th: it closes on the 25th of September in all the Cumberland rivers except the Derwent, in which it continues from the 10th of February to the 10th of October. Game, especially grouse, is sent in great quantities to the south of England.

The ship canal from Carlisle to the Solway Frith is the only canal in Cumberland. [CARLISLE.] Two important turnpike-roads cross the county: one passes from east to west and the other from south to north; the latter, one of the principal roads between London and Glasgow and Edinburgh, enters the county near Penrith. It passes through Carlisle and then through Longtown to Edinburgh; previously giving off a branch 3 miles north of Carlisle to Glasgow, by Gretna, which crosses the Esk by a cast-iron bridge. The road from east to west extends from Newcastle to Carlisle, 56 miles, and from Carlisle to Whitehaven 41 miles. A turnpike-road extends from Brampton to Longtown, 11 miles: there is also one from Keswick to Ambleside,

18 miles, which passes through a pleasant and picturesque country. There are several other turnpike-roads. The Lancashire, Kendal, and Carlisle railway enters the county near Penrith, and proceeds in a northerly direction past Carlisle, quitting the county at Springkirk, about 14 miles from Carlisle: its total length in Cumberland is about 30 miles. The Newcastle and Carlisle railway proceeds eastward from Carlisle; its entire length in the county, which it quits near Denton, is about 20 miles. The Carlisle and Maryport railway proceeds from Carlisle in a south-westerly direction to Maryport, 28 miles, whence it is continued along the coast past Workington and Whitehaven, by the Whitehaven and Furness junction to Broughton, 38 miles. From Workington a branch, 8½ miles long, is carried on to Cockermouth.

Geology, Mineralogy, &c.—Cumberland is situated in the red marl district which lines the western base of the great chain of mountains denominated the British Apennines (the Back-Bone of England), extending from the Tweed into Derbyshire. This district extends in a northerly direction from the north-west corner of the Cheshire plain, along the western coast of Lancashire into Cumberland and the south of Dumfriesshire. White and red sandstone, but chiefly the latter, may be found almost everywhere within the limits described. St. Bees' Head is entirely composed of new red-sandstone. At Whitehaven the red marl formation is seen reposing on the coal formation, covered by the marl-beds containing gypsum: the same formation is seen filling up the great space between the Cumberland group of mountains and the British Apennines at Cross-fell. At Newbiggin and Coat-hill, near Carlisle, gypsum is found lying in red argillaceous marl between two strata of sandstone: the former quarry is much wrought, and gypsum is exported in great quantities from Carlisle. At Barrock, 3 miles to the south of Newbiggin, is a large rock of greenstone, much used on the public roads. A trap or basaltic rock is also observed near Berrier, at the hill called Binsey, and also on the north side of the Derwent, near Cockermouth. The primitive and transition groups of the Cumbrian mountains consist of granite, sienite, hypersthene, greenstone, slate, old red-sandstone, and mountain limestone. A gray kind of granite is found in the bed of the Caldew, on the north-east side of Skiddaw; and also in a branch of the river Greta, between Skiddaw and Saddleback. Sienite is met with at Irton-fell, Muncaster-fell, and Nether Wasdale; and hypersthene, in conjunction with quartz and felspar, commonly referred to the class of sienite, at Carrock-fell. A reddish felspar porphyry is found on Ambroth-fell and on both sides of St. John's Vale, near Keswick. Varieties of slate, intersected by dykes of trap or greenstone, constitute the great mass of Skiddaw, Saddleback, and the adjacent mountains. The common stone of the Keswick district is called blue rag, schistic earth, or whintin. At Borrowdale, Eskdale, and Patterdale, Scaw-fell and Helvellyn, and some adjacent places, gray slate is associated with hornstone, amygdaloid, and argillaceous porphyry, constituting the towering crags and lofty precipices of these districts. Many of the cataracts of the lakes fall over rocks of this description. Quartz, garnets, calcareous spar, chlorite, epidote, and sometimes agate, opal, and chalcedony, are found in these rocks. The old red-sandstone occurs near Melmerby. Metalliferous limestone, productive of lead ores, abounds in the mountains of the east and also of the west of the county. Boulderstones, from the granite rocks of Dumfriesshire, occur in the eastern parts of the county; and some of the granite of Caldew and of the sienite of Carrock is found near Carlisle. Shap-fell boulders are found on the shores of the Solway Frith; and boulders from the sienite of Buttermere and Eumardale are met with on the west coast of the county.

The minerals are silver, copper, lead, iron, plumbago, limestone, and coal. The principal lead-mines are situated at Alston, and are almost exclusively the property of Greenwich Hospital, to which institution they were appropriated by Act of Parliament on the attainder of the Earl of Derwentwater. Silver and copper are found in some of the mines in the same veins with the lead-ore. Silver and lead are got in abundance at Greenside and Eagle-crag in Patterdale. Veins of lead-ore have been found and worked between Skiddaw and Saddleback, in Buttermere, Newlands, and Thornthwaite. There are copper-mines at Alston, Caldbeck, and at Wythburn. There is one also below the level of Derwent-water, and another in the parish of Lower-water. Iron-ore is raised in great abundance near Egremont; the thickness of the band of ore, which is hard solid metal, is said to be between 24 and 25 feet. The quantity of iron-ore shipped from Ulverston and Barrow is very great. The ore of this county produces upwards of double the quantity of metal that is got from iron-ore in general. Coal is worked to a large amount at Whitehaven, Workington, and in the vicinity of Maryport, whence it is exported to Ireland and the west of Scotland. The eastern part of the county also abounds in coal, particularly Tindale-fell, Talkin, and Blenkinsop, which produce the chief supply for Carlisle, Brampton, Penrith, and the intermediate country. Some of this coal is now exported at Port Carlisle to Ireland and Scotland. There are collieries at Gilerux, Arkleby, Oughterside, Bolton, and Hower-hill. Limestone is very abundant in many parts of the county. In some places it is burnt in great quantities for exportation, particularly to the west of Scotland. At Catlands the limestone is overlaid by the coal-measures on all sides. Plumbago, or black-lead, is found in irregular masses in a rock of gray felspar porphyry at Borrowdale near Keswick. A little

cobalt has been got at Newlands, and antimony near Bassenthwaite. Lapis calaminaris, small quantities of manganese, galena, iron pyrites, and spar of various kinds and of different colours and forms are found in several places. Slate of a pale-blue colour and of the finest quality plentiful in Cumberland, particularly in the neighbourhood of Keswick and Ullswater.

Climate, Soil, Agriculture.—In consequence of the great extent of coast and the numerous high mountains, the climate is various. The mountains and high grounds are cold and piercing; the lower parts are mild and temperate: the whole county is exposed to wet and variable weather, particularly in the autumn, yet it is healthy, and many instances of longevity occur. The annual mean quantity of rain at Carlisle is about 30 inches; at Wigton, 34 inches; at Whitehaven, 50 inches; and at Keswick 68 inches. April on an average is the driest month of the year. July, August, September, and October are wet months: about twice as much rain falls in each of these months as in the month of April; and about one-third less rain falls in the first six months of the year than in the last six months. The soil of this county varies much; it often differs in the same parish, and sometimes even in the same field. The mountainous districts are bleak and barren; the most prevalent soil being mossy or dry gravel covered with heath. They are chiefly used as sheep pastures and preserves for moor-game. Some good land of dry brown loam is found in the valleys and on the sides of some of the smaller mountains. On the margins of the rivers is much valuable ground, consisting of rich brown loam. On the coast the soil is light, sand or gravel. The lowland country, extending from Carlisle in every direction for many miles, is fertile, though a considerable portion of it is cold wet loam and black peat earth; this land has been much improved by draining, which is now carried to a very great extent. There is a good deal of fertile clayey loam in the neighbourhood of Wigton. Sand and light loam prevail near Brampton, and likewise near Penrith. In the west of the county there is some wet soil on a clay bottom, and also some hazel mould. The subsoil in many places is a wet sterile clay. The agriculture of the county has improved considerably of late years, and great quantities of corn and produce of various kinds are now exported. The chief exports are from Port Carlisle, Whitehaven, Workington, and Maryport, and consist of cattle, sheep, poultry, grain, potatoes, butter, bacon, &c. The land being divided into small farms, the dairies are necessarily on a small scale, though their produce is excellent, and bears a high price in the market. Many of the farms do not exceed 100 acres, and some are not more than 30 or 50 acres. They are possessed on verbal or written contracts, or on very short leases. There are few farms let on leases of 14 or 21 years. Many persons, provincially called 'lairds,' or 'statesmen,' occupy their own lands, which in some instances have passed for several centuries in a regular line of descent in the same families. Some of these persons have an air of independence which forms a peculiar trait in their character. A small part of the land, in some places, lies in open town fields, which cannot have the benefit of the common improvement in husbandry. This land usually lies in ridges of variable width, upon which the grazing cattle that are herded do frequent injuries to the crops. In other places there are certain common lands that are annually stocked with cattle and horses, on a fixed day, by the owners or occupiers. These lands are always in grass. In high and mountainous districts the chief object of attention on the part of the farmers is their sheep stock, though of late years a considerable quantity of high-lying land has been brought into cultivation, which, on account of the steep declivities, is very laborious. In some of these places the climate is cold, the corn backward, and the harvest late. The valleys and low ground are cultivated chiefly for grain, and produce excellent crops of wheat, barley, and oats; these are alternated with turnips and potatoes or fallow. Some of the lands that are well supplied with water are kept as meadows or pastures for dairies, and for rearing and fattening cattle.

Candlemas is the usual time for entering upon farms, and the rents are paid half-yearly, in equal portions, at Lammas and Candlemas. The modern farm-houses have a handsome appearance, being generally built of stone, and roofed with blue slate. The old farm buildings and cottages have clay or mud walls, and are thatched with straw. There is a great variety of cattle and sheep. A peculiar breed of sheep, called 'Herdwicks,' from their being farmed out to herds at a yearly sum, is met with on the mountains, at the head of the Duddon and Esk rivers. The ewes and wethers and many of the tups are polled; their faces and legs speckled, and the wool short and coarse. They are lively and hardy little animals. The tups are in great request to improve the hardiness of other flocks. There are several agricultural societies and cattle shows in the county, which give a stimulus to agriculture, and encourage improvements in the breed of live stock, by distributing rewards and premiums. At Carlisle, Whitehaven, and Penrith are horticultural and floral societies, which are well supported, and are of service in exciting attention to the cultivation of fruits and flowers.

Cumberland farmers are in general temperate, social, and intelligent people. They are strong and robust, and in their usual modes of life frugal and industrious. They rise early and labour hard. They wear clogs and coarse plain dresses, take oatmeal porridge to breakfast, and often bacon and salt meat to dinner. Their bread is commonly made

of barley, or of barley and rye. In some places, oaten bread formed into thin cakes, and 'soons,' or unleavened cakes, are chiefly used. Milk, potatoes, and skimmed milk cheese are universally consumed. Tea, wheat bread, and animal food are now fast superseding these simple articles of diet. About 60 years ago the farmers wore kelt cloth, which was of a gray colour and home spun, and hence the name of 'gray-coats,' which the Cumbrians received. Home-spun clothes are now only worn by a few persons in the mountain districts. The peasants pay great attention to the education of their children. In some rural districts, where the quarter pay is not adequate to support the master, he is allowed a 'whittle-gate,' or the privilege of dining in rotation with the parents of his pupils—a custom which formerly prevailed also in some places with the poorer clergy. Farm-servants are hired at Whitsuntide and Martimus, at the fairs held in the large market-towns. They stand in the market-places, and are distinguished by having a piece of straw or green branch in their mouths. After the hiring is over, the remainder of the day is dedicated to mirth and festivity. Cumbrian peasantry have various festive meetings, called the 'kiirn,' or harvest-home, sheep-shearing, merry nights, and upshots. Bridewains and bidden-weddings are still held in some parts of the county. Wrestling, running, and leaping are the favourite amusements and athletic exercises of the peasantry.

Divisions, Towns, &c.—This county is divided into five wards, or hundreds, known by the names of Allerdale above Derwent, Allerdale below Derwent, in the northern extremity of the county, Cumberland, Leath, and Eskdale wards. It contains one city, CARLISLE; the parliamentary boroughs of COCKERMOUTH, and WHITEHAVEN, and 15 market-towns, namely, ALSTON, BOOTLE, BRAMPTON, EGREMONT, HARRINGTON, HESKET-NEWMARKET, IREBY, KESWICK, KIRKOSWALD, LONGTOWN, MARYPORT, PENRITH, RAVENGLASS, WIGTON, and WORKINGTON. Harrington, Heskett-Newmarket, Ireby, Kirkoswald, and Ravenglass we notice here; the other towns will be found under their respective names.

Harrington, population of the parish 2169 in 1851, is a small flourishing sea-port about 3 miles S. from Workington. The houses are mostly modern and well built. The harbour is well constructed, and the trade steadily increasing. Coal and lime are exported. In the coal trade, which is carried on chiefly with Irish ports, upwards of 40 vessels are employed; and in the lime trade, which is chiefly carried on with the opposite coast of Scotland, there are several hundred sloops. Here are a yard for ship-building, a rope-walk, and a vitriol and copperas manufactory. The parish church is a plain structure without a tower. There are chapels for Wesleyan and Primitive Methodists, a British school, and a clothing society. There is here a station of the Whitehaven Junction railway. Iron-stone and fire-clay are found in the vicinity.

Heskett-Newmarket is a small but neat town, situated on the banks of the Caldew, 13 miles S.W. from Carlisle: population of Caldbeck parish, in which Heskett is situated, 1667. The Wesleyan Methodist and Quakers have places of worship. It has a small weekly market on Friday; and there are several fairs which are well attended.

Ireby, population of the parish 505 in 1851, is 16 miles S.S.W. from Carlisle, on the left bank of the little river Ellen, which issues from Over-water and falls into the sea at Maryport. Ireby is a very old town, having had a market granted to it 600 years ago. The church is small. There is a school with a trifling endowment. Clea Hall, Whitehall House, and Snittlegarth are in this neighbourhood.

Kirkoswald, population of the parish 925, is situated in a beautiful vale on the small river Raven about half a mile above its junction with the Eden, 15 miles S.E. from Carlisle. The church was dedicated to St. Oswald, the celebrated martyr and king of Northumberland. The tower, in which are three bells, stands about a furlong eastward from the church on an elevated site. Near the town are the remains of an ancient castle and a mansion called the College. The town is amply supplied with water. There are a paper-mill, a saw-mill, a mill for carding and spinning wool, corn-mills, a brewery, and coal and lime-works. The weekly market is on Thursday, and there are great markets on Thursday before Whitsuntide and August 5th.

Ravenglass, population of the parish of Muncaster in which it is situated 623, is a small market-town and sea-port, situated along the coast at the confluence of the Esk, Mite, and Irt. There is a fair held here with very singular customs and ceremonies on August 5th. It has a market on Friday, a large workhouse, and an endowed school. Near this place are Muncaster House and the ruins of Walls Castle. Oysters abound on the coast between this town and Bootle. Ravenglass possesses a small coasting trade, chiefly in corn, timber, and coal.

The following are some of the more important villages, with their population in 1851 and a few other particulars:—

Abbey Holme, or *Holme Cultram*, about 6 miles W. by N. from Wigton, near the mouth of the river Waver: population of the parish 3212. The parish church was formerly the chapel of a Cistercian monastery, which was founded by King Henry I. At the west end is an elaborate Norman doorway. The Wesleyan Methodists and Quakers have places of worship. Fairs are held on October 29th and on the Tuesday before Whitsuntide. *Allonby* is on the sea-coast, 5 miles N.E. from Maryport: population of the chapelry 749. Allonby is a favourite resort for sea-bathing during the season. The village contains some good houses and has a neat appearance. The

herring fishery formerly employed the inhabitants, but is now of little consequence. There are here a chapel of ease and a place of worship for Quakers. *Aspatria*, about 6 miles N.E. from Maryport: population of the joint township of Aspatria and Brayton, 1128. The parish church has many interesting architectural features. The Independents have a place of worship in Aspatria. A small market is held on Thursdays. *St. Bees*, a village near the sea-coast, about 4 miles S. from Whitehaven: population of the township, 971. The parish church was formerly a part of the monastery of St. Bega: the building is cruciform and has a massive tower. The nave only is used for public worship. The chancel is occupied by the Clerical College and School of Divinity, established in 1816 by Dr. Law, late bishop of Chester, for the instruction of young men intended for holy orders. Nearly 1000 clergymen have been educated at St. Bees' College. The number ordained in 1851-52 was 34. There were 115 students attending the college in 1852. The Grammar school, founded at the close of the 16th century by Archbishop Grindall, has an income from endowment of about 1200*l.* a year. The provost of Queen's College, Oxford, has the appointment of the head and second masters. There were 167 scholars in 1852. The school has some presentations to fellowships and scholarships at both Oxford and Cambridge. *Brigham*, about 2½ miles W. from Cockerinmouth: population of the township, 446. The parish is extensive, having as its boundaries the lakes of Bassenthwaite, Buttermere, Crummeck, and Lowes-water, and the river Derwent. The parish church, dedicated to St. Bridget, is an ancient edifice, possessing some fine windows; it is situated on an eminence on the left bank of the Derwent, about half a mile from the village, in a position which commands an extensive prospect. *Borrowdale*, a township in the parish of Crosthwaite; the name is also applied to an extensive and exceedingly picturesque district: population of the township, 425. The celebrated mines of plumbage or black lead are at the head of the valley of Borrowdale, about 9 miles from Keswick. Borrowdale chapel, which is near Rothwaite, was rebuilt and somewhat enlarged about twenty years back. Borrowdale formerly belonged to the abbey of Furness. The people of the district are chiefly employed in mining and agriculture. A sheep fair is held on the first Wednesday in September. *Bowness*, 12¼ miles W. by N. from Carlisle: population of the township, 508. The village is built on a cliff on the shore of the Solway Frith. The site of the Roman station Tinnocelum was in the parish of Bowness; many coins and other Roman remains have been found here. Bowness is much frequented by summer visitors for bathing. Although Bowness is 7 miles from the head of the Solway Frith, at the mouth of the rivers Esk and Sark, and the distance to the coast of Scotland is about 2 miles, the sands are traversed at low water, when travellers are conducted across by guides between Bowness and Annan in Dumfriesshire; at high water the channel is navigable for ships of large burden. The parish church, dedicated to St. Michael, is a small building of ancient date. There is here a Free school founded in 1735. About a mile E. from Bowness, at a place called the Binnacle, the ship canal from the City of Carlisle opens into the Frith. [CARLISLE.] *Burgh*, in the parish of *Burgh-by-Sands*, a village about 5 miles N.W. by W. from Carlisle, and about 2 miles from Port Carlisle at the mouth of the Eden: population of the township, 541. The ship canal from Carlisle passes the village of Burgh on the north side. The parish church of St. Michael is an ancient building, constructed evidently for purposes of defence as well as of worship. *Buttermere*, a small village in the parish of Brigham, about 8 miles S.W. from Keswick, situated between Buttermere-water and Crummeck-water: population of the chapelry of Buttermere, 78. The village consists of a few small cottages and farm-houses. The chapel is a small building erected at the expense of the Rev. Vaughan Thomas. The chapel which formerly occupied the same site was of very diminutive size, probably the smallest chapel in England. Buttermere-water or lake attracts many visitors on account of the picturesque beauty of the lake itself and the grandeur of the surrounding scenery. *Caldbeck*, 12 miles S.S.W. from Carlisle: population of the parish, 1667. The parish church, dedicated to St. Kentigern, was repaired in 1818; the date of its erection is said to be 1112. The Independents and Quakers have places of worship. Caldbeck possesses a woollen manufactory for blankets, flannels, duffles, and stocking-yarns; a fulling-mill, tile-works, bleach and dye-works, and a brewery. About three miles south from the village are lead-mines. *Calder Bridge*, 10 miles S.S.W. from Whitehaven: population of the parish of St. Bridget Beckermot, 664. The village, which is situated on elevated ground on the banks of the river Calder, is much visited on account of the picturesque ruins of Calder Abbey, which stand on the right bank of the river, about a mile above the village. The abbey was founded in the 12th century for monks of the Cistercian order. Part of the abbey church remains, with a tower supported on pillars, from which spring beautiful pointed arches. *Dalston*, on the left bank of the river Caldew, about 4 miles S.S.W. from Carlisle: population of the township, 1022. A small market is held here. The parish church, dedicated to St. Michael, was rebuilt about a century ago: there are two Free schools. Rose Castle, an ancient building, a residence of the Bishop of Carlisle, and supposed to have been the principal episcopal residence from the early part of the 13th century, has received a thorough remodelling at the hands of the present

bishop. Water-power is applied from the Caldew to work several cotton-mills, a flax-mill, and a flour-mill. There is a manufactory of agricultural implements. *Dearham*, about 2 miles E. from Maryport: population of the township, 1209. Coal is extensively raised in the neighbourhood, and there is an earthenware manufactory. The church has an ancient font with curious carvings. The churchyard contains a sculptured cross of considerable antiquity. *Egremont*, population of the parish 2049, about 6 miles S.S.E. from Whitehaven, is pleasantly situated on the banks of the Ehen, the stream flowing from Ennerdale Lake. The parish church is an ancient structure, with a low tower. The Wesleyan Methodists have a place of worship. There is a National school. The ruins of Egremont Castle, a fortress erected in the 12th century, stand on an eminence at the west end of the town. Egremont sent members to Parliament in the time of Edward I., but the expense of paying their representatives being too great for the town, the privilege was, on petition, taken away. A small market is held on Saturday, and there are fairs in February, May, and September. *Ellenborough*, about a mile S.E. from Maryport: population of the joint township of Ellenborough and Ewanrigg, 969. This place was the site of an important Roman station named Glanaventa. Many Roman remains, including altars and inscribed tablets, have been found here. The Free school is under the superintendence of trustees. *Garrigill*, in the parish of Alston, near the eastern border of the county, adjoining the county of Durham, population of the chapelry 1443, is situated near the river Tyne, a few miles from its source, and is distant about 27 miles E.S.E. from Carlisle. The Independents and Wesleyan and Primitive Methodists have places of worship. Garrigill is conjointly with ALSTON the seat of a Poor-Law Union. *Gosforth*, about 5 miles N. by W. from Ravenglass: population of the parish, 1116. The village is of considerable size, but rather irregularly built. The parish church is a small but neat building. The churchyard contains a stone column, which was formerly surmounted by a cross. Cattle fairs are held here on April 25th and October 18th. *Greystoke*, about 18 miles N. from Carlisle: population of the township, 345. A few broken towers are all that remain of the ancient castle; the present castle was built about the middle of the 16th century, and was improved by the late Duke of Norfolk; around the castle is an extensive park, stocked with deer. The parish church is a spacious edifice of the decorated style. In the parish are collieries and slate quarries. *Hesket*, 9 miles S. by W. from Carlisle; High and Low Hesket form one township, the population of which was 806. The parish church, which was repaired in 1760, is a commodious edifice. There is an Endowed school, which had 80 scholars in 1852. Quarries of gypsum are worked to a considerable extent. In this parish the Court of Inglewood Forest for the disposal of manorial business is annually held on St. Barnabas Day under a thorn-tree by the road side. *Millom*, near the mouth of the Duddon, 6 miles S. by E. from Bootle, population of the townships of Upper and Lower Millom, 980, was formerly a market-town; it is now a place of no consequence. There is here a small fishery, and there are mines in the neighbourhood. The church is ancient, and contains some curious monuments. The remains of a castle are used as a farm-house. *Nenthead*, 4¼ miles E. by S. from Alston, population of the chapelry, 1964, is a somewhat busy place; it has a small customary market on Thursday. The church, a handsome building, of which all the seats except six are free, was erected by subscription in 1845. There is a Wesleyan Methodist chapel. The market-house is a convenient structure with a clock tower. The London Lead Mining Company have extensive smelting-works here: they maintain a surgeon for their workmen and miners, and have founded a school for the education of the miners' children. *Seaton*, about a mile and a half N. from Workington, population of the township 835, is a thriving place owing to extensive iron-works and collieries in the neighbourhood. Some remains of an old fortress are standing, which are known as Burrow Walls. *Sebergham*, 10 miles S. from Carlisle, population of the parish 855, is a picturesque little village on the right bank of the Caldew, which is here crossed by a bridge. The church is small but rather handsome. In the parish are extensive coal-mines and limestone-quarries. *Wetheral*, 4 miles E. by S. from Carlisle, population of the township 635. There are here the remains of a Benedictine monastery. The church is a rather superior building of the perpendicular style. In the parish are mills for cotton spinning and the manufacture of checks and gingham. The Newcastle and Carlisle railway has a station at Wetheral.

Divisions for Ecclesiastical and Legal Purposes.—The whole of the county is in the diocese of Carlisle, with the exception of the ward of Allerdale-above-Derwent in the diocese of Chester, and the parish of Alston in that of Durham. There are 3 deaneries, Carlisle, Penrith, and Wigton; 1 archdeaconry; 104 parishes; 41 rectories; 28 vicarages; and 59 perpetual curacies and chapelries. According to the 'Census of Religious Worship' taken in 1851, it appears that there were then in the county 389 places of worship, of which 161 belonged to the Church of England, 96 to the Wesleyan Methodists, 24 to Independents, 23 to Primitive Methodists, 20 to Quakers, 17 to the Wesleyan Association, 17 to Scotch Presbyterians, 9 to Baptists, 8 to Roman Catholics, and 14 to smaller bodies. The number of sittings provided in all was 101,608. By the Poor-Law Commissioners Cumberland is divided into 9 Unions: Alston with Garrigill Bootle,

Brampton, Carlisle, Cockermouth, Longtown, Penrith, Whitehaven, and Wigton. These Unions include 200 parishes and townships, with an area of 838,864 acres, and a population in 1851 of 194,935.

Cumberland is comprehended in the province of York, and in the northern circuit. The assizes are held at Carlisle twice a year. The Midsummer and Christmas quarter-sessions are held at Carlisle, and the Easter and Michaelmas sessions at Cockermouth. County courts are held at Alston, Carlisle, Cockermouth, Keswick, Penrith, Whitehaven, and Wigton. The county returns four members to the Imperial Parliament; two for the eastern and two for the western division. Carlisle sends two members, the borough of Cockermouth two, and Whitehaven one.

History and Antiquities.—The earliest inhabitants of Cumberland of whom we have any account were the Brigantes, a bold and warlike people, conquered by the Romans about A.D. 121, when the famous Roman or Picts' Wall was erected by Hadrian, to prevent the ravages of the Caledonians, who bore an inveterate hatred to the Romans. [BRITANNIA.] This barrier was formed of earth, and connected a chain of forts erected by Agricola in 78: being found insufficient, Severus, in 210, built one of stone, from near the mouth of the Tyne to the Solway Frith. The last was strengthened by an outward ditch, and guarded by towers and a chain of forts and stations. Remains of both walls, but particularly of that of Severus, may still be traced in several places. At a very early period the inhabitants, who were the true and genuine Britons, were called Cumbri: and hence probably the name of the district, Cumberland. In almost every part of the county are remains of British and Roman antiquities. About three miles from Kirkoswald is a Druidical temple, consisting of a circle of 67, or according to some accounts 72, unhewn stones, called Long Meg and her Daughters. Another and more entire circle of 48 rude stones is situated a mile and a half south-east of Keswick. This county has been a perfect magazine of Roman antiquities. The remains of Roman garrisons or stations are still distinctly observable at Maryport, Old Carlisle, Old Penrith, and Bewcastle. Several altars, inscriptions, coins, instruments, utensils, &c. have been discovered at these places. After the retreat of the Romans, the country was laid waste and the city of Carlisle reduced to a complete state of ruin by the Scots and Picts. The country had also to endure the ravages of the Danes. During the Saxon Heptarchy it was joined to the kingdom of Northumberland, but was governed by its own chieftain under what was called the Danish law, until the Norman Conquest. In 945 Cumberland was granted to Malcolm king of Scotland, and was for a long time the scene of war and bloodshed between the two crowns, being sometimes under the dominion of the kings of England and sometimes under that of the kings of Scotland. At the time of the Conquest the county was in such a state of poverty and desolation that it was not rated in the Domesday Book, William the Conqueror having remitted all its taxes. Walter, one of his countrymen, laid the foundation of a priory at Carlisle, which was afterwards converted into an episcopal see. In 1237 Cumberland was finally annexed to the crown of England by Henry III. at a conference held at York; but the feuds between the two kingdoms continued for more than three centuries afterwards, and this county, situated on the borders, and containing the 'debateable land,' was often the scene of contention, rapine, and bloodshed. In 1307 Edward I. died, on an expedition towards Scotland, at Burgh Marsh, near Carlisle, where a monument has been erected to his memory. The inhabitants of the county at various times suffered many cruelties and deprivations, had several towns burnt and monasteries destroyed, and were not relieved from hostile attacks and inroads until the union of the two crowns by the succession of James I. Even after this time, outrages and robberies were frequently committed. During the civil war between King Charles and his Parliament, and also during the time of Cromwell, Carlisle was besieged, and the inhabitants were much harassed and distressed. This county was the scene of hostilities in the rebellion of 1715; and again in 1745, when Carlisle was taken possession of by Charles Stuart and his followers, and was retaken by the king's forces under the Duke of Cumberland.

There were formerly several monasteries and ancient hospitals in Cumberland. The Augustine monks had a priory at Lanercost and another at Carlisle. The Benedictines had priories at Wetheral, St. Bees, and Seaton. The Cistercians had an abbey at Holme Cultram and another at Calder. There was a convent of Gray friars at Penrith; one of Black friars and another of Gray friars at Carlisle. There were religious houses of ancient foundation at Carlisle, St. Bees, and Dacre. A nunnery is said to have been founded at Carlisle by David, king of Scotland, at which place there was an hospital for thirteen lepers, dedicated to St. Nicholas. At Wigton, an hospital and free chapel were dedicated to St. Leonard. Many of the old churches exhibit remains of the Norman and early gothic architecture. Specimens of the Norman style may be seen in the churches of Aspatria, Torpenhow, and Kirklington; and of the pointed gothic in the abbeys of Lanercost and Holme Cultram. The west end of the last-mentioned abbey is a good specimen of the later perpendicular style. The churches of Burgh-by-Sands, Newton Arden, and Great Salkeld have strongly-fortified towers, which probably served as places of refuge for the inhabitants of these

villages in the time of an invasion. Cockermouth church, one of the finest churches in the county, was destroyed by fire, on the night of Friday, Nov. 15th, 1850, but has since been replaced by a neat and commodious building, erected by subscription. In 1851 the county possessed seven savings banks, at Alston, Carlisle, Cockermouth, Keswick, Maryport, Whitehaven, and Workington. The total amount owing to depositors on the 20th of November, 1851, was 280,775*l.* 16*s.*

CUMBRAE, or CUMBRA, *Big or Great*, Buteshire, Scotland, an island and parish in the Frith of Clyde, about 8½ miles in length from N.E. to S.W., 2 miles in breadth, from 10 to 11 miles in circumference, and containing about 5120 acres. It lies between 55° 45' and 55° 49' N. lat., 4° 52' and 4° 56' W. long., 4 miles E. from the Island of Bute and 2 miles W. from the coast of Ayrshire. The population in 1851 was 1266.

The name Cumbrae, derived from the Gaelic, signifies a steep coast rising from the sea, an appearance which the island may at one time have presented, though the level of the ocean having sunk, the sea has now left a flat space along the whole shore to the base of a range of hills which run from south to north, and extend nearly the whole length of the island, reaching about the middle an elevation of 500 feet. The shore is in some places sandy, in others gravelly and clayey, but in general it is rocky. The temperature of the island is mild; the prevalent winds are from the south and west, and are frequently accompanied by rain; the north and east winds are cold, but the cold is rarely severe or of long continuance. The brown whinstone forms the base of the hills, and is used for making the roads. Freestone is quarried in abundance. The beds of this stone are generally intersected by the whin. Limestone is found in considerable quantities. The soil along the shore is light and sandy. In the valleys it is a rich black loam, bedded on clay, and producing good crops, while on the high grounds and hills it is light and thin, and covered with heath. There is not much wood on the island. Three-fifths of the soil is under cultivation. The island abounds with excellent spring water.

The island of Cumbrae belongs to the Earl of Glasgow and the Marquis of Bute, Lord Glasgow holding about two-thirds of the soil. The land is divided into large farms, the houses and buildings of which are generally good. Grain of all kinds is raised, though the pasturage of black cattle and sheep is the principal agricultural employment.

The village of *Millport* is situated in the south-east corner of the island, in 55° 46' N. lat., 4° 54' W. long. It is much resorted to in summer for sea-bathing. There is an excellent harbour, capable of affording complete protection from every storm to a large number of vessels. A fine pier was erected several years ago by Lord Bute. The inhabitants of the village are occupied in weaving. There is daily steam communication between Millport and Glasgow, Ayr, and the various towns on the Frith of Clyde, and a ferry at all times from the island to the Ayrshire coast. Several small vessels, chiefly sloops, from 15 tons to 50 tons burden, belong to the harbour. Besides the parish church the village contains a Free church, a parochial library, a friendly society, and a savings bank. There is another small village on the island called Newton.

(*New Statistical Account of Scotland.*)

CUMNER. [BERKSHIRE.]

CUMNOCK. [AYRSHIRE.]

CUNEO. [CONI.]

CUNNINGHAM. [AYRSHIRE.]

CUPAR ANGUS, or COUPAR ANGUS, Perthshire and Forfarshire, Scotland, a town, and formerly a burgh of royalty, in the parish of Cupar Angus, is situated in 56° 33' N. lat., 3° 15' W. long., on a small rivulet falling into the river Isla, near the point at which the Isla falls into the Tay, about 16 miles N.E. from Perth, and 61 miles N. by W. from Edinburgh by the Edinburgh and Northern and the Scottish Midland railways. The part of the town south of this rivulet is in Forfarshire, the remainder and larger part in Perthshire. The population of the town in 1851 was 2004. The town is neatly built, with clean and well-lighted streets. In addition to the parish church there are chapels for Episcopalians, the Free Church, United Presbyterians, Original Seceders, and Independents. A tower which occupies the site of the old prison serves the double purpose of a town-house and a jail. The town contains a reading-room, a savings bank, and several charitable societies. Linen-weaving, tanning, and bleaching are carried on. There are several fairs in the course of the year. Near the town are the vestiges of a Roman camp, upon the site of which a monastery was erected and richly endowed by Malcolm IV. in 1164. Of the monastic buildings scarcely any remains are now left.

CUPAR FIFE, Fife (so named in contradistinction from the small towns of Cupar Angus and Cupar Grange in Perthshire), the county town, and a royal and parliamentary burgh, is situated in 56° 19' N. lat., 3° 0' W. long.; nearly in the middle of the peninsula of Fife, at the confluence of the small streams Eden and Lady or St. Mary's Burn; having on the south a range of high hills, and on the north a fertile country, diversified with hills and numerous woods. The town is 32½ miles N. from Edinburgh, by the Edinburgh and Northern railway, and the ferry on the Forth, and 14½ miles E. from Dundee. The population of the burgh in 1851 was 4005, that of the

parliamentary burgh was 5686. Conjointly with St. Andrews, Crail, Anstruther Easter and Wester, Kilrenny, and Pittenweem, Cupar Fife returns one member to the Imperial Parliament. Cupar was made a royal burgh by David II., in 1368: it is now governed by 3 bailies and 15 councillors, of whom one is provost.

The site of the town is about 25 feet above the level of the sea, from which the distance is about 6 miles; the climate is comparatively mild. The burgh consists principally of one long street, extending from west to east, with a cross street leading north and south. The public buildings, of which the most noticeable are the town hall and the county hall, are neat and convenient. Besides the parish church and St. Michael's church, there are a Free church, two chapels for United Presbyterians, and one for Scottish Episcopalians. The town has a respectable appearance, and the vicinity is ornamented with some neat villas. A good supply of water is obtained from springs and wells. The streets are lighted with gas and well-paved. There are two reading-rooms and a subscription library. A large Grammar school on the Castle Hill was formed by the union of the ancient burgh schools with one of Dr. Bell's foundation. There are weekly corn markets; and several annual fairs for grain and agricultural stock, produce, and utensils, which are well attended. The chief manufactures are of coarse linens; leather, candles, and snuff are made. On the river Eden are breweries and flax-mills. Bricks and coarse earthenware are made from clay beds in the vicinity of the town; and there are several quarries of white sandstone.

On the mound called the Castle Hill, there formerly stood the fortress of the chiefs of the family of Macduff, the feudal earls or thanes of Fife. At the foot of the Castle Hill was a convent of Dominican monks, or Black friars. A green esplanade before the castle, still called the Play Field, was in ancient times used for the performance of the religious shows called 'mysteries' and 'moralities,' and here was acted the famous drama of 'Sir David Lindsay of the Mount,' called the 'Three Estates,' a popular satire on the priesthood, which is believed to have promoted the subsequent religious revolution. Cupar was represented in the Scottish Parliament by Sir David Lindsay, whose estate is not far from the town.

(*New Statistical Account of Scotland.*)

CURACOA, or CURAÇAO, an island in the Caribbean Sea, lying to the east of the peninsula of Paraguana, the most northern point of Venezuela, in 12° 6' N. lat., and 69° 3' W. long. Its length from north-west to south-east is 35 miles, and its breadth 6 miles. The surface is hilly. The hills on the west side are seen from a considerable distance at sea. The island is wholly dependent upon rain for water, and the soil so wanting in fertility that the inhabitants are partly supplied with provisions imported from other places. Sugar, indigo, tobacco, and maize are the chief products. The shores are so bold that vessels of considerable size may sail round the island within a cable's length. There are several harbours; the principal one, Santa Anna, is on the south-west side of the island. The entrance is very narrow; on the eastern side of it is Fort Amsterdam, and on the opposite side of the harbour is the town of Curaçoa or Willemstad, said to be one of the handsomest in the West Indies.

Curaçoa was settled by the Spaniards early in the 16th century; it was taken in 1632 by the Dutch, and was captured by the English in 1798, but restored to Holland at the peace of Amiens. It was again taken by the English in 1806, and finally given up to Holland at the general peace in 1814.

CURDISTAN. [KURDISTAN.]

CURIA MURIA ISLANDS are situated on the southern coast of Arabia, and afford protection to a bay called Curia Muria Bay, which is extensive, and has good soundings throughout. They lie in the direction of the eastern continuation of Ras Noss, a very elevated headland, and between 55° 20' and 66° 10' E. long., and near 17° 30' N. lat. They are five in number, called from west to east Hasik, Soda, Hallanny, Karzawet, and Jebeliya. A long reef is said to extend from Hallanny to Soda, so as to render it very dangerous, if not impossible, for any vessel to pass between them; but between Soda, Hasik, and the mainland, the channels are good. Hallanny is the only one of the islands that is inhabited: the anchorage and village are at the northern extremity, where water may be obtained, but it is brackish. Its mountains are high, and apparently of volcanic origin. (Captain Owen, *Voyages; London Geographical Journal*, xi. xv.)

CURISCHES HAFF, a lagoon, or shore-lake, of the Baltic, on the coast of East Prussia, supposed to have originated from the throwing up of the sand and the retiring of the waters of the Baltic. From Labiau, in the south, to its opening into the Baltic at Memel, it is about 60 miles in length; at its greatest breadth, between Cranzkukren and Juwendt, nearly 28 miles: it contains altogether 588 square miles. Its confluence with the Baltic is formed by what is called the 'Memel Deeps,' which are from 800 to 1200 feet in width, and 12 feet deep. It cannot properly be called a part of the sea, inasmuch as its waters are fresh, like those of the other Haffs in this quarter. It is separated from the Baltic by a very narrow neck of land, called the 'Curische Nehrung,' formed by a series of low sand banks, almost destitute of vegetation, about one to two miles in breadth—except where they taper to a point as they approach Memel—and about 70 miles in length. On this neck of land there are a

few villages. The bed of the Haff is unequal and variable, and the navigation is therefore very precarious; hence the only description of vessels used here is a peculiar kind of large flat boats, and even these are unable to land along many parts of the coast. In stormy weather the navigation is very dangerous. The Dange, the Mi and the Memel, or Niemen, discharge their waters into this Haff.

CURNOU'L, a principality formerly governed by an independent chief, and now forming one of the subdivisions of the Balaghaut ceded districts. It came into possession of the English in 1841, previous to which the country had been subdivided into a great number of petty jaghires, and the government of the principality was so badly administered, that a great part of the lands were allowed to revert to a state of nature, and were overgrown with rank weeds and jungle. It has since been much improved.

CURNOU'L, the capital of the province of the same name, is a populous town on the south side of the Toombuddra, in 15° 44' N. lat., 78° 2' E. long., about 279 miles N.W. by N. from Madras, and 127 miles S.S.W. from Hyderabad. It is surrounded on all sides by the rivers Toombuddra and Henday, which at the town are from 700 to 800 yards wide. Some strong works have been erected on the western side of the town; but in 1815 the place held out against the assaults of the English only one day, after which it was surrendered at discretion. The buildings in the town are partly of stone and partly of mud. (Rennell, *Memoir of a Map of Hindustan; Parliamentary Papers.*)

CURZOLA, in Slavonic *Karkar*, the ancient *Corcyra Nigra*, or Black Corcyra, so called from the dark colour of its pine woods, is an island in the Adriatic, comprised in the circle of Ragusa in the Austrian crownland of Dalmatia. The channel of Curzola separates it from the peninsula of Sabioncello. Curzola contains one town, a market-town, and about 6500 inhabitants. The total area is 57,130 acres, of which 43,471 acres are covered with woods, which furnish good ship-timber; the vineyards annually yield about 80,000 hogsheads of wine, and the fisheries on the coast are productive; but little grain is raised, and the fresh-water is scarcely fit for use. Curzola, the chief town, is situated on a neck of land upon the channel or canal of Curzola, in 42° 57' N. lat., 16° 50' E. long.; it is surrounded by walls, and has a cathedral, two monasteries, and about 800 houses. It gives title to a bishop: its inhabitants build vessels, and traffic in the produce of the island.

CUSHENDALL. [ANTRIM.]

CUSSETT. [ALLIER.]

CÜSTRIN, properly KÜSTRIN. [BRANDENBURG.]

CUTCH, a principality lying between 22° and 25° N. lat., and between 68° and 72° E. long., is bounded N. by the Great Sandy Desert, E. and S. by the Gulf of Cutch, and W. by the Koree or eastern outlet of the Indus. The country is naturally divided into two portions, of which that towards the south is an irregular hilly tract; the northern part, called the Runn, is an extensive salt morass, 160 miles long from east to west, and varying in breadth from 4 to 60 miles. During the rainy season the Runn is completely covered with water, and the country to the south is quite insulated. During the dry monsoon the waters retire, and the Runn assumes a diversified appearance. In some parts it is still an impassable salt swamp; in other parts there are great banks of dry unproductive sand covered occasionally with saline incrustations, while other parts afford tolerable pasture. During the rainy season the Runn can be traversed with difficulty, and only in certain parts by horsemen.

The soil of the habitable part of the country is for the most part clay covered with about five inches of deep sand. Towards the east the soil is loamy, and near the hills the surface is covered with volcanic matter, and abounds with specimens of metallic scoria. A range of hills named the Lakhi, running east and west through the centre of this part of Cutch, divides it into two nearly equal portions. These hills are one continuous mass of rock, destitute of soil and of water except during the rainy season, when the water forms channels for itself, through which it rushes to the plain on each side. A high bank of sand extends along the shore the whole distance from the Indus to the Gulf of Cutch. But little wood is found in the principality. A few common trees have been planted about the villages, and among them are date-trees, which yield fruit of good quality. The cultivation of cotton is carried on extensively, and the produce is exported in return for grain, which is procured from Gujerat and Sindh. Iron-ore occurs throughout the country, and coal of an inferior quality is found in abundance.

The horses of Cutch are much esteemed; the oxen are not reckoned of much value. Goats and sheep are numerous. The wool of the sheep is of long staple but coarse, answering well for the manufacture of blankets and carpeting: the weight of the fleece averages from four and a half to five pounds. Coarse woollen cloths are made by the inhabitants for home use. Towards the north, and near the Runn, wild asses are very numerous, and are met with in herds of sixty or seventy together. This animal is larger and stronger than the tame ass. It is fierce and untameable in its nature, and when unable to procure pasturage in the desert lands advances into the inclosed country, and does much damage to the grain crops: the flesh is said to be good eating.

The principal towns of Cutch are ANJAR, Bhooj the modern capital,

Luckput Bunder, Mandavee, Rohur, and Tahrah. *Bhooj* was founded about 200 years ago by Rao Bharra; it stands on the south-west side of a hill in 23° 18' N. lat., 69° 50' E. long. The fortifications are extensive, but not well planned. The town contains several mosques and pagodas of white masonry interspersed with plantations of date-trees, and from a distance presents a handsome appearance, but on a nearer approach there are found to be a large proportion of mean dwellings. The palace of the rao is a large and well-built structure, covered with a kind of white enamel, which adds to its beauty. *Luckput Bunder*, formerly called Bustabunder, but which obtained its present name in 1793, when the fort of Luckput was built, stands near the east side of the Koree, in 23° 47' N. lat., 68° 56' E. long., 75 miles N.W. from Bhooj. The town is built on the brow of a hill which rises from a swampy plain; it contains about 2000 inhabitants, and is principally important as being on the high road from Bhooj and Mandavee into Sindh. Previous to the great earthquake of 1819 the communication from this town to the head of the estuary of the Koree was by means of a small shallow creek navigable only by small boats, but the effect of the convulsion was to deepen the water to eighteen feet and effectually to open the navigation; it is however not a place of much trade. *Mandavee*, the principal sea-port of Cutch, situated on the shore of the Indian Ocean on the north side of the entrance to the Gulf of Cutch, in 22° 51' N. lat., 69° 34' E. long., is the most populous place in the principality, and contains 50,000 inhabitants, who are principally Bhattias, Banyans, and Brahmans. The port is an open roadstead with a creek. There are 250 vessels belonging to the place, which carry on a very considerable trade with Zanguebar and the whole east coast of Africa, with the Red Sea and Arabia, with the Persian Gulf, Mekran and Sindh, and with India as far as Ceylon. The vessels employed in this traffic vary from 25 to 200 tons burden; they carry a large lateen sail, and have two masts, but are never decked; they are navigated by native pilots, who have acquired the use of the quadrant and steer by charts. The most valuable branch of the trade of Mandavee is that carried on with the eastern coast of Africa, a distance of 3000 miles, whence the merchants of Cutch procure ivory, rhinoceros hides, and other valuable articles. The principal article of export is cotton. *Rohur*, also a sea-port, is situated in the Gulf of Cutch opposite to Wumania on the Gujerat peninsula, and is in 23° 2' N. lat., 70° 21' E. long., about 12 miles from Anjar: the depth of water in this part of the gulf does not admit of any but small vessels. The chief trade of Rohur is carried on with Gujerat. *Tahrah*, a populous place inhabited principally by Hindoos, is a fortified town about 80 miles S.E. from Luckput Bunder, on the road between that place and Mandavee.

The population of Cutch may amount to about 500,000, about one-half of whom are Mohammedans, and of the remaining half the greater part are Hindoos. The Jharejah tribe of Rajpoots, who were estimated in 1818 to amount to 12,000, are believers in the Koran, and at the same time adhere to many Hindoo observances. This tribe, the chief of which is the rao or sovereign prince of Cutch, is remarkable for the almost universal practice of female infanticide, a practice which the English government has vainly endeavoured to suppress. The morals of the tribe are in other respects said to be very degraded; they are ignorant, indolent, and almost universally addicted to indulgence in the use of intoxicating liquors: their wives are necessarily procured from among other tribes. Cutch is held by the Rao of Cutch under British protection, the annual subsidy payable to the East India government being 20,000*l*.

(Hamilton, *East India Gazetteer*; *Parliamentary Papers*.)

CUTTACK, a district in the province of Orissa, bounded E. by the Bay of Bengal, N.E. by the province of Bengal, W. by various Maharratta states, and S.W. by the Northern Circars. Its length from north-east to south-west is 180 miles, and its average breadth 110 miles. The area of the district is about 16,929 square miles. The population is estimated at 761,805. On the coast, and for 20 miles inland, the country is low, and covered with wood, and being subject to inundation at spring-tides is very marshy. Beyond that distance the country rises considerably, and the soil is dry and fertile. Still farther inland it swells into hills, and is well wooded; some of the trees are valuable for cabinet work, and others are used in dyeing. The forests are infested with wild beasts. The region thus lying beyond the marshy delta is called the Mogulbundy. Beyond this is a third region, which is hilly, and extends westward as far as Gundwana. This region is parcelled among 16 hereditary Zamindars, who are under the protection of the English, and pay a subsidy at the rate of about one-tenth of the net produce of their estates. The country is subdivided under these Zamindars into a great number of estates, which are also held by hereditary succession. Iron and a great variety of minerals are found in this hilly country.

Cuttack is watered by numerous streams, which during the rainy season become large rivers. The principal of these are the Mahanuddy and its numerous branches the Bhaminee, the Byturnee, and the Subanreeka. The *Bhaminee* rises in the mountains of Gundwana, and flowing first to the south and then to the east, traverses the district of Cuttack; uniting with the Beroopah, a branch of the Mahanuddy, it joins the sea near Point Palmyras. The *Byturnee* rises among the mountains of Chuta Nagpore in Bahar, and flows south through Gangpore in Gundwana; on entering Cuttack it turns to the

south-east, and afterwards to the east, and falls into the Bay of Bengal in 20° 48' N. lat. The *Subanreeka* also rises in Chuta Nagpore, and flows in a south-easterly direction, with a very winding course, for 250 miles, and joins the Bay of Bengal, forming the southern boundary of the province of Bengal. These rivers abound with fish.

In Cuttack the rainy season does not begin so early as in Bengal, but it continues from September to November with so much violence as to cause the different rivers to overflow their banks. In November the weather becomes fine. From April to June the heat is very oppressive, and would be hardly supportable but for occasional thunder-storms, accompanied by rain. At other times the climate is more temperate, but the thermometer seldom sinks below 60°.

The manufacture of salt is carried on along nearly the whole of the coast; the produce is very white and pure, and is considered to be the finest manufactured in India: the manufacture yields a large revenue. There is little other trade. The Mogulbundy produces rice and other grains, pulse, spices, dyeing stuffs, and sugar. Maize and wheat are the chief products in the hilly country farther inland. During the periodical rains, when the rivers are full, a good deal of teak and other timber is floated down to the coast. The forests in which this timber is cut are very unhealthy, and for that reason can be visited only at certain seasons of the year.

The principal towns of the district are Cuttack, Balasore, and Juggernauth, or Juggernatha. [CUTTACK; BALASORE; JUGGERNAUTH.] The other towns, or rather large villages, deserving of mention, are Buddruck, Soroli, and Piply. *Buddruck* is 38 miles S.S.W. from Balasore, in 21° 7' N. lat., 86° 26' E. long. It is this village and its neighbourhood that furnish most of the people who are known in Calcutta as Balasore bearers. *Soroli* is about 23 miles S.W. from Balasore; it contains two fine tanks and the ruins of a mud fort. *Piply* is 27 miles S. from the town of Cuttack, in 20° 5' N. lat., 85° 58' E. long. The district contains a great number of small villages. A great part of the circulating medium of the district is composed of cowries, supplies of which are obtained every year from the Maldivé Islands in return for grain. A considerable amount of bullion is carried into Cuttack by pilgrims, but the greater part of it generally finds its way to Calcutta.

The district of Cuttack, including Balasore and other dependences, was ceded to the East India Company, in full sovereignty, by the Raja of Berar in December 1803; the fort and town of Cuttack were taken by the English army in the month of October preceding. The salt monopoly was partially introduced soon after the acquisition of the territory, but was first legally recognised by the government in 1814. The measures at first pursued operated rather to restrict the supply than to subject the article to taxation, and much distress was thereby occasioned to the people. The too rapid introduction of a new revenue system led to numerous sales of land for arrears of rent, so that in the course of eleven years more than one-half of the settled lands in the Mogulbundy passed from the original possessors. A very serious revolt, which was in consequence attempted in 1817, was not fully quelled until two years after, causing a considerable sacrifice of lives. After this insurrection arrangements were made for supplying the district with salt by an extended system of local sales, at fixed prices, below those of the auction-sales at Calcutta, and by this means a much larger quantity was sold for consumption within the district, the revenue was improved, and the people were relieved from a severe oppression.

(Rennell, *Memoir*; *Parliamentary Papers*.)

CUTTACK, the capital of the district above described, is situated in 20° 27' N. lat., 86° 5' E. long., about 251 miles S.W. by S. from Calcutta, and 902 miles S.E. from Delhi, travelling distances. The town is built on a tongue of land between two branches of the Mahanuddy River. During the rainy season it is completely insulated, and the town itself would be subject to periodical inundations but for large and solid embankments faced with hewn stone, which effectually keep out the water. The river during the rains is a mile and a half broad, and from 30 to 40 feet deep at this part, but during the dry season it is a narrow stream with a depth of only 3 feet.

The Sanscrit word 'catak,' from which the name of the town is derived, signifies a royal dwelling. While the province of Orissa preserved its independence, Cuttack was the residence of the Gajapati, or superior raja, at whose court the military chiefs of Orissa performed feudal service. The town contains a very well-built street, with houses of stone two and three stories high, a large market-place, and several mosques; in one of these is exhibited a stone brought from Mecca, and bearing an impression of the foot of Mohammed. Cuttack is said to be one of the healthiest and pleasantest towns in India. The fortress of Barabuttee, which was built in the 14th century, stands about a mile north-west from the town.

(Rennell, *Memoir*; *Parliamentary Papers*.)

CUXHAVEN, a harbour on the left bank of the Elbe, at its entrance into the German Ocean. It is situated in 53° 53' N. lat. 8° 44' E. long., 59 miles from Hamburg, to which city it belongs. It affords a secure shelter against this dangerous sea in the winter months, or to ships waiting for fair winds. The town or village of Cuxhaven contains about 1000 inhabitants, chiefly pilots and fishermen. It has a lighthouse and bathing establishments. Vessels lie in the

harbour waiting for favourable winds. In winter, when the Elbe is frozen over, the Hamburg steamers ply from Cuxhaven.

CUZCO, a town in South America, in the republic of Peru, in 13° 31' S. lat., 72° 4' W. long., and at a distance of about 300 miles due E. from Pisco Bay, in the Pacific, has above 40,000 inhabitants. Before the arrival of the Spaniards it was the capital of the extensive empire of the Incas, and is said to have been built by the founder of the empire, Manco Capac, in the 10th or 11th century. In the year 1534, when it was taken by Pizarro, the Spaniards were astonished at the magnificent buildings which it contained, especially the Temple of the Sun. Of this temple there remain at present only some walls of singular construction, upon which stands the magnificent Dominican convent. The town is built at a height of above 11,000 feet above the sea, and at the foot of some hills in the middle of a wide valley, which has an undulating surface. This valley extends eastward to a mountain stream, the Quillabamba; in the lower part it is well cultivated, the fields having the advantage of irrigation. The houses of Cuzco are built of stone, covered with red tiles. Many of them still retain their original walls. The great size of the stones used in their construction, the variety of their shapes, and the excellent workmanship which they display, give to the city an interesting air of antiquity. The cathedral, the convents of St. Augustin and of La Merced, are very large buildings, inferior in architecture to few in the Old World. Upon a lofty hill, a little north of the city, are the ruins of a great fortress, many parts of the wall of which are in perfect preservation. They consist of stones of extraordinary size and of polygonal shape, placed one upon another without cement, but fitted with such nicety as not to admit the insertion of a knife between them. This stupendous work was erected by the Incas for the protection of their capital. A great part of the population is composed of Indians, who are distinguished by their industry; they manufacture cotton and woollen goods and leather. Their embroideries and carved furniture are much valued. The town has a university, two colleges, a mint, and several hospitals. The great high road of the Incas extended from this town northward as far as Quito, and southward probably to the southern extremity of the valley of the Desaguadero to the neighbourhood of Oruro, or from the equator to 20° S. lat. (Ulloa; *Memoirs of General Miller*.)

CYCLADES. [ARCHIPELAGO.]

CYDNUS, RIVER. [ANATOLIA.]

CYPRUS, called by the Turks Kibris, an island in the Mediterranean, lying near the coasts of Syria and Asia Minor. The principal part of the island, in shape an irregular parallelogram, is about 110 miles long from east to west, between Cape della Grega (the ancient Pedalium) and St. Pifano, or Hagios Epiphanius (the ancient Cape Akamas). The breadth of this part of the island varies from 30 to 50 miles, its most southern point being Cape delle Gatte (the ancient Curias), and its most northern point Cape Kormachiti (the ancient Crommyon), which is 45 miles distant from Cape Anemur in Cilicia. The rest of the island forms a horn-like projection, extending for about 20 miles in length with a breadth of from 2 to 5 miles, terminating in Cape Andrea (the ancient Dinaretum), off which lie two small islets called Kleides, or 'the keys of Cyprus.' This part of the island, which is rugged, mountainous, and rocky, takes a north-eastern direction, and lies nearly in a line with Cape Khanzir, the most southern point of the Amanus Mountains on the coast of Syria. The distance from Cape Andrea to Cape Khanzir is about 75 miles; but the nearest part of the Syrian coast, in the neighbourhood of Latakiah, is only about 60 miles distant from Cape Andrea. The island is about 230 miles north from the Damietta mouth of the Nile. A range of mountains runs through the island in the direction of its length, keeping closer to the north than to the south coast. These mountains, called Olympus by the ancients, now Stavro-Vuno and Santa-Croce, are according to some more than 7000 feet, to others more than 10,000 feet above the sea. On Mount Santa-Croce, 18 miles north of Larnaka, is a church said to have been founded by Helena, the mother of Constantine: another summit, 5 miles from Zerini, or Ghirneh, near the north coast, has a monastery and an old castle upon it, from which there is a splendid view. The northern slope of these mountains is bold and rugged: the southern side is still more so, presenting a deeply-serrated outline with thickly-wooded steepes, diversified by precipitous masses of limestone and deep picturesque valleys, in which grow the narcissus, the anemone, and the ranunculus. The most extensive plain, called Messarea, is in the south-east part of the island, and is watered by the river Pediceus, which is however nearly dry in summer, like all the other rivers of the island. Another level tract, watered by the Tretus, lay to the south of the former, near the ancient city of Citium.

Strabo (Casaub., 682, &c.) gives the following enumeration of the towns of Cyprus in his time. On the north coast, east of Cape Acamas, were Arsinoë, Soli, with a harbour founded by Phalerus and Acamas of Athens; Limenia, inland; then east of Cape Crommyon, Lapathus, built by the Lacedemonians; next Agidus, Aphrodisium, and Carpasia; east of the last was a mountain and cape called Olympus, with a temple of Venus upon it, which women were forbidden to enter. Turning thence towards the south was Salamis, at the mouth of the Pediceus, one of the principal cities of the island, said to have been built by Teucer, an emigrant from the island of Salamis. Near

the mouth of the Pediceus was Ammochostos, the name of which remains in the corrupt form of Famagosta. Proceeding southward was another Arsinoë, with a port; next came Leucolla, near Cape Pedalium, a lofty table-land, called the 'Table of Venus.' West of Pedalium was Citium, with a harbour that could be closed. Citium was a large town, and the birthplace of Zeno the Stoic. West of Citium was Amathus. Inland was Palæa, and another mountain called Olympus. Sailing round Cape Curias to the west was the town of Curium, with a port, built by the Argivi. Here the coast turns to the north-west, looking towards Rhodes, and had the towns of Treta, Boosoura, and Old Paphos (Palæpaphos); then Cape Zephyrium; and next to it another Arsinoë, with a port, temple, and sacred grove; and New Paphos, built by Agapenor, 60 stadia by land from Old Paphos. [BAFFO.] The north-eastern part of the island was called the Akte of the Greeks, from the tradition that Teucer landed upon it with his colonists. [ACTIUM, vol. i. col. 59.]

Most of the above towns, and others which Strabo has left out, have long since disappeared. The present towns of Cyprus are the following:—*Lefkosia*, vulgarly called *Nikosia*, the capital of the island, and the residence of the Turkish governor, which is near the site of the ancient Letra, or Leucotra. Its population is not more than 16,000. The town stands in the centre of the island, in a plain surrounded by mountains. Lefkosia was the residence of the kings of Cyprus of the Lusignan dynasty, and was then much larger than at present: the Venetians destroyed part of it in order to strengthen the remainder. It is now three miles in circumference. The church of St. Sophia, a fine gothic building, is converted into a mosque: the monuments of the Lusignans in it are sadly mutilated. There are also a fine bazaar, a khan for travellers, several Greek churches and convents, a Roman Catholic church, and the palace of the governor, on the portal of which is still seen the Venetian lion in stone. The bastioned walls erected by the Venetians still stand. The streets are narrow and dirty, and many of the fine old mansions are crumbling to decay. Carpets, cotton prints, and morocco leather are the chief industrial products; there is some trade in raw cotton and wine. The Greek archbishop of Lefkosia is metropolitan of the whole island. *Famagosta*, on the east coast, a few miles south of old Salamis, and not far from the site of the ancient Tamassus, once famous for its copper mines, is a town once strongly fortified by the Venetians, but now much depopulated and decayed. The Venetian palace and most of the churches are now in ruins, and the fortifications are now insignificant. *Larnaka*, or *Larnika*, near the site of old Citium, near the south coast, and 24 miles S. from Lefkosia, is a thriving place, being the residence of the European consuls and factors, and the seat of the chief trade. The port of Larnaka is at Salines, about a mile and a half from it. A Greek bishop resides at Larnaka, and there are also some Catholic churches in the town. The houses are built chiefly of clay, and only one story high above the ground-floor, on account of the earthquakes to which the island is subject. The interior of the houses however is comfortable, the apartments are paved with white marble, and almost every house has a garden, of which the Cypriotes are very fond. The principal exports consist of cotton, wine, the best of which is produced near Limasol, salt, corn, opium, turpentine, silk, and fruit: population about 3000. *Limisso*, or *Limasol*, near the ancient Amathus, 42 miles S.W. from Larnaka, has a good harbour, but the town is a heap of ruins: in the country hereabouts the vine and other fruit-trees flourish; carob-trees are especially abundant. *Baffo*, or *New Paphos*, has been already noticed. [BAFFO.] On the north coast is *Zerini*, or *Ghirneh*, the ancient Cerinia, with a fort and a small harbour, from which there is some traffic with the opposite coast of Caramania. Besides these, there are a few Greek villages and several monasteries scattered about the island.

The soil of Cyprus is naturally fertile; formerly under the Venetians it maintained a population of nearly 1,000,000; but the number of inhabitants in 1850 was only 140,000, about 100,000 of whom are Greeks, and 30,000 Turks, and the remainder Catholics and Maronites. From neglect and oppression, the inhabitants are in a state of the greatest misery. Many districts of the island are uninhabited and of course uncultivated wastes or clothed with heath, thyme, and other aromatic plants. Cotton of the finest quality, excellent wine, and all kinds of fruit are produced; but agriculture is in a most backward state. The average annual yield of corn is about 112,000 quarters. Besides the productions just named, madder, opium, colocynth, oranges, lemons, pomegranates, hemp, tobacco, &c., are grown. The carob-tree (*Ceratonia Siliqua*) abounds in some districts; its succulent pods are exported to Egypt and Syria, while the pulp, which is called St. John's Bread, and resembles manna, is used as an article of food. Other products are olive-oil, pitch, wool, cheese, raisins, and silk. On the mountains are forests of fine timber. One of the most important plants of the island in respect to its economical uses is the *Ferula Græca* (the ancient *ρῆν*, and still called *Narthéka*): of the stalks the Cypriot forms a great part of his household furniture; and the pith is used instead of tinder for conveying fire from one place to another, as taught by Prometheus of old. (Æschylus, 'Prom.' 109-111.) Sheep and cattle thrive. In ancient times Cyprus was famous for its valuable copper mines as well as for gold, silver, and precious stones, including the diamond, emerald, jasper, opal, and agate. Copper, asbestos, talc,

rock-crystal, and various other minerals are now known to exist, but no mines are allowed to be worked. Salt is made on the sea-shore to the amount of about 10,000 tons annually. Game and fish are plentiful. The island is infested with snakes, tarantulas, and venomous spiders; and sometimes almost every green herb and leaf is devoured by clouds of locusts from the neighbouring continent. The climate is cold in winter, owing to the winds that blow from the mountains of Asia Minor and Syria. In the plains the heat of summer is excessive, but it is moderated by the sea breezes; rain is very rare in summer, and as irrigation is neglected of course there is then very little verdure. Some districts are unhealthy, from want of drainage, and the consequent malaria. The total value of the exports in 1841 was 56,595*l.*, and of the imports, 25,327*l.*

Cyprus appears to have been colonised by the Phœnicians at an early period, and the island, or a portion of it, seems to have been subject to them even down to the time of Solomon. Their chief town *Citium* is supposed to have been the most ancient city in Cyprus, and to be the *Chittim* mentioned in the Old Testament. Its ruins are seen between Larnaka and its port Salines. Phœnician inscriptions have been found in the foundations of a fort, which defended a large basin or harbour now nearly filled up. Lieutenant Leycester ('*London Geographical Journal*, vol. xxii.) found in Cyprus inscriptions of the earliest times—Cuneiform and Phœnician. Ethiopians are also mentioned as forming part of the population, but it is difficult to say exactly who are designated under this name. Greek colonies afterwards settled on the coast. According to Strabo it was divided among several petty tyrants, who were at times at war with and sometimes allied to the neighbouring powers of Asia Minor and Greece. Amasis, king of Egypt, invaded Cyprus and took *Citium* ('*Herod.*' ii. 162), and it was probably he who introduced the Ethiopian or African settlers. The island became subject to the Persians ('*Herod.*' v. 108), and afterwards submitted to Alexander the Great, upon whose death it fell with Egypt to the share of Ptolemy the son of Lagos. It continued under the Ptolemies, sometimes united with Egypt, and sometimes under a separate prince of the same dynasty. The last of these princes, brother to Ptolemy Auletes, king of Egypt, incurred the enmity of P. Clodius Pulcher, who being taken prisoner by the Cilician pirates, sent to the king of Cyprus for money to pay his ransom. The king sent a sum which was too little. Clodius having recovered his liberty by other means, when he became tribune of the people obtained a decree to be passed for reducing Cyprus to a Roman province. (Strabo, 684; and Dion, xxxviii. 30.) M. Cato was sent to take possession of it. The king on hearing of this design put himself to death before Cato's arrival. Cato seized upon the treasury, which was well filled, and sent a large booty to Rome. Cyprus thus became a Roman province. On the division of the empire it fell to the lot of the Byzantine emperors, and after several vicissitudes became a separate principality under a branch of the Comneni. Richard of England took it in 1191, and sold it to the Templars, whose oppression drove the people to revolt. Richard resumed the sovereignty, and gave it to Guy of Lusignan, the expelled king of Jerusalem, in 1192. The Lusignans retained it for nearly three centuries, which was a flourishing period for Cyprus. John III. of Lusignan died in 1458, leaving the kingdom to Charlotte, his only legitimate child, who married her cousin Louis, count of Geneva, second son of the Duke of Savoy and of Anna of Cyprus. She was solemnly crowned at Lefkosia in 1460, but was soon after expelled by her natural brother James, assisted by the Mamelukes of Egypt. James married Catharine Cornaro, the daughter of a Venetian merchant, who brought him a dowry of 100,000 gold ducats. On this occasion the Venetian senate adopted Catharine Cornaro as daughter of St. Mark, and the marriage was celebrated in 1471. In 1473 James died, and his wife soon after was delivered of a son, of whom the republic of Venice assumed the guardianship, and Venetian troops were sent to garrison the towns of the island. The child dying while an infant, the senate persuaded Catharine, in 1489, to abdicate the sovereignty in favour of the republic, and to retire to a princely style on a liberal pension. Meantime Charlotte Lusignan had retired to Rome, where she died in 1487, bequeathing her claims to Charles, duke of Savoy, in consequence of which the sovereigns of that dynasty assume to this day the title of kings of Cyprus and Jerusalem. The Venetians kept possession of Cyprus till 1570, when Selim II. sent a powerful force to invade the island. The Turks took Lefkosia by storm, and massacred about 20,000 people. They then laid siege to Famagosta, which was long and gallantly defended by the proveditor-general, Marcantonio Bragadino. At last, in August 1571, the Venetians were obliged to capitulate, on condition of being sent safely home. The pasha Mustapha signed the capitulation, but when Bragadino with the other Venetian officers repaired to his tent to deliver the keys, he had them all seized and put to death; except Bragadino, whom after some days he caused to be led naked to the square of Famagosta, where in the pasha's presence the executioner began to slay him alive. Bragadino expired in the midst of the torments, which he endured to the last with the greatest constancy. His skin was filled with straw and hung up to the yard-arm of the admiral's vessel, in which Mustapha returned to Constantinople. Venice raised a monument to the memory of Bragadino in the

church of San Giovanni e Paolo; and his relatives after a time ransomed his skin, which was placed in the monument. From that time the Turks have remained in possession of Cyprus. Cyprus now forms a pashalic in the Eyalet of the Djezair, or islands which are governed by the Capitan Pasha.

CYR, ST., a village near Versailles, in France, celebrated for its royal abbey, an institution founded by Louis XIV., at the desire of Madame de Maintenon, for the education of young ladies of noble birth. Previous to the foundation of this establishment, St. Cyr was composed only of some peasants' cottages, with the château of the lord of the village. The institution was for 250 young ladies who could show a noble descent of four generations on the father's side: they were received between the ages of seven and twelve years, and maintained, instructed, and furnished with everything till they reached the age of twenty. The girls were instructed by about forty nuns. On quitting the establishment they received a dowry of a thousand crowns. The buildings of the abbey were designed by Jules Hardouin Mansard, the architect of Louis XIV., and consisted of twelve principal piles of building, forming five courts, with extensive gardens attached. The buildings were commenced in 1685 and completed in a year; 2500 workmen were engaged in the work. Louis XIV. was in the habit of visiting Madame de Maintenon in a pavilion in the garden; and in the buildings of the institution the young ladies used to perform the '*Fæther*' of Racine, whose '*Athalie*' was also written for them, though only performed by them twice, and that without dresses, and not in their theatre. Madame de Maintenon passed the close of her life at St. Cyr, and dying there in 1719, was buried in the choir of the church, where a long epitaph, in French and Latin, was inscribed to her praise.

This establishment was suppressed at the Revolution, and the buildings were at first devoted to the purpose of a military hospital, subsidiary to the Hôtel Royal of Paris. In 1814 Napoleon transferred hither the military school of Fontainebleau, and the restored Bourbons sanctioned the change. The pupils, who are admitted after passing an examination, amount to 350. They enter between the ages of sixteen and twenty, and about 140 leave the institution every year, who are appointed to regiments as vacancies occur.

CYRENAICA, a region of North Africa, comprehending the country between the Great Syrtis and the Gulf of Platea, now Bomba. The western limits between Cyrenaica and the Carthaginian dominions were fixed at the Philætorum Aræ at the bottom of the Great Syrtis, and its eastern limits towards Egypt seem to have been about the Catabathmus Major. Cyrene, Teuchira, and Hesperis were the earliest Greek colonies. Barca was a colony of Cyrene, mixed with Libyan aborigines. Afterwards, under the Ptolemies, Teuchira took the name of Arsinoë, Hesperis was called Berenice, and the port of Barca became the city of Ptolemais, and drew to it most of the inhabitants of Barca itself. The port of Cyrene, called Apollonia, became also an important town. From these five cities, Cyrene, Apollonia, Ptolemais, Arsinoë, and Berenice, the country was sometimes called Pentapolis. The interior was peopled by Libyan tribes. There were also other towns mentioned as having existed in this country in the Roman period, such as Darnis, Hadriana, Neapolis, Thintis, &c.; but their site is not well ascertained, except Darnis, which is believed to have been where Derna is now. [BARCA.]

As the traveller approaches Bengazi from the south, leaving behind the sandy tracts of the Syrtis, which continue to spread inland in an eastern direction, he enters a new region of hills and plains fit for cultivation, and covered with vegetation. The coast stretches to the north-east, forming a curvilinear projection which advances into the Mediterranean, between the Great Syrtis to the west and the Gulf of Bomba to the east. The chord of this curve from Bengazi to Bomba is about 150 miles, but the sweep of the coast is above 200 miles. A ridge of mountains from 800 to 1100 feet high begins to the south-east of Bengazi, and extends to the north-east in a diagonal direction to the shore, being distant from Bengazi about fourteen miles, from Teuchira five miles, from Ptolometa about two miles, and then comes close to the sea at Ras Sem, continuing along the coast to Apollonia, and as far as Derna. Farther inland is another range, nearly 2000 feet above the sea, which forms the plateau on which Cyrene stood, and which declines gradually towards the east, and blends with the lower one near Cape Bujehara. It then joins the mountains of Akabah el Kebir, the Catabathmus Major (Greater Acclivity) of the ancients, which run through Marmarica in a south-east direction to the Oasis of Siwah. To the south and south-west the mountains of Cyrene slope gradually to the level of the Libyan Desert and of the sandy tract which borders the Great Syrtis. According to Pacho, the greatest breadth of the hilly region from north to south is between seventy and eighty miles. Towards the north both the higher and lower ridges are frequently broken by deep wadis, or chasms, through which the winter torrents rush to the sea. In these chasms or valleys grow a vast number of pine-trees, generally small, though some are large enough for top-masts of a man-of-war. The largest of these chasms is near Cape Ras Sem, with a perennial stream running through it, which is supplied from the fountain of Cyrene. Clusters of date-

trees are seen near Bengazi and Derna. The road from Bengazi to Tocra or Teuchira and Ptolemeta lies through a very fertile and beautiful country, though a comparatively small part of it is cultivated. It is a plain, thickly covered with wood and flowering shrubs, stretching from the sea to the foot of the mountains, and narrowing every mile as we proceed towards Ptolemeta, where the high land comes very close to the sea. The whole length of the plain from Bengazi to Ptolemeta is 65 miles. The sides of the mountains also are thickly clothed with wood, chiefly pine of various kinds, and numerous shrubs, among which the juniper abounds. Ravines whose sides are covered with wood and verdure cross the road very frequently in their course from the mountains to the sea, most of which must be impassable in the rainy seasons, as there is nothing like a bridge over any of them. Open spaces, some of considerable extent, also occur occasionally in the woods; they were probably once cultivated, but are now thickly covered with grasses of various kinds, among which oats grow spontaneously, as well as a species of wild artichoke, which is eaten raw by the Arabs. Several towers of very solid construction are scattered along this road.

Of the five towns of the Pentapolis, Bengazi is generally believed to occupy the site of the ancient Hesperis, afterwards called Berenice, of which there are hardly any remains above ground. [BENGAZI.] In the neighbourhood of Bengazi there are some curious chasms or pits sunk in the rock 60 or 70 feet below the plain, with excellent soil at the bottom covered with trees and rich vegetation, and which seem to answer the description which Scylax gives of the gardens of the Hesperides. The next town on the coast is *Tocra*, the ancient *Teuchira*, afterwards called *Arsinoë*, which although totally deserted is still completely inclosed, except on the sea or north side, by walls of uncommon solidity and thickness, strengthened at intervals by quadrangular towers, twenty-six in number, and is entered by two strong-built gateways placed opposite to each other on the east and west sides of the walls. The circuit of Teuchira is about a mile and a half. It is situated on a plain about four miles from the foot of the mountains. The interior of Teuchira has been utterly destroyed, and the few remains, among which are those of a handsome Christian church, are not distinct enough to give an idea of the former buildings. The line of some of the streets however is distinctly traced. We know very little about the history of Teuchira or of the epoch of its final destruction. The walls were repaired by Justinian, in doing which blocks of stone and marble have been introduced, many of them bearing Greek inscriptions, which evidently formed part of much older buildings. A number of quarries with excavated tombs are seen outside of the city walls. There is no appearance of a port at Teuchira, and the position of the coast is such as not to afford shelter to vessels. *Ptolemeta*, or *Tolmeta*, the ancient *Ptolemais*, is also ruined: several of the buildings however are partly standing, such as a lofty gateway, an amphitheatre, two theatres, a palace or large building, the inner court of which retains its tessellated pavement; several columns are still erect, and a number of others are thrown down in heaps. Though the walls of Ptolemeta have been thrown down their line can be traced in many places, but nowhere do they rise more than a foot above the ground. Ptolemais was originally the port of Barca, which latter is mentioned as one of the five cities of the Pentapolis, though it was inhabited by a mixed Greek and Libyan race. Ptolemais and Barca have been confounded by some geographers, but Ptolemaeus distinguishes them, and Scylax says that Barca was 100 stadia from the sea. Under the Ptolemies of Egypt the port of Barca assumed the name of Ptolemais; and in the vicissitudes of the country the Greek population of Barca withdrew to Ptolemais, which flourished through its maritime trade. Pomponius Mela mentions Ptolemais, and not Barca, among the cities of Pentapolis. [BARCA.] Ptolemeta lies in a delightful position at the foot of the hills, and on a slope stretching to the sea between two romantic wads, wadys, or ravines. Its extent as far as can be traced was about one square mile; but the whole space is now overgrown with wild vegetation, with patches of corn here and there among the ruins. The Arabs sow the corn and leave it to the winter rains, and they return at harvest time to cut and carry it off. There are several large cisterns in good preservation, which were restored by Justinian, and now afford a supply of good water.

The road from Ptolemeta to Cyrene leads up a romantic valley, the sides of which are thickly clothed with pines, olive-trees, and various kinds of laurel, interspersed with clusters of luxuriant honeysuckles, myrtle, arbutus, juniper, and a variety of wild roses, and then opens into the plain of Merdje, a large and fertile tract about five miles in breadth, on the summit of the first range of mountains, with pools and small lakes formed by the waters from the upper ridge. The Arabs encamp here, and partly sow the ground with corn and use the rest as pastures. From the plain of Merdje the path follows the track of the ancient road in a north-east direction, leading through a succession of hills and fine valleys to *Ghrennah*, the Arab name for *Cyrene*. On approaching Ghrennah the country becomes more clear of wood, the valleys produce fine crops of barley, and the hills afford excellent pasture for cattle. A plant three feet high, perhaps the silphium of the ancients, and resembling in shape the hemlock, grows here in great abundance. The position of Cyrene is one of the finest that can be imagined, being on the edge of the upper range of hills,

about 800 feet above the lower range. Below the town the hill slopes down towards the north, forming several natural terraces one below the other, and terminating with a fine sweep of table-land, which is the summit of the lower range, and which is covered with scattered tracts of corn and verdant pastures. Ravines sides are overgrown with trees intersect the country in various directions, and form the channels of mountain streams. This table-land extends east and west as far as the eye can reach, and to the north after stretching about five miles it descends abruptly to the sea. The slope of the lower ridge, which runs along the coast of Cyrenaica, is here thickly covered with wood. Its height is about 1000 feet, so that Cyrene is about 1800 feet above the sea, of which it commands an extensive view. The ledges or terraces of the upper ridge afforded room for roads or drives sweeping along the sides of the mountain, and the tracks of the chariot wheels are still impressed upon the rock. The remains of Cyrene occupy a vast extent of ground, but they have been sadly disfigured by the hand of man. Innumerable tombs either built of stone or excavated in the rock encircle the town, and are ranged on each side of the avenues leading to it. In some of these excavations paintings have been found in good preservation, representing funeral games, hunting parties, several sketches of private life, and allegorical subjects. The costumes are beautifully rendered, and the colours very brilliant. Within the precincts of the ancient town are the remains of a bath built of brick, of which some parts of the vaulted work are still left, some towers or forts, a very large hypogeum picturesquely situated on the extremity of the only grove that is found on the plateau, several large temples of the Doric order, two small excavated temples of the Roman period with Christian emblems, two theatres, an amphitheatre, and an aqueduct, but all sadly damaged; in fact the whole of the existing remains are at present little more than one mass of ruins, and the tombs afford the most perfect examples of Grecian art now remaining in Cyrene. A quantity of prostrate columns, statues, capitals, reliefs, and inscriptions are scattered about the ground, but the statues are mutilated, and many of them want their heads, which the Arabs have cut off. There are two copious springs, from one of which, supposed to be the Fountain of Apollo, the water flows into a subterraneous channel, and then issues out on the other side of the mountain.

The country around Cyrene must have been in the time of its splendour a complete garden, and it is easy to conceive how the people of such a country became so much addicted to luxury and pleasure as they are reported to have been. Even now in its wild state "the rich ochrish red soil, watered by rivulets gushing on every side, brings forth a rich vegetation which pierces the mossy rocks, clothes the hills, extends in rich pastures, or develops itself in forests of dark juniper, green thaya, and pale olive-trees. The modern name of the Cyrenaica, 'Jebel Akhdar,' that is, the Green Mountain, expressly indicates its rich and smiling aspect." (Pacho.)

Cyrene was governed by kings, from its foundation by Battus, who died about B.C. 591, to about B.C. 450, when the government appears to have changed to a republic. (Aristoteles, 'Politic.,' vi. 4.) The subsequent history of Cyrene seems to have been a series of changes and internal troubles till after the time of Alexander, when it became subject to Egypt in the reign of the first Ptolemaeus, and so it continued till Ptolemaeus Physcon, whose natural son Apion being in possession of the chief power, gave it into the hands of the Romans about B.C. 97. Strabo says (837, c) that in his time the kingdom of Cyrene, with Crete, formed a Roman province. Cyrene appears to have gradually declined under the Romans as the maritime towns of the Pentapolis rose in importance. It afterwards suffered greatly, and was in a great measure ruined during the insurrections of the Jews under the reigns of Trajan and Hadrian; the province was depopulated when Hadrian colonised it afresh, at which time it is probable that many of the buildings of Cyrene were restored, for there is a variety of Greek and Roman style observable in them as well as in the sculptures. The Jews were at one time very numerous in Cyrenaica; they had settled in it in the time of the Ptolemies, and chiefly resided at Berenice, where they formed a distinct community governed by two archons.

Coin of Cyrene.

British Museum. Actual Size. Gold. Weight, 68 grains.

In the 4th century Synesius, bishop of Ptolemais, one of the most eloquent of the early fathers, deplored the ruin and depopulation of Cyrene, hastened by the oppressions of the Byzantine governors. It was in his time that Cyrene was destroyed by an invasion of some barbarous hordes of the interior of Libya, whose women were armed as well as the men, who destroyed all before them, and only spared the male children to recruit their ranks. (Synesius, 'Opera,' p. 300.) Those of the inhabitants of Cyrene who escaped took refuge at

Ptolemais. The barbarians besieged Ptolemais, in which Synesius had remained faithful to his flock, and they were repulsed. In the early part of the 7th century the Persians under Khosroo Purveez, after overrunning Egypt, invaded the Pentapolis and depopulated the country. The Saracens afterwards completed the work of the Persians, and the towns of the Pentapolis have remained in ruins ever since. Now the nomad Arabs wander about the whole region, which is nominally subject to the beys of Bengazi and of Derna, who are dependents of the pasha of Tripoli. *Apollonia*, afterwards *Sozysa*, and now called *Marsa Sousa*, was the port of Cyrene, from which it is about 12 miles distant. The ancient road leading to it still remains. *Apollonia* lies at the bottom of an open bay, protected however by two small islands in front of the town. The town is ruined, but the greater part of the wall is standing, and there are remains of two Christian churches (the columns of which are of fine marble), of a basilica, a fort, &c. The Oasis of Aujilah, to the south of the desert of Barca, was reckoned part of Cyrenaica.

(Pacho, *Voyage dans la Marmarique et la Cyrénaïque*; Della Cella, *Viaggio da Tripoli alle Frontiere di Egitto*; Beechey, *Expedition to the North Coast of Africa*.)

CYRUS. [ARAS; KUR; BENDAMIR.]

CYTHÉRA. [IONIAN ISLANDS.]

CYZICUS (also called *Cyzicum*), an ancient town of Asia Minor, built on an island in the Propontis near the coast of Mysia, which was joined to the mainland by two bridges. An isthmus gradually formed itself, and the island became a peninsula. It is said to have been a Milesian colony, formed in the 8th century B.C. Strabo (*Cusaub*, 675) speaks of Cyzicus as worthy of being numbered among the first cities of Asia for its size, beauty, and splendour, and for the goodness of its laws. It became early allied to Rome, and remained faithful in its alliance. It withstood all the power of Mithridates who besieged it, and the brave resistance of the citizens gave time to L. Lucullus to come up with his army and drive him back into Pontus. The Romans, grateful for the fidelity of Cyzicus, not only respected its liberties, but gave it an increase of territory, which extended, according to Strabo, to the east, as far as the lake Dascylitis, and to

Coin of Cyzicus.

British Museum. Actual size. Bronze. Weight, 229 grains.

the west, beyond the *Æsepus* into Troas as far as Adrasteia. To the south it reached Miletopolis. The town of Cyzicus was built partly on the sea-coast and partly on a hill; its site is now covered with cherry orchards and vineyards; there are some remains, and among others a theatre, an amphitheatre, and some massive substructions. On the same island, or peninsula, west of Cyzicus, was another Greek colony called Artace, the site of which is now occupied by the miserable town of Erdek. The island, or peninsula, was also called Cyzicus. (Pococke; Sestini; Leake, *Asia Minor*; Hamilton, *Researches*.)

CZEGLED, a large market-town in the county of Pesth in Hungary, and circle of Ketskémét, stands near the point 47° 10' N. lat., 19° 48' E. long. A station on the Vienna, Pesth, and Szolnok railway, is called after the town, and is 47 miles S.E. from Pesth; but Czegléd lies a little way south of the station so called. It has a Roman Catholic and a Calvinist church, several handsome buildings, and contains about 13,000 inhabitants, or 16,500 including the commune. The country around it is well cultivated, and produces much grain and a great quantity of common red wine. The breweries are considerable. The town is about 20 miles N. from Ketskémét, or Ketskémét.

CZERNAGORD. [MONTENEGRO.]

CZERNIGOF (pronounced *Tschernigof*), formerly part of the Ukraine, now a government or province of Little Russia, lying between 50° 20' and 53° 20' N. lat., 30° 10' and 34° 40' E. long., is bounded N. by Mohilev and Smolensk, E. by Orel and Kursk, S. by Poltava, and W. by Kiev and Minsk. The government contains an area of 21,157 square miles, and had an estimated population in 1846 of 1,480,000.

The general character of the surface is a level, occasionally interrupted by hills, and rising into high land as it approaches the elevated banks of the Dnieper, its south-western boundary. With the exception of some sandy tracts, the subsoil is clay, which is well covered with rich loam, and presents a succession of luxuriant arable and pasture lands. On the banks of the Dnieper the chalk, slate, and clay alternate, but slate predominates. Most of the streams which

water Czernigof empty themselves into the Dnieper. The Ipout drains the north-western district, and enters the Soj, a feeder of the Dnieper, in the government of Mohilev, at Nov-Bielitz. But the principal river of the interior of Czernigof is the Desna, a navigable stream, which entering the province in the north-east from Orel, traverses it nearly in its whole length in a south-westerly direction, and enters the Dnieper a few miles above the city of Kiev. The waters of the Desna are increased by those of the Snof, Ostre, Seim, and Sudost. Czernigof abounds in small streams, and in natural sheets of water, none however large enough to be called lakes.

The climate is dry, mild, and salubrious; but the crops sometimes suffer from locusts. Agriculture and grazing constitute the principal pursuit of the inhabitants; corn of all kinds, particularly rye, barley, and oats, are grown, and the yearly produce is estimated at three millions of quarters, of which upwards of two millions are consumed in the country itself. Hemp in large quantities, flax, tobacco, peas and beans, linseed, and hops are also raised. Melons and the commoner sorts of fruit are plentiful, but the grape does not ripen sufficiently for wine. There is here a peculiarly fine species of the cherry, called *Tsherasun*, from which brandy and sugar are obtained. The woods and forests yield an abundance of excellent timber, charcoal, potash, and tar. Horses and cattle are reared in great numbers; the horse is of the small, active, and hardy breed of the Ukraine and well adapted for the use of light cavalry, and some fine studs are kept by the nobility. The ox is of a fine breed, and is here used for the plough exclusively. Large herds of sheep and swine are kept. Bees are very numerous, and much honey and wax are gathered. Of minerals Czernigof possesses iron, alum, saltpetre, porcelain earth, potter's-clay, chalk, and slate.

There are scarcely any serfs in this government. The Greek is the predominant form of faith, and ecclesiastical affairs are directed by the archbishop of Czernigof and Neshin.

The inhabitants generally make their own clothing and utensils. Manufacturing industry increases slowly in the province; the principal products of this kind are linen, broadcloths, leather, glass, and beetroot sugar. The fondness of the people for ardent spirits has occasioned the establishment of a great number of distilleries here as in other parts of Russia. There is some internal trade, which mostly centres at Neshin, where four large fairs are held in the course of the year. The exports, consisting principally of horses, cattle, swine, tallow, wool, skins, bristles, grain and meal, honey and wax, potash, hemp and hempsed, and brandy, are considerable.

Czernigof is one of the privileged governments, the ancient prerogatives of the nobility having been confirmed to them in 1802, and the Cossak inhabitants enjoying the privilege of distilling brandy in any spot they please, without its being deemed an infringement on the crown monopoly. The province is placed under a civil governor, who is a councillor of state, and resides at Czernigof the capital.

The government is divided into 12 circles. The capital, *Czernigof*, is noticed in the next article. Among the other towns we notice the following:—*Neshin*, *Nejin*, or *Nieshin*, stands on the Oster, and has 15 churches and 16,000 inhabitants, who carry on a large trade in soap, leather, preserves, and liqueurs. The town is surrounded by walls, and has a cathedral, several convents, an hospital, and a college. *Gluchof*, on a feeder of the Seim near the eastern boundary, is surrounded by an earthen wall, and has 12 churches and about 9000 inhabitants. *Novgorod-Seversk*, on the Desna, has 8000 inhabitants, and an active trade in corn, hemp, and lime. *Starodub*, on the Babinza, has about 4500 inhabitants. *Mglin*, on the Sudenka, a feeder of the Ipout, has 4 churches and about 5000 inhabitants. *Baturin* is noticed in a separate article. [BATURIN.] *Oster*, at the junction of the Oster and the Desna, 40 miles S. from Czernigof, has a population of 4000.

CZERNIGOF, the capital of the government of Czernigof in Russia, is situated on the elevated banks of the Desna, in 51° 27' N. lat., 31° 15' E. long., about 80 miles N.N.E. from Kiev, and has about 10,000 inhabitants, many of whom are Jews. It is surrounded by a rampart of earth, which is converted into walks. It was built in the year 1024, and is accounted the oldest town in European Russia. In its centre stands a high hill with a castle on its summit; it has several churches, among which is the cathedral, a well-built edifice, in which the remains of St. Theodosius are deposited. There are also four monasteries, a gymnasium, an ecclesiastical seminary, with a printing establishment attached to it, an Imperial Orphan asylum, a riding-school, a mechanics school for 400 pupils, and several establishments for the indigent. The inhabitants are chiefly employed in retail trade and mechanical pursuits, and manufacture small quantities of woollens, linens, leather, and soap. Four markets are held here in the course of the year. Czernigof is the residence of the archbishop of the diocese and of the governor of the province.

CZERNOWICZ. [BUKOWINA.]

CZIRKNITZ (*Zirknitz*), a market-town in the Austrian crownland of Carinthia, lies on the Brohitza, and contains about 1500 inhabitants, who are occupied in fishery and in salt and tile-making. Near it is the Lake of Czirknitz, inclosed within limestone mountains of very grotesque outlines. The lake in dry seasons is from 12 to 15 miles in circumference, and when quite full about 24 miles; its entire area is then about 68 square miles. Its form however is made very

irregular by numerous bays, capes, and islands. At the foot of the Javornig, which rises on its southern bank, the peninsula of Dervoseck stretches far into the lake; on the west is the island of Vorneck, on which is the village of Ottock. While passing over the more shallow parts the rocky bottom of the lake presents a very dark appearance, occasioned by numerous funnel-shaped cavities of various dimensions, and all distinguished by significant names. Its general depth compared with other lakes is inconsiderable: the cavity of Rescheto, the deepest part of the whole lake, is only 56 feet deep below the mean surface of the lake. The lake is remarkable for great variation in the height of its water, which is owing to the nature of the limestone rocks. The bottom of the lake, especially of the funnels, is full of clefts and fissures, through which the water passes at forty different openings into subterranean caverns and channels, and re-appears under the

form of the Bistriza and Baronniza in the valley of Laibach. During the dry season, which generally occurs in autumn, the bottom of the lake is covered with luxuriant herbage, which is made into hay. Only a very small portion of the lake however is susceptible of cultivation; millet and buck-wheat are sown, which ripen in six weeks; but as the waters of the lake frequently do not subside for three or even more years, the sowing and harvest are of course very irregular. In January 1884 the waters left the lake and did not return till March 1885. During the interval grain and vegetables were sown and gathered, and cattle grazed on the bottom of the lake—an occurrence which, for the long cessation of the waters, is said to be unprecedented. The lake abounds in pike and other fish; it is also frequented by numerous aquatic fowl.

UZORTKOV. [GALICIA.]

THE ENGLISH CYCLOPÆDIA.

GEOGRAPHY.

BOHEMIA.

BOHEMIA.

BOHEMIA. [Aisne.]

BOHEMIA (in German, Böhmen), also termed Boheim in many ancient records, derives its name from the Boji, who once occupied the parts about the sources of the Elbe and Moldau. It now constitutes a kingdom forming part of the empire of Austria, comprising Bohemia Proper; the margraviate of Moravia, and that small portion of the duchy of Upper Silesia which was not ceded to Prussia under the treaty of Hubertsburg in 1763 properly belong to it, but they now form a distinct province of the Austrian empire. The margraviates of Upper and Lower Lusatia also formed part of the Bohemian dominions, until the treaty of Prague in 1635 transferred them to the electorate of Saxony. The details which we are about to give will be confined to the territory generally known by the designation of Bohemia; which is an irregular quadrangle in the south-east of Germany, extending between 48° 33' and 51° 5' N. lat., and 12° and 16° 46' E. long.; it contains an area of 20,013 square miles, which is more than two-thirds of the area of Ireland or Bavaria. It is bounded N.W. by the kingdom of Saxony, N.E. by the Prussian province of Saxony, and by Austrian and Prussian Silesia, S.E. by Moravia, S. by the archduchy of Austria, and S.W. by the kingdom of Bavaria. The whole circuit of Bohemia is estimated at about 810 miles, of which 165 lie next to Prussia, 294 to Saxony, and 175 to Bavaria; so that 176 miles only of this circuit are skirted by other parts of the Austrian dominions.

Surface, Population, &c.—The kingdom of Bohemia is now divided into seven circles, which, with their respective areas and populations, are as follows:—

Circles.	English Square Miles.	Population in 1830-1.
Prague	2392	602,725
Budweis	3531	569,673
Eger	2861	500,732
Glatzsch	3127	838,774
Böhmisch-Leipa	1614	530,822
Pardubitz	2890	677,800
Pilsen	3600	629,374
Total	20,013	4,409,908

There are in the kingdom 289 towns, 278 smaller towns and places of importance, and 12,079 villages. The inhabitants are 220 to a square mile.

Bohemia is inclosed on every side by lofty and in parts wild and dreary mountains. On the west side, and from a point close upon the Fichtelgebirge, issue two ranges, the one taking a north-east and the other a south-east direction. The first of these ranges, which separates Bohemia from Saxony, and may be termed 'the left arm of the Sudetsch chain,' is known under the name of the Erzgebirge (Ore Mountains). It runs to the left bank of the Elbe between Tetschen and Schandau, and is neither precipitous nor of a wild character, but with few exceptions wooded nearly to its summit. Its ridges form an undulating line, here and there broken by gentle depressions. The short slope is towards Bohemia, and the longer one towards Saxony. The highest points of this range are the Schwarzwald, or Sonnenwirthel, near Joachimsthal, 4125 feet (or according to Hallaschka 4000 feet only); the Lesser Fichtelberg, near Wiesenthal, 3999, or according to some 3709 feet only; the Kupferberg 2749 feet, towards the south end of the range; and the Schneeberg, near Tetschen on the

Elbe 2291 feet at the northern end of the range. The western and south-western borders of Bohemia are defined by the Böhmer-Waldgebirge (Bohemian Forest Mountains). The Sudetsch chain, of which the principal range is more peculiarly designated the Sudetengebirge (Sudetsch Mountains), extends from the right bank of the Elbe as far to the eastern side of Bohemia as Grulich. Certain portions of this range bear particular names; such as the north-western, called the Isergebirge (Mountains of the Iser), and that small portion lying next to the Elbe, which is called the Lausitzer Bergplatte (Mountain plateau of Lusatia).

In the last-mentioned quarter the loftiest summit on the side of Bohemia is the Tafelichte, which lies at the extreme point of the Bohemian frontier next to Silesia and Saxony, and according to Gersdorf has an elevation of 3750 feet. Commencing from the eastern side of the Iser, the frontier line between Bohemia and Silesia runs along the crest of the remaining and principal arm of the Sudetsch chain, termed the Riesengebirge (Giant Mountains), name frequently applied to designate that chain in general. Seen from a certain distance this range describes a waving line, with a few elevated points, which present the appearance of having been cut short off at their upper extremities. The highest of these abrupt and naked summits is the Riesen, or Schneekoppe (Giant or Snow-caps), 5058 feet, upon which a circular chapel dedicated to St. Lawrence has been erected. Next in height are the double-capped Brunn or Bornberg, and the Great Sturmhauke (Tempest-hood); the former of which is 5000 and the latter 4700 feet above the level of the sea. The Sudetsch chain, which runs south-south-east to the vicinity of Grulich, is called the Glatz Mountains (Glatz-Hegebirge), the waving outline of whose occasionally cap-crowned ridge forms a pleasing object to the eye. Its highest point, though it belongs rather to Moravia than Bohemia, is the Grulich or Spiegeltz Schneeberg; but the most elevated on the Bohemian side are the Pieschay, Hohenkoppe, or Grenzkoppe, as it is also termed, which rises to the height of 3748 feet above the sea, and the Marienberg near Grulich, to which some assign an elevation of 4545 feet. The highest ranges of the Sudetsch Mountains consist of primitive formations, and are in some parts rich in ores: those of inferior height are composed of clay-slate and limestone, intermixed with beds of coal; and the offsets of lower elevation are formed in some parts of quartz and sandstone, and in others of granwacke and basalt.

A lower range runs along the south-eastern boundary of Bohemia, termed the Bohemian-Moravian Mountains, and forms a connecting link with the Glatz Mountains towards the north, and with the Mannhart Mountains in the archduchy of Austria towards the south. This range, which is of moderate elevation and gentle ascent, separates the basins of the Elbe and Moldau from those of the Danube and the March.

The range which runs nearly north-west and south-east, and forms the boundary-line between Bohemia and Bavaria and part of Austria, is known by the name of the Böhmer-Waldgebirge (Bohemian Forest Mountains), which is wholly of primitive formation, and characterised by naked and precipitous features and deep ravines. Towards Bavaria its slope is extremely abrupt, but on the Bohemian side the descent is gradual; and on this side the loftiest heights are the Heidelberg, whose summit forms a spacious plateau at an elevation of 4500 feet, the Kubani, or Boubin, 4211 feet high, and the Dreissesselberg (Mount of Three Seats), on the boundaries of Bohemia, Bavaria, and Austria, 3798 feet. The whole range presents a

considerable obstacle to intercommunication between the inhabitants occupying the country on its opposite sides. Its western descent is very steep; the glens and valleys are narrow, rugged, and often swampy. Few roads traverse it. On the Bohemian side of the mountains the population is principally composed of Czeches: the German inhabitants are very few. Many rivers descend from this range: some of them go to the Danube and send their waters to the Black Sea; others fall into the Elbe and go to the North Sea. On the side of Bohemia the principal rivers are the Moldau, one of the chief sources of the Elbe, and two of its most considerable affluents, the Wottowa, with the Wolinka, and the Beraunka. Metals are found in many parts of the range; gold occurs in small quantities; silver is more abundant, and worked profitably; lead and iron are largely wrought. Antimony, zinc, cobalt, and cinnabar are common. Coal occurs, but only in few places on the Bohemian side.

Bohemia is also intersected by several ranges of inferior elevation; the northern, called the Northern Hill, or Traup Mountains, spreads in various directions; and the more southerly, called the Midland Mountains, which are arms of the Bohemian Forest chain, consist of the Beraun, Moldau, Euler, and one or two other ranges.

The interior of Bohemia presents an undulating surface, very frequently studded with high and pointed eminences, but with a general slope towards the centre of the country. The most extensive plains are in the provinces of Königgratz and Chrudim, from Neustadt to the Nasaberg acclivities. The country is full of valleys and mountain passes, among which we may mention the delightful valleys of the Elbe and Beraun; but the deepest is the Riesengrund or Giant's Glen among the Giant Mountains.

Hydrography, Communications. The whole of Bohemia being at a considerable elevation, its rivers rise either within or close upon its borders. The *Elbe* (the ancient *Albis*, or the *Labe* of the Bohemians) traverses the north-east part of the country. It originates in the junction of two brooks, the White-water and Elbe-brook, whose sources lie 10 miles apart in the Giant Mountains; it descends as an impetuous torrent into the hill-country, receives a multitude of minor streams in its course, and assumes a blood-red tint after heavy showers, which is particularly remarkable in the neighbourhood of Josephstadt and Königgratz. It forms in many parts a rich alluvium by the overflowing of its banks, and quits Bohemia after a course of about 190 miles at Herrnskretschau, near Schandau, where it enters the kingdom of Saxony. Its sources are 4000 feet above the level of the sea, while its bed, at the point where it leaves the Bohemian territory, is not more than about 287 feet above it. Its principal tributaries within the borders of Bohemia are the Moldau and Eger. The *Moldau* rises from the Black Mountain (Schwarzberg), in the Bohemian Forest Mountains, close upon the confines of the Bavarian bailiwick of Wolfstein: it first flows south-east, and when it has reached Rosenberg, at the southernmost extremity of the kingdom, takes a northerly direction through the heart of the country, and falls into the Elbe near Melnik, after a short bend to the east. The Moldau, termed the *Witwa* by the natives, runs for about 280 miles before its junction with the Elbe: it generally runs between steep rocks, and at its confluence with the Elbe is nearly as broad as that river. From Budweis, where it becomes navigable, to Prague, its length is about 130 miles, and from Prague to Melnik about 18 miles. Its breadth at Prague varies from 250 to 286 paces; and the height of its surface, which is 1511 feet at Krummau, declines at the bridge in Prague to about 529 feet. The *Eger*, called the *Cheb* by the Bohemians, rises on the east side of the Fichtelberg in the Bavarian circle of the Upper Main, whence it soon after enters Bohemia and flows eastward for about 80 miles until it joins the Elbe on the west bank near Theresienstadt. The minor tributaries of the Elbe are the Aupa, the Eritz or Adler, which rises near Königgratz and skirts the principality of Glatz in Prussian Silesia for a short distance, the Mettan, which flows from the vicinity of Josephstadt, and the Iser, which descends from the south slope of the Giant Mountains, not far from Brandeis. The streams that join the Moldau are the Luschnitz, which flows from the neighbourhood of Moldautin, the Wottowa or Watawa, which flows from the Bohemian Forest Mountains, and for some distance first bears the name of the Widra, the Szawa or Czazawa, whose source lies near Hradishka, and the Beraun or Beraunka, which rises near Königgratz. The whole drainage of Bohemia finds an outlet through the narrow pass of the Elbe at Herrnskretschau. As this outlet, independently of its confined width, bears evident marks of violent disruption, and as every other side of Bohemia is walled in with mountains, it has been conjectured that the whole of Bohemia must at one time have formed an immense lake, which has been drained by a disruption taking place at the point where the Elbe ceases to be a Bohemian stream. Among the numerous falls of water in Bohemia the most interesting are those of the Elbe, of the Moldau across the Devil's Wall, and those in the vicinity of Neuwald.

Though full of small pieces of water, Bohemia has no lakes. There are several large swamps and morasses, particularly the Servina swamp (or Gezera), between Brünn and Postelberg, and the Slatina swamp near Doran on the Eger; a considerable portion of the first of these has, however been drained and converted into pasture land.

The roads throughout Bohemia are generally well made, and kept in excellent order. Of the public roads is upwards of 1700

miles. The only passenger railway in Bohemia is a portion of the great Austrian line described under AUSTRIA, which connects Vienna with Dresden, Berlin, and the other chief cities of Germany and the continent generally. This line enters Bohemia from Saxony near Bodenach and runs southward to Prague (80 miles), whence, under the title of the Prague, Olmutz, and Vienna railway, it runs nearly east to Böhm-Trubau (101 miles), where it turns southward to Vienna; a few miles south from Böhm-Trubau it quits Bohemia. At Böhm-Trubau, a loop-line which passes by Olmutz diverges eastward, and shortly afterwards quits Bohemia. There is also a line chiefly for minerals from Budweis southward to Linz and Gmunden; the carriages are drawn by horses, and passengers are not conveyed on that part of the line which belongs to Bohemia.

Geology, Mineralogy, &c. The geological character of Bohemia has been sufficiently described under AUSTRIA. From Zippe's Survey it would appear that the whole of the mountains which enclose Bohemia are of primitive formation, with the exception of two points, the one in the north where the Elbe quits Bohemia, and the other in the north-west, about Braunau and Trautmann, which are of a later formation. A very extensive formation of sandstone is observed in the heart of the country; and there is one most remarkable mass, the Steinwald, near Adersbach, which is nearly 5 miles in length and above a mile in breadth. It stands at some points in compact masses, and in others is shaped into lofty columns, pyramids, cones, &c., forming immense labyrinths. In many parts again there are hills and mountains composed of a solid mass of basalt.

Bohemia contains large masses of quartz, granite, and sandstone; precious stones, particularly the celebrated Bohemian garnet or pyrope, rubies, sapphires, topazes, chrysolites, amethysts, carnelians, chalcedonies, and agates; limestones, beautiful marbles, porcelain earth, slates, potter's clay, between twenty and thirty species of serpentine, basalt, porphyry, &c. The mountain districts yield gold (though now but a small quantity) and silver, quicksilver, tin, lead, iron, bismuth, zinc, cobalt, arsenic, manganese, nickel, chrome, &c. Of salts Bohemia furnishes native alum, natron, several kinds of vitriol, and almost every variety of officinal salts from its mineral springs; and as common salt is extracted from some of the springs it has been inferred that beds of rock-salt exist in some quarters. Considerable strata of sulphureous slate, as well as coals, have been found, and in some directions peat-turf is dug; black-head of good quality likewise frequently occurs. The country is extremely rich in mineral waters, and several of them are in great repute: of such as are publicly known there are upwards of 160. At the head of the ferruginous springs are the Franzens Brunn near Eger, the three springs at Marienbad, and that at Giesshuld; among the alkaline springs are those of Karlsbad and Teplitz, one at Marienbad, and others at Bilin, Liebwerda, &c.; there are bitter waters at Sedlitz, Snidschitz, and Pullna; sulphurous springs at Teplitz, Soberschan, &c.; aluminous and vitriolic springs at Stecknitz, Mochau, Zbonitz, &c.; carbonic acid waters at Karlsbad; and saline springs at Sedlitz and in other places. The virtues of the springs of Karlsbad, as well as the beauty of the adjacent scenery, have placed that spot at the head of the baths of Germany, and acquired for it the designation of 'the Pearl of Bohemia.' The temperature of some of them at the moment of their first emission is not less than 59° to 60° of Reaumur (about 165° of Fahrenheit); that of the springs of Teplitz is 30° (98° Fahr.); the Franzens Brunn near Eger not more than 9° or 10° (54° Fahr.). A large quantity of mineral water is annually exported from the Bohemian springs.

Climate, Soil, Productions, &c.—The elevation of the interior of Bohemia and its remoteness from any coast, for it is nearly equidistant from the Baltic and Mediterranean, give it a clear and salubrious atmosphere and general constancy of weather. The climate naturally becomes keener and blunter as the chains of mountains which encircle Bohemia rise in height. The regions about Gottschau (God's Gift) in the Ore Mountains are considered the coldest in Bohemia, and there are few months of the year in which there is not need of fire; nor will grain ripen in them. In the Bohemian Forest range, where the snow frequently lies 12 feet deep, and does not disappear until the middle of April, as well as in those parts of the province of Budweis which are saturated with moisture, there are many districts in general covered with woods or forests which are not habitable. The mean temperature at Prague is 7° Reaumur (47° Fahr.), whilst on the elevated site of Reihberg it is not more than 4° (41° Fahr.). In the neighbourhood of Reichenberg, where the harvest is two or three weeks later than in the low country, the highest degree of heat has been found to be 12° Reaumur (50° Fahr.), and the severest degree of cold 6° (18.5° Fahr.). The prevalent winds blow from west to some points north, and from west to some points south. These winds, according to Diak, invariably bring dry weather in winter but wet in summer; the more southerly their point of departure in summer the finer the weather. In winter it is precisely the reverse, they being usually accompanied by rains and thaws. On the other hand the nearer to the north their point of departure the more frequent and the more violent are the storms by which they are attended.

The soil of Bohemia varies considerably in productiveness. It is nowhere entirely sterile except in certain parts of the Giant

Forest, on the Ore, and Giant Mountains, those lands along the banks of the Elbe, particularly from Kuneritz to Königsgrätz, which are covered with drift sand, and in some of the districts where swamps abound. The rest of the low country is in general rich and productive, particularly the province of Sautz. No soil in Bohemia is however more fertile than that which has been formerly the site of large sheets of water, its deep black loam being highly favourable to the growth of wheat, rye, and barley. Bohemia produces almost every description of grain and pod seeds, but no maize. The cultivation of the soil is however susceptible of great improvement. The land is divided into estates of vast magnitude; and the peasantry are held in servitude and derive little benefit from their labour, and consequently feel little interest in it. The quantity of arable land in 1846 was 6,105,995 acres; of meadow and garden ground 1,421,072 acres; of pasture land 997,575 acres; of vineyards 4462 acres; and of forests and woodland 3,758,987 acres. The quantity of wheat raised in 1846 was 1,234,126 quarters; of rye 2,999,345 quarters; of barley 1,703,687 quarters; of oats 2,834,169 quarters; and of potatoes 21,034,349 bushels. Among other productions flax is grown in every circle, but of various qualities, and hemp is raised in some few quarters; vegetables, nuts, liquorice-root, chicory, excellent hops, &c.; rape-seed is also largely cultivated for the sake of the oil. Fruit abounds in all parts except the more elevated districts; the vine is only cultivated along the valleys of the Elbe and Moldau. The finest orchards, or rather groves of fruit-trees, exist in the vicinity of Neustadt above the Mettau; whole woods of plum-trees are met with near Melchówek, Weltrus, and other spots. Bohemia is in fact a large exporting country for apples, quinces, dried plums, pears, cherries, &c., though less so than formerly. Bohemia is celebrated for an excellent kind of hops, of which the produce is considerable; those grown in the province of Sautz, and next to these the hops cultivated in the provinces of Rakonitz, Bunzlau, and Pilsen, are in highest esteem: a considerable quantity is annually exported. Beet is cultivated to some extent in order to meet the growing demand for the beet-root sugar manufacture. The border mountain ranges, from which however some of those which adjoin Moravia must be excluded, contain rich supplies of timber and fuel. Mosses, particularly the Iceland sort, herbs, grasses, and medicinal plants, many of them of rare occurrence elsewhere, are plentiful in the mountain regions.

Bohemia has a very superior breed of horses. This breed, though not of large size, has undoubtedly the advantage over that of any immediately adjacent country from its loftier stature and finer limbs: the number is about 150,000. The supply of horned cattle, amounting to about 250,000 oxen and 700,000 cows, is not adequate to the home demand. The native race is in general small and of inferior shape; and on account of the insufficient supply, large importations are made from Poland and Moldavia. The sheep, of which there are about 1,500,000, afford excellent wool. The stock of goats and swine is abundant. Poultry, particularly turkeys and geese, are reared everywhere; honey and wax are produced in all the circles. The stock of game has fallen off in those quarters where the population has increased; it cannot however be termed scanty, and Bohemia still possesses stags, deer, hares, wild hogs, pheasants, and partridges in abundance. Some of the wild animals, such as bears, wolves, and lynxes, continue partially to infest certain districts, chiefly the adjoining the Bohemian Forest Mountains. The fox, marten, polecat, weasel, and squirrel also inhabit the Bohemian woods. Birds of prey abound. Considerable supplies of fish are obtained not only from the rivers and brooks, but from the extensive ponds in various parts of this country; amongst them is the salmon, which finds its way from the North Sea into the Moldau and Wottowa. The mountain streams are full of trout; and eels and craw-fish are found in many rivulets. The Moldau contains a mussel from which pearls are extracted, which are also obtained in the Wottowa and White Elster, near Steingrün, in the district of Eger.

Manufactures, Trade, &c.—Bohemia is one of the most manufacturing countries in the Austrian territory; and the northern provinces, especially the parts adjacent to Reichenberg, Rumburg, and Trautenau, where the rawness of the climate or an indifferent soil is unfavourable to agriculture, are the principal seats of manufacturing industry. The glass of Bohemia has been in repute for its cheapness, lightness, and durability ever since the 13th century: in 1837 it employed 3500 families. In that year there were 75 glass-houses and 22 grinding and polishing mills. The chief seats of the manufacture are Silberberg, Adolphshütte, Libenau, Georgenthal, and Defereck; the polishing is for the most part done at Leitmeritz. The best mirrors and enamelled wares are produced at Neuhardenberg and Birgstein. The cultivation and working up of flax constitutes a chief means of subsistence among the inhabitants of the highland districts. Many parts of the districts adjoining the northern and eastern ranges of mountains form one continued manufactory of linens, in which thousands of humble cabins perpetually resound with the noise of the jenny or loom; 500,000 hands at least (a considerable proportion at their leisure hours only) are said to be employed in the manufacture of yarn, and as many as 55,000 weavers in that of linen; above 1000 individuals depend on the weaving of tapes and ribbons, and 20,000 on lace-making. But this branch of manufacture is less productive than formerly, in consequence of the progress making in that of cotton. Much cotton-twist

of the inferior numbers is spun by machinery at and near Neumarktsdorf, Wernstätt, Rothenhaus, Joachimsthal, Schönlinde, &c.; but the higher numbers are imported from England and the archduchy of Austria. The weaving of plain calicoes is principally carried on about Leitmeritz, Bunzlau, Ellbogen, and Gitschin; the finer descriptions are manufactured in the same quarters, as well as at Prague; and cotton-printing, which has greatly advanced of late years, is best done at Cosmanos, Reichstadt, Jung-Bunzlau, and Prague. The number of pieces made throughout Bohemia is said to be upwards of 100,000, over and above what is produced by machinery. In 1848 there were 445,714 spindles and 8284 persons employed in cotton-spinning. About 18,000 persons are said to be employed in making hosiery. There are 500 bleaching-grounds, and many of them, particularly that at Landskron, are on an extensive scale. The cotton manufacture however, like most of the manufactures of Bohemia, is mainly upheld by the protective system of the Austrian government. The potash manufactories employ a large number of hands. Large quantities of worsted stuffs and woollens of an inferior quality are made. Reichenberg is the great seat of manufacture for the middling descriptions of Bohemian woollens. It has been estimated that the trade in wool and woollen manufactures affords subsistence to upwards of 70,000 individuals. Of silks the manufacture is inconsiderable, and it is almost wholly confined to Prague. Leather and manufactures from it give employment to many hands. The manufacture of china has been brought to much perfection at Schlaggenwald, Ellbogen, Pirkenhammer, and in other places; and that of earthenware is carried on in several parts of the country. Iron ware is somewhat largely made; steel, cutlery, and needles are manufactured principally, and of the best quality, at Prague, Nixdorf, and Carlsbad. Bohemia also possesses copper and tin manufactories, but so little brass is made that it depends for its supply on the archduchy of Austria. The number of paper-mills exceeds 100. One-third at least of the population of Bohemia depend upon manufactures for the chief means of subsistence. The imperial tobacco manufactory at Sedlitz supplies the whole country with tobacco. The manufacture of beet-root sugar, as already mentioned, appears to be on the increase. The total value of the articles manufactured in Bohemia in 1841 (the latest year for which we have an official return) was 14,168,000*l*.

Few branches of industry are more valuable to Bohemia than the working of its mines; and although the produce of the precious metals has declined, the whole annual supply of those mines, which is estimated at above 200,000*l*., has not fallen off in value. The quantity of gold and silver now principally got near Příbram, Joachimsthal, Erle, and Balbin is but small compared with what was obtained in the 16th century, when the mines yielded as much as 1,000,000 marks, or about 9,917,300 ounces of silver, up to the year 1589 alone. Quicksilver has hitherto been found only in the form of cinabar; the copper-mines have ceased to be productive; those of tin (and it may be here observed that Bohemia is the only part of the Austrian dominions where it is found) have greatly declined. The lead-mines, principally situated about Příbram, Mies, and Bleistadt continue to yield abundantly. The iron-mines, the richest of which lie in the districts of Harzowitz and Gitschin in the district of Beraun, and in that of Pilsen employ several thousand hands; but the article inferior to the Styrian and Carinthian iron. Quarries are worked in every part of Bohemia; and there is scarcely a district in which lime is not prepared. Marble is obtained at Steinmetz; sandstone in several places; the Příbram, Breitenstein, and other quarries yield excellent mill-stones; large quantities of basalt are worked into form for building and paving at Páchen, Rodan, &c.; quartz of superior quality is got at Böhmisch-Aicha, Weisswasser, Giesshügel, and elsewhere. Among the precious stones found in Bohemia, the celebrated garnet, which is equal to that of the East in brilliancy as well as colour and hardness, is principally found at Swietlau in the province of Czeslau, and Dlaschkowitz in the province of Leitmeritz. The produce of the coal-mines has greatly increased of late years; and coal is in much greater demand in consequence of the increasing price of wood, particularly in the northern provinces. The southern parts of the province of Rakonitz, in particular, furnish a coal of very superior description. Graphite, or black-lead, is found near Krumman and Swojanow, and is extensively worked; but is far inferior to the English. About 4000 cwt. of sulphur are annually obtained, and vitriol and sulphuric acid are prepared from the residue.

Bohemia, which possesses peculiar facilities for internal and external intercourse by means of the natural lines of communication of the Elbe and Moldau, carries on an active trade with the other parts of Austria, and with foreign countries. Its exports are chiefly of mineral products (principally glass), which are of value about one-fourth of the whole; of vegetable productions, the value of which is somewhat higher; and of animal products, particularly wool and quills. Prague is the centre of the chief commercial and money transactions, for which its situation peculiarly fits it. Much benefit has accrued to the country from the establishment of a periodical exhibition of native productions and manufactures, as well as the foundation a few years since of a society at Prague for the promotion of national industry.

Inhabitants.—We have stated that the population of Bohemia in 1850 was 4,409,900; in 1833 it was 4,000,000, and cannot be one-third of

the population live in towns; the remainder form the rural population. With the exception of the capital, Bohemia contains no town of the second or third rank, and very few even of the fourth, that is, which contain between 5000 and 15,000 inhabitants. The houses of the Bohemians possess in general few claims to elegance of structure, or even comfort in their arrangement; and there is scarcely a town which is not ill built and badly laid out. Places of any magnitude are usually constructed of stone, but here and there of slate; in the agricultural and mountainous districts the houses are rarely built with any other material than wood.

According to the Census of 1846 about 2,500,000 of the inhabitants of Bohemia (for the most part belonging to the central and eastern circles) are of Slavonian blood, and call themselves Czeches or Tscheches; they differ from every other class of Slavonians in the Austrian dominions, according to Professor Schnabel, from the superior antiquity of their literature and the greater suppleness and refinement of their dialect, both as it exists at present and as it existed in past ages. In common with the Slovaks and their brethren in Moravia they are descendants of the Lechi or north-western branch of the Slavonians, who were the first to cultivate and refine their native language. The Czeches are passionately fond of music and singing, and generally remarkable for intelligence and strength of memory. Next to this race the Germans, who are about 1,780,000, are the most numerous; they chiefly inhabit the districts bordering upon Prussia, Bavaria, and Saxony. In mechanical and mercantile pursuits they are superior to the Slavonian inhabitants; and their language has become that of the educated classes throughout the country. The Jews, about 70,000 in number, appear from the inscriptions on several ancient tombstones to have been settled in Bohemia as far back as the 1st century; their principal occupation is trading and money transactions; most of the brandy distilleries and many breweries are in their hands, and they generally rent the government potash-works. At Prague there is a colony of Italians who settled there in early times, and are exclusively employed in trading.

The Roman Catholic religion is professed by the majority of the inhabitants. The secular clergy consist of the metropolitan archbishop of Prague, the three bishops of Leitmeritz, Königgratz, and Budweis, a titular bishop, and twelve prelates; and the affairs of the Bohemian Church are conducted by the metropolitan and the three above-mentioned bishops. In 1850-51 there were, according to the official returns, in Bohemia 4,190,892 Roman Catholics, 34,311 Protestants of the Augsburg Confession, 52,671 of the Reformed Lutheran, and 44 of other sects. It is proper however to add that the accuracy of these returns has been strongly impeached in Vienna itself, especially as respects the Protestants, whose number is said to be greatly underrated. Still it is quite certain that as far as Bohemia is concerned, the Protestants—though Bohemia was one of the birth-places of the Reformation—are numerically inconsiderable. The Protestants are most numerous in the north-eastern parts of Bohemia; but there are none in the south-western.

The civil administration of the country is vested in a central government, subordinate to the higher authorities in Vienna; its seat is Prague, and its president is styled the superior burgrave. There is a president placed over each of the seven circles. Judicial affairs fall under the superior cognizance and control of a court of appeal and bench of criminal justice in the same capital.

The system of education has been noticed under AUSTRIA: it will be enough to repeat here that there were in the kingdom of Bohemia, in 1847, one university at Prague, 3 schools of arts, 3 theological academies, 3 schools of philosophy, 22 gymnasia, and 57 schools for particular purposes—in all 89 upper schools; while the popular schools consisted of 50 head schools, 3511 lower schools, and 3521 adult schools—in all 7082. In Prague are an academy of arts and sciences, and an economic-patriotic society, which has done much for the improvement of agriculture.

BOII, a nation of ancient Gaul, which made various immigrations into Italy and Germany. The district whence they originally came is not ascertained (D'Anville, 'Notice de l'Ancienne Gaule'), but it would appear that they were near the Lingones and the Helvetii. They are mentioned as forming part of the first Gaulish emigration recorded by Livy, Justin, and others, which set off in quest of new lands, and under two chiefs, Bellocesus and Segovesus, both nephews of Ambigatus, king of the Bituriges. Bellocesus went over the Alps into Italy, while Segovesus crossed the Rhine into Germany, and penetrated to the skirts of the great Hercynian forest. The Boii would appear to have followed Segovesus, and to have settled in the heart of Germany, in the country called after them Boiohemum (Bohemia), from which they were afterwards driven away by the Marcomanni, a German nation, and withdrew south of the Danubius to the banks of the Enus (Inn). Bojodurum, now Innsbruck, took its name from them. The Boii are mentioned also as having immigrated into Italy, together with the Lingones and other tribes, by passing over the Pennine or Helvetic Alps. The epoch of this immigration is a matter of doubt: some believe it to be contemporary with that of Segovesus

and Bellocesus, and they place it as early as 600 years B.C., whilst others believe it to have taken place nearly 200 years after, and not long before the march of the Gauls against Rome. (Niebuhr's 'History of Rome.') The Boii crossed the Po, and settled in the country between the Tarus, the Silanus, and the Apennines, and they took possession of the Etruscan city of Felsina, afterwards called Bononia. The Boii were often engaged in war with Rome, and they obtained at times advantages over the Roman arms; but they were finally subjugated by Scipio Nasica, and part of their lands was taken from them. As they still continued restless, they were altogether removed by the Romans and sent across the Noric Alps, when they settled on the banks of the Dravus, near the Scordisci. Having afterwards engaged in wars with the Cetei, they were almost entirely destroyed; and we find in Pliny (iii. 24) a vast tract between the Dravus and the Danubius called 'Deserta Boiorum.'

We find the Boii engaged in the Helvetian immigration into Gaul in the time of Cæsar. Whether these were from some part of their tribe which had remained in Gaul, or whether they came back from Germany into Helvetia, is not known. After the defeat of the Helvetians the Ædui begged of Cæsar that the Boii might remain among them, which being assented to, the Ædui settled them in a district between the Ligeris (Loire) and the Elaver (Allier).

The Boii from Bohemia, who had settled on the banks of the Enus, became subject to the Roman empire, and formed part of the province of Vindelicia. During the decline of the empire they were exposed to the irruptions of the Marcomanni, the Thuringii, and other tribes who occupied their country, which afterwards took the name of Boioaria, or Boiaria, some say from the united names of the Boii and the Avari, a Pannonian tribe. From Boiaria the modern appellation of Bavaria is derived. (Aventinus, 'Annales Boiorum.') There was also a district in Aquitania called Boii, near the sea, in the neighbourhood of Burdigala (Bordeaux).

(D'Anville, *Notice de l'Ancienne Gaule*.)

BOIS-LE-DUC, a fortified town, the capital of the province of North Brabant in the kingdom of Holland, is situated in 51° 42' N. lat., 5° 16' E. long., and has a population of about 23,000, including the garrison of about 3000 men. This town was founded in 1184 by Godfrey III., duke of Brabant, who possessed on the same spot a house in the middle of a forest in which he was accustomed to hunt, and hence the town has derived its name; Bois-le-Duc in French and s'Hertogenbosch in Dutch, signifying 'the Duke's Forest.' Henry, the son and successor of Godfrey, caused the forest to be cut down, and surrounded the town with walls. In 1579 the town separated itself from the states, and was besieged both in 1601 and 1603 by Prince Maurice of Nassau. In 1629 it fell into the hands of the Dutch after a siege of four months. The French defeated an English force near Bois-le-Duc in September 1794, and in the following month the place surrendered to Pichegru. The Prussians under General Bulow took Bois-le-Duc in 1814.

Bois-le-Duc is situated near the junction of the Dommel and the Aa. It is a clean and well-built town, about five miles in circumference, and contains many good streets and squares; it is intersected by canals, over which are upwards of eighty bridges. The town-hall, which stands in the principal square, is a handsome building, surmounted by a steeple with a fine chime of bells. The town contains six churches—four Catholic and two Protestant. The Catholic cathedral of St. John's is one of the finest gothic churches in Holland; its foundations were laid in 1280, and it was not finished until 1312: its roof is supported by 150 columns. The Protestants had the use of this church from 1629 till 1810, when it was restored to the Catholics (who are very numerous in the town) by Louis Bonaparte. The town contains an academy of painting, sculpture, and architecture, and a grammar school, in which Erasmus and Gravesande received instruction. Linen thread, woollen cloth, hats, brandy, glass, cotton prints, ribbons, pins, needles, and cutlery are manufactured in Bois-le-Duc.

BOJADOR, CAPE, on the west coast of Africa, 26° 12' N. lat. and 14° 10' W. long., forms one of the projecting points of the Great Desert, or the Sahara. It rises to a considerable height, and is the western extremity of the Jebel Khal, a rocky ridge which runs eastward into the desert.

The coast which extends northward to Cape Nun is one of the most dangerous on the whole globe, being so flat that one may walk a mile into the sea without being in water over the knees. Vessels consequently strike at a very considerable distance from the beach. Besides, this low coast is always enveloped in a hazy atmosphere which extends for many miles out at sea. The danger caused by the combination of such disadvantageous circumstances is still increased by the currents along the whole coast from the Straits of Gibraltar to Cape Blanco setting in towards the land with great force and rapidity. The trade-winds also which prevail in the Sahara, and generally in the sea to the westward of the Canary Islands, rarely blow in the channel which divides these islands from the continent, but are here replaced by a westerly or north-westerly wind; from which it will be evident that the dangers which here await the unwary navigator are more numerous than in any other description. The vessels which are cast away upon this shore fall into the hands of the Moors, and have to undergo all the hardships of a most severe slavery in the interior.

The difficulties which oppose the progress of vessels near Cape Bojador was the reason why the Portuguese navigators in the beginning of the 15th century employed eighteen years in discovering the coast between Cape Nun and Cape Bojador. Though the former had been doubled in 1415, it was not till 1432 or 1433 that Gilianes succeeded in passing the second. The name Bojador is Portuguese, and means 'a round cape.'

(Burrus, *History of Asia and the Indies*, i. 24; Rennell's *Investigation of the Currents*; Jackson's *Account of Morocco*.)

BOKHARA, a country situated in Central Asia between 36° and 42° N. lat., 63° and 70° E. long., was by the Greeks and Romans called Sogdiana or Transoxiana, and by Persian and Arabian authors Mawaruhnahr. It is bounded N. by the desert of Kizil Koom and the khanat of Khokand, E. by Kunduz and Badakshan, S. by Cabul, and W. by the desert of Kharizm, which extending on both sides of the Oxus joins the desert of Kizil Koom, and separates Bokhara from Khiva. The area is estimated at 235,000 square miles, and the population at 2,500,000, of whom 1,500,000 are Uzbeks.

Surface. Bokhara forms the south eastern corner of that remarkable depression which extends northward to Saratow on the Volga in Southern Russia, and southward to the Hindu-Koosh. The surface of this extensive depression, which occupies all the countries to the north and east of the Caspian Sea and those surrounding the Sea of Aral on all sides to a great distance, is nearly a desert, the soil of which is commonly a stiff clay of great aridity, covered here and there by sandy hills of small elevation. Bokhara partakes of the disadvantages of such a soil, but being surrounded by high mountain ranges at a short distance on the east and south, it enjoys a considerable supply of water, by means of which the industry of the inhabitants has changed considerable tracts into fertile fields and beautiful gardens.

Neither the great range of mountains which borders the high tableland of the Chinese province of Thian Shan Naulu on the west, and on our maps is called Bolor-Tagh (but ought to be called Tartash-Dagh), nor the range of the Hindu Koosh, advances to the boundary of Bokhara. They remain at the distance of sixty miles and upwards from it; but some offshoots of the Tartash-Dagh enter the country. Such are the Akh-Tagh (White Mountains), which advance to the neighbourhood of Samarcand north of the river Zar-afshan, and the Kara-Tagh (Black Mountains), which extend to the south of the same river about the same distance, if not further, west. These ridges and a few others of less magnitude make at least one-fourth of Bokhara rather mountainous, and supply the remainder of it with the water necessary to agriculture. The remainder is an open plain, on which small isolated hills rise to the height of from eight to twenty feet, with a length varying from a few yards to one or two hundred yards. These hills as well as the plain on which they stand are composed of clay, covered with moving sand which also forms hills in some places, but these hills are of a different form and still lower. The plain is uncultivated except along the banks of the rivers, along which the fields and gardens extend from half a mile to ten miles in width.

Rivers. The three principal rivers, along which perhaps nine-tenths of the cultivated lands are situated, run from east to west, and are the Zar-afshan, the Kashka, and the Oxus or Amoo.

The *Zar-afshan*, called also *Kohik* and formerly *Sogd*, rises in the high mountains where the Akh-Tagh and Kara-Tagh branch off from them at a distance of about two hundred miles east of Samarcand, and first traverses the valley formed by these two ranges. Near Samarcand it enters the plain, and between that place and the town of Bokhara it fertilises the Meeankal, the most populous, rich, and fertile district of the whole country. Before it reaches Bokhara it divides into two branches, of which the northern, called *Vafkend*, after having fertilised the country along its banks for many miles, is at last exhausted and lost in the clayey sand. The southern branch passes the town of Bokhara to the north at the distance of six or seven miles, then declines to the south, and terminates at a distance of about twenty miles from the Oxus in the lake of *Kara-kool*. This lake, which is about twenty-five miles in circumference, is surrounded on all sides by sand-hills. It is very deep and its water is salt, though its only feeder is a fresh river. It is connected with the river Amoo by canals of irrigation which terminate in the river near *Chard-jooee*.

The *Kashka*, or *Kurshee*, rises in the Kara-Tagh nearly in the meridian of Samarcand, and passes through Shuhr-i-Subz and Kurshee, below which it is exhausted and lost in the desert. The district of Shuhr-i-Subz yields rich crops of rice and cotton, and the neighbourhood of Kurshee is covered with gardens and orchards.

The *Oxus* (which is now called *Amoo* and *Jihoon*), after forming with its feeder the *Khum*, a part of the boundary towards Badakshan and Kunduz, runs first westward, leaving the city of Balkh considerably to the south, and then towards the north-west, and enters the khanat of Khiva a little south of 40° N. lat. [BADAKSHAN; OXUS.]

The fertile lands along the Zar-afshan extend from Moodjan east of Samarcand to Chard-jooee, upwards of two hundred miles, and those along the Kashka probably more than sixty miles; along the Amoo they are not continuous, but frequently interrupted by uncultivated lands. The most fertile district in the basin of the Oxus is that

which surrounds the town of Balkh, where the river Balkh, a tributary of the Oxus, is divided into numerous canals. [BALKH.]

These cultivated tracts offer a very pleasing aspect. Few lands are better cultivated than these plains, covered with houses, orchards, and fields divided into small squares called 'tanab,' of which the edges are formed by a fine turf raised about a foot above the plain for the purpose of retaining the water which has been introduced into them. The numerous canals, as well as the roads, which are very narrow, have commonly rows of large trees planted alongside them. As the water of these canals does not run on the same level they form at their junction small falls, all which taken together render these tracts a very agreeable country.

Climate.—The climate is regular and constant. The summer commences at the beginning of March and lasts till October. In this season it does not rain: the thermometer rises in the cultivated grounds to about 90°, and in the deserts to 100°. The nights are cool. October is the first season of rain, which continues for two or three weeks. In November and December it begins to freeze a little, and sometimes a small quantity of snow falls; but even in the latter month some fruits, as melons, are left in the gardens. The coldest month is January, in which the thermometer generally falls to 27° Fahrenheit, and sometimes to 6°. Occasionally the snow covers the ground for a fortnight. The rains begin again in February, and last to the end of this month. They are followed by a considerable degree of warmth, and in a few days vegetation has attained its full vigour. The mildness of the climate shows that the surface cannot be at any considerable elevation: probably not more than 500 feet above the level of the sea. In winter and in summer violent storms blow more especially from the north-west, which raise a great quantity of fine sand, by which the atmosphere is so filled that it assumes a gray hue like a fog, and distant objects become invisible. In the desert travellers are not able to distinguish objects which are only a few steps distant. To these winds may be attributed the frequency of ophthalmia among the inhabitants. In other respects the climate is healthy.

Products.—The industry of the natives is most conspicuous in the cultivation of their lands. The larger and the smaller canals, both of which are numerous, must have required a good deal of labour when they were first made, and they are still kept up at a considerable expense. Besides this the agricultural labour is rather more difficult than in Europe. The irrigation of the fields can only be effected in winter, from December to the middle of March, and in summer when the rivers are supplied with water by the melting of the snow on the mountains. Even the Zar-afshan is dry for three or four months in summer.

Rice is only cultivated in the Meeankal and in Shuhr-i-Subz. Wheat is sown in autumn, and cut in July; and directly afterwards the ground is prepared for peas, which give a crop the same season. The other grains which are cultivated are barley and jawaree. As there are no natural pastures in Bokhara, trefoil and the jawaree are grown for green feeding. Of pulse, peas, beans, and haricots are raised in great quantity. Cotton, which forms one of the principal exports of this country, is carefully cultivated everywhere. Hemp also is grown, but only to produce an inebriating drug, called in India 'bang,' and from its seed oil is pressed. Oil is also obtained from the seed of cotton and sesamum. Silk is a staple article in Bokhara, and is raised in considerable quantities, especially along the banks of the Amoo.

On the low hills near Kurshee and Balkh is a small yellow flower called 'esbaruck,' which is used as a dye, and produces a better colour than the rind of the pomegranate. The creeping roots of the vine yield a colour that is dark-red, and is as much used as madder, which is also grown. Indigo is imported from India. Suzar is not grown, but a saccharine gum exudes from the camel's thorn, which is collected and used as sugar very extensively. Tobacco is cultivated in many places; that of Kurshee is the best. The vegetables raised are turnips, carrots, onions, radishes, brinjals, and a variety of greens; the beet-root is cultivated in extensive fields.

Bokhara is celebrated for its fruits, but more for quantity than quality. The orchards contain the peach, plum, apricot, cherry, apple, pear, quince, walnut, fig, pomegranate, mulberry, and grape. There are several sorts of grapes, and some of a very fine flavour. The raisins prepared here are not inferior to any in the world; but the wines of Bokhara have little flavour, owing to the defective mode of making them. Mulberries are dried like raisins, and a syrup is extracted from them as well as from grapes.

In the gardens great quantities of melons, pumpkins, and cucumbers are grown. Of melons there are two different species, and some of them grow to be four feet in circumference. A kind of molasses is extracted from melons: Bokhara appears to be the native country of this fruit.

The mountainous portion of the country yields timber, which is floated down the Zar-afshan as far as Bokhara and Kara-kool in rafts. In the plain only willows and poplars are found; the latter are used for house-building.

Animals.—Sheep and goats constitute one of the principal riches of Bokhara. The sheep have large tails. Sheep with a jet-black curly fleece is peculiar to the district of Kara-kool, and cannot be transplanted

to other places without degenerating. The skins of the male lambs are most highly prized, and the lambs are commonly killed a few days after their birth. The annual export of these skins amounts to about 200,000. The goats of Bokhara are the same kind as those of the Kirghiz: they yield a shawl-wool only inferior to that from Tibet.

Camels are numerous, and high priced on account of the continued demand, all the traffic of the country being carried on with them. They shed their hair in summer, from which a water-proof cloth is made. The camel with two humps is frequent: it is lower than the dromedary, yet bears greater burdens by 140 lbs.; the one carries 640 lbs., and the other only 500 lbs. English.

Horses are brought from the desert of Kharismor Desht Kowar, where the Turkomans have a very good breed, more remarkable for strength and swiftness than beauty. The horned cattle are of moderate size, and not numerous. The Turkomans bring butter to Bokhara in sheep-skins. The asses are large and strong, and are used both for saddle and burden.

The wild animals are few: tigers of a diminutive species, wild hogs, antelopes, wild asses, foxes, wolves, jackals, and cats are most common. Bears are found in the mountains, and rats, tortoises, and lizards in the deserts, but no serpents. Of birds only eagles, hawks, cranes, plovers, water-fowl, and wild pigeons have been noticed. Fish abound in the Amoo and the Lake of Kari-kool.

Minerals. Gold is found among the sands of the Amoo. All other metals are imported from Russia. Salt is dug out in masses in some parts of the desert, and on the banks of the Amoo, below Churd-joooc. Alum and brimstone are got in the neighbourhood of Samarcand, and sal ammoniac in the mountainous districts.

Towns, Population, &c.—The most remarkable towns of Bokhara are Bokhara, Samarcand, and Balkh. Besides these are Kirshee, which, according to Burnes, contains 10,000 inhabitants; and Kari-kool, to which Meyendorff assigns 30,000 inhabitants, observing however that it is smaller than Kirshee. There are some towns of moderate size in the Meeunkal, but the rest are small, containing only from 300 to 500 houses.

Bokhara being situated between the two elevated table-lands of Asia, has frequently been invaded by the nations who inhabit each of them, and on such occasions a portion of the conquering nation has remained in the country and settled there. At present eleven different nations may easily be distinguished according to Meyendorff, namely, Uzbeks, Tajiks, Turkomans, Arabs, Persians, Mongols or Kalmuks, Kirghiz, and Kara-Kalpaks, Jews, Afghans, Lezhis, and gipsies.

The Uzbeks compose by far the greater number of the inhabitants, and the country has been sometimes called from them *Uzbekistan*. They are the last of the nations who have subjected this country to their sway: they say that, before this event, they inhabited the countries about Astrakhan. About the beginning of the 16th century they invaded Turan. They are of Tartar origin. The characteristics of their face are a flattened nose, projecting cheek-bones, narrow eyes, and very little beard. The Uzbeks partly continue the erratic life which the whole nation led before its arrival in Bokhara; others are employed as officers by government; and a few apply themselves to agriculture, commerce, or the mechanical arts. These latter inhabit the large cities and their vicinity.

The Tajiks consider themselves as the aborigines of the country, and as the descendants of the ancient Sogdi and Bactrians. They are a wide-spread race in the East. Their body is stout and short, their complexion florid, and in features they resemble the European. The Tajiks are very industrious. They cultivate the soil, and apply themselves to commerce, manufactures, and all the mechanical arts. The merchants who visit Orenburg and the great fair of Nishnei-Novgorod are there called Bokharians, but they are Tajiks.

The Turkomans, Kirghiz, and Kara-Kalpaks belong to the Turkish race. The Turkomans inhabit the desert plain to the west of the Amoo River, and acknowledge their dependency on the khan of Bokhara only when it suits their interests. The Kirghiz and Kara-Kalpaks are few in number, and live north of the Zar-afshan, and in the vicinity of Kirshee.

The Arabs and Persians settled here at the time when this country was subjected to the kalifs of Baghdad. Many of the latter have also been brought to this country as slaves.

The Mongols and Kalmuks settled here at the time of Tshengis Khan's conquest; some families also about 1770, when the Turgot Mongols abandoned Russia and emigrated to Zungaria, or the Chinese province of Thian Shan Pelu.

The few Afghans and Lezhis in Bokhara are said to be the descendants of hostages which were brought here by the famous Timur when he subjected their respective countries. Both at present speak their own languages.

The Jews and gipsies have settled here voluntarily.

The population as estimated by Meyendorff consisted of Uzbeks, 1,500,000; Tajiks, 650,000; Turkomans, 200,000; Arabs, 50,000; Persians, 40,000; Mongols, 20,000; Kirghiz and Kara-Kalpaks, 6000; Jews, 4000; Afghans, 4000; Lezhis, 2000; gipsies, 2000: total, 2,478,000. He estimated the surface of the cultivated districts at about 6500 square miles, and their inhabitants at about one million and a half, so that those tribes who live entirely a nomadic life would

amount to about a million. Burnes however estimated the whole population at only one million.

The mechanical arts are not neglected in Bokhara, and some commodities are even made for exportation. The most extensive manufactures are those of cotton and silk, and cloth in which both these materials are combined. The dye of all their manufactured goods is excellent. The Bokharians make excellent Morocco leather. Their swords are good, but much inferior to those of Persia.

The towns of Samarcand and Bokhara were some centuries ago famous as seats of learning, and were much resorted to by students from all the Mohammedan countries of Asia. At present the number of foreigners who live here for the sake of study is considerable: the modresses, or colleges, are numerous, though the instruction is now limited to the study of the Koran and its numerous commentaries. After having acquired this stock of learning, the students become *malveris* or *mollas*. But the lower classes of the people are less instructed than in other Mohammedan countries, and the greatest part of them can neither read nor write. The Tajiks, who wish to employ their children in commerce, take greater care of their instruction than the other tribes. The children of rich people learn to read, write, and repeat the Koran by heart.

Two languages are spoken in Bokhara, the Persian and the Turkish, the former by the Tajiks, the inhabitants of the towns, and the latter by the nomadic tribes, who are always ready for military enterprises, and bound to send, if required, a certain number of horsemen, he may easily raise his army to 90,000 or even 100,000 men.

The government is despotic, but, as it is regulated on the laws of the Koran, the authority of the sovereign is controlled by the *ulmas*, or the corporation of priests and lawyers.

The khan of Bokhara is the most powerful of the princes of Turkistan, and maintains a standing army of about 25,000 men, of which only 4000 are infantry. But as a great portion of his subjects are nomadic tribes, who are always ready for military enterprises, and bound to send, if required, a certain number of horsemen, he may easily raise his army to 90,000 or even 100,000 men.

Dr. Wolff visited Bokhara in 1844 to ascertain the fate of Colonel Stoddart and Captain Conolly, who had gone on a mission to Bokhara and were reported to have been murdered by the khan in 1843. Dr. Wolff reached Bokhara by way of Trebizond, Erzurum, and Teheran, and found that the report was true. He was himself detained a prisoner by the khan for several months. On his return to England in 1845 he published a narrative of his journey.

(Meyendorff, *Voyage d'Orenbourg à Boukhara*; Burnes, *Travels into Bokhara*; Berghaus, *Map of Iran and Turan*.)

BOKHARA, the capital of the khanat of Bokhara, is situated in 39° 48' N. lat., 64° 21' E. long. It is from eight to nine miles circumference, and is said to contain 8000 houses and 70,000 inhabitants: Burnes estimates its population at 150,000.

The town is of triangular shape, and inclosed by a wall of earth about 24 feet high, and as wide at its base, but only 4 feet wide at the top. In this wall are eleven gates, built of bricks, with a round tower on each side, in which a small number of soldiers are stationed. The widest street measures about 7 feet, and the narrowest only 3 or 4 feet in width. The houses are built of sun-dried bricks on a frame-work of wood, and are all flat-roofed. They are arranged in the oriental manner, presenting towards the street a mere wall without windows, with a gate in the middle leading to a court-yard, round which the rooms are placed, which generally receive the light through the doors. The town is intersected by canals, which convey water from the Zar-afshan. The water is afterwards distributed to 68 cisterns, each about 120 feet in circumference; but this distribution is made only once a fortnight. The palace of the khan stands on a conical hill with a flat top, and about 200 feet high. It is inclosed by a wall about 60 feet high, which has only one gate, opening into a large corridor. This corridor, formed by vaults which seem to have been built many centuries ago, leads to the top of the hill, where the edifices stand in which the khan and his court are lodged. They are composed of a mosque, the dwellings of the khan and his children, the harem, which is surrounded by a garden and concealed by trees, and a house in which the vizir of the khan performs the duties of his station; there are also lodgings for the guards and slaves, and stables.

The most remarkable edifices of Bokhara are the mosques, of which there are about 360 in the town alone. The principal mosque stands opposite the royal palace, on the other side of the great square called *Segistan*, and occupies a square of 300 feet. Its dome is about 100 feet high. On the front bricks of different colours are so disposed as to form different designs of flowers tied together, and others contain sentences of the Koran. The prevailing colour of these bricks is blue, but those of the inscriptions are white. Some mosques are only built of earth. Attached to the principal mosque is the minaret of *Mirgharab*, which is 180 feet high, and its base upwards of 70 feet in circumference. It diminishes in width as it rises, and is considered the finest monument of architecture in Bokhara.

Bokhara contains about sixty medresses, or colleges. Some accommodate upwards of 70 students, and some only 10; but the total number of students seems to be about 2000. These edifices are generally in the form of a parallelogram, two stories high, and

include a spacious court-yard. In each story are two rows of chambers, one having its windows and doors to the court-yard, and the other to the street. These chambers are sold to the students, who in this manner acquire a claim to a certain yearly maintenance from the college. The medreses have considerable revenues, the whole of the bazars and baths of the city having been erected by pious persons and left for the maintenance of the medreses and mosques. The number of public baths, some of which are of large dimensions, is eighteen. Several vaulted chambers are built about a large basin filled with warm water. The fuel used is small shrubs brought from the desert.

As Bokhara is the most commercial town of Central Asia much has been done to facilitate the sale and transit of merchandise. There are fourteen caravanserais, all of them built on the same plan, though of very different dimensions. They are square buildings of two stories, inclosing a court-yard. The rooms round the court-yard are used as warehouses and let to the merchants. The bazars are numerous and extensive, some of them being upwards of a quarter of a mile in length. In the shops with which they are lined on both sides every sort of merchandise is exposed to sale, with the exception of woven goods, which are sold in large edifices built for that purpose. Several of them, consisting of some hundreds of small shops, contain only the silk goods which are manufactured in the town, and others the cottons, linens, and brocades of India, Persia, England, and Russia.

The number of shops on the great square, or Segistan, is likewise considerable. Texts of different colours are filled with the more common manufactures of the country; but the greater part of the place is a market, in which the fruits and grain of the country and all the necessities of life are exposed for sale. The active commerce which Bokhara carries on with all the neighbouring countries brings to this town the merchants of nearly all the nations of Asia. On the Segistan a stranger may converse with Persians, Jews, Turks, Russians, Kirghiz, Chinese, Turkomans, Mongols, Cossacks, Hindoos, and Afghans, besides the Tajiks and Uzbeks, the inhabitants of the town. The Tajiks compose by far the greater part of the inhabitants of Bokhara, amounting to three-fourths of the whole. They are merchants, manufacturers, and artists. The number of Jews and Hindoos settled at Bokhara is considerable.

No duties are levied on commodities exported, and only a small duty on imports, and this is paid only when the articles are sold. Bokhara has for many centuries been a place of extensive commerce, and its geographical position must always ensure it considerable advantages in this respect. It is the centre from which six commercial routes diverge; three towards the north lead to Russia and the table-land of Central Asia, and three towards the south connect it with Persia, Afghanistan, and India.

The road which leads to the high table-land of Central Asia runs from Bokhara along the banks of the Zarafshan to Samarcand, and thence northward over the mountains, passes the river, and then extends into the basin of the Sir Daria (Jaxartes). Along this river it passes through the towns of Khoend and Khokand to Marghilan, and then in a south-eastern direction to Oush, from which place it leads by the mountain pass of Terek to Koksoo and Khashgar. The Bokharians take on camel-back to Khashgar woollen-cloth, cord, pearls, cochineal, brocade, velvet, fur (especially of otters and martens), leather, sugar, large looking-glasses, copper, tin, needles, glass, and some iron utensils. They bring back in exchange a great quantity of tea, china, musk silk goods, raw silk, rhubarb, and silver. In this branch of commerce from 700 to 800 camels are employed.

Two roads lead to Russia; one on the east of the Sea of Aral, across the desert of the Kirghiz to Orenburg or Troisk; and the other down the valley of the Oxus, between the Aral and the Caspian, to Astrakhan. From the towns mentioned on the Russian frontier the goods are transported to the fair of Nishnei-Novogorod, where nine-tenths are sold. The Bokharians bring to Russia rhubarb, raw cotton, cotton goods, skins of marten, hare-skins, fox-skins, dried fruits, silk goods (especially for morning dresses), carpets, Cashmere and Persian shawls, and tea; and take in exchange cochineal, spices, sugar, tin, sandal-wood, woollen-cloth, leather, wax, iron, copper, steel, small looking-glasses, utter-skins, pearls, Russian nankin, utensils of cast-iron, needles, coral, cotton-velvet, cotton-handkerchiefs, musk brocade, glass, and a small quantity of linens and Indian muslins. They employ 3000 camels in this trade.

Three roads lead from Bokhara to Persia and Afghanistan: one to Meshed, the second to Herat, and the third to Cabul. The Bokharians bring to Persia a portion of the goods imported from Russia, besides raw cotton, silk, cloth of their own manufacture, woollens, spices, and rhubarb; they take back the common shawls of Persia used in Bokhara as turbans, girdles of a yellow colour, woollen combs, carpets, and turquoises. About 600 camels are employed annually in this branch of commerce.

The road to Cabul passes from Bokhara to Kursher, and thence through a desert to the Amoo Doria, which it passes at Khojusaln. Hence it turns eastward, and passes through Balkh and Khulm, from which latter place it runs southward along the river Khulm, till it enters the Hindu-Koosh. Before it reaches Cabul it traverses the valley of Bamecan. This road and its continuation through Pesh-

wur, Attock, and Lahore, connects Central Asia with India. The commerce along this route is entirely in the hands of the merchants of Cabul, and of the Hindoos of the Panjab and Shikarpore. They import shawls from Cashmere and Cabul, silken brocade, fine muslins, pearls and precious stones, and a great quantity of indigo; and export raw cotton, paper, iron, copper, glass, cochineal, and some of the goods manufactured in the country.

(Meyendorff and Burnes.)

BOLAN PASS. [AFGHANISTAN; BELOUCHISTAN.]

BOLBEC. [SEINE INFÉRIEURE.]

BOLCHOW, or BOLKHOV, the chief town of the circle of Bolchow, in the government of Orel, or Orlov, in European Russia, is situated at the confluence of the Nogra with the Bolchowka, feeders of the Oka, in 53° 26' N. lat., 35° 53' E. long., and has about 14,000 inhabitants. Though most of the houses are of wood the town is well built. Its foundation is of remote date, for it was an ancient family possession of the Russian sovereigns. It contains 22 churches, 14 of which are of stone and 8 of wood, a monastery, and the convent of Nova-Petsherskoi. The town has manufactures of leather, soap, hats, shoes, gloves, stockings, &c., and carries on a brisk trade with the interior in hemp, rape-oil, tallow, hides, colonial produce, shoes, stockings, &c., together with fruit grown in the immediate neighbourhood.

BOLINOBROKE. [LINCOLNSHIRE.]

BOLIVIA, Republic of, South America, was originally called Upper Peru, and formed a portion of the viceroyalty of Buenos Ayres. Being separated from the more populous parts of Buenos Ayres by the desert of Chaco and a very rugged and dreary mountain region, it had little in common with that state, and it consequently soon separated from it after the subversion of the Spanish authority. The republic declared itself independent on the 6th of August, 1824, and assumed the name of Bolivia in honour of General Bolivar, on August 11th, 1825.

The northern boundary of Bolivia is formed by the parallel 10° S. lat. from the river Parana on the west, to the peninsula formed by the confluence of the rivers Sancre and Mamore, thence called the Medeira, on the east. The most southern point is on the shores of the Pacific at the Bahía de Nuestra Señora, between Punta del Norte and Punta del Sur, about 25° S. lat. It consequently extends over 15 degrees of latitude, or upwards of 1000 miles from north to south. The most eastern part is contiguous to the river Paraguay, where after leaving Brazil it forms for some space the boundary between Bolivia and Paraguay, and extends to 57° 30' W. long. The most western portion of the republic borders on the Pacific at Punta del Norte, about 70° 30' W. long. Bolivia is bounded on the west for about 250 miles by the Pacific Ocean; the remainder of its western and north-western frontier is formed by the republic of Peru. It borders on the north-east and east on the empire of Brazil, except the most south-eastern corner, where it joins Paraguay. To the south of it extends the republic of Buenos Ayres, and where it approaches the Pacific that of Chili. Under the parallel of 22° the extent of the country from east to west may be about 750 miles, but towards the north it is less.

Surface, Population, &c. The area of the republic of Bolivia is estimated at 318,750 square miles. The following table shows the area of each of the provinces, and also the population according to the semi-official estimate of 1843, the latest which gives the number of inhabitants in the several provinces: a more recent return gives the entire population as 1,330,000.

Departments.	Chief Places.	Area in sq. miles.	Population.
La Paz	La Paz	39,050	200,000
Oruro	Oruro	8,500	80,000
Potosí	Potosí	31,875	200,000
Cochabamba	Trapaza	55,200	200,000
Chuquisaca	Chuquisaca	34,125	150,000
Santa Cruz de la Sierra	San Lorenzo	118,700	250,000
Total		318,750	1,070,000

As nearly the whole of this country is situated within the tropics it might be expected that its climate and productions would correspond to its geographical situation; but perhaps not more than one-half of its surface has a tropical climate. The other half is occupied by high mountain ranges, table-lands of great elevation, high valleys, and widely extending slopes. This mountainous portion of Bolivia belongs to the great range of the Andes, under which head will be found a general description of it.

Where the Andes running from south to north enter Bolivia they send off at about 24° S. lat. a lateral branch to the east, which extends to a great distance, and separates the alluvials of the Rio Bermejo from those of the Pilcomayo, both of which fall into the Paraguay on its right bank. This lateral mountain range, which constitutes the southern boundary of Bolivia and separates it from Buenos Ayres, does not rise to a very great height, but is extremely rugged and barren. The principal chain of the Andes here runs nearly south and north, and contains some peaks which rise above the snow line. The Nevado de Chorolque (21° 30' S. lat.) is said to rise to 16,548

feet. Up to this mountain the Andes seem to form a single and undivided range from the southern extremity of Chili; but to the north of it at about 20° S. lat. there is an extensive mountain-knot called the Cordillera de los Lipez (19° 30' S. lat.); the mountains divide into two great longitudinal ridges, which run parallel to one another and bound an immense interalpine valley or table-land called the valley of the Desaguadero, which includes the great Lake of Titicaca. The western ridge, called the Western Cordillera, continues, as far as it lies within the boundaries of Bolivia, a due northern course, and contains near the boundary-line several snow-capped peaks, of which the highest, called Qualatieri, rises to 21,960 feet.

The eastern ridge, called the Eastern Cordillera, or Cordillera Real, separates from the mountain-knot north of Porco (19° 50'), and of Potosi (19° 38'). The metalliferous mountains which surround Porco may be considered as constituting its southern extremity, and the celebrated mountain or Cerro of Potosi also belongs to it. From this point the Cordillera runs north, inclining a little to the west, to the Nevado de Illimani (16° 40'). Between Potosi and this summit the highest part of the range attains an elevation of 16,037 feet. The Illimani forms a serrated ridge with four peaks rising to the height of 21,145 feet, or 4600 feet above the snow line. At this point the range somewhat changes its direction, continuing nearly due north-west, and forming an almost continuous line of snowy mountains till it joins the ridge called the Andes of San Juan del Oro and of Vilcanota, which between 14° and 15° extend nearly east and west, and again connect the two ranges of the Andes. In this portion of the Eastern Cordillera, in lat. 16° 10' is the Nevado de Sorata, 21,286 feet high. Both chains of mountains, with the intermediate valley of the Desaguadero, occupy a breadth of upwards of 230 miles to the north of 18°, but to the south of that parallel they are upwards of 300 miles in width. According to the investigations of Burghaus and Humboldt ('Zeitschrift für Erkunde,' b. ix., and 'Ansichten der Natur,' Sabine's translation, i. 278) the mean height of the ridge of the eastern chain of the Bolivian Cordillera, as determined by the passes, is 13,502 feet; of the western chain 14,896 feet; while the height of the highest summits or culminating points is, in the eastern chain, 21,286 feet; in the western, 22,350 feet; "consequently the ratio of the height of the ridge to that of the culminating point is, in the eastern chain as 1:1.57, and in the western chain as 1:1.54. This ratio, which is as it were the measure of the subterranean elevating force, is very similar to that which exists in the Pyrenees (= 1:1.43), but very different from the Alps, where the mean height of the passes is less as compared with Mont Blanc (= 1:2.09)."

The valley of the Desaguadero, which lies between two ranges, with a mean elevation above the sea estimated at 13,000 feet, runs in its southern portion nearly parallel to the meridian, but north of 17° lat. it forms an angle of almost 35 degrees with that line, running very nearly north-west-by-north and south-east-by-south. Not having any outlet towards the sea the rivers which descend into it are either lost in the sandy soil or empty themselves into the Lake of Titicaca at its northern extremity. This lake, the largest in the South American continent, occupies an area of about 4600 square miles, and its surface is 12,795 feet above that of the Pacific. In some places its depth has been ascertained to be 120 fathoms, but many parts are probably much deeper. It is remarkable that the watershed on the eastern part of the valley of the Desaguadero, and as it would seem also on the western, is not formed by the high ranges, but by two low lateral ridges distant from 20 to 30 miles from the lake, and generally rising from 500 to 1000 feet above its level. The waters collected between these lateral ridges and the high mountain ranges descend eastward to the plains traversed by the river Madeira and its upper branches; and westward towards the sea. The only outlet of the Lake of Titicaca is the river Desaguadero, which issues from its south-western extremity in lat. 16° 38' 10", and is a small stream when compared with the immense extent of the lake. Its depth however is considerable, but its velocity is scarcely two miles an hour. It runs southward, and forms near 19° a lake called Lago del Desaguadero, or Ullagas, in which it is lost. Its course between both lakes may be 180 miles.

The Lake of Titicaca contains numerous small islands, which rise directly from the water's edge to a considerable height. That from which it has taken its name, and which is known in the history of the ancient Peruvians as the place where Manco Capac made his appearance, is situated at the south-east extremity. Both the southern part of this lake, which bears the name of Laguna de Umamare, and the eastern shores, nearly in their whole extent, belong to Bolivia.

The climate of the valley of the Desaguadero offers many peculiarities. Being in its lowest parts upwards of 13,000 feet above the level of the sea, the heat is never great, nor is the cold very sensible, except during the night from May to November. This season, which is the winter, is extremely dry, the sky is cloudless, and neither rain nor snow is known to fall. But snow precedes and follows the rainy season, which in this valley begins at the end of November, and continues through the summer months to the beginning of April. During these months it rains nearly every day, more or less; but during the night the sky is clear, and no clouds are observed; snow falls only in November and April.

The vegetation of this valley has also a very peculiar character. There are no trees, but the lower districts, especially near the great lake, are covered with the most beautiful green turf where the land is not cultivated. The cultivation is limited to a few things; wheat, rye, and barley are indeed sown, but they do not ripen, and are cut green as fodder for the llamas. The plantations of quinoa (*Chenopodium Quinoa*, Linn.) are extensive, and also of potatoes, which are found growing wild in some more elevated places; these plantations extend to a considerable distance up the sides of the adjacent hills. There are no peculiar seasons for sowing or harvest, and the natives are continually occupied either in performing the one or the other operation. The country which extends between the ridges of hills and the high ranges contains for the most part undulating plains covered with a coarse grass, on which numerous herds of llamas are fed. Here also the guanacos, alpacas, and vicuñas feed in a wild state. Besides these no wild animals have been observed in the valley of the Desaguadero, except a peculiar kind of chinchilla, the *Lagotis Curieri*, and the lagostomus (the viscacha or bisaccho of the natives), which in some places has so burrowed the soil as to render travelling on horseback unsafe. The Lake of Titicaca abounds in fish, and numerous birds visit it. The condor is frequently met with on the mountains. Among the spontaneous plants the rushes which grow along the banks of the lake deserve to be noticed, as the entire want of trees has compelled the natives to apply them to nearly as many uses as the bamboo is applied in India. With these rushes the natives build their huts, and make the boats and sails with which they navigate the lake; mats made of them are the bed of the poor, and serve in the houses of the rich as carpets.

From this valley six mountain passes traverse the Western Cordillera to the Pacific Ocean. Their highest points rise to nearly 15,000 feet above the sea, and consequently they are not inferior to the mountain passes of the Himalaya in elevation. The ascent to these passes from the valley is only 2000 feet, and the slope is gentle; but the descent to the sea is exceedingly rapid. The highest point of the great range being close on the maritime declivity of the Cordillera, and consequently at an inconsiderable distance, not exceeding 80 miles from the sea, the descent is extremely precipitate and abrupt.

That portion of Bolivia which extends between the Andes and the Pacific, in length 250 miles between San Tatal Point, the southern angle of the Bahía de Nuestra Señora, and the small river Loa, has been described under ATACAMA, by which name it is known. It is for the most part a barren waste, but there is fertile land along the narrow valleys and river courses. The coast about Bahía de Nuestra Señora is low and rugged; from thence to Jura Head the coast runs in a direct line for 52 miles, the shore being steep and rocky, and backed with hills from 2000 to 2500 feet high. Farther north is the spacious Bay of Mexillones, 8 miles across, and affording anchorage off the western side; but it is of little use as the shore is steep, and neither wood nor water is to be obtained. Thirty miles north-east from Leading Bluff, the northern headland of Mexillones Bay, is Cobija Bay, the only port of the republic of Bolivia. In this bay is the town of Puerto de la Mar, better known as Cobija, a poor place of about 1400 inhabitants; it is an inconvenient place for shipping as it is ill supplied with water, while vegetables even for the consumption of the inhabitants are brought from Valparaiso, a distance of 700 miles. North of Cobija Bay are several shallow sandy bays with rocky points. Algodon Bay, 28 miles from Cobija Bay, is the first place which affords any anchorage. About 10 miles farther is Cape San Francisco or Paquiqui, on which is an extensive bed of guano, which has been largely worked. Somewhat farther is Point Arana, near which is a fishing village; and 12 miles farther is the gully of the Loa River, which forms the boundary-line between Bolivia and Peru.

By far the greatest part of Bolivia is situated to the east of the Andes, and this portion may be divided into the mountainous district and the plains. The mountain district extends along the eastern side of the Andes, and is not of great extent to the north of 17° 40', because the slope of the Eastern Cordillera towards the plains is nearly as rapid as that of the Western towards the sea, and the branches which this chain sends off extend to no great distance from the principal range. But at about 17° 10' S. lat. a mountain range detaches itself from the Eastern Cordillera, which runs generally due east for upwards of 200 miles. This branch rises near the city of Cochabamba, above the line of perpetual snow, in the pointed peak called Nevado de Tinalra; farther eastward it gradually declines till it terminates on or near the banks of the Rio Guapui or Grande, at no great distance west of the town of Santa Cruz de la Sierra. This chain is commonly called the Sierra of Santa Cruz. Between this ridge and that forming the boundary-line towards Buenos Ayres, which we have already noticed, extends the mountainous portion of Eastern Bolivia. Its western boundary may be fixed at about 63° W. long. This country is traversed by many lateral ridges, which are offsets from the great chain of the Andes, and form extensive valleys. Many of these valleys sink slowly, and often maintain themselves for a considerable extent at nearly the same level. This circumstance, as well as the width of the valleys, renders them particularly fit for agriculture, and for the cultivation

of tropical as well as extra-tropical productions. Many persons have considered these valleys as the most fertile, and the most beautiful parts of South America. Here the slopes of the mountains are generally covered with fine trees to a great height. South of 20° however the valleys are narrower, and the ranges which inclose them are without wood, and nearly without vegetation.

Hydrography.—No part of America has a greater abundance of water than the region east of the Andes. The rivers which descend from the eastern declivities are very numerous and contain a volume of water which cannot be exhausted by irrigation. These rivers are among the most distant heads of the Amazonas and La Plata rivers. The Cordillera Real contains the sources of the greatest of the tributaries of the Amazonas—the Rio Madeira. This large river is formed by the junction of two considerable streams, the Rio Beni and the Rio Mamore, both of which descend from the Cordillera Real and unite their waters between 10° and 11° S. lat. The upper branches of the Rio Beni are the Rio Caca, the Rio Chuqueapo, and the Rio Quetoto. The Rio Quetoto, the most northern of them, rises where the Sierra de Santa Cruz detaches itself from the Eastern Cordillera, and taking a north-east and north course enters the plain, where it soon meets the Chuqueapo, which has its origin in the valley of the Desaguadero to the north-west of the Nevado de Illimani. The Chuqueapo, which is only prevented by a low ridge from entering that river, after having passed the town of La Paz, traverses the great chain (16° 55') through an enormous chasm. It then runs for nearly 100 miles through a fine valley and joins the Quetoto on entering the plain. After this junction the river continues its north-west course, dividing the mountainous country from the eastern plains till it meets the Rio Caca. The Caca, under the name of Mapiri, rises likewise in the valley of the Desaguadero, at no great distance from the Nevado de Sarata towards the west, and running first north and then east, traverses by a deep chasm the Cordillera Real north of the Nevado de Yuni, a high snow-capped peak. During a very tortuous course the Mapiri is joined by a great number of streams which descend from the eastern declivity of the same Cordillera, and by their union the Rio Caca is formed. This stream joins the united rivers Quetoto and Chuqueapo about 13° 30', and the river formed by their junction is called Beni, which name it preserves in its northern and north-north-eastern course to its junction with the Mamore. Thus the Beni brings to the Madeira all the waters from the eastern and from a portion of the western declivities of the Cordillera Real, as well as a portion of those from the Sierra de Santa Cruz.

The other great branch of the Madeira, the Mamore, rises under the name of Cochabamba in the western extremity of the valley which bears the same name, and is distinguished by its cultivation and its numerous products. It first runs east by south and afterwards due east, when being swelled by many small rivers it assumes the name of Rio Grande. It afterwards makes a very large semi-circular sweep, by which it arrives at the town of Santa Cruz de la Sierra, whence it runs north-west, and after uniting with the Chaparé at about 16° 30' receives the name of Mamore, and by degrees changes its north-west course into a north one. The Chaparé is formed by four or five streams descending from the northern declivity of the Sierra de Santa Cruz. Before the Mamore unites with the Itanez, a large river which rises in the western parts of Brazil, it receives the waters of the Yacuma, whose source is at no great distance from the banks of the Rio Beni, and which runs through an extremely flat country. The Itanez [BRAZIL] is increased before its junction with the Mamore by the river Uchay, which rises in a lake called Laguna Grande, in the country of the Chipitos, and is therefore also called Rio de Chipitos. After the junction of the Mamore with the Itanez, the river continues its northern course till it meets the Beni near the north-eastern angle of Bolivia, from which point the river has the name of Madeira.

The waters which descend from the eastern declivity of the Andes south of 15° S. lat. go to the Pilcomayo, one of the principal branches of the La Plata River. The Pilcomayo rises on the southern declivity of the mountain knot called Cordillera de los Lipez, and running generally due east, is soon increased by numerous other streams, some of which are considerable, as the San Juan, which rises about 22° 30', and falls into the Pilcomayo from the south; the Paspaya, which rises in the neighbourhood of Potosi on the southern declivity of the Eastern Cordillera and soon becomes navigable; and the Cochymayo, which rises not far from the source of the Cochabamba, and traverses the beautiful and well-cultivated valley of Chuquisaca. After the junction with the Cochymayo, the Pilcomayo continues its eastern course for about 100 miles, when turning suddenly to the south it enters the desert called Grande Chaco, and leaves the territories of Bolivia.

The whole eastern portion of Bolivia, from the banks of the Pilcomayo and the frontier of Buenos Ayres to the junction of the Mamore and Beni, is one extensive plain, broken only by a few isolated ranges of hills which from east to west extend about 200 miles, and from south-east to north-west upwards of 700 miles. In the southern part of this plain lies the watershed between the affluents of the Amazonas River and those of the La Plata, but it does not appear to rise to any great height above the sea. This plain is principally watered

by the Beni, the Mamore, and the Uchay, which in the rainy season, from October to April, inundate the country along their banks to a considerable extent. In many places there are lakes, and though none of them are very large, the exhalations, united with those from the inundations, render the climate excessively humid. This humidity, added to the heat which prevails all the year round, gives rise to many dangerous diseases, and renders this plain very unhealthy, especially for Europeans. This part of the republic has consequently been almost abandoned by the Creoles, though its great fertility would better repay the labour of the cultivator than any other district of the country. Immense forests of high trees cover nearly the whole of these plains, but their valuable products are neglected, except that a considerable quantity of cocoa is gathered by the natives and brought to the towns of San Lorenzo de la Frontera, La Paz, and Cochabamba. The plantations consist commonly of mandioc and maize, those of cotton and rice being rare, but all the other tropical productions might be cultivated with great advantage.

Climate, Soil, Productions. The climate of the different districts has been noticed in our description of the surface. Rain never falls on the coast along the Pacific. In the valley of the Desaguadero, in the mountain region, and in the plains, the summer is the rainy season; but the rain is continual only in the plains. The mountains are subject to tremendous hail-storms; thunder-storms are also peculiarly severe in these elevated regions. In winter the traveller is subject to temporary blindness called 'surumpi,' which is caused by the rays of the sun being reflected from the snow, and rendering the smallest ray of light absolutely insupportable. Earthquakes are very common along the coast of the Pacific, less so in the valley of the Desaguadero and the mountain region, but in the plains they have not been observed.

The scanty productions of the valley of the Desaguadero have been noticed. The few places on the coast which are cultivated produce no grain but maize, excellent fruits however grow, especially figs, olives, and melons, besides pomegranates, plantains, and algarrovas (*Prosopis dulcis*, Humb.), a kind of pulse, which grows to the length of a foot, with its seeds enveloped in a substance like cotton, which is eaten. It is of a sourish taste, but very cooling. Cotton, a little sugar-cane, and the *Arundo donax*, of which there are large plantations, are also cultivated.

The other portions of the republic, especially the beautiful vales watered by the Cochabamba and Cochymayo, are more fertile. As the levels which occur along their banks are at different elevations above the sea, they abound in all the fruits, grains, and other agricultural productions common to Europe and to tropical countries. Among the spontaneous products are cocoa, sarsaparilla, different species of vanilla, copaliba, balsam, and caoutchouc. The mighty forests which line the rivers abound in the finest timber for all purposes, especially for ship-building, and in trees which distil aromatic and medicinal gums. The plantain is found in abundance; and there is a species of cinnamon called by the Creoles the Cancha de Chayo which only differs in the greater thickness of the bark and its darker colour from that of the East Indies. Cotton, rice, tobacco, indigo, sarsaparilla, copaliba, and other medicinal drugs grow abundantly east of the Andes. Throughout the valleys of the eastern slopes of the Andes, below the level of 8000 feet, vast quantities of the coca (*Erythroxylon*) are grown. The plant grows wild, but it is also largely cultivated, the dried leaves being employed almost universally by the Indians of Bolivia and Peru as a narcotic. According to Dr. Weddell 1,600,000 Spanish pounds are annually produced in the district of Yungas alone, while nearly one-twelfth of the entire revenue of Bolivia is derived from the tax on coca.

Besides the animals peculiar to the valley of the Desaguadero, there are the tapir, the jaguar, the leopard, six or seven sorts of monkeys, and several amphibious creatures. Of domestic animals, there are horses, asses, and mules, but for sheep the climate is too warm. Great herds of learned cattle find abundant pastures on the banks of the rivers in the plains.

Among the birds have been noticed many different kinds of parrots, several species of turkeys, and a multitude of beautiful singing birds, as the thrush, the whistler, and the malfico, remarkable for its plumage and the sweetness of its note.

All the rivers, but especially those of the plains, abound in fish.

Gold is found in abundance in many places, but especially on the eastern declivity of the Eastern Cordillera, where it is washed down by rivers which run between slate mountains in narrow ravines. All the waters descending from this range, which fall into the Beni or its branches, carry down gold sand, but more particularly the small river Tipiani, which falls into the Mapiri. The mines of Potosi have long been considered as the richest in the world for their produce of silver, but they are now little worked, which is also the case with other silver mines. Copper is abundant: at Coruenero, a small place about 70 miles from La Paz, enormous masses of native copper found crystallised in the form of perfect cubes. This ore though is said to contain seven-eighths of pure copper, is of scarcely any use, being found in very high mountains and at a great distance from the coast. Besides these metals there are ores of lead and tin: and saltpetre, brimstone, and salt.

Political Divisions.—The republic of Bolivia is divided into six departments:—

I. The department of La Paz extends over the northern half of that part of the valley of the Desaguadero which belongs to Bolivia. It contains also the Eastern Cordillera from the Nevado de Illimani northward, the numerous valleys which lie on the eastern declivity of that range, and that portion of the plain to the west of the Rio Beni. The lower part of the valleys and the plain are very fertile, but only a few spots are cultivated. The rivers bring down a great quantity of gold sand. It contains only one town of importance, the capital LA PAZ.

II. The department of Oruro lies between La Paz and Potosi; the Andes bound it on the west, the department of Chuquisaca lies on the east. It contains the southern part of the valley of the Desaguadero. In this valley is the capital Oruro, population about 5000; it stands nearly 13,000 feet above the sea, and contains several churches and convents. In the neighbourhood considerable silver-mines are worked. A road leading from Oruro to Potosi traverses the southern part of the Eastern Cordillera, and rises in the mountain pass of Tolapalca to 14,075 feet.

III. The department of Potosi comprehends the most southern portion of Bolivia, namely, the whole of the coast along the Pacific, the country south of the valley of the Desaguadero, and the southern part of the mountain region as far north as the Pilcomayo River. Nearly the whole of its surface is covered with sand or barren mountains, but as it contains numerous mines of silver at Potosi and other places in the northern range, which have been long worked, the country about them is more populous than any part of the republic, except the valleys of the Cachymayo and Cochabamba. Except the capital, Potosi, this department contains no considerable place.

IV. The department of Cochabamba comprehends the greatest part of the rich and well-cultivated valley of the Cochabamba or Guapiti, the Sierra de Santa Cruz, and the five valleys which lie on the northern declivity of this chain. Every kind of agricultural produce is here grown in abundance, and in some of the rivers which fall into the Chaparé gold is collected. The capital of this department, Oropesa, contains about 16,000 inhabitants, and is the most industrious of the towns of Bolivia, the manufacture of cotton goods and of glass being carried on to some extent. Many of the dwelling-houses are large; and there are several convents and churches. It is situated at the western extremity of the department in a fine valley traversed by the Codorillo, a branch of the Cochabamba. The small town Cochabamba, from which the department has received its name, lies on the banks of the river Guapiti, or Cochabamba.

V. The department of Chuquisaca, or Charecas, extends over the mountainous country between the rivers Paspaya and Rio Grande de la Plata, in which the valley of the Cachymayo is comprehended in all its extent, and a great portion of that of Cochabamba. It contains some considerable mines, and is one of the most populous portions of Bolivia, on account of its fertility and the healthfulness of its climate. The principal town, CHUQUISACA, is the capital of Bolivia.

VI. The department of Santa Cruz de la Sierra is by far the largest, and extends over nearly the whole plain which constitutes the eastern part of Bolivia. The greater part of it is still occupied by independent tribes of Indians; and other districts, where the Creoles had formerly settled, have been abandoned on account of their unhealthiness. The capital, *San Lorenzo de la Frontera*, not far from the old town Santa Cruz de la Sierra, on the banks of the Rio Grande de la Plata, has only about 5000 inhabitants.

Inhabitants.—The inhabitants of Bolivia are composed of aborigines, and of people of foreign extraction. The aborigines form probably more than three-fourths of the population. They may be divided into those who speak the Quichua language and those who speak different dialects. The Quichua language prevails among all the inhabitants of the coast and of the valley of the Desaguadero. Agriculture had been adopted by them before the arrival of the Europeans, and even at present it is their principal if not their exclusive occupation, but it is practised in a very unskillful manner. They have been converted to the Roman Catholic faith, but retain some ceremonies of their ancient religion. The natives who do not speak the Quichua language inhabit the eastern declivities of the Andes and the plains extending to the east of them. They are divided into a great number of tribes who speak different languages: in the province of Moxos alone there are thirteen tribes. Some of them have been converted to the Christian religion: these wear a light dress of cotton, have fixed dwelling-places, and apply chiefly to agricultural pursuits. Some of them make excellent cotton-cloth, and in general they have an aptitude for mechanical arts. The Indians who inhabit the Lower Beni below Reyes, and those on both sides of the Ubaby, as well as the Chiquitos, who occupy the country bordering on Brazil and Paraguay, still lead a roving life, live mostly on wild roots and fruits, and on game, and go naked.

The inhabitants of foreign extraction are either the descendants of Spaniards or of Africans and the mixed races. The descendants of the Spaniards are most numerous in the mining districts and in the valleys of the Cochabamba and Cachy Pilco, where they may be said to compose the great bulk of the inhabitants; they are much less numerous on the coast and in the valley of the Desaguadero, and their number in the plains is very small. The people of pure African

blood are few in number, but the mixed races, which owe their origin to a mixture with negroes, are numerous on the coast; much less so in the mining districts; and in other parts very few of them are found. The bulk of the population is concentrated in two larger and several smaller valleys. Immense tracts consist of barren deserts, others though fertile are not cultivated, and nearly uninhabited.

Commerce, Manufactures.—No country perhaps is under greater disadvantages with respect to commercial intercourse with foreign countries than Bolivia, though possessing a coast of 250 miles, with several good harbours. The part which is contiguous to the coast is a sandy desert, which produces nothing fit for a foreign market, and it is separated from the rest of the country by a chain of high and nearly impassable mountains up to the parallel of Potosi. The only road which connects the coast with the internal districts of the republic runs on the comparatively level country along the shores, and passes to the valley of the Desaguadero by the pass of Lofnas (19° 45'), which rises to 14,210 feet, and thence runs to Oruro and La Paz. But this road, like all others in this country, is only practicable for mules and llamas, and consequently does not allow the transport of very heavy or very bulky commodities. To go from La Paz to the more populous districts on the eastern side of the Eastern Cordillera, this high chain must be traversed by the pass of Pacumani (16° 33'), which rises to 15,226 feet. Another mountain pass which leads from Oruro to Chuquisaca, which rises to 14,700 feet, is called the pass of Challa (17° 40'). The difficulties encountered in travelling from the port of Cobija to Oruro are so great, that though the Bolivians have declared Cobija a free port, they hardly use it, and prefer importing the small quantities of foreign commodities for which there is a demand through Arica and Tacna. Few foreign commodities are imported into Bolivia. They are chiefly iron and hardware, with a few articles of finery, as silk, &c. The exports are nearly altogether limited to the precious metals, and to different kinds of woollens, made of the wool of the llamas and alpacas, and to hats made of the wool of the vicuñas. In June 1852, the navigation of the rivers of Bolivia flowing into the Amazonas and La Plata was declared free to vessels of all nations.

Being as it were excluded from foreign commerce the Bolivians are obliged to satisfy their wants by their own industry. The manufactures of cotton are the most extensive. The better kinds are made in Oropesa; but in many districts the Indians make great quantities, which are coarse though strong. Next to these are the woollens, made of the hair of the llamas and alpacas. The coarser kind, called 'hansucas,' is used by the lower classes for dress and likewise for blankets; the finer sorts, called 'cambis,' are embroidered with great care, and used as carpets by the rich. The best are made at La Paz and are very dear. At San Francisco de Alacana very fine hats are made of the wool of the vicuña, and at Oropesa very good glass is made. In some towns in the neighbourhood of the silver-mines they make vessels of silver-wire, which are not without elegance.

Government, Finances, &c.—In 1825, when Buenos Ayres had renounced its claim on Upper Peru, and the representatives of the country determined to form an independent state, they adopted a constitution proposed by Bolivar, according to which the executive power was to be placed in the hands of a president chosen for life, and the legislative was to consist of three bodies, the senate, the tribunes, and the censors. At the same time Bolivar was chosen president. In the following year a successful revolution occurred, and Bolivar's constitution was superseded. Since then there have been numerous changes, sometimes merely of dictators, but at others in the forms of government. The years 1847, 1848, and 1849 were consumed in civil war; and the country has been ever since in a more or less unsettled state. The legislative power is however still at least nominally vested in three bodies, the executive being in the hands of an elective president. Of the finances of the country we have no very distinct account. The national debt is said to amount to about 1,084,443*l.* (5,424,716 piastres), including the sum required to discharge the arrears of interest unpaid since 1847, but we believe that it does not include the whole of the sums borrowed by the treasury. According to a statement published by the government the revenue in 1850 amounted to 395,243*l.* (1,976,217 piastres), while the expenditure was 347,748*l.* (1,738,744 piastres). The standing army is limited to 2000 men. The country is ecclesiastically divided into the bishoprics of Cochabamba and Santa Cruz de la Sierra, but there is no established church.

(Portland and Parish, in *Geogr. Jour.* vol. v.; Meyen's *Reise um die Welt*; Captains King and Fitzroy's *Sailing Directions for South America*, published by the Admiralty; Captain Basil Hall; Temple; Azara; Von Tschudi, &c.)

BOLOGNA, the second city in the States of the Church, is situated in 44° 30' N. lat., 11° 21' E. long., 150 miles N. by W. from Rome, and 50 miles N. by E. from Florence, in a plain north of the Apennines, and between the rivers Reno and Savona, and has a population of about 75,000. A canal, called Naviglio, navigable for barges, connects Bologna with Ferrara, from whence, by means of the Po, the Adige, and the intermediate canals, the water communication extends to Venice. Bologna is a thriving city, with an industrious population; the higher classes, who consist chiefly of landed proprietors, are wealthy. Many noble families reside at Bologna, where they have fine palaces, some of which contain valuable galleries, and are decorated

with fresco-paintings by the great masters. The palace of the Podestà, in which Hentzius, son of the emperor Frederick II., and nominal king of Sicily, spent in confinement twenty-two years of his life, and in which he died in 1272, contains the archives of the city. The Palazzo del Pubblico, a large structure, is the residence of the cardinal legate and the seat of the various courts of justice. In the square before it is a handsome fountain with the colossal statue of Neptune by Giovanni da Bologna.

Bologna abounds with churches, most of which are rich in paintings. The church of San Petronio, a magnificent though incomplete gothic structure, which was founded in 1390, has a meridian line traced on its pavement by the astronomer Cassini; the interior, which consists merely of nave and choir, is richly ornamented with sculpture; and the three canopied doorways of the unfinished façade are covered with marvellous clusters of beautiful bas-reliefs, representing the main subjects of the Old and New Testaments in stone. The central portal was completed by one man's hand—that of Jacopo della Quercia. Charles V. was crowned in San Petronio by Pope Clement VII. The cathedral of San Pietro is rich in works of art. The church of San Domenico contains several fine monuments, including those of San Domenico by Niccolò di Pisa; tomb of Hentzius, of Taddeo Pepoli, of Guido and his pupil Elisabetta Sirani, of Count Marsigli, and other illustrious individuals. The adjoining convent is the residence of the tribunal of the Inquisition. The church of San Stefano, one of the oldest and most interesting religious edifices in Italy, consists of no less than seven churches united. One of these, dedicated to St. Peter and St. Paul, dates from A.D. 330, and all of them are decorated with Greek frescoes, oil-paintings, and works of ancient Christian art.

Bologna is surrounded by walls about six miles in circuit, and has twelve gates; except in the older quarters of the city the streets are tolerably wide, and most of them have low arcades on each side to shelter pedestrians from the sun or rain. In the centre of the city, near the *Ferrato* or Chamber of Commerce (a fine gothic structure, built in 1294) are two lofty towers, the highest of which, called *Asinelli* from the name of its founder, is 256 feet high; the other, *Garisenda* (which is alluded to by Dante in the 31st canto of the *'Inferno'*), is only about one-half of the height of its neighbour, but inclines on one side about nine feet. The *Asinelli* is also a little out of the perpendicular, though in a much slighter degree. Both towers date from the 12th century.

The University of Bologna is the oldest and still one of the first in Italy. Its origin is stated to have been under Theodoric II., and it is said to have been restored by Charlemagne. We find it enjoying great celebrity early in the 12th century. It has the following classes, — theology, medicine, law, philosophy and mathematics, and belles lettres. The faculty of medicine has the most and the best filled chairs. The university is established in a noble palace (in which the Institute of Bologna has its apartments, library, and collections built in the *Strada San Donato* by Cardinal Poggi in the 16th century. The building was purchased by the Senate of Bologna in 1714. The great linguist, Cardinal Mezzofanti, commenced his career as librarian to the University of Bologna. Annexed to the university are a museum, a botanical garden, an anatomical cabinet, and a library containing 80,000 volumes (20,000 of which were presented by Pope Benedict XIV.) and 4000 manuscripts.

Besides the library of the university, the city of Bologna has a public library, the legacy of Father Magnani, which occupies three rooms of the convent of San Domenico, and contains 83,000 volumes. The academy of the fine arts has a splendid gallery of paintings, chiefly of the Bolognese school, which was founded by Francesco Bolognese, a follower of Giotto, in 1313; arrived at great eminence under Francesco Francia in 1585; and reached the culminating point of its fame under the Carracci and their illustrious pupils Domenichino, Albani, and Guido towards the end of the 16th and the beginning of the 17th century. The Roman and other Italian schools are each represented in the gallery by a few master-pieces. The *Istituto delle Scienze*, founded by Count Marsigli, has an observatory. The *Philharmonic Lyceum*, in which 100 pupils are maintained at the expense of the town, possesses a valuable musical library of 17,000 volumes, collected by Father Martini, a Bolognese composer of the 18th century. The *College Venturoli*, founded in 1825, is devoted to students of architecture. There is also a college for Spanish students, founded by Cardinal Albornoz; and another for Flemish students, who are sent here by the goldsmiths' company of Brussels. It was founded by John Jacobs, a Flemish goldsmith, and a friend of Guido. The *Scuola Pie*, or public school for the children of the poorer classes, is a fine building by the Bolognese architect Terribilia. The university was held in this building before it was transferred to the palace of the Institute above mentioned. The children are taught gratuitously Latin, arithmetic, singing, and drawing.

Bologna is an archbishop's see, and the series of its bishops ascends to A.D. 270, when St. Zama was its first bishop. St. Petronius, who lived about A.D. 430, was the tenth bishop of Bologna. Among the distinguished natives of the city are no less than six popes and nearly one hundred cardinals. The city and the province of Bologna are administered by a cardinal legate appointed by the pope. The court of appeal for the four provinces of Bologna, Ferrara, Ravenna, and Forlì sits at Bologna, and consists of six judges.

There are several manufactures of silks, paper, and pottery. The large sausages (*mortadelle*) of Bologna have a long established reputation, as well as its liqueurs, jama, and syrups. The people of Bologna are frank and fond of gaiety; the lower classes are noisy, and their dialect is the most uncouth and rough sounding in all Italy. The women are generally good looking. There is a casino, or assembly-rooms for the nobility, besides reading-rooms and private conversations. There are several theatres, at which some of the best performers of Italy are generally engaged.

Outside of the walls, the *Campo Santo* or cemetery contains many handsome monuments. On the hill called *Della Guarilia*, about three miles from Bologna, is the handsome church of *La Madonna di San Luca*, which is joined to the town by a long arcade consisting of 535 arches. The once splendid monastery of San Michele in *Bosso* was sadly injured during the French wars, and its frescoes by the Carracci and others were nearly effaced by the hands of the soldiers.

Bologna occupies the site of the ancient *Felsina*, which was the principal city of the Etruscans north of the Apennines, and is traditionally said to have been founded by Cennus, brother of Aulistes, the founder of Perugia. When the Gauls invaded Lombardy, the Boii, one of their tribes, crossed the Po, and established themselves in Felsina and the neighbouring country. Afterwards the Boii became involved in wars with Rome, and they joined Hannibal in his invasion of Italy. After the end of that war the Boii, with the other Cisalpine Gauls, were conquered by the Consul Scipio Nasica, and Felsina became a Roman colony B.C. 189. The name seems then to have been changed into *Bononia*, for it appears from Livy that the name Felsina was retained as late as B.C. 196. The *Via Emilia*, a continuation of the *Via Flaminia*, was carried from Ariminum through Bononia. In the civil war between Antony and the senate, Bononia was attached to the party of the former, and it was here that the Consul Pansa, defeated by Antony in the first battle of Mutina, died of his wounds B.C. 43. In the autumn of the same year the famous meeting took place between Antony and Octavius, in a small island formed by the river *Ilhenas* (*Reno*) between Bononia and Mutina.

A fire consumed great part of Bononia under Claudius ('*Tacit.* xii. 58), when 10,000,000 sesterii were granted from the public treasury for rebuilding the town. On this occasion young Nero pleaded before the senate in favour of Bononia. ('*Sueton.* Nero, vii.) In the 3rd century the first Christian church was built in Bononia, and dedicated to St. Felix, which was afterwards destroyed in the persecution under Diocletian, when Proculus, Agriola, Vitalis, and other Christians of Bononia suffered martyrdom. Bononia escaped with comparatively little damage the invasions of the northern barbarians. Alaric besieged but did not take this city. It also seems to have escaped the ravages of Attila. In the time of the Lombards Bononia formed part of the exarchate of Ravenna under the Eastern empire, until Langobard occupied it with the rest of that province. Bononia was one of the towns given by Pepin, after his defeat of the Lombards, to the see of St. Peter. Under the church, Bononia was administered by dukes, probably of Lombard race. In the confusion of Italian affairs after the extinction of the Carolingian dynasty, the towns of the exarchate no longer recognised the dominion of the church, whose temporal sway was not acknowledged even at Rome itself. The bishops, and the various dukes and marquesses divided among them the dominion of the country. Under the Otos of Saxony, Bononia, as well as the other cities of North Italy, obtained privileges and franchises as imperial towns governed by their own municipal laws. Under Conrad the Salic we find counts of Bononia, who administered justice together with the *Missi* of the emperor.

The municipal independence of Bologna was acknowledged by the emperor Henry V. in 1112 by a charter. The commune had the right of coining money. The citizens assembled in general comitia, and appointed their consuls, judges, and other magistrates. The country districts were subject to the town, the territory of which was at first extremely limited, being surrounded on every side by a host of feudal nobles, and by the domains of the churches and monasteries, which were independent of the jurisdiction of the town. By degrees however several of the surrounding nobles applied for the citizenship, and being admitted came to reside in the town. Others lost their territory in wars against the city, so that Bologna came to rule over a great part of Emilia, the country now generally called Romagna, which extends from Bologna to Rimini.

In the war between Frederick I. and the Lombard League Bologna joined the latter. It likewise fought against Frederick II., on which occasion the Bolognese took prisoner Hentzius, the natural son of the emperor, whom they detained in captivity till the time of his death. The war of the Bolognese against the Modenese, who were of the imperial party, has been immortalised by Tassoni in his burlesque poem, '*La Secchia Rapita*,' or '*The Rape of the Bucket*,'—a title suggested by an incident of the war: the Modenese cavalry having made a sudden dash into Bologna and carried away from one of the fountains a bucket, which was deposited as a trophy in the tower of Modena. The factions of the Guelphs and Ghibelines proved the ruin of the independence of Bologna. The Lambertazzi, the head of the Ghibeline party, being worsted in the city by the Ghereschi, the chief family of the Guelphs, were, after much bloodshed, driven away in 1274 with 15,000 of their partisans and dependents, men, women, and

children. They however rallied in the towns of Romagna, where they were joined by Guido da Montefeltro, lord of Urbino, and made incursions to the very gates of Bologna. The Ghermei applied to the pope for assistance, offering to acknowledge him as liege lord of Bologna. Pope Nicholas III. accordingly sent a legate to Romagna to restore peace to that province, and through his mediation the Ghilellini exiles were recalled. The pope was now acknowledged protector and suzerain of Bologna. In 1334 the pope's legate was driven out of the city on account of his tyranny, and soon after Taddeo de' Pepoli, a wealthy citizen, was proclaimed lord. He used his authority with temperance and justice and for the good of the commonwealth for twelve years, but after his death his two sons, not able to maintain their power, sold the town to the Visconti of Milan. The yoke of the visconti was hard and cruel, and after a long continued anarchy and much bloodshed Giovanni Bentivoglio was made first magistrate of Bologna in 1462, and he retained the chief authority over the state under the nominal high dominion of the papal see until 1501, when the army of Julius II. took the city and established the direct dominion of the church. In 1511 the sons of the late Giovanni Bentivoglio, supported by the French, regained possession of Bologna, where they remained until the following year, when, after the battle of Ravenna and the retreat of the French armies, the town surrendered again to Pope Julius, who built a castle to keep the citizens in awe. From that time till the end of the 18th century Bologna remained subject to the papal see, retaining however its senate, the members of which were appointed for life by the pope, and appointed in their turn all subordinate civil officers, and administered the finances of the commune.

In June 1796 Bonaparte entered Bologna, and drove away the papal authorities. In February 1797 Bologna became the chief town of the Cispadane republic. On the establishment of the kingdom of Italy in 1804 Bologna became the capital of the department Del Reno. In 1811 it was occupied by the Austrians. In 1815 General Steffani, in the name of Austria, restored Bologna and the other legations to the papal authorities. In 1831 an insurrection broke out at Bologna against the papal government, which was put down by an Austrian auxiliary force. Since the revolutionary movements of 1848 an Austrian Corps d'Armée has occupied the marches and legations, with Bologna for head-quarters.

There are but few remains of antiquity in Bologna; some fragments of sculpture and a few inscriptions are preserved in the museum of the university.

(Malvasia, *Macchia Felsina*; Montalbani, *Antichità di Bologna*; Savio, *Annali*; Leandro Alberti, *Istoria di Bologna*; *Dictionary of Greek and Roman Geography*; Murray's *Handbook for Central Italy*.)

BOLOGNA, LEGAZIONE DI, a province of the Papal State, is bounded E. by the province of Ravenna, N. by that of Ferrara, W. by the duchy of Modena, and S. by the central ridge of the Apennines, which divides it from Tuscany. Its length from south-west to north-east, from the sources of the Reno above La Porretta (famous for its sulphurous baths) to the confines of Ferrara beyond Malalbergo, is about 50 miles, and its greatest breadth from the Panaro, which divides it from Modena, to the Silaro, which separates it from Imola in the province of Ravenna, is about 30 miles. The area of the province is 1292 square miles, and the population in 1843 was, including that of the city, 348,652. It is watered in its length by the Reno, which enters the Po near Ferrara, and by numerous torrents descending from the Apennines. The north-east part of the province near the Po is very marshy and subject to inundations, and the southern part is mountainous, but the middle part or plain of Bologna is very productive, and in a high state of cultivation. In the wet lands near the Po rice is grown. The lower hills also, and valleys at the foot of the Apennine chain, are well cultivated. Corn, wine, oil, fruit, all sorts of vegetables, hemp, flax, saffron, and silk are the principal products of the country. Timber is scarce. Pigs, bees, and silkworms are reared in great numbers: horned cattle are not very numerous. The mineral products are marble, gypsum, and chalk.

The territory is divided into 250 communes or parishes, and has a number of large villages and market-towns: the principal are Smt' Agostino, 5000; Baricella, 5000; Borgo Panigale, 3400; Badrio, 10,000; Castelfranco, 5500; Castel Guelfo, 2400; Castelmaggiore, 3400; Castel S. Pietro, 6600; Crepallano, 3400; Crevalcore, 6800; S. Giorgio di Piano, 3300; S. Giovanni in Persiceto, 6700; Malalbergo, 4700; Medicina, 9000; Molinella, 7000; Minerbio, 5000; S. Pietro in Casale, 4500; Porretta, 2200. Each of these numbers includes the whole population of the respective territory or commune. All the above towns are styled 'terre'; they are all parishes and market-places, and many of them are surrounded by walls. They have each a municipal council composed of 24 or 18 members, taken one-half among the nobles or chief proprietors, and the other half among the tenants or farmers. Seats in the municipal councils are hereditary, subject however to the qualification of holding possessions or domicile within the commune, being past 24 years of age, and having a good moral character. Vacancies in the councils are filled by the councils themselves by majority of votes. The councils appoint the magistrates, and vote every year the municipal expenditure, as well as the communal taxes and other means to provide for it. This budget must be approved of by the legate, after which

it is printed and published. The council administers the communal property subject likewise to the inspection and approbation of the legate. This municipal system exists in all the Papal States.

The peasants of the province of Bologna are seldom proprietors, few even have leases, but they hold their farms from father to son by a tacit agreement, giving one-half of the produce to the landlord and paying half the taxes. They are sober, peaceful, and industrious. This metayer system prevails over most of the northern papal provinces, and also in Tuscany.

BOLOR or BELUR-TAGH, a name found on many modern maps, and applied to the extensive mountain range which separates the high table-land of Eastern Asia on the west from the deep depression which surrounds the Sea of Aral on all sides, and the Caspian on three sides. This name, we believe, is first found on some Russian maps made in the beginning of the last century, and rests on the authority of Marco Polo, the Venetian traveller, who says that after leaving Badakhshan, or Baluchistan, and traversing a country called Vorun (now Wakhan; see BADAKHSHAN), he arrived at the highest mountains in the world, and, having passed them, to the table-land of Pamir. Travelling from it in a north-eastern direction for forty days over a mountain region of great extent and elevation, he adds that this country was called Bolor. Afterwards he arrived at Kashghar. The mountain range thus designated by the Venetian traveller lies between 40° and 35° N. lat. on both sides of the meridian 72° E. of Greenwich. It is described in this work under TARTASH-TAGH, the name by which it is now known among the natives. The Chinese map gives it the name of Tartash-i-ling.

BOLSENA, a small and decayed-looking town in the province of Viterbo, is situated on the slope of a hill at a little distance from the north shore of the Lake of Bolsena, 56 miles N.N.W. from Rome, and has about 1800 inhabitants. Bolsena is near the site of the ancient Volsinii, one of the principal cities of the Etruscans, which maintained its independence after the rest of Etruria had been conquered. But the citizens of Volsinii having become addicted to indolence and pleasure emancipated their slaves, and entrusted them with arms for the defence of the town, and even admitted them into the senate. By degrees the liberti, or freedmen, becoming possessed of all the power in the state, tyrannised over their former masters, held their persons and property at their mercy, and violated the honour of their wives and daughters. The citizens secretly sent deputies to Rome imploring assistance. A Roman army under the Consul Fabius Gurgus marched against Volsinii and defeated the revolted liberti, but the consul was killed in the engagement. A new consul, M. Fulvius Flaccus, was sent from Rome, who after a siege took Volsinii, B.C. 266. Most of the revolted liberti were put to death, but at the same time Fulvius Flaccus razed the city which had so long withstood the power of Rome. He carried away the spoils, among which it was said there were 2600 statues. (Livy, v.) The inhabitants built themselves a new town in the neighbourhood. This new Volsinii is little noticed in subsequent history. Sejanus, the favourite of Tiberius, was a native of it. The Via Cassia passed through Volsinii. Among the few remains of antiquity at or near Bolsena are some ruins of a temple said to have been dedicated to the Etruscan goddess Nursia. Two ancient urns are in the vestry of the church of Santa Cristina, and in the square before the church is another urn with curious bassi-relievi representing satyrs and bacchantes, and near it is likewise a large and elegant vase of oriental granite. In the neighbourhood are numerous sepulchres and tumuli, the remains of an amphitheatre; and large numbers of Etruscan vases, statues, and other relics have been found here in recent years. It is in the church of Santa Cristina that the miracle of the Bleeding Host is reported have occurred in 1263, which furnished Raphael with the subject of one of his finest paintings in the Vatican.

BOLSENA, THE LAKE OF, in the States of the Church, is situated in the delegation of Viterbo about the point 42° 35' N. lat., 11° 55' E. long. In shape it is nearly oval, and its circuit is about 27 miles. It is almost wholly surrounded by hills, which are covered with trees, vines, and gardens. To the south-east the town of Montefiascone rises on a conical hill at a short distance from the lake, and from the summit there is a splendid view of the surrounding country. To the eastward, behind the town of Bolsena, is the calcareous ridge of Bagnorea and Orvieto, which divides the basin of the lake from the valley of the Tiber. South-west of the lake the country opens into the unwholesome plains which extend towards the sea. At this end the river Marta (Lartus) issues out of the lake, and after a course of about forty miles enters the sea near Corneto. The lake is subject to overflowings; it is in many places shallow near its borders, where it is covered with reeds and frequented by multitudes of water-fowl. The air around the lake is unhealthy in summer; its treacherous beauty conceals malaria in such fatal forms that a sail is never seen on its waters, and although the ground is cultivated to the very margin of the lake no labourer can with impunity sleep a single night on the field where he has worked by day. The lake of Bolsena abounds with fish; its large eels were celebrated in the time of Dante. ('Purgatorio,' xiv. 22.) Two small islands rise out of it, Isola Bisentina and Isola Martana. The hills that surround the lake of Bolsena are basaltic; but the rock in most places has a covering of rich mould, though in others it is bare and shows hexagonal prisms

ranged in all lines of direction. Judging from the form of the lake and the geological formation of the rocks immediately encircling it, many have regarded the Lake of Bolsena as occupying the crater of an extinct volcano. The country produces very good wine, both red and white, especially of the Muscat kind.

BOLSOVER, Derbyshire, a village, formerly a market-town, in the parish of Bolsover and hundred of Scaresdale, is situated in 53° 13' N. lat., 1° 16' W. long., 24 miles N.N.E. from Derby, 146 miles N. by W. from London: the population of the parish in 1851 was 1611. The living is a vicarage in the archdeaconry of Derby and diocese of Lichfield.

At the time of the Domesday Survey, Bolsover was the property of William Peveril, who is supposed to have built the castle, the interior architecture of which is of the Norman period. The castle was in the possession of the barons in 1215, but was taken from them by assault for the king (John) by William de Ferrers, earl of Derby. The Earl of Richmond (father of Henry VII.) died possessed of it in 1456, together with the castle of Harston, both of which were granted in 1514 to Thomas Howard, duke of Norfolk, on the attainder of whose son it again reverted to the crown. Edward VI. granted it to Talbot, earl of Shrewsbury, in whose family the manor of Bolsover continued until the time of James I., when Earl Gilbert sold it to Sir Charles Cavendish. The old castle was in ruins long before. It was rebuilt by Sir Charles Cavendish, who appears to have exactly rebuilt the ancient Norman fortress, of which the lower walls are distinctly visible. It is even probable that the beautiful arches in the kitchen, servants' hall, and larder are those of the original structure.

As Bolsover Castle is an exceedingly interesting edifice, we shall notice it somewhat fully. The present castle may be described as an Elizabethan imitation of a Norman fortress, erected on the Norman foundations, and retaining the Norman character. The ancient fortifications surrounding the castle courts and yard have been rebuilt, and the whole is a remarkable specimen of an ancient fortress reproduced soon after 1600. It is a square, lofty, and embattled structure of brown stone, with a tower at each angle, of which that at the north-east angle is much higher and larger than the others. The castle stands on the brow of a steep and wooded hill, commanding of the finest inland views in England. A noble terrace leads up to the great gates, through which the entrance is by a stone court. The great hall and pillar room are beautifully arched and supported by Norman pillars, and have been furnished with ornamental carving of the 16th and 17th centuries. Above these is a room called the Star Room, which has been fitted up by Mrs. Hamilton Gray as a library, and contains one of the finest private collections of Etruscan antiquities in England, with many beautiful specimens of old Italian carving. The remainder of the castle has been fitted with all the conveniences of a modern residence.

The first Duke of Newcastle built the riding-house and the magnificent range of buildings along the great terrace, now in ruins, but well preserved as a picturesque object. Here King Charles I. was several times entertained by the Duke, then Marquis of Newcastle. On one of these occasions the reception of that monarch and his queen at the noble owner 11,000*l*. All the nobility of the midland counties were assembled on the terrace, and Ben Jonson composed the masque of 'Love's Welcome' for the festival. Previous to the banquet already mentioned the marquis had entertained the king at Bolsover in 1633, when he went to Scotland to be crowned. The dinner on this occasion cost 4000*l*. In the remains of this grand range of buildings there are a gallery 200 feet long, a dining-room 78 feet long, and two drawing-rooms 39 feet and 36 feet long.

In the early part of the civil war the castle was garrisoned for the king, but was taken in 1644 by Major-General Crawford, who is said to have found it well manned and fortified with great guns and strong works. During the sequestration of the Marquis of Newcastle's estates Bolsover Castle suffered much both in its buildings and furniture, and was to have been demolished for the sake of its materials, but was purchased for the earl by his brother, Sir Charles Cavendish. The noble owner repaired the buildings after the Restoration, and occasionally made the place his residence. It now belongs to the Duke of Portland, whose family derived it in the female line from the Newcastle Cavendishes. The mansion has long ceased to be even occasionally occupied by its owners, and is now inhabited by the Rev. John Hamilton Gray.

The village of Bolsover is pleasantly situated, together with the castle, upon a point projecting into a valley which surrounds it on every side except the north-east, where the separation has been made by a deep ent. In ancient times the whole village was fortified, having been surrounded on the level side by a deep trench and mound which still exist; while the steep banks under the village are crowned with four watch towers, and were probably once defended by walls. The village inhabitants are chiefly employed in agriculture. The parish church is of mixed architecture. The tower and the principal parts of the church are early English; the chancel pillars and piers are Norman. In a side chapel are two splendid monuments of the Cavendish family. In the village is a National school, with a commodious house for the master. There is also a fund for distribution among the poor, arising from the interest on a bequest of nearly 3000*l*. bank annuities.

BOLTON-LE-MOORS, Lancashire, a manufacturing town, parliamentary and municipal borough, and the seat of a Poor-Law Union, in the parish of Bolton and hundred of Salford, is situated on the banks of the river Croal, in 53° 35' N. lat., 2° 37' W. long.; 11 miles N.W. from Manchester, 197 miles N.W. by N. from London by road, and 198 miles by the North-Western railway via Trent Valley: the population of the municipal and parliamentary borough which are co-extensive was 61,171 in 1851. Bolton is governed by 12 aldermen and 36 councillors, one of whom is mayor; and returns two members to the Imperial Parliament. The living is a vicarage in the archdeaconry and diocese of Manchester. Bolton Poor-Law Union contains 26 parishes and townships, with an area of 43,329 acres, and a population in 1851 of 114,712.

The name of Bolton is involved in obscurity, though its affix of *le Moors* evidently points to a Norman origin. The manor was successively owned by the families of Merscheys, Blunderville, Ferrers, and Pilkington. In the reign of Henry VII., the Earl of Derby became possessed of nearly all the land in the town of Bolton, which he held until part of it was confiscated during the Commonwealth. After several changes the immorial rights have become divided among several families, of whom the Earls of Derby and Bradford are the chief.

During the long strife between the Royalists and the Parliamentarians Bolton was garrisoned by the latter, and remained in their possession till 1644. Prince Rupert and the Earl of Derby attempted to take the town by storm, and after a first repulse, the Earl of Derby having collected his tenantry and levied new troops returned to the attack, and succeeded in dislodging the parliamentary forces, and obtaining possession of the town. It was soon after again surrendered to the Parliament; and after the battle of Worcester, the Earl of Derby being taken prisoner was condemned by a military tribunal at Chester, and sent under an escort to Bolton, where he was beheaded October 15th, 1651.

Bolton was formerly famous for its manufactures. Ireland speaks of it as having a market for cottons and coarse yarns. The making of woollens appears to have been introduced by some Flemish clothiers who came over in the 14th century. Other branches of trade were introduced by the French refugee manufacturers, who were attracted by the prosperity of the neighbourhood; and the manufacture of cotton-cloth was improved, and in many of its kinds originated, by some emigrant weavers who came from the palatinate of the Rhine. The improvements in the machinery for spinning cotton gave an impetus to the trade, which has been gradually increasing ever since. Almost the first invention of importance was a machine which combined the principles of the spinning-jenny and the water-frame, and was called a 'mule,' by its inventor, Samuel Crompton, who lived at 'Hall in the Wood,' near Bolton, and who had to struggle for an existence, while his invention was enriching others. In the meantime Sir Richard Arkwright, another native of Bolton, who had risen from a very obscure condition, had established large factories in Derbyshire, where he carried the cotton machinery to the greatest perfection. The opposition made by the labouring classes in Bolton to the improvements in machinery has, at various times, driven the most lucrative branches of employment from that town to other places. The introduction of the mule and of the power-loom was not accomplished until they had enriched other communities for some time. After a while cotton-factories, filled with machinery upon the best principle, began to rise up in various parts of the town. Foundries and machine manufactories followed them, and a great extension was immediately given to the trading interests of the place.

The two portions of which the borough of Bolton consists are separated by a small river called the Croal or Crole, which rises at Red Moss in the hamlet of Lostock, and runs due west into the Irwell, dividing in its course Great and Little Bolton; the south side of it being the township of Great Bolton, and the north side the chapelry of Little Bolton. Though an ancient town, the streets of Bolton are wide and straight, and the houses are generally well built. The roads leading to and from the town in every direction are kept in good condition, and the principal entrances are good. The revenues derived from the rents of the inclosed portions of Bolton Moor property are all available for the general improvement of the town.

Difficulties as to jurisdiction have occasionally occurred between the governing authorities of Great and Little Bolton. An Act of Parliament passed in 1850 defines the rights and liabilities of each body, and provides for the execution of several necessary improvements in the town. The town is lighted with gas.

The charter of municipal incorporation was obtained in 1838. The superintendent of police prepares annually a valuable statistical table relating to the social and mercantile progress of the town. The municipal revenue of the borough in 1849 amounted to about 6500*l*.

Among the places of worship in Bolton, the chief is the large parish church dedicated to St. Peter, which is of ancient date: it has a low tower, but has few pretensions to architectural beauty. The largest church in Little Bolton is St. George's, a brick building with a tower and a peal of bells. There are six other churches and chapels of the Establishment. Emmanuel church, built in 1838 at a cost of 2200*l*., originated in a desire on the part of the parishioners

to present a service of plate to the vicar, who requested that the fund might rather be applied to the building of a church in the most destitute part of the town. There are numerous chapels for Independents, Wesleyan and Primitive Methodists, Baptists, Quakers, English Presbyterians, Roman Catholics, and Unitarians. The terra cotta church at Haulgh, in Bolton parish, built in 1844, is an elaborate example of the decorated style, with a spire consisting of open-work tracery. The walls, spire, and ornamental details are all executed in terra cotta, formed of common fire-clay, and shaped in moulds expressly modelled for the purpose.

Bolton Free Grammar school, contiguous to the parish churchyard, founded in 1641 by Robert Lever, citizen and clothier of London, and united in 1651 with an old school, of unrecorded foundation, has an income from endowment of 414*l.* a year, besides two exhibitions of 60*l.* a year, and one of 5*l.* a year, each tenable for four years: the number of scholars in 1852 was 60. Among the masters who have presided over this school are Robert Ainsworth, the compiler of the Latin dictionary, and Dr. Lemprière, the author of the classical dictionary. The other public schools at Bolton are Hulton's Charity school, and Marsden and Popplewell's Charity school, both founded and endowed in the 18th century. There are several National, British, Infant, and Roman Catholic schools.

The public buildings include the town-hall, the exchange, market-house, baths, a temperance-hall, erected in 1839, assembly-rooms, theatre, barracks, &c. The cloth-hall is situated in Market Street. There are a mechanics institution, the Reform news-room, and a reading-room connected with the Sunday School Society.

Considerable sums are distributed to the poor from various bequests connected with the town, including Hulton's Charity, Parker's Charity, Gosnell's Charity, Crompton's Charity, Astley's Charity, Cocker's Charity, Aspendell's Charity, Mort's Charity, Lomax's Charity, Greenhalgh's Charity, and Popplewell's Charity. There are a dispensary established in 1814; a clothing fund; a range of almshouses founded in 1840, and other benevolent institutions.

The cotton-mills of Bolton are numerous; and some of them are among the largest in the county, employing more than 100,000 spindles each. Plain and fancy muslins, quiltings, counterpanes, and dimities are the chief kinds of cloth, but cambrics, ginghams, &c. are also woven. Formerly fustians, jeans, thickets, and similar fabrics were the principal articles made in the town, but these descriptions of cloth are now chiefly produced in the power-loom, as well as calicoes and dimities. The bleach and dye-works in the town and neighbourhood are among the largest in the kingdom; there are likewise a few print-works.

Attempts occasionally made to introduce the silk manufacture into Bolton have only been partially successful. The manufacture of steam-engines and machines is carried on to a large extent. The town is abundantly supplied with coal.

Bolton is well situated for intercommunication with other towns. There is a canal of 12 miles from Bolton to Manchester; and another of 6 miles from Bolton to Bury. There are railways which branch out from Bolton in six directions, to Liverpool, Leigh, Manchester, Bury, Blackburn, and Preston respectively.

BOMBAY, PRESIDENCY OF. Bombay is the seat of one of the three presidencies into which the British empire in India is divided. It is subordinate to the Governor-General of India, whose residence is at Calcutta. The territory under the immediate jurisdiction of the governor and council of Bombay is situated between 14° and 29° N. lat., 68° and 77° E. long.; and comprehends the following districts:—

Bombay Island, with Ahmedabad, Kaira, Surat, and Baroach, north of the Island of Bombay; Darwar, Candesh, Northern Concan, Southern Concan, Poona, and Ahmednuggur, south of the Island of Bombay; with the recently acquired large and valuable province of Sind.

The population of this presidency, including Sind, is probably about ten millions and a half; but there are few materials for a correct estimate. Within the limits of the political supremacy but not under the direct rule of the East India Company, there are under the Bombay presidency about 50 native states, possessing an area of 57,375 square miles, with a population of 4,393,400. The aggregate annual revenue of these states is about 1,867,082*l.*; and the aggregate annual subsidy, tribute, or other payment made by them to the Company's government is about 186,299*l.* Their military resources include 13,632 cavalry, 27,872 infantry, and 369 artillery.

Among the population, which is composed of different races of people speaking different languages, and who up to a recent date have lived under different systems of religion, laws, and government, the greatest variety must necessarily exist. The number of resident Europeans in this presidency is smaller, as compared with its area and native population, than the number of Europeans in Bengal and Madras.

Government, &c.—The Civil Establishment consists of a governor, first and second ordinary members of council, with provisional members to fill vacancies, a chief secretary with two under secretaries, secretaries for the departments classified as—judicial and general, revenue and finance, military and naval, with subordinate officers, and various officers of state. The Law Department is presided over

by a chief judge, and one puisne judge; the other officers and the divisions of the courts are similar to what has been described under **BENGAL**. The police is under a chief magistrate and a superintendent. The Ecclesiastical Establishment, for which there is a grant of 20,650*l.* annually, consists of a bishop, an archdeacon, a registrar, 7 chaplains, and 19 assistant chaplains. There are two chaplains of the Church of Scotland in Bombay, who are paid by the government; and allowances are made to Roman Catholic priests within the presidency. The East India Company in this way arranges for affording opportunities of religious instruction and worship to the soldiers and civilians in its employment. There are two ministers of the Free Church of Scotland in Bombay, and there are ministers of various Dissenting bodies in the town and throughout the presidency.

Education.—Government appropriates for educational purposes in the presidency about 12,500*l.* a year. There is a Sanscrit college with a limited number of students, which has 2000*l.* in addition. The chief obstacles in the way of establishing new schools are the small sums devoted annually by the government for educational purposes, and the difficulty of obtaining qualified teachers. The Bombay Board of Education has adopted a system somewhat different from that followed in the other presidencies. It has provided normal schools for the training of teachers, and requires that teachers should give instruction through the vernacular language. It looks for local assistance from the natives, and requires small fees from the pupils; but it assists in the building of school-rooms, furnishing books, &c. not only for the schools but for village libraries. The 'Elphinstone Native Educational Institution' is the principal establishment in Bombay, where about 600 scholars attend, about one-half of whom pay a fee. There are a few provincial English schools, and a considerable number of Government District Vernacular schools. There are also several village schools. There are two schools, founded in 1815 by Archdeacon Barnes, for educating the children of the European poor, in which 327 children are boarded and educated; they are mostly the orphans of soldiers. There is also the Grant Medical College, and a medical college founded by Sir Jemsetjeejeejee, a Parsee, in connection with the hospital. The Scotch Church has a school in Bombay, and an Orphan Asylum for females. The Scottish Free Church has several schools. Both bodies avail themselves largely of the assistance of natives as teachers. Other religious bodies also contribute by their efforts to the spread of education. The managers of Charity schools are now empowered to apprentice the children under their charge, and magistrates of police have authority to bind those that fall into their hands, to learn trades and professions. Schools of industry have long been established at Bombay, for the reception of the destitute, and for the instruction in the improved practice of arts and handicrafts of all who care to resort to them.

A literary society has been established for many years in Bombay, and several quarto volumes of its transactions have been published. In 1819 the society became a branch of the Royal Asiatic Society of London. A geographical society has also been established at Bombay.

The military charges for Bombay presidency amounted in 1851-52 to 1,633,828*l.* The total receipts of the presidency for the year 1851-52 amounted to about 2,733,962*l.*; the disbursements to about 3,209,533*l.* The public debt of the presidency on April 30th, 1851, was about 1,346,658*l.*

During the year 1845-46 the amount expended on the construction and repair of roads, tanks, and buildings was about 20,000*l.*; during 1846-47 it was about 31,500*l.* Since that time, in addition to the ordinary outlay for such purposes, a special grant has been made for the construction of a mole and road at Kurrachee, in Sind. The total amount expended during fifteen years (1837-38-1851-52) on public works, comprising roads, bridges, embankments, canals, tanks, and wells, was about 579,154*l.*

In the Bombay presidency the revenue settlement is chiefly *ryotwar*. A new survey is now being made, and under it the lands are subdivided into fields of moderate size, so that each subdivision may be without difficulty cultivated by a farmer of limited means. The government assessment is laid separately upon each field, and houses are granted for 30 years, at a fixed sum, binding on the government for the full term: the cultivator having on his part the option of surrendering any one or more of his fields, or altogether putting an end to his lease at the close of any given year.

The imports into the Bombay presidency for five years (1845-46-1849-50) were as follows: 1845-46, 4,337,004*l.*; 1846-47, 4,157,012*l.*; 1847-48, 4,043,606*l.*; 1848-49, 5,713,413*l.*; 1849-50, 6,171,219*l.* For the corresponding years the exports stood thus:—6,264,965*l.*; 4,965,193*l.*; 4,379,948*l.*; 6,862,191*l.*; 6,435,777*l.* These amounts are exclusive of the port-to-port trade in India. The salt manufacture, which in India is so important, is carried on in the Bombay presidency by individuals, but subject to an excise duty of 12 annas, or 1*l.* 6*d.* per maund of 82 lbs., a similar duty being imposed on imported salt. The salt made in the Bombay presidency is procured by solar evaporation. The whole quantity sold wholesale and retail, or imported, in 1846-47 in the presidency amounted to 2,573,625 maunds of 82 lbs., or nearly 95,000 tons. The revenue derived from salt, including government sales, excise on private manufacture, and customs duty,

in Bombay presidency during five years (1845-46-1849-50), stood thus: 210,110*l*.; 177,756*l*.; 234,500*l*.; 210,685*l*.; 215,759*l*. Hitherto the chief cotton-field of British India has been in Guzerat, in the Bombay presidency. Of 165,665,220 lbs. of cotton exported from the three presidencies of India in 1849-50, the amount furnished by Bombay was 150,754,063 lbs. Of this quantity 105,637,028 lbs. were exported to Great Britain. Opium grown and manufactured within the territories of Bombay is subjected to a heavy duty, with a view to discourage its production. The cultivation of the poppy is stated to have ceased in the district of Ahmedabad in 1839, and nearly so in those of Kaira and Cambay. The production of opium has been prohibited in Sindh. The government purchase all that is produced in Bombay, and supply through the licensed retailers the quantity required for home consumption. The receipts from the opium revenue for five years (1845-46-1849-50) were as follows:—595,624*l*.; 608,863*l*.; 371,855*l*.; 887,506*l*.; 729,483*l*.

BOMBAY (the Island of) is situated on the western coast of Hindustan, off the shore of the Concan in the province of Bejapore. The 19th parallel of N. latitude passes nearly through the centre of the island. It lies to the south of the island of Salsette, a dependency of Bombay. The two islands are connected by a causeway, constructed in 1805 by Mr. Daman, then governor of the presidency.

Bombay Island is little more than 8 miles long from north to south, and about 3 miles broad in its widest part. It is formed by two ranges of whinstone rock of unequal length, running parallel to each other on opposite sides of the island, at a distance of between two and three miles. The eastern range is about 7 miles long, and the western about 5 miles long; they are united at the north and south by belts of sandstone which are only a few feet above the level of the sea. The interior of the island was formerly liable to be flooded so as to give the whole the appearance of a group of small islands. This flooding is now prevented by the construction of several substantial works which keep out the spring tides; but as the lower parts of the island are ten or twelve feet under high-water mark, much of the interior is, during the rainy season, reduced to a swamp. The site of the new town of Bombay is subject to this disadvantage, so that during the continuance of the wet monsoon the houses are separated from each other by water sometimes for seven or eight months of the year: this spot was recovered from the sea in the latter part of the last century.

The natural difficulties of the island must have prevented any settlement upon it by Europeans but for the advantages of its position for commerce, and its harbour, which is unequalled for safety throughout the British empire in India. This excellent harbour, on account of which the island received its name (Bom Bahia) from the Portuguese, is bounded N. and W. by the islands of Salsette, Bombay, and Colaba, or Old Woman's Island. Colaba is a small island or narrow promontory, naturally connected by a mass of rock, rising near the surface of the water, with the south-eastern extremity of Bombay, and now united to it by a causeway which is covered by the water at spring-tides. The cantonments for the European troops are situated on Colaba. East of the harbour, about four miles from Bombay, is Butcher's Island, and behind this the island of Elephanta, celebrated for its caves and temples, only five miles from the Mahratta shore. Three miles south of Butcher's Island, and five miles east from Bombay, is Caranja Island, on the west side of which is an extensive shoal. The entrance to the harbour thus formed is between Colaba and Caranja islands, or rather between the shoal just mentioned and a reef of rocks surrounding on all sides the point of Colaba, and extending about three miles to the southward. The channel between these is about 3 miles wide, and 7 to 8 fathoms deep. A sunken rock and a bank occur in the passage. There is a lighthouse built on the southern extremity of Colaba Island, 150 feet above the level of the sea, which may be seen seven leagues off the coast.

There is no other important harbour in British India where the rise and fall of the tides are sufficient to admit of the formation of wet-docks. The rise at ordinary spring-tides is 14 feet; occasionally it is three feet higher.

Arrian, in the 'Periplus of the Erythrean Sea,' says that this island was then called Kalliana, and that it was little frequented. It had previously been an established commercial port, but Sandanes, one of the sovereigns of Barugaza, prohibited any of the Egyptian trading-vessels from entering the harbour; and if any were compelled to do so by accident or stress of weather, a guard was immediately put on board, and they were taken to Barugaza.

Bombay was ceded by the Moguls to the Portuguese in 1530, and came into the possession of the English on the marriage of Charles II. with the Infanta Catharine of Portugal. By the marriage-contract the king was to receive 500,000*l*. in money, the town of Tangier in Africa, and the Island of Bombay with its dependencies, together with permission for his subjects to carry on a free trade with all the Portuguese settlements in India and Brazil. A fleet of five ships of war, commanded by the Earl of Marlborough, with 500 soldiers on board, was sent to receive possession of Bombay, where they arrived on September 18th, 1682. From some misunderstanding the Portuguese governor refused to complete the cession, and the fleet returned to England. This matter was not arranged between the two governments until 1684, when possession was taken in the name of the king

of England by Mr. Cooke, and Bombay has since that time remained in the possession of the English. The island was transferred to the East India Company in 1668: the deed of transference states that the island is "to be held of the king in free and common socage, as of the manor of East Greenwich, on the payment of the annual rent of 10*l*. in gold on the 30th September in each year." With the place itself the Company received authority to exercise all political powers necessary for its defence and government. In 1674-75 a mutiny broke out in Bombay, but was easily repressed, when the ringleaders were tried and executed, the Company then first exercising the power of enforcing martial law. Another insurrection in 1683 was more formidable, and occasioned so much annoyance to the government that it was deemed expedient to guard against any similar attempts in future by transferring to Bombay the seat of the Company's government in India, which had previously been placed at Surat. In 1687 the title of regency was given to the administration at Bombay, and unlimited power over the rest of the Company's settlements in the East was given to the governor.

Since the first occupation of the island by the English, the resident population has enormously increased. At that time it amounted to about 15,000. In 1716 the number was 16,000; in 1816 it was 161,550. Including the fluctuating population, which is at all times very great, it was estimated by Von Orlich in 1842 that Bombay contained 200,000 (which is of course almost altogether that of the city). Since that time it has augmented so rapidly that by the Census taken at the beginning of 1850 it amounted to 566,119, of which number about 296,000 were Hindoos, about 125,000 Mohammedans, and about 115,000 Parsees; there were 5083 Europeans, 7454 native Christians, and 1132 Jews.

The floating population is of a very mixed character, and consists principally of Persians, Arabs, Mahrattas, Carnatas, Portuguese, Indians from Goa, and a great number of sailors.

The property of the island is principally in the hands of the Parsee inhabitants, who are active and intelligent, taller, better formed, more athletic and of more handsome features than the Hindoos. The principal merchants on the island are Parsees, and it is usual for European houses of commerce to contain one or more Parsee partners, who supply a great part of the capital. These people wear the Asiatic costume, but they assimilate more than other eastern people to the customs of Europeans, and nearly the whole of them speak English; their children are taught the language, and many of them speak it as fluently as Europeans; at the same time they adhere most rigidly to their religious customs and observances. In the morning and evening they crowd to the shore, where they prostrate themselves in adoration before the sun. They deposit their dead in large cylindrical buildings, each 25 feet high, the interior of which is built up solidly with masonry to within 5 feet of the top, with the exception of a kind of well, 15 feet in diameter in the centre. The bodies are deposited between this well and the wall, and being only loosely wrapped in cloth, are speedily devoured by vultures. The bones are at intervals thrown into the well in the centre, from the bottom of which they can be removed through subterraneous passages. The more wealthy of the sect have private tombs of similar construction.

The cocoanut-tree formerly grew very abundantly on the island, but the spots now capable of being cultivated will hardly yield a week's supply of provisions for the inhabitants, who are dependent upon the farmers and gardeners of Salsette, which island is well cultivated.

BOMBAY (the City of) stands principally on a narrow neck of land at the south-eastern extremity of the Island of Bombay, in 18° 56' N. lat., 72° 53' E. long. The fortifications are extensive, and would require a numerous garrison for their defence; towards the sea the works are extremely strong, but on the land side, supposing an enemy to have made good a footing on the island, they would offer comparatively little resistance. The houses within the walls are built of ad. with verandahs and sloping roofs covered with tiles. In 1803 a fire destroyed many houses; after which a great number of dwellings were built on a salt ground then newly recovered from the sea. Many of the dwellings are commodious, particularly in what is called the European quarter. The shops and warehouses are upon a large scale. The northern quarter of the fort, principally inhabited by Parsee families, is dirty and uninviting. The houses without the walls, occupied by the poorer classes, are built of clay, and thatched with palmyra leaves. The chief public buildings in the town are, the cathedral, two Scotch churches, several Portuguese and Armenian churches, three Jewish synagogues, a number of mosques and Hindoo temples; the government-house, the custom-house, and other government offices. The largest Hindoo temple is that dedicated to Momba Devi, a short distance out of the town. There is likewise an hospital founded and endowed by Sir Jemsetjee Jeejeeboy.

The barracks, arsenal, and docks are all within the fort. The docks although they are the property of the East India Company, are entirely under the management of Parsees, by whom merchant-vessels of 1000 to 1200 tons burden, frigates, and even line-of-battle ships are built. These docks were about 7 years ago enlarged and improved under the superintendence of Major Cooper of the Engineers. The buildings are greatly admired for their architectural beauty; the slips and basins are calculated for vessels of any size. The teak-wood

used for building ships is very durable. Bombay being situated between the forests of Malabar and Gujerat, receives supplies of timber with every wind that blows. Some Bombay built ships, after being employed as traders during 14 or 15 years, have been bought by government and added to the naval force of the country, being then considered much stronger than newly-built European vessels. The *Minden*, a 74 gun-ship, launched at Bombay in 1810, was constructed entirely by Parsees, without any assistance from Europeans, and since that time several frigates and line-of-battle ships have been built at these docks.

In addition to the trade with Europe and with China, a very great traffic is carried on by coasting-vessels with all the ports on the western side of India, from Cape Comorin to the Gulf of Ootchi. The vessels thus employed vary in size from 10 to about 200 tons burden, and nearly 800 of them are registered as belonging to the port. The articles which form the principal part of this trade from Bombay are European manufactures and the produce of Bengal and China, the returns being made in cotton-wool and cloths, timber, oil, and grain from the northern ports; and from the south, cotton, hemp, coir, timber, pepper, rice, and cocoa-nuts. The merchandise thus brought to Bombay is in great part re-exported in larger ships to different parts of Europe, to North and South America, to Canton, to the Arabian and Persian gulfs, and to the Bay of Bengal. The goods sent from India to China comprise principally cotton-wool, opium, metals, spices, dye-woods, and woollen goods.

Bombay receives from Persia raw silk, copper, pearls, galls, coffee, gum-arabic, copal, myrrh, olibanum, bdellium, assafetida, dried fruits, horses, and bullion. The returns are grain, Bengal and China sugar, British manufactured goods, cotton and woollen, and spices. The merchandise sent to Calcutta from Bombay, in return for sugar, indigo, and rice, are timber, coir, cocoa-nuts, sandal-wood, and cotton.

Cotton forms the most important article of export from Bombay. It is received from the provinces of Gujerat and the Concan, from Malabar, Ootchi, and Sindh. The shipments from England to Bombay consist of the usual assortment of British manufactures and metals; the returns for which are made in Persian raw silk, cotton-wool, spices, gums, and drugs.

Among the mercantile establishments conducted in Bombay are an insurance company, banks, a mint, &c. An experimental line of railway from Bombay, to or near Culian (a distance of about 40 miles), with a view to its extension to the Mulsej Ghaut, was authorised in 1849. The East India Company grants the land that may be required, and guarantees to the East India Peninsular Railway Company a return of 5 per cent. on the capital for 99 years.

The seamen from the port of Bombay are considered to be the best among the natives of India. The western coasts of India are infested by numerous piratical vessels, and to keep these in check it has been necessary for the East India Company to maintain a considerable naval force at this station. The navy thus maintained is not for the exclusive benefit of Bombay, but for the protection of an extensive and profitable commerce from which every part of British India derives benefit. Bombay has been the chief Indian port connected with the establishment of steam communication with England. In 1837 three steam-vessels made voyages from Bombay to Suez, and continued to run in 1838 and 1839. By the month of May 1843, there were eight steam-vessels employed on the Bombay and Suez route. In 1839 a plan was adopted under the united sanction of the Admiralty, the Treasury, and the East India Company, for a regular monthly transmission of mails by steam, by way of Alexandria and Suez; and this system has been since maintained.

(*Renell's Memoir of a Map of Hindustan*; *Mill's History of British India*; *Vincent's Periplus of the Erythrean Sea*, part ii.; *Parliamentary Returns on Public Works (East India)*, 1851; *Statistical Papers (India)*, 1853.)

BONA, a town and sea-port in the French possessions in North Africa, is situated in the province of Constantine, 85 miles N.E. from the city of Constantine, 270 miles E. from the city of Algiers, in 36° 53' N. lat., 7° 46' E. long., and has a population of about 10,000, of whom 6000 are Europeans. It lies on the west side of a bay in which there is good anchorage. The harbour which was formerly choked up with mud has been greatly improved by the French, and Bona now has regular steam communication with Algiers, Tunis, Marseille, and Cette. The Seiboon, a considerable river, enters the sea about two miles to the south-east of Bona. Bona is built at the foot of a hill which rises to the north and north-west of the town, and which forms the extremity of a ridge that runs westward parallel to the sea, as far as the Gulf of Storm. The town itself is surrounded by a wall strengthened by square towers, and pierced by four gates. The chief defence of the place is Fort Cicogne, which is situated on the hill above the town. The streets are narrow and crooked, but great improvements have taken place since the French got possession of the town. New squares and markets, a theatre, and bazaars have been built, coffee-houses and reading-rooms opened, so that the town is now much more French than Arab in its appearance. Cloth for wearing apparel, tapestry, saddles and horse furniture are among the articles manufactured. The exports include corn, wool, hides, wax, and coral. Previous to the French occupation in 1832 Bona contained only between 3000 and 4000 inhabitants.

Along the coast eastward of Bonn were the French settlements of La Calle and Bastion de France, which France retained by ancient treaties with the Regency of Algiers for the protection of the coral fishery along this coast.

Bona is a corruption of the ancient name Hippon or Hippo; the Arabs call it Belad-el-Areb. The country about it is very fertile in corn and fruits. Between the town and the Seiboon is a marsh, which is crossed by two small rivers that flow into the Seiboon just above its entrance into the sea. This marsh is believed to have been the ancient harbour of Hippo Regius, the scanty remains of which town are seen about a mile and a half south of Bona. Of Hippo St. Augustine was bishop; the town was destroyed by the Kalif Othman.

BONAVISTA, or BOAVISTA. [Cape Verde.]

BONCHURCH. [Wight, Isle of.]

BONHILL, a town in the parish of Bonhill and district of Levenax or Lennox, Dumbartonshire, Scotland. The parish is divided in its length into almost equal parts by the south end of Loch Lomond, and the river formed by it, the Leven, from which the district derives its name, and which falls into the Clyde at Dumbarton. The population of the town of Bonhill in 1851 was 2327.

The town is situated on both banks of the Leven, about five miles above Dumbarton. A mile nearer this town and on the right bank of the stream is the thriving village of Alexandria, with a population of 3781.

The inhabitants are chiefly engaged in print-works and bleachfields on the banks of the Leven, the water of which, from its softness and purity, is peculiarly fitted for the processes of printing and bleaching. Cords, lime, and other articles required in manufactures are brought up the river in shallow broad-bottomed lighters. The extensive works on the river are generally the property of mercantile houses in Glasgow. The Leven is celebrated for its fine salmon and trout.

Besides the parish church of Bonhill there is a chapel-of-ease at Alexandria. At both places are chapels for Free Church and United Presbyterian Dissenters. There are also two chapels in Alexandria for Independents.

BONIFACIO, Town and Strait of. [COSA.]

BONIN or ARZOBISPO ISLANDS, a group in the Japanese Sea, extend in a direction nearly north and south between 26° 30' and 27° 45' N. lat., the centre line of the group being in about 142° 15' E. long. The islands were named by Captain Beechey, who visited them in 1827. The northern cluster he called 'Parry's Group'; to the middle cluster, consisting of three larger islands, he gave the names respectively of 'Peel,' 'Buckland,' and 'Stedden,' and the southern cluster he called 'Bailey's Islands.'

The islands are of volcanic formation, and smoke is seen to issue from some of them: they are high, and wooded to the shores. The coasts are steep and craggy; in many places basaltic columns of a gray or greenish hue appear; olivine, hornblende, and chalcedony are found. The islands are surrounded with sharp rugged rocks, and often with coral reefs: the water around them is very deep. They are all uninhabited except Peel Island, on which a few Europeans and Malays have settled near Port Lloyd. The islands abound in the cabbage and fan palms, the former of which is an excellent vegetable, areca, pandanus, tamarac of Otaheite, and various other trees: the sea also contains abundance of turtle, ray, eels, cray-fish, and a great variety of other fish, of the most beautiful colours. Of birds, there are brown herons, plover, rails, snipe, wood-pigeons, crows, and small birds; also a species of vampire bat, some of which measure three feet across the extended wings, with a body eight or nine inches in length. The islands are subject to earthquakes, and in winter to violent storms. The Bonin Islands abound in good harbours, and are frequently visited by whalers, who go to them for turtle, fish, and the cabbage palm.

The islands were visited in 1853 by Commodore Parry of the United States navy, who recommended the purchase of Port Lloyd as a stopping place for steamers between California and China. From the Commodore's dispatch the following notice of Peel Island is taken with slight alterations and omissions:—

"Port Lloyd is situated on the western side, and nearly in the centre of Peel Island. It is easy of ingress and egress, and may be considered a safe and commodious harbour, though of deep anchorage, ships usually anchoring in from 18 to 22 fathoms. The safest anchorage is to be found as high up the harbour as a ship can conveniently go, having regard to depth and room for tacking and veering cable. Wood and water can be obtained in abundance, though the former must be cut by the crew, and of course taken on board green. The water is obtained from running streams, and is of good quality. The few settlers still remaining on Peel Island raise considerable quantities of sweet potatoes, Indian corn, onions, taro, and a few fruits, the most abundant of which are water-melons, bananas, and pine apples; a few pigs and some poultry are also raised. For these they find ready sale to the whale ships constantly touching at the port for water and other supplies; they receive in exchange articles, of which ardent spirits are most acceptable to many of the settlers. The soil is of excellent quality for cultivation, very much resembling that of Madeira and the Canary Islands (the latter being in the same parallel of latitude), and consequently it is admirably adapted for the cultivation of the vine, and of wheat, tobacco, sugar-cane, and many other valuable plants. Of

sugar and tobacco the settlers already cultivate enough for their own consumption. Timber for building purposes is rather scarce, and would soon be exhausted if any increase of population were to call for the erection of many buildings. The best kinds are the tamar and the wild mulberry. The former is similar to the real wood of Brazil and Mexico, and is very durable." Commodore Perry caused the island to be explored, and a few animals placed upon two of the group. He also distributed garden seeds among the settlers, and secured a suitable spot for the erection of offices, wharves, coal sheds, &c. at Port Lloyd.

(*Navigacion Especulativa y Practica*, Manila; Beechey, *Voyage to the Pacific and Behring's Straits*.)

BONN, a town in the Cologne circle of Rhenish Prussia, is situated on a gentle eminence in a pleasant and fertile country on the left bank of the Rhine, 15 miles S. by railway from Coblenz, and has 20,000 inhabitants, including university students and the garrison. It occupies the site of the ancient Bonna, a town of the Ubii, which became the headquarters of a Roman legion, and, according to Antoninus's 'Itinerary,' was afterwards kept up as one of the Roman strong-holds on the Rhine. It rose ultimately to be a place of some note, and in the time of Tacitus was considered to be in that division of Gallia Belgica which was called Germania Secunda. According to Tacitus ('Hist.' iv. 20), the Roman troops under Herennius Gallus were defeated near Bonn by the Batavi under Claudius Civilis. Bonn is said to have embraced Christianity in the 88th year of the Christian era, in consequence of the preaching of Maternus, bishop of Cologne; it is known that Helena, the mother of Constantine the Great, about the year 316 built the church in this town, on the site of which the cathedral was afterwards built. In the year 355 Bonn was destroyed by an irruption of German tribes, and in 359 it was recovered and rebuilt by the Emperor Julian. In 755 Charlemagne crossed the Rhine at Bonn, in his second campaign against the Saxons; and in 881 it was almost ruined by the Northmen. In 1240 it was surrounded with walls and a ditch by the archbishop of Cologne, who conferred a variety of immunities upon it: from the year 1320 it was the constant residence of the archbishops of Cologne. The Emperor Charles IV. was crowned here in 1346, about which time it had risen into sufficient importance to conclude a treaty of defensive alliance with Cologne and other towns on the Rhine, when it undertook to furnish an auxiliary force of 500 men. During the thirty years' war Bonn was exposed to great sufferings and vicissitudes. In 1673 the French, who had possessed themselves of the place, were besieged in it by the prince of Orange and Montreuculi, and surrendered after a slight resistance: having regained possession of it fifteen years afterwards, they extended and greatly strengthened its defences. In 1689 it was taken by Frederick III., elector of Brandenburg, after a three months' siege; and in 1703 it was captured by the Duke of Marlborough, the operations of the siege having been conducted by the celebrated Marshal Coehorn. The fortifications were razed in 1717. In 1777 Maximilian Frederick, elector of Cologne, founded the academy, which was enlarged into a university in 1784. This university was dissolved by the French, and remained in abeyance while they held Bonn in Napoleon's time, but was re-established upon a more extensive scale in 1818 by the King of Prussia.

The town of Bonn has the Rhine for its eastern boundary: it is skirted on the south by the former electoral palace, and on the north and west by the cathedral, and a succession of gardens which stretch as far as the banks of the river. It has the appearance rather of a modern than of an ancient town, and though it cannot be termed a well-built place, for several of the streets are narrow and ill-lighted, its appearance at a distance, with its white palace, now the university building, the steeples behind, and the gardens all round it, is cheerful and pleasing. The air is at times bleak and cold, in consequence of the currents occasioned by the heights that hang over its low site, which is placed at the point where the Rhine emerges from between those heights: the evaporation from the river also renders the atmosphere damp. Bonn is nearly of a circular figure: the distance from the Cologne to the Coblenz gate does not exceed ten or twelve minutes' moderate walk. It contains above 1100 houses, built in a substantial manner, 20 public edifices, 8 churches and chapels, 9 mills and manufactories, and 5 gates. The inhabitants derive their subsistence chiefly from the university, from their fields, gardens, and vineyards. The chief manufactures in the town are cottons, silks, and sulphuric acid. The buildings without the gate are on the increase, and so disposed, under the direction of a board, as to be ornamental to the town. Among the open areas the market-place is the most spacious; but the square planted with trees next the Minster or Cathedral, and thence called the Minster-platz, is the finest: here is the monument of Beethoven, whose house is in the Bonngasse. There is no public edifice in Bonn to be compared with the Minster (dedicated to St. Cassius), an ancient gothic structure, probably of the 12th or 13th century. In the interior is a bronze statue of St. Holoun, kneeling at the foot of the cross, as well as bassi-relievi in white marble, representing the birth and baptism of our Saviour. In the church of St. Remigius there is a fine altarpiece in oils, in which Spießberg the painter has represented the baptism of Clovis, king of the Franks, by the patron saint. The town-hall, which is on one side of the market-place, is a handsome edifice in the modern style, with a double flight of stone steps in

front. Bonn has also a gymnasium; it is the seat of the superior board of mines for Rhenish Prussia, and of two tribunals for civil and criminal affairs. Among other scientific associations it possesses an academy of naturalists and a society for promoting the sciences of natural history and medicine. Upon the re-establishment of the university the electoral palace at the southern end of the town was appropriated to its use. There are five faculties—Protestant theology, Roman Catholic theology, medicine, jurisprudence, and philosophy. There are attached to it forty professors in ordinary, and ten adjuncts. Besides the lecture-rooms, the university buildings contain a library of 100,000 volumes, a collection of Roman antiquities, an anatomical hall ornamented with frescoes, an anatomical theatre and museum, a cabinet of surgical instruments, a museum of natural history, geological collections, a philosophical apparatus, and an observatory. At a distance of less than fifteen minutes' walk from the town lies the country residence of the former electors of Cologne, Clemensruhe, near the village of Poppelsdorf, which contains collections in natural history, geology, &c., the chemical and technological laboratory, a gallery of paintings and engravings, and lecture-rooms, besides apartments for the accommodation or use of the officers and professors of the university. There are five elementary schools in the town, as well as a free-school for 300 poor children, an excellent library of scientific publications and a mineralogical collection attached to the board of mining, and several benevolent institutions. To the university is attached a botanical garden, and also an agricultural institute, which has an area of 120 acres devoted to its purposes, and a manufactory of earthenware and pottery at Poppelsdorf.

BONNETABLE. [SARTHE.]

BONNY. [BAFRA; QUORNA.]

BOOLDI'R. [ALEUTIAN ISLANDS.]

BOOM. [ANTWERP.]

BOONDEE, a principality in the south-east quarter of Rajpootana, under the protection of the Anglo-Indian government, between which and the Raja of Boondel a treaty was concluded in 1818. The area of the territory is 2291 square miles: the population is estimated at 229,100. The revenue is about 50,000*l.* a year, irrespective of the revenues of feudal grants and religious endowments. A tribute of about 4000*l.* is payable by Boondel to the Company's government. The military resources of Boondel comprise 1000 cavalry, 520 infantry, and 150 artillery, besides a police-force of 2000 men, and an irregular feudal force of 2500. The boundaries of Boondel are Koodah on the S. and E., Jeypoor and Dhojare on the N., and Jaizmir on the W. [Rajpootana.] (Mill's *British India: Parliamentary Papers*.)

BRONHEE, the capital of the above principality, is 25° 28' N. lat., 75° 42' E. long. The old town, which is nearly deserted by the inhabitants, and for the most part incruins, contains some fine pagodas and fountains. The new town, to the east of the old town, is enclosed by high stone walls and connected with fortifications on a cliff behind the town, and commanding it. The greater part of the houses are built of stone, and are two stories high. At one end of the principal street stands an extensive temple, dedicated to Krishna, covered with groups of figures sculptured in relief; at the other end is the great palace of the raja, built on the side of the hill; the intermediate space is occupied by two rows of shops fantastically ornamented. At the lower end of the street, near the temple, are figures of the natural size, cut in stone, of a horse and an elephant—the latter raised on a pedestal. On the north-eastern side of the city is a lake which is supplied with water during the rainy season by another great lake artificially formed by embankments on the high ground. The pass through the hills north of the city is more than 6 miles long, and at three spots is defended by barriers. Near to one of these barriers is a summer residence of the raja, and some Hindu temples. Adjoining the second barrier is the cemetery of the raja's family.

BOORHANPORE, a large and ancient city, formerly the capital of the province of Candeish, on the right bank of the Tuptee River, in 21° 19' N. lat., 76° 18' E. long.; 240 miles from Bombay, and 97 miles from Calcutta. This city is one of the best built in the southern part of Hindustan: the houses are generally constructed of brick, and are two or three stories high. Many of the streets are wide, and paved with stone: the market-place is a large and substantial building, but except the principal mosque the city is without architectural ornament. The mosque is of gray stone, with an extensive façade supported on arches, and it has two handsome minarets of an octagonal form; in front are a fine terrace and a reservoir of water. Boorhanpore, which had been made the seat of government for the subah or vicerealty of Candeish by Anrungszebe, was taken, together with the rest of the subah, by the Marhattas about 1760. The principal commerce of the place is carried on by a peculiar sect of Mohammedans known as 'Bohrals,' but who call themselves 'Ismaeliah,' from one of the early followers of Mohammed. Many of them are very wealthy; their mosque and cemetery are about 2 miles from Boorhanpore. The Tuptee is here a narrow river, and fordable in the dry season. Water for the supply of the city is brought by means of an aqueduct from a distance of 4 miles, and is plentifully distributed through every street. The grapes which grow abundantly in the neighbourhood of the city, are said to be the finest in India.

BOORU, an island in the Eastern seas, situated between Celebes and

Ambosyna, between 3° and 4° S. lat., 125° 30' and 127° 15' E. long. It is of an oval shape; its length from east to west is 75 miles, and its average breadth about 40 miles. The inhabitants of the coast, who are Mohammedans, acknowledge the authority of the Dutch settlers, but are governed immediately by their own chiefs, or 'oran cayas.' The inhabitants of the interior, which consists for the most part of very high mountains, are the aboriginal Horaforas, and subsist upon wild fruits and the produce of the chase, deer and horned-pigs. At Cajelli or Booro Bay, in the north-east of the island, is Fort Defence, the settlement of the Dutch. This port is frequented by South Sea whalers for shelter during the monsoons, as well as to obtain wood and water, which are plentiful. The principal productions are rice, sago, and various kinds of dye and aromatic woods, for which many Chinese vessels come to the island. The Cajeput-tree is a native of Booro, and Cajeput oil is obtained in considerable quantity. The Booro Strait separates the island from Ambosyna and Ceram. (Stavorinus, *Voyages*, vol. i.; Furthest, *Voyage to New Guinea*; Porter, *Tropical Agriculturist*.)

BOOTA'N, or BHOOTA'N, an alpine region in Northern Hindustan, bounded W. by the territories of the Raja of Sikkim, E. by an unknown mountain district, N. by Tibet, and S. by Bengal and Bahar. Bootan occupies the descent between the table-land of Tibet and the low plains on the banks of the Ganges, together with a narrow tract of country at the foot of the slope. The surface of Bootan is covered with masses of rocky mountains. The valleys, which are extremely narrow, are traversed by rivers which for many miles are a succession of cataracts and rapids. Bootan includes the southern declivity of the Himalaya range, and here on the boundary of Tibet stands the Chamalari which rises to a height of about 25,000 feet. The Soomoonung Pass, one of the highest of the passes over the Himalaya in this district, is 15,744 feet above the level of Calcutta.

The northern parts of Bootan, which belong to the alpine region, extend southward from the boundary of Tibet and along the southern slope of the Himalaya for about 10 miles. It appears that within these narrow limits the high land descends more than 10,000 feet. This rapid descent constitutes the character of the northern districts of Bootan; exhibiting different botanical features as the land descends. The rivers rush forth like torrents, forming violently among huge masses of rock that obstruct their tortuous course, in which they dash from one side to the other. The spray rising from the numerous water-falls loads the atmosphere with vapours, and renders the air extremely chilly, even in summer. The upper regions are uninhabitable except during a few summer months.

Contiguous to this inhospitable alpine region is the best cultivated part of Bootan, which occupies about one-half of the whole country. The mountains probably never, or rarely, attain the height of 10,000 feet, and they descend with gentle declivities. The sides and summits of the mountains are clothed with pines, firs, birch, aspen, maple, and yew. The valleys are open, and present many fertile spots, where fruit and corn grow in great variety. Numerous villages, hermitages, and farm-houses are distributed up and down the hills and along the banks of the rivers. The climate resembles that of the southern countries of Europe.

Before the rivers reach the low plains of Bengal, they still descend another slope, which in somewhat more than 10 miles sinks from upwards of 3000 feet to less than 300 feet. Here the valleys are again close and deep, and so narrow that the roads have been made on the side of high mountains along deep precipices. Agriculture in this district is confined to a few small spots. Cattle and hogs find abundant food in the spontaneous produce of the woods. This region is exposed to the full south-west monsoon, and is unhealthy, having a tendency to produce gñtre.

To the south of this mountain region, and only divided from it by a few miles of gently sloping ground, extends the Tariyani, noted all over Bengal for its forests and its unhealthiness. It belongs partly to Bootan. This region is an entire swamp. There being no outlet for the numerous springs which issue from the base of the mountains, the water becomes stagnant, and the ground laden with vegetation of extraordinary rankness. An almost inexhaustible supply of timber is obtained from this region.

Travelling in the Tariyani is performed by means of elephants; but in the mountainous parts, which have no carriage-roads, it can only be undertaken on horseback. Sometimes travellers must be carried over steep parts of the mountains on the backs of men. The natives have built a great variety of bridges adapted to the river and to the specific circumstances in each case, thus evincing no little ingenuity and judgment. The bridges are generally of timber, and if the width of the river will admit, they are laid horizontally from rock to rock. Over broader streams a triple or quadruple row of timbers, one row projecting over the other, and inserted into the rock, sustains two sloping sides, which are united by a horizontal platform: thus the centre is raised very much above the current, and the whole bridge forms nearly three sides of an octagon. The widest river of Bootan has an iron bridge, consisting of a number of iron chains, which support a matted platform, and two chains are stretched above parallel to the sides, to support a matted border. Over deep chasms, two ropes, commonly of rattan or stout and flexible osier, are stretched from one mountain to another, and they are encircled by a hoop of the

same material. The passenger places himself between them, sitting in the hoop, and seizing a rope in each hand, slides himself along with facility and speed over a tremendous abyss.

The most considerable river of Bootan is the Tchin-tchien, which traverses the whole country from north to south, rising in the mountain-range between the Chamalari and Mount Ghawra, and running by Tassindon; it receives the Pa-tchien and the Ha-tchien, and after a turbulent course joins the Bramaputra near Rangamatty. Eastward and parallel to the Tchin-tchien is the Chuan-tchien, formed by the confluence of the Ma-tchien, Pa-tchien, and Tahan-tchien; it enters the Bramaputra within the confines of Bengal. The rapidity of all the rivers of Bootan is far too great to allow of either navigation or irrigation.

In the hilly country the slopes are cut into stages, and the rice planted on them is watered by the descending streams, which are made to overflow the beds successively. The natives show much industry in the cultivation of their fields, which are always neatly dressed. Besides rice they cultivate wheat, barley, and a species of the polygonum of Linnæus, which produces a triangular seed, nearly the size of barley, and is the common food of the people in many places. The level tracts along the Tchin-tchien yield two crops in the year; the first, of wheat and barley, is cut in June, and the rice, which is planted immediately after, enjoys the benefit of the rains. Turnips, eschallots, cucumbers, gourds, and melons are cultivated.

Of domestic animals only horses, cattle, and hogs are kept. The horses are nearly all of a peculiar species, indigenous in Bootan. They are usually 13 hands high, and remarkable for their just proportions, uniting in an eminent degree both strength and beauty. They are commonly of a piebald colour, with various shades of black, bay, and sorrel upon a ground of the purest white. The chowry-tailed cattle, or yak (*Bos grunniens*) pastures in summer among the snow-topped mountains which constitute the boundary between Bootan and Tibet, and in the winter it descends into the deep glens further to the south. Bees are common, and are managed with care.

There are no towns in Bootan, and the villages generally consist of not more than ten or twelve houses. Only the palaces of the lamas, of the Daeb Raja, and the governors of the provinces, have any degree of importance. The fortresses are built on very advantageous sites, generally at the confluence of two rivers. The natives of Bootan, called by the Hindoos Bootecas, or Botiyas, are members of a very extensive Himalaya nation. They belong physiologically to the Chinese and Birman race. They are Buddhists; but in their religious ceremonies they differ widely from other nations. Their temples are small squares, in which the image of Buddha is preserved. They are never opened, and the whole divine service of the people consists in processions made round the temple, accompanied with the mystic words, "Om man ni pad me hūm!" ("the jewel of the Buddhistical fulness is truly revealed in the Padma (Lotus) flower.") Near the temples are many tall flagstuffs, which have narrow banners of white cloth reaching nearly from top to bottom, and inscribed with the same mystic words. The same words cut in relief are inscribed on tablets inserted in walls erected near the temples. The Bootecas consider the Dharma Raja as an incarnation of the Divinity, and he is their ecclesiastical chief as well as their sovereign. Being entirely absorbed in the contemplation of the Divinity, he takes no part in the internal or external affairs of the country, which are entirely left to the management of the Daeb Raja, except that the Dharma Raja appoints one member of the state council. This council consists of eight persons, without the assistance of whom the Daeb Raja can do nothing of consequence. The number of priests, called gylongs, amounts to upwards of 5000. Their principal duty consists in the study of the religious books, which seem to be numerous and full of metaphysical distinctions. They are bound to celibacy, and are not permitted to cultivate the ground; but they may enter into trade, and accept public offices. The Bootecas do not kill any animal, but they eat the flesh of those which have been killed by others, or have died. New-born children are washed the first day with warm water, and the following day they are immersed in a cold river. No religious ceremonies are observed on entering into matrimony. It is asserted that polygamy exists among the rich, and polyandry among the poor. The dead are burned, and the gylongs officiate on such occasions: the ashes are thrown into the river. On the house of the burned person flagstuffs are erected, in order to accelerate the regeneration of the owner.

Bootan has little mineral wealth. Only iron and copper are found, and iron only is worked. Potter's-clay is obtained in a few districts. Some commerce is carried on by Bootan with all the neighbouring countries; the most important is that with Bengal and Tibet. The commodities for Bengal consist of Tangun horses, linen-cloth, muschins, chowries, oranges, walnuts, and mungit (a kind of red colour); they are brought to Rungpoor, where they are exchanged for woollen cloth, coarse cottons, indigo, sandal-wood, assafœtida, and spices, all of which articles are consumed in the country or sent to Tibet. The same commodities are sent to Nepal and Assam, with the addition of rock-salt. Part of the commodities brought from Bengal are sent to H'Luem, in Tibet, with rice, wheat, and flour. Tea, gold, silver, and unbrotheries are received in exchange. The Bootecas import from Cutch Behar cattle, hogs, dried fish, betel, tobacco, and coarse cottons.

Commerce in Bootan is monopolised by the government, the governors of the provinces, and their officers.

(Turner's *Embassy to the Teshoo Lama, and Kishen Kant Bose, in Asiatic Researches*, vol. xv.)

BOOTHIA. [NORTH POLAR COUNTRIES.]

BOOTLE, Cumberland, a market-town and the seat of a Poor-Law Union, in the parish of Bootle and ward of Allerdale-above-Derwent, is situated in 54° 17' N. lat., 3° 20' W. long., 60 miles S.S.W. from Carlisle, and 278 miles N.W. from London by road. Bootle station of the Whitehaven and Furness railway is 361 miles from London by railway via Carlisle. The population of the parish in 1851 was 811. The living is a rectory in the archdeaconry of Richmond and diocese of Chester; but this part of the archdeaconry is to be hereafter transferred to the diocese of Carlisle. Bootle Poor-Law Union contains 12 parishes, with an area of 91,700 acres, and a population in 1851 of 6007.

Bootle is about two miles from the coast of the Irish Sea. The town, which is one of the smallest market-towns in England, consists of a long street of tolerably well-built houses. The chief building is the church, the oldest portion of which is probably Norman; the greater part is of early English date and style. The font which is of black marble is ancient and curious; on it is an inscription in Anglo-Saxon characters. There are a chapel for Independents, and a National school; the school-house was built in 1838 by Captain Shaw, R.N., who also left at his death in 1840 a sum of 300*l.* to keep the building in repair. The inhabitants of the parish are chiefly agricultural. A considerable trade is carried on in curing hams. The chief trade in provisions is with Liverpool. The market is held on Wednesday. There are fairs on April 5th and September 24th. The lofty mountain, Black Comb, celebrated for its vast extent of prospect, is in the vicinity of Bootle. At Seton, in Bootle parish, are some vestiges of a Benedictine monastery. There are also remains of stone circles and other primeval antiquities.

BOOTON, or BOÛTONG, an island of the Eastern seas, lying off the south-eastern extremity of the island of Celebes, round the point, 5° S. lat., 123° E. long. It is about 85 miles long from north to south, and its average breadth is about 20 miles: it is separated from the island of Panjassang by a narrow but deep channel called Booton Strait. The island is mountainous and woody, but is well cultivated in parts, yielding abundant crops of rice, maize, yams, and the usual variety of tropical fruits. Fowls and goats are reared for food, and buffaloes are pretty numerous.

On the east side of Booton is a deep bay, called by the Dutch 'Dwaal,' or Mistake Bay. There is danger in calm weather of ships being drawn by the set of the currents into this bay, in which case they can only get out again at the coming in of the west monsoon. South of Dwaal Bay is Booton Passage, which separates the island from the extensive and dangerous reef or bank on which the Tonkang-basi Islands lie to the eastward. To the west of Panjassang lies the island of Cambyna, next the mouth of the Bay of Bony, and farther west is the island of Salayer, which is separated from the Macassar peninsula of Celebes by the Salayer Strait. To the south of Salayer lie the Tonin and Schielan groups, and between them and the Booton Passage the Tiger Islands, scattered over a reef 50 miles long by 50 miles wide.

The inhabitants are Mohammedans; those who reside on the sea-coast speak the Malayun language. The island has an independent government under its own king, who rules likewise over some of the neighbouring islands. The Dutch East India Company formerly maintained a settlement on the island, to which they every year sent an officer to destroy the clove-trees, under a treaty with the king of Booton, who received an annual payment of 360 guilders (about 30*l.*) as an equivalent for the privilege, and for the assistance which he bound himself to give them in destroying the trees.

(Stavorinus, *Voyages*; Forrest, *Voyage to New Guinea*.)

BOPAIL. [BHOPAL.]

BORDEAUX, an important seaport town in France, the capital of the former province of Guienne and of the present department of Gironde, stands on the left bank of the Garonne, 75 miles from the mouth of the estuary of the Gironde, in 44° 50' N. lat., 0° 34' W. long. It is 360 miles S.S.W. from Paris by the railway route through Orleans, Tours, Poitiers, and Angoulême, which is all finished except the section between the two last-mentioned towns, and this is rapidly approaching completion. Bordeaux is also 360 miles distant from Marseille by the railway now in course of construction through Agen, Toulouse, Carcassonne, Narbonne, and Cette. A railroad 34 miles long, and running west from Bordeaux, connects it with La-Tête-de-Bœuf, a small seaport on the Bassin d'Arcachon; and from the La-Mothe station on this line a railway is in course of construction to Bayonne. The population of Bordeaux according to the Census of 1851 was 123,935, including the whole commune, which comprises little more than the city.

The city extends in the shape of a crescent about four miles along the river, which here bends with a rapid sweep from north-west to north-east. A magnificent bridge of 17 arches and 532 yards long joins the city to the suburb La-Bastille on the right bank of the river. The view of Bordeaux from this bridge is splendid. Opposite, at the entrance of the town, is the Porte de Bourgogne,

built to commemorate the birth of the grandson of Louis XIV. Along the river bank extends a broad causeway, a line of quays above three miles in length, and behind these a crescent of beautiful houses and stores, built of cut stone, and in the Italian style of architecture; while in the background spring up the numerous towers and spires of the churches and other public buildings of the city. Below the bridge the river increases to 800 yards in width, forming a large and safe harbour, which is capable of containing 1200 ships, and has from 19 to 39 feet of water at high tide. Vessels of 800 tons can load and unload at all times close to the quays. The greatest breadth of the town from the quays inland is about a mile; but towards the north and south the width is much less.

Bordeaux consists of an ancient and modern part, separated from each other by the Rue Chapelle-Rouge, which runs east and west and forms with its continuance the Rue de l'Intendance, one of the finest streets in Europe. To the south of this street lies the ancient part of the town, which consists of irregularly built squares and narrow winding streets: it contains but few handsome houses, though these are generally built or faced with cut stone. The northern part of Bordeaux, called the Quartier des Chartrons from the Carthusian convent which stood in it, was formerly a suburb, cut off from the rest of the city by the Château-Tronpette, a citadel erected by Charles VII. and strengthened by Vauban in the time of Louis XIV. The citadel has been demolished, and its site is now occupied by the Place Louis-Seize (which was called for a time Place Louis-Philippe), and by several fine streets which connect the Quartier des Chartrons with the rest of the town. This part, which is well and regularly built, is the residence of the principal merchants. The town has extended towards the west and south also far beyond its ancient limits.

A distinguishing feature of Bordeaux is its 'Cours' and its 'Places.' The former are wide streets lined with rows of trees, which form shady avenues on each side, and run through several parts of the town. The principal of them are the Cours d'Aquitaine, the Cours d'Albret, the Cours de Tourny, and the Cours du Jardin-Public, which form a continuous boulevard two miles in length, round the most closely built part of the town. The Places are open spaces surrounded by buildings: in shape some of them are square, some circular, and others are more like our parks than squares, being of large extent, laid out in walks and planted with trees. Bordeaux contains 40 of these Places, the largest of which are the Place Louis-Seize and the Jardin-Public: these contain from 18 to 20 acres each, and are laid out in the manner described. The Place Tourny is at the junction of the Cours de Tourny and the Cours du Jardin-Public: it is adorned with a fine statue of M. de Tourny, to whose Bordeaux is indebted for most of its modern improvements. The Place Dauphine at the southern end of the Cours de Tourny is of circular shape; the height and regularity of the buildings which surround it render it one of the finest Places in Bordeaux. The Place Royale is on the quay; its proximity to the bourse, the custom-house, and the port make it the rendezvous of foreigners and men of business. The Place de Richelieu is also on the quay, it stands between the Place Royale and the Place Louis-Seize, and is magnificently built.

Bordeaux contains many beautiful churches. The gothic cathedral of St.-André was built by the English in the 13th century. Its whole length is 413 feet; the choir which has a gallery and lofty clerestory windows is 193 feet long, 53 feet wide, and 85 feet high. The interior is lighted through painted windows, and embellished with sculptures and bas-reliefs. The southern facade is flanked by two unfinished towers which rise on each side of a triple and deeply recessed doorway decorated with a profusion of sculptures. The northern front has a similarly decorated portal surmounted by a splendid rose-window and galleries of beautiful stone-work tracery; and on each side of the doorway spring up two highly decorated gothic towers surmounted by elegant spires 262 feet high. When infidelity occupied the high places in France after the first revolution, the grand portal entrance at the western extremity of the nave was blocked up. A simple opening scarcely deserving the name of a door was made after the restoration of public worship, and still remains. This western portal dates from the 13th century, and is of great elegance. A grant of half a million of francs was made in 1853 at the instance of the emperor Napoleon III. to restore this western facade and render it worthy of the rest of the edifice.

A tower 200 feet high, called 'La Tour Peyberland,' from Archbishop Pierre Berland, who built it in 1440, stands at the east end of the cathedral, but apart from it, and serves it for a bell-tower. It was converted into a shot-tower during the first French revolution. Of the other churches the most remarkable are those of St.-Michel, built by the English in 1160, Sainte-Croix, St.-Seurin, Notre Dame, and Des Fenillans. This last is now the college church; it contains the tomb of Montaigne. At the western extremity of the town is the beautiful church of the Chartreuse convent, the vineyard of which is now turned into a cemetery. There are two reformed chapels and a Jewish synagogue in Bordeaux. Among the other public buildings must be mentioned the former palace of the archbishops of Bordeaux, which, after often changing its destination since 1791, became the town-hall in 1838; the theatre, a beautiful structure in the Corinthian style, and the finest building of the kind in France; the bourse or exchange; the custom-house; the great hospital, situated

in the highest part of the town, and facing the old fortress of HA. which is now used as a prison; the museum, in connection with which are the public library, containing 128,000 volumes and several valuable manuscripts, cabinets of natural history and antiquities, picture galleries, an observatory, and schools of painting and design. The only vestige of the Romans in Bordeaux is the ruin of the amphitheatre, improperly called Palais-Gallien (Palace of Gallienus). When the first revolution broke out, it was nearly entire; after that event the materials of which it was built were used for erecting a mass of houses in the arena. The arena was of the usual elliptic form; the major axis measuring 253 feet, and the minor axis 180 feet. The two gates at the extremities of the major axis are nearly entire; they are 30 feet high and 20 feet broad.

Besides the places already mentioned must be named the mint, the college, the public baths, the lunatic asylum, the lying-in hospital, the ship-building yards, the abattoir, the victualling office, the glass works, the immense wine stores along the quays, and the departmental nursery and botanical garden near the cemetery at the west end of the town.

Bordeaux gives title to an archbishop, whose see comprises the department of Gironde: his suffragans are the bishops of Agen, Angoulême, Poitiers, Périgueux, La-Rochelle, and Luçon. Bordeaux has a bank, and tribunals of first instance and of commerce. It is the seat of a High Court of Justice and of a University Academy. In connection with the Academy there are a faculty of theology, a secondary school of medicine, and an endowed college. There are also several learned societies, schools of architecture, hydrography, navigation, botany, and natural history, and a large establishment for deaf-mutes. The town is the residence of a great number of foreign consuls, and the head-quarters of the 14th military division, which includes the departments of Gironde, Charente, Charente-Inférieure, Dordogne, and Lot-et-Garonne.

Besides its advantageous position for foreign commerce Bordeaux has great facilities for internal traffic. By means of the Garonne, the Dordogne, and their affluents, its commerce is extended over a great surface of the interior of France; and by the Canal-du-Midi it has communication with the Mediterranean, and is able to rival Marseille in the sale of colonial produce. Wine, brandy, and fruits are the chief articles of export. The Médoc or claret wines are sent chiefly to England and Russia; the inferior sorts to Holland and Germany. Large quantities of wine are also shipped to America. Other articles of commerce are—all kinds of bread-stuffs, hemp, flax, pitch and tar, cork, oil, salt provisions, hardware, metals, cotton-yarn, ship timber, and rigging. Ships are fitted out at Bordeaux for the whale and cod fisheries. The manufactures of the town are jewellery and plated goods, linen, muslin, woollen stuffs, calicoes, hosiery, gloves, corks, soap, chemical products, musical instruments, &c. There are also several distilleries, sugar-refineries, breweries, gas-works, glass and china works, tobacco-factories, rope-walks, and dockyards. Colonial products, cotton, dye-stuffs, pepper, hides, tobacco, and rice are the principal imports. There is a regular service of packets from Bordeaux to the Havanna and the coast of Mexico.

Bordeaux occupies the site of the Roman *Burdigala*. The city having been destroyed by fire about A.D. 260 was rebuilt by the Romans. In the 4th century it became the capital of Aquitania Secunda. Of its state at that time Ausonius, who was a native of Burdigala, has left a description in his 'Clare Urbes,' xiv. 8. The splendour of the Roman Burdigala waned under the blighting away of the Visigoths, who sacked it on their way to Spain, and held it till their defeat at Vouillé by Clovis, nearly a century afterwards, when they abandoned the town to the conqueror. Under Charlemagne it was governed by a count of its own, became again prosperous, and was in 850 the capital of the duchy of Gasconne. Its prosperity attracted the Northmen, who plundered and demolished the town; but early in the 10th century it was rebuilt by the dukes of Gasconne. On the union of the duchies of Gasconne and Guienne the dukes chose Poitiers for their capital, and Bordeaux became the capital of a county. By the marriage of Eleanor of Guienne in 1152 with Henry of Normandy, afterwards Henry II. of England, Bordeaux with all the south-west of France became subject to the English kings. In the reign of Edward III. it was the residence of the Black Prince for eleven years, and here his son Richard II. was born. On the decline of the English power in France the city submitted in 1451 to Count Dunois, and acknowledged the sovereignty of Charles VII. In the following year, on the arrival of the great Earl Talbot, the city revolted and joined the English; but after Talbot's fall before Castillon, Charles VII. in person invested Bordeaux, which unprepared for a siege submitted at discretion. At this time Charles erected the Château-Trompette and the Fortress of HA. In 1548 the townsmen rose in insurrection on account of the oppressive gabelle, or salt-tax, and massacred the governor Tristan de Monneims. The disaffected were soon put down, and many of them punished with death. This punishment however was not deemed sufficient. The constable Montmorency, at the head of an army, entered Bordeaux, which offered him no resistance, through a breach made in the walls with his cannon, deprived the citizens of all their privileges, and amongst other horrors caused one citizen to be hung for every tenth house in the town. The privileges of the town, which consisted

mainly of the right of self-government by a mayor and six jurats elected by their fellow-citizens, were restored in 1550 by a royal edict. In the religious wars of the 17th century Bordeaux was the scene of many cruelties against the reformers. In the war of the Fronde it opposed the court party, and was twice blockaded; and by an edict issued in 1675 the parliament of Bordeaux was removed to Condom, and subsequently to La-Roche, and troops were quartered among the citizens to curb their rebellious spirit. The parliament returned to Bordeaux in 1690, and the city enjoyed repose and prosperity till the outbreak of the great French Revolution. On the territorial division of France after that event it became the capital of the department of Gironde. In 1814 the citizens, headed by the mayor, M. Lynch, advanced to meet the English troops, delivered to them the keys of Bordeaux, and hoisted the white flag of the Bourbons. In 1815 however they refused to support the Duchess of Angoulême, who wished to make a stand at Bordeaux against Napoleon. On the issuing of the ordinances of Charles X. in 1830 Bordeaux substituted the tricolour for the Bourbon flag before the news of the revolution at Paris had arrived.

The different forms of the name of Bordeaux met with in old writers are Bourdeaux, Bourdeaux, and Bordenulx.

(Vinet, *L'Antiquité de Bordeaux*; Millin, *Voyage dans les Départements du Midi*; Devienne, *Histoire de Bordeaux*; Malta Brun; Balbi; *Dictionnaire de la France*, 1845.)

BORDELAIS, a subdivision of Guienne in France, which was named from its capital Bordeaux. It included the territory immediately adjacent to that city, the districts of Médoc, Les Landes de Bordeaux, and many others, and extended on both sides of the Garonne, the Dordogne, and the Gironde. It was bounded N. by Saintonge, E. by Périgord and Bazadais, S.E. and S. by Les Landes, and W. by the ocean. It is now included in the departments of GIRONDE and LANDES.

BORÉ, a phenomenon which occurs in some rivers near their mouth at spring-tides. When the tide enters the river the waters suddenly rise to a great height, in some rivers many feet above the surface of the stream, and rush with tremendous noise against the current for a considerable distance. Sometimes the waters do not subside till they have almost reached the limit of tide-water. As this swell does not occur in all rivers where there is a tide it is evident that it must be caused by some conformation of the banks or bed of the river, or by both combined. It seems to be necessary, in order that there should be a bore, that the river should fall into an estuary, that this estuary be subject to high tides, and that it contract gradually; and lastly, that the river also narrow by degrees. The rise of the sea at spring-tides pushes a great volume of water into the wide entrance of the estuary, where it accumulates, not being able to flow off quick enough into the narrower part. The tide therefore enters with the greater force the narrower the estuary becomes, and when it reaches the mouth of the river the swell has already obtained a considerable height above the descending stream, and rushes on like a torrent.

In England the bore is observed in some rivers, more especially in the Severn, Trent, Wye, and in Solway Firth. The most remarkable bores hitherto described are those of the Ganges and Brahmaputra. In the Hoogly branch of the Ganges the bore is so quick that it takes only four hours in travelling from Fulta to some distance above Hoogly town, a run of nearly 70 miles. At Calcutta it sometimes causes an instantaneous rise of five feet, which would occasion great damage among the smaller vessels if it did not run along one bank only, so that the barges on hearing the noise which precedes it can be safely brought to the other side of the river, or to the middle, where the swell is indeed considerable, but not so sudden as to endanger vessels which are skilfully managed. In the channels between the islands at the mouth of the Brahmaputra the height of the bore is said to exceed 12 feet, and it is so terrific in its appearance, and so dangerous in its consequences, that no boat will venture to navigate there at spring-tide; but it does not ascend to any great distance in this river, which is probably owing to the great width of the channel.

The phenomenon observed in the mouths of the Indus must be of the same kind. Burnes remarks that "the tides rise in the mouths of the Indus about 9 feet at full moon; and flow and ebb with great violence, particularly near the sea, where they flood and abandon the banks with equal and incredible velocity. It is dangerous to drop the anchor unless at low water, as the channel is frequently obscured and the vessel may be left dry. The tides are only perceptible 75 miles from the sea." The boats of Alexander experienced these dangerous tides in the Indus, and his historian Arrian is the first who has described them. ('Annab.' vi. 19.) The bore in the Gulf of Cambay and its tributaries is exceedingly high and rapid.

On the north coast of Brazil, especially on the shores of the provinces Pará and Maranhão, a similar phenomenon is observed in some rivers, and in the channel which extends between the coast and a series of islands from Cape Norte to the mouth of the river Macapá. This phenomenon, which is called by the Indians 'pororoca,' is particularly strong in the Araguari River, which runs into the sea near Cape Norte, and in the rivers Guama and Capim near Pará, and also in the river Meary in Maranhão, and according to some writers in the Amazonas. The description of the pororoca does not differ materially

from that of the bore of the rivers in India, except that it rises to 15 feet, and forms three or even four swells, which follow in rapid succession.

(Rennell, *Hindustan*; Ayre, *Corografia Brasilica*; Burnes, *Etherney*, and Servin, in the *London Geographical Journal*; Eschwege, *Brasilien*.)

BORGNE, LAKE. [MISSISSIPPI.]

BO'RGNO, an Italian appellation, which occurs in the name of several towns, is derived from 'burg,' which is said to have been first adopted by the Romans on the German frontiers of the empire to signify an assemblage of houses not inclosed by walls, Burgus or Burgum. It was afterwards applied to the fortified villages of the German soldiers in the service of Rome. The Germanic nations, in their invasions of Italy, introduced the appellation into that country, where it was generally applied to the houses and streets built outside of the gates of a walled town, corresponding to the Roman suburbia. The French faubourg had a similar meaning, being derived from foris burg or foris burg, a 'burg outside of the town.' Several districts in the Italian cities have retained their original name of Borgo, although they are now inclosed within the walls. The district of Rome which is between the bridge of San Angelo and St. Peter's is called Il Borgo. So there are several districts at Florence called Borgo, as Borgo dei Pinti, because they were originally outside of the city walls. There are however also towns standing by themselves which have the name of Borgo.

Borgo San-Dominico, a town in the Duchy of Parma, is situated 13 miles N.W. from the city of Parma, on the road to Piacenza. It was formerly a feudal castle of the house of Pallavicini, around which the town rose up; it now has 5000 inhabitants, some fine buildings, and an old cathedral. It is the chief town of the province of Borgo San-Dominico, which lies between the Taro and the Riglio, and has an area of 621 square miles, with a population (in 1851) of 132,036. Borgo San-Dominico is a bishop's see, and has a college, elementary schools for boys, and several manufactures. It stands on the ancient Æmilian Way, and on the line of the projected railway from Bologna to Piacenza.

Borgo San-Sepolero, a city of Tuscany, 14 miles E.N.E. from Arezzo, in the valley of the Upper Tiber. It originated in the 10th century with two pilgrims, who having been to Palestine brought back a piece of the stone of the Holy Sepulchre (San Sepolero), and built a hermitage on this spot. The fame of their sanctity attracted many people, and a number of houses were built, to which the name of Borgo San-Sepolero was given. The town was formerly inclosed by walls, which were shaken down by an earthquake; it is still defended by a citadel. It is a bishop's see and has a cathedral, several other churches, and a theological seminary: population about 5000. Borgo San-Sepolero was subject to the Holy See till 1440, when Eugenius IV. transferred it to Florence. It has produced a great number of eminent painters, whose works adorn the churches of their native city.

Borghetto, the diminutive of Borgo, frequently occurs as the name of small places in the States of the Church.

BORKUM. [AURICH.]

BO'RMIO (in German *Worms*), a town of Austrian Italy in the Valteline, is situated between two head streams of the Adda, and at the foot of the Ortler-Spitz, one of the highest summits of the Rhetian Alps. The famous road over the Stiller Joch, or Monte Stelvio, connecting the valleys of the Adda and the Adige, skirts the north-west flank of the Ortler in passing from Bormio to Glurns. This road, the highest point of which is 9000 feet above the sea, was constructed by Austria between 1819 and 1825. Bormio is a small town, numbering less than 2000 inhabitants. It was partly burnt by the French in 1799. The climate is cold. Some barley and rye and excellent honey are the principal productions of the neighbourhood, which affords also good summer pasture. The town has several churches: that of Sant' Antonio contains some good paintings. The mineral baths of San-Martino near Bormio are frequented by invalids from the Tyrol and the Valteline. In the Valfurva, east of Bormio, there are iron-mines and a chalybeate spring.

Bormio formerly belonged to the Swiss canton of Grisons; together with the Valteline and Chiavenna it was annexed to Lombardy by Napoleon I. in 1796.

BORNEO (called by the natives Pulo-Kalantan), the largest island on the globe, with the exception of Australia, occupies the centre of the Indian Archipelago. It is bounded S. by the Java Sea; E. by Macassar Strait, which divides it from Celebes, by the Celebes Sea, and the Sooloo Sea; and N. and W. by the Chinese Sea, which is joined by the Balabac Strait to the Sea of Sooloo, and by Caramata Strait to the Java Sea. The island is divided by the equator into two nearly equal parts, though the most southern point, Cape Salatan, is only a little more than four degrees south of the equator, and the most northern point, Cape Sampanmanjo, extends a few minutes north of 7° N. lat. The most easterly point of Borneo is Kaniungan Point, which lies under the meridian of 119° 20' E.; the most western point is about one degree north of the equator and nearly under 109° E. long. The island is about 850 miles in its greatest length from north-north-east to south-south-west; and its greatest breadth is about 680 miles. The main mass of the island lies south of 2° 30' N. lat., and is about 550 miles long by 450 miles broad; to the north of that parallel a peninsula extends towards the north-east upwards of 300 miles in length and 120 miles in average breadth: consequently the area

of the whole island may be close upon 284,000 square miles. The population has been estimated at three millions; but it is needless to remark that nothing definite is known upon this head.

Coast-Line.—The eastern shores south of Kaniungan Point, the whole extent of the southern shores, and the western coast up to Cape Datu, on the western side of Sadong Bay, are for the most part low, and in some places marshy and alluvial. From Sadong Bay the coast runs in a north-east direction to Cape Sampanmanjo, which shelters Maludu Bay on the west. The navigation along this part of the coast used to be deemed perilous on account of the numerous islets and rocks that line it and the sudden squalls to which it is subject. The establishment of the colony of Labuan and the acquisition of the rajahship of Sarawak by Sir James Brooke have in recent years attracted British cruisers to this coast, and the perils of the navigation no longer seem to be very formidable. The coasts of the peninsula are in many parts old and rocky, and indented by several large bays, the principal of which are those of Maludu and Labok, long the haunts of the Lanun, Sooloo, and other pirates. It was in the Maludu Bay that Mr. Burnes was murdered by the Lanuns a few years ago. Off the mouth of Maludu Bay lie the islands of Balambangan and Banguay. To the south of Labok Bay, but separated from it by Sandakan Bay, lies the peninsula and promontory of Unsoong, which is a great resort of the swallows, whose edible nests form an important object of commerce with China. The peninsula of Unsoong is said to be the most eastern point on the globe in which the elephant is found in its wild state.

Mountains.—Of the interior of Borneo very little is known. A Dutch expedition started from the south-west of the island in 1823 to take possession of the gold and diamond mines, and advanced about 300 miles inland without meeting any mountains of such an elevation as to prevent their progress. They came to a large lake called Danao Malayu, 30 miles long and 12 miles broad, somewhere in the interior, but they did not fix its site. Borneo has a grand mountain system, but little more is known of it than the general direction of the leading ranges. And of the interior of the country generally it may be said that we are almost entirely ignorant.

From Cape Datu, a remarkable headland on the west coast, a range of mountains (averaging between 3000 and 4000 feet in height) sweeps inland to a considerable distance from the shore of the Chinese Sea, and then runs to the north-eastward, increasing in height as it goes northward, and known under different names—the Kriabang Mountains, which bound Sarawak on the south; to the north of these the Bataug Lupar Mountains, and then the Madi Mountains. Between this range and the Chinese Sea lies the extensive country of Borneo Proper, which occupies all the north-west of the island. Near 5° 30' N. lat. the axis of the range strikes the north-western corner of a large lake called Kini-Batu. The range here declines a little to the westward, and seems to be a little broken, but it soon resumes the northerly direction, and rises on the north-west side of the lake to an elevation of 13,695 feet in Mount Kini-Batu (Chinese Widow), the highest known point in Borneo; from this mountain the range continues northward to its termination in Cape Sampanmanjo. Near the parallel of 4° N. Mount Malu rises at a long distance from the main range (it is probably unconnected with it) to the height of 8000 feet. Numerous rivers flow across Borneo Proper from these mountains, the principal of which, proceeding northwards from Cape Datu, are the river of Sarawak, the Batang-Lupar, the Rajang, and the Kumanis, all of which are navigable streams.

Mount Kini-Batu forms a conspicuous object to mariners along the north-west coast. At its base lies the Lake of Kini-Batu, which is 35 miles long and 30 miles broad, with an average depth of between five and six fathoms. The country east of the Lake and Mountain of Kini-Batu is occupied by the Maludu Dyaks. The extreme north-east coast is indented by the bays of Labok, Sandakan, and Gioug; the last two are separated by the peninsula of Unsoong, which is traversed by the Kinibatangan Mountains, and along the northern base of these runs the Kinibatangan River into Sandakan Bay. Gioug Bay is of great extent, its western shore nearly touches 115° E. long. To the south of the Maludu country a large extent of territory belongs to the sultan of Sooloo.

The Madi Mountains seem to comprise a central knot whence lofty ranges run to the east and south-east dividing the rest of the island into distinct and extensive basins. One of these ranges runs east by south from Mount Beringin, near 2° 30' N. lat., and terminates at Kaniungan Point, separating the territory of Coti from the Beru country, which comprises the basin of the Pantai River. At a short distance south of Mount Beringin another lofty range, the Anga-Anga Mountains, springs from the Madi Mountains and runs south-east to the equator, which it strikes under 116° E. long., and thence takes a southern direction to its termination in Cape Salatan the most southern part of Borneo. This range separates the Dutch territory of Bangermassin from the territories of Coti, Passir, and Tanah-Bumbu which lie between these mountains and the strait of Macassar. The southern part of this long range, where it separates Bangermassin from Tanah-Bumbu, is called the Meratus Mountains. On the western side of the Anga-Anga Mountains is the extensive basin of the Banjar River, and to the west of that the basin of the Great Dyaks River. At no great distance from the point where the range leaves the Madi Mountains it sends off a long offshoot called the

Kaminting Mountains, which near $1^{\circ} 40' S.$ lat., under the name of Pembrangan Mountains, run north-westward to Mount Malin, and then break up into numerous ramifications some of which extend westward to near $110^{\circ} E.$ long., just above the bifurcation of the Simpang River. The country between the Kaminting Mountains and the great north-western range comprises the basins of the Simpang and Sambas rivers. It was up the former of these that the Dutch in the expedition of 1823 proceeded. The Sambas district lies immediately to the south and south-west of Sarawak, and like that province carries on a considerable commerce with Singapore.

Rivers.—The rivers of Borneo are numerous and many of them are of considerable size at their embouchures and are navigable for a considerable distance from the sea. We proceed to enumerate the most important of those that are known, commencing our survey as before with Sarawak and proceeding round the island northwards. The Sarawak coast extends from Cape Datu to the mouth of the Samarahan River. The chief river that enters the sea between these points is the *Sarawak* which rises in the north side of the Krimbaug Mountain, passes the town of Kuching the capital of Sarawak, a little below which it divides into two arms, the more eastern of which, called the *Maratubus* entrance, falls into the sea in about $1^{\circ} 20' N.$ lat., $110^{\circ} 30' E.$ long. The other branch, called the *Santabong* entrance, reaches the sea at the peninsula of Sipang, on which is Mount Santabong 2712 feet high.

In Borneo Proper the *Batang-Lupar* rises in the mountain of that name and flows past the town of Patusan between jungly banks, and enters the sea near $1^{\circ} 25' N.$ lat., $111^{\circ} E.$ long. Farther north-east are the Sarebas and Rajang rivers. The river Cadayan, near the mouth of which is Brunei the capital of Borneo Proper, enters the south side of a large bay, the eastern shore of which is skirted by mountains rising abruptly from the shore. This bay lies to the south-south-east of the island of Labuan.

The lake of Kiri-Balu lies between $5^{\circ} 25'$ and $5^{\circ} 58' N.$ lat., $116^{\circ} 45'$ and $117^{\circ} 15' E.$ long. It has an outlet northward into Maludu Bay. Besides this no less than three other outlets are conjecturally marked, namely, the *Pattan* which runs north-east and enters the sea about $6^{\circ} 35' N.$ lat.; the *Kinibatangan* which runs east along the northern base of the Kinibatangan Mountains, and has its mouth in $5^{\circ} 45' N.$ lat., $118^{\circ} 35' E.$ long.; and the *Sibokko* which has a south-eastern course into Sadakam Bay: but it need not be remarked that this conjecture, is very improbable, and we think it will eventually be found that the rivers just named, which certainly exist, have their sources in highlands near the shore of the lake.

In the territory of the sultan of Sooloo in the north-east of Borneo are the rivers *Sambakung* and *Atas* which enter the Sea of Celebes; and the *Bulungan* which rises in the Anga-Anga Mountains, runs eastward passing the town of Bulungan on its left bank, and enters the sea in about $3^{\circ} 10' N.$ lat., $117^{\circ} 30' E.$ long.

The Beru country comprises the basin of the *Pantai* River which is formed by the junction of the Segu and the Kaley at the town of Gunong-Tebur, situated on the left bank of the Segu, in $2^{\circ} 10' N.$ lat., $117^{\circ} 32' E.$ long. Near the junction is the town of Sambiliong on the right bank of the Kaley. Both of these head streams flow from the Anga-Anga Mountains eastward, in which direction the Pantai continues to flow to the Celebes Sea, which it enters by several mouths a little north of $2^{\circ} N.$ lat.

The *Coti* or *Djura* River, which drains the territory of Coti, rises between the Anga-Anga Mountains and the eastern range that terminates in Kaniungan Point. It receives a vast number of tributaries on both banks in its course, which is towards the south-east. At a considerable distance from the sea the Coti divides into several arms inclosing deltas and entering the sea between $0^{\circ} 10'$ and $0^{\circ} 50' S.$ lat. The town of Coti stands on the southern arm several miles above the embouchure. In the Passir and Tana-Bumbu territories numerous rivers flow from the Meratus Mountains eastward into Macassar Strait and the Strait of Pulo Laut which separates the small mountainous island of *Pulo Laut* from the south-eastern angle of Borneo; but they are all of short course.

The Java Sea receives several considerable rivers from Borneo. The largest is the *Hanjer* or *Barito*, the head stream of which rises in Mount Bandang in $0^{\circ} 30' N.$ lat., $113^{\circ} 30' E.$ long. The course of the river is eastward to $115^{\circ} E.$ long., where it turns to the south, and running in this direction in a very tortuous course receives many small streams from either side. About $2^{\circ} 40' S.$ lat., the Hanjer divides into two arms, the principal of which enters the sea in about $3^{\circ} 30' S.$ lat., $114^{\circ} 35' E.$ long. The Dutch settlement of Bangermassin is on the left bank of this branch in about $3^{\circ} 18' S.$ lat. The western arm called the *Murong* or *Little Dayaks* River has its outfall about $3^{\circ} 25' S.$ lat., $114^{\circ} 12' E.$ long. The next river to the westward is the *Kayan* or *Great Dayaks* River which flows south from the Kaminting Mountains and enters the sea about $3^{\circ} 20' S.$ lat., $113^{\circ} 50' E.$ long. The other rivers in order along the coast are the Mendawi, the Sampit, the Pembuan, and the Kotta-Waringin, all of which are named from towns near their mouths.

The country included between the Kaminting Mountains, the Anga-Anga Mountains, and the great north-western range is drained chiefly by the *Simpang* River, which rises in the Anga-Anga Mountains near $1^{\circ} 10' N.$ lat., $114^{\circ} 10' E.$ long., and flows west by south receiving

numerous tributaries. In the upper part of its course the Simpang traverses a country inhabited by nomadic tribes. Near $0^{\circ} 10' S.$ lat., it divides into two branches, the *Kapuas* and the *Mantu*. The Kapuas flows first to the west then to the north-west, throwing off the *Ulak* which reaches the sea near $0^{\circ} 25' S.$ lat., while the embouchure of the Kapuas is in $0^{\circ} 2' N.$ lat. The town of Pontianak is situated on the left bank and near the mouth of the Kapuas in $0^{\circ} 2' S.$ lat., $109^{\circ} 20' E.$ long. The Mantu branch runs south by west and enters the sea in about $0^{\circ} 52' S.$ lat., $109^{\circ} 50' E.$ long.; in the embouchure is a large island on which are Mount Majak and Mount Miami. The north channel between the island and the main is called the *Majak* River. The southern part of the delta of the Simpang forms a district called *Kubu*. To the south of the Simpang flows the *Pawan* River, which runs south-west from Mount Malin and enters the sea by an estuary (in which is the island of Pajong) in about $0^{\circ} 50' S.$ lat., $111^{\circ} 20' E.$ long. The Sambas district is drained by the *Sambas* River, which rises in Mount Pandan ($0^{\circ} 54' N.$ lat., $109^{\circ} 35' E.$ long.), runs first north-east, then to the north-west, afterwards south-west, passing the town of Sambas on its left bank, and enters the sea by a wide estuary, on the left shore of which is an eminence called Mount Panaukat.

There are numerous islands off the south-western shore of Borneo, the principal of which are the Natuna and Tambelan groups, St. Esprit, St. Barbe, and Daton islands near the equator, the Panumbungan Islands nearly opposite the outfall of the Simpang, and the Caramata Islands which give name to the strait between Borneo and Billiton Island.

Climate and Products.—The climate of this island, as far as it is known, is very hot and moist, especially along the coast, and among the wide-spreading forests which cover many parts of the country. In the districts situated on the western shores the wet season takes place during the south-east monsoon, from April to September; but along the Strait of Macassar, and in the Java Sea, it occurs with the north-east monsoon, from September to April. From a series of observations made near the coast during twelve months between the hours of 6 and 7 A.M., the average annual temperature at that hour is deduced to be 70° Fahr. And from a similar table giving the maximum temperature of each month at the same hour the average annual maximum temperature at the time of observation is 87.6° Fahr. From this it may be inferred that the heat of midday is very great in the low countries, and that in marshy districts the climate must be unhealthy; but the higher parts of Borneo, especially towards the north-east, have a climate almost as temperate as Europe.

A country with a good soil and abundance of moisture, situated under the equator, must be extremely rich in vegetable productions. These include rice, sago, manioc, cotton, sugar, camphor, cassia, pepper, cloves, nutmeg, opium, ginger, betel-nuts, cocon-nuts, areca palm, a vast variety of timber-trees, sandal-wood, ebony, banana, bread-fruit, gutta-percha, upas-tree, sesamum; a vast number of oil-yielding plants, such as the cayaputi, which yields cajuput-oil; rattan and other plants used for making cordage; benzoin and other gums and woods used for frankincense; indigo, safflower, annatto, turmeric (which is used less for dyeing than as an aromatic for seasoning food), and several dye-woods, &c., &c.

The horticulture of Borneo comprises (besides several articles above enumerated) the calabash, the gourd, the pumpkin, the musk-melon, the water-melon, and a variety of cucumbers, yams, butatas; a great variety of fruits including lemons, oranges, citron, pine-apples, mangoes, mangustins, custard-apples, tamarinds, pomegranates, &c., &c.

Both sea and river fish abound, particularly the former. The numerous banks off this and the neighbouring islands afford the fish upon them such abundance of food, that no part of the world has a better supply of fine fish, especially where the shores are flat. The edible fish are here very numerous, among which the pomfret, the caloop, and the sole are the most delicate. A great variety of fish is dried in the sun, and forms a considerable article of commerce; fish in this state is an article of as universal consumption among the Indian islanders as flesh in cold countries. Some kinds of fish, especially shrimps, are pickled, and form an article of internal commerce under the name of blanchand; and the tripang swala, or sea-slug, is a valuable article of exportation to China. Among land animals are included the elephant, rhinoceros, leopard, buffalo, deer, wild hog, monkeys, horned cattle, a few horses, fowls and ducks, a great variety of birds, &c. Bees abound everywhere and vast quantities of wax are exported to China. The lac insect is found in the forests. Tortoises are very abundant on the northern and north-eastern coast; those found farther west are smaller, and the shell is thinner and less valuable. Tortoise-shells are exported to China, whence many of them find their way to Europe. Pearls and mother-of-pearl oysters are fished along the north-eastern coast, but they are not so much esteemed as those of the Sooloo Islands.

Population, &c.—The inhabitants of Borneo are either aborigines or foreign settlers. The former are divided into a great number of tribes. The Dyaks occupy the western and southern districts. The Biajoos and others, the peninsula extending to the north-east, and the Tiroon live on the eastern coast. In the interior are the Kayan, the Dusun, the Marut, and the Tataceli; other tribes are the Kadians, the Millanoros, the Dyak Darrat (or Land Dyaks), and Dyak Lant (or

Sea Dyaks). The foreign settlers are Malays, Javanese, Bugis, Macassars, Chinese, and a few Arabians.

All the inhabitants, with the exception of the Chinese and Arabians, belong to one race, which is called the Malay race. Their persons are short, squat, and robust. The medium height of the men is about 5 feet 2 inches, of the women 4 feet 11 inches. Their lower limbs are large and heavy, and their arms rather fleshy than muscular. The face is of a round form, the mouth wide, the chin somewhat square, the cheek-bones are prominent, and the cheek consequently rather hollow; the nose is short and small, never prominent, but never flat; the eyes are small, and always black; the complexion is generally brown, but varies a little in the different tribes, the Dyaks inhabiting the interior of the island being fairer than those of the coast; the hair is long, lank, harsh, and always black. The languages of the different aboriginal tribes differ widely from one another, and they have it is said no literature.

The aboriginal tribes have not attained a high degree of civilisation. Agriculture however seems generally diffused among them, as well as the most necessary arts of life. They cultivate chiefly rice, and collect gold-dust and diamonds. They trade also in rattans, gutta-percha, and other products of their forests. Their dress consists only of a small wrapper round their loins. Their houses are wooden buildings, often large enough to contain upwards of 100 persons. In the construction of their boats and some of their utensils they display considerable ingenuity. These tribes though otherwise mild and simple have been accused of cannibalism. Some who live on the coast have embraced the Mohammedan religion, but the greater part are idolaters. Polygamy is in general use among those who are able to maintain many wives and large families. A portion of the Bajos live constantly on the sea in small covered boats, and shift to leeward from island to island with the variations of the monsoons. Their fishing-boats, in which they live with their whole families, are of about five tons burden, and their principal occupation is the catching of sea-slugs, for which they frequently dive in seven or eight fathoms water.

The number of the Chinese settlers is considerable; and in Sambas especially they have of late years gained considerable influence by means of their secret societies, so as to embarrass the Dutch government considerably. In every part of the island where trade or industry is rewarded by security of life and property, some Chinese families are to be found. They follow the occupations of merchants, mechanics, and labourers; cultivate the ground, distil arrack, make sugar, search for gold-dust, and trade to the interior as well as on the coast. They are not rich, being too fond of good living, and addicted to gambling, opium, and merry-making.

The Bugis, who come from the island of Celebes, are remarkable among the nations of Southern Asia for their industry and activity. They chiefly apply themselves to trade, to the manufacture of Bugis cloth, and the working of raw silk into cloth. Many of them become comparatively wealthy, although they are generally poor when they arrive, but they are extremely economical and even penurious in their manner of living. These Bugis are very active seamen, and visit all the islands and countries round Borneo, in their light, cheaply-built, but often richly-freighted praus, many of which frequent the harbour of Singapore.

The Malays are the most numerous of the foreign settlers. They have formed a great number of small states along the coast, and subjected the Dyaks, whom they often treat with great cruelty. The interior of the country and portions of the coast also are in possession of the Dyaks.

The Dutch have possession of about one-half of the coast, and have extended their dominion far inland in some places, so that the rich gold and diamond-mines are in their possession. All the Dutch establishments are on the southern and western coast, and they govern the territories of the sovereigns of Bangermassin, Succadana, Pontianak, Manipava, Sambas, and Matan, and of some others farther inland. This great tract of country is governed by three Residents, established at Bangermassin, Pontianak, and Sambas, with two subordinate residences at Manipava and Landak. Around Sambas the area of the Dutch territory is given at 5269 square miles, with a population of 46,819 in 1849; the territory of Bangermassin is 54,203 square miles, with 304,076 inhabitants; and Pontianak, in the south-west, area 138,973 square miles, population 311,100.

In the Dutch territories there are three places of considerable trade, Sambas, Bangermassin, and Pontianak. Gold is found at six different places, at Ombak, Sangga, Larak, Banjar-laut, Sambas, Pontianak, and Montralak. The metal is found in alluvial deposits, which are channelled by the beds of numerous rivers, not usually above five or six feet from the surface. The principal diamond-mines are at a place called Landak, whence the diamonds of Borneo are called Landak diamonds. The mines, which are entered by perpendicular and lateral shafts, are worked by the Dyaks, but the gold-mines are mostly worked by the Chinese. The Bugis resident merchants are the great dealers in diamonds.

To the north-east of the Dutch territories and along the north-western coast, extends the kingdom of Borneo Proper, which extends from Cape Datu to the north of the river Kimania. It contains a sea-coast of between 600 and 700 miles, and extends from 100 to 150

miles towards the interior of the island. The capital is Bruni. The intercourse between Borneo Proper and Singapore is considerable. From Sadong, on the western frontier, great quantities of antimony are brought to Singapore. The mountain which contains the antimony is about one day's journey from the coast. The sultan and a considerable portion of the population are Malays.

Borneo Proper has recently been the scene of a remarkable enterprise, which has brought this part of the island prominently before the world. Mr. James Brooke, a gentleman of independent station, sailed from England in 1838, in his own yacht 'The Royalist,' to investigate the islands in the Eastern Archipelago. With a crew of about 20 men, he arrived at Singapore in June, and at the coast of Borneo in August. He found that the part of the island at which he touched was governed by a raja, who was engaged in the province of Sarawak in the suppression of pirates. Mr. Brooke sailed up the river to Kuching, the capital of Sarawak, and being kindly received he got leave to explore much of the country, and discovered the mineral riches which it contains. Mr. Brooke returned to Singapore in the spring of 1840, but made another voyage to Borneo in August of the same year. He assisted the raja in his wars, and was promised the government of Sarawak, and in September 1841 he was installed in due form 'Raja of Sarawak.' Mr. Brooke, who built himself a house at Sarawak, and established a sort of court there, exerted all his influence to suppress piracy on the coast. In July 1842 he made a formal state-visit to the sultan, at the capital of Borneo, to endeavour to establish friendly relations with England. In the early part of 1843 Mr. Brooke went to Singapore, and shortly afterwards returned in the Dido, commanded by Captain Keppel, who was commissioned to assist in suppressing piracy in those seas. In June a strong party, composed of Europeans and natives, set out from Sarawak into the interior, and put down a formidable nest of plundering tribes. Captain Keppel soon after left Borneo for China; but on his return in July 1844 another expedition was led against hostile inland tribes, which was as usual successful. Keppel returned to England; but Sir Edward Belcher assisted in the proceedings at Sarawak; and Mr. Brooke received the appointment of agent for the British government in Borneo, in which character he had two interviews with the sultan of Borneo in the city of Bruni, with a view to conclude a treaty of peace and commerce between the two countries. In the autumn of 1845 Mr. Brooke aided the government officers in fixing on some spot as the location for a colony or British settlement off the coast of Borneo. After a careful examination of the small islands of Labuan and Balam-bungan, Mr. Brooke fixed on the former as presenting the greatest advantages. In the spring of 1846 a serious reverse occurred. Some of the discontented chiefs induced the sultan to plot mischief against the English; two native rajahs who had from the first been favourable to Mr. Brooke were murdered, and a plan was formed to poison Mr. Brooke himself. But prompt measures were taken: a squadron was sent from Singapore, and the hostile proceedings were put down. In 1847 Mr. Brooke went to England, where he was knighted, and had his title of 'Raja' recognised by the British government. He returned to Borneo as Governor of Labuan, and agent or representative of England at Borneo. On the night of July 31, 1849, the raja with a fleet of Sarawak prahus, and assisted by her Majesty's ship *Royalist*, the East India Company's steamer *Nemesis*, and three boats of her Majesty's ship *Albatross*, attacked and annihilated a fleet of 150 Dyak and Malay prahus and bangkongs at the mouth of the Seribas River. The prahus were manned by from 30 to 70 men each, who were chiefly Dyaks of the Seribas and Sakarran, with a few Malay chiefs among them; about 800 are said to have been killed; many were drowned in their swamped prahus, and only 2500 are said to have escaped to the jungle. The raja's boats after this action ascended the river and destroyed the villages along the Seribas. This fearful chastisement was inflicted upon these people, according to Raja Brooke, because they were pirates, and head-money was paid to those concerned in the action; but there are not wanting those who stoutly maintain that they were 'inoffensive traders,' and that the expedition was undertaken by the raja from ambitious personal motives.

The researches of the last eight years have shown that Borneo, at least in the province of Sarawak, is one of the richest and most fertile countries of the globe. Among the minerals are diamonds, gold, antimony, tin, iron, copper, lead, and coal; while the soil is of such various kinds, that it will grow almost every variety of vegetable produce. [SARAWAK.]

The commercial intercourse of Borneo with China is much more extensive than with Europe. Edible swallows' nests, sea-slugs, aquilawoods, and camphor are exported to Canton, Amoy, Ningpo, and Shanghai. The Dutch carry on a most active commerce, exporting pepper, gold, and other products. The commercial intercourse of the west coast of Borneo, and more particularly of Borneo Proper and Sarawak with Singapore, has of late years become very considerable.

(Dr. Leyden, *Description of Borneo in the Asiatic Journal*; Crawford, *History of the Indian Archipelago*; *Asiatic Journal*; Stavorinus, *Voyages*; Captain Keppel, *Expedition to Borneo and Indian Archipelago*; Petermann, *Map of Borneo*, London, 1861.)

BORNEO (properly *Brunei*), the capital of the kingdom of Borneo Proper, in the north-west of the island of Borneo, is situated in 4° 56'

N. lat., 114° 44' E. long., on the left bank of the river Borneo or Cudayan, about ten miles from the sea, and is said to have a population of about 20,000. The mouth of the river is narrow, with a bar in front of it, on which however there is a considerable depth of water. Farther up the river has an average depth of six fathoms, and here the shipping lies, consisting of prahus and Chinese junks, which trade to Singapore and China. The town, which is on low ground, contains a considerable number of houses, built on piles four or five feet high, which at the rise of the tides allow the water freely to pass under them.

Borneo is a place of considerable trade. Its commerce was formerly carried on with China, the Philippines, and the Sooloo Islands, but since the foundation of Singapore the Bugis merchants of Borneo often visit that port. The exports are rice, black pepper, camphor, cinnamon, bees'-wax, sea-slugs, turtle-shell, pearls, and mother-of-pearl, with tea, wrought and raw silk, and nankeen, the three last articles being imported from China. At Singapore they take in exchange cottons and woollens, opium, iron, arms, and ammunition. Under the weak and oppressive government of the sultans of Brunei the town is said to have of late years decayed in importance, and numbers of the population are said to have removed to Labuan and Sarawak.

(*Asiatic Journal*.)

BORNHOLM, an island in the Baltic, belonging to Denmark, and attached to the province of Seeland, is situated about 90 miles E. from the island of Seeland (Sjælland), about 40 miles E. by S. from Ystad on the coast of Sweden, and about 50 miles N.E. from the island of Rügen. It is about 26 miles long by 12 miles wide, and including three islets to the north-eastward it contains an area of about 216 square miles, with a population of about 25,000, who are almost entirely of Danish extraction. Bornholm is a rocky and mountainous island; it is so walled in by precipitous cliffs and dangerous reefs that at certain seasons of the year the approach to it is extremely hazardous. A high range, called Almindingen, which stretches across Bornholm from north to south, contains the Rytterknecht, the most elevated point in the island, about 500 feet in height. The Almindingen is intersected by fertile valleys skirted with underwoods of oak. There is also a spacious moor, 'the Lyngmark,' in the interior, on which nothing will grow but low juniper and other wild shrubs, with some coarse grass; the inhabitants however use it as common pasture ground. The remainder of the island has a stony soil, partially intermingled with tracts of deep loam, and on three spots with drifting sand. Bornholm is watered by a number of rivulets, possesses some excellent springs, and has several sheets of water. Every spot is diligently cultivated. The climate is cold, but dry and healthy. Timber is scarce. The agricultural products are oats, rye, barley, peas, and some flax, hemp, hops, and potatoes. The live stock are small, but of good quality; their numbers are estimated at 9000 horses, 20,000 oxen and cows, and 25,000 sheep. Bees are everywhere reared; poultry, particularly ducks and geese, is abundant, and marine fowl are plentiful, but game is scanty. The coast abounds with fish, mostly salmon, haddocks, and small-sized herrings. Coal is raised for domestic use; quarries of sandstone and millstones are worked; marble, slate, and potter's-earth are found. The manufactures include woollens, pottery, bricks, tiles, and clocks and watches. The farmers are in general well to do; they are the owners of the lands they cultivate. The lands descend to the youngest son; but on the failure of male issue the eldest daughter, not the youngest, inherits them. The Bornholmers pay only half the taxes imposed on their fellow-subjects, but provide for the defence of the island out of their own resources. Rønne, in the south-west of the island, is the capital. It is a thriving place, with a small fortified harbour, from which steamers ply regularly to Copenhagen, calling at Ystad on the south coast of Sweden. The population exceeds 4000: they are chiefly occupied in the fisheries, in the manufacture of woollens and tobacco, and in trading.

The other towns are Nexø, on the south-east coast, which possesses a good harbour and about 1700 inhabitants; Aakirkeby, in the interior, which has a handsome black marble church, the finest in Bornholm, and about 600 inhabitants; Hasle, on the west coast, with an indifferent harbour and about 700 inhabitants; Svanke, on the east coast, population about 900; and Sandvig, on the north-east point of the island, with about 200 inhabitants. The three small islands or rocks of Christiansøe, Fredericks-holm, and Griesholmen, are about 17 miles E. from the north point of Bornholm. Christiansøe and Fredericks-holm are inhabited and fortified, and on Christiansøe there is a lighthouse. The fisheries and the taking of the sea-fowl are very productive.

BORNOU, a kingdom situated nearly in the centre of North Africa, between 10° and 16° N. lat., 12° and 16° E. long. It is bounded N. by the Sahara and the kingdom of Kanem, which extends along the north shore of Lake Tchad; E. by Lake Tchad and the river Shary; S. by the mountainous country of Mandara; and W. by the Felatah kingdom of Houssa.

The surface is level, with only a few very gentle ascents and descents. The eastern parts along Lake Tchad are inundated in the rainy season, when the inhabitants are compelled to retreat farther to the west. But even the remainder of the country is partially subject

to inundations, the slow rivers and rivulets which intersect the country being unable to carry off the immense supply of water during the rainy season; and thus extensive tracts which skirt their banks on both sides are covered with water, and remain inundated generally for three months. The rivers have generally a short course; they fall either into Lake Tchad or into the Shary or the Yeou. The Shary has its source in the Mandara Mountains, and seems to form the boundary between Bornou and Bagharni for nearly the whole length of its course in the plains. Towards its mouth it divides into many branches and forms numerous deltoid islands; those which lie nearest to the mouths of these branches are complete swamps, and unfit for agriculture even during the dry season. The Yeou River rises in the hilly country of Houssa, near 10° E. long., where it is called Shoolum, and after having traversed in the first half of its course a country mostly covered with low rocky hills, it runs for the remainder of its course, which in general is in an eastern direction, through the extensive plain of Bornou to Lake Tchad.

The heat of Bornou is very great, but not uniform. The hottest season is from March to May, when there is no rain, and the thermometer sometimes rises to 105° and 107° at two o'clock in the afternoon. The prevailing southerly winds at this season are suffocating and scorching. In the night the thermometer sometimes falls to 86° and 88°. This hot season is followed by violent thunder and lightning, and rain sets in towards the middle of May. At the end of June the inundations of the rivers and lakes begin. In October the rains become less frequent, the air is milder and more fresh, and the weather serene; breezes blow from the north-west, with a clearer atmosphere. Towards the end of December and in the beginning of January the thermometer never rises above 75°, and in the morning it falls to 58°.

The only implement of agriculture is an ill-shaped hoe, made from the iron found in the Mandara Mountains. All the labours of the field devolve almost entirely on women. The most valuable products are maize, millet, sesua, some rice, a little wheat and barley, together with cotton and indigo, of which the two last grow wild close to Lake Tchad and in the overflowed grounds. The indigo is of a superior quality, and the dark-blue colour of their robes, or large shirts (the only dress the people wear) is probably not excelled in any part of the world. Bornou is almost entirely destitute of fruit-trees. Mangoes are only found in the southern districts near Mandara, and date-trees only to the north of Woodie, at the north-western angle of Lake Tchad.

The wealth of the inhabitants principally consists of slaves, bullocks, and horses. Black cattle are most numerous. The Shoussa, who are of Arabic descent, and the ruling tribe on the shores of Lake Tchad, breed also many horses, and send to Soudan annually from 2000 to 3000. The other domestic animals are dogs, sheep, and goats; the common fowl. Bees and locusts are numerous; the latter are eaten by the natives. The beasts of burden are the bullock and the ass. There is a very fine breed of asses in the Mandara valleys. Camels are only used by foreigners or persons of rank.

The lion, the panther, a species of tiger-cat, the leopard, the lynx, the jackal, the civet-cat, the fox, and several species of monkeys, black, gray, and brown, are found in Bornou. Elephants are so numerous near Lake Tchad that herds of from fifty to two hundred are sometimes seen: they are hunted for the ivory as well as for their flesh. Other wild animals whose flesh is eaten are the buffalo, the crocodile, and the hippopotamus. The flesh of the crocodile is extremely fine: "it has a green firm fat, resembling the turtle; and the calipee has the colour, firmness, and flavour of the finest veal." (Denham.) The giraffe is found in the woods and marshy grounds near Lake Tchad; there are also antelopes, gazelles, hares, and an animal called kooriguin, of the size of a red deer, with annulated horns.

Partridges, grouse, wild ducks, and geese, snipes, ostriches, pelicans, spoon-bills, and the crane species abound. Guinea-fowl abound in the woods. Reptiles, especially scorpions, centipedes, large toads, and serpents of several kinds are very common.

Iron is found in the Mandara Mountains, and imported into Bornou, but in no great quantity. The best comes from Soudan, mostly worked up into good pots and kettles.

The inhabitants speak ten different dialects of Arabic. The Shoussa, who inhabit the borders of Lake Tchad, are Boduina, and have preserved the Arabic nearly pure. They are the best troops of Bornou, and it is said that this country can muster 15,000 Shoussa. The aborigines of Bornou, who call themselves Kanowry, have large unmeaning faces, with flat negro noses and mouths of great dimensions, with good teeth and large foreheads. Their dress consists of one, two, or three robes, according to the means of the wearer. Persons of rank wear a cap of dark-blue, but common people go bare-headed, and take care to keep the head constantly free from hair. They are Mohammedans, and less tolerant than the Arabs. They tattoo their bodies like the other negro nations of these latitudes.

The principal towns or cities are thirteen, among which the most important are Kouka, Angornon, the residence of the sheikh, and Birnie, the residence of the sultan. These are all situated at a little distance from each other and from the west shore of Lake Tchad, between 12° 30' and 13° N. lat. Other towns are Old Birni, higher

up the Yoon, and Digou and Affagay, on the route to the Mandara country.

The country is governed nominally by an absolute sultan, but the whole power is in the hands of the Arab sheikh, whose soldiers are well disciplined and armed, and he can if necessary collect an army of 20,000 men.

The commerce of this country is not great, but there is a considerable transit-trade across Barren between Soudan and the Moors of Tripoli. The Moors bring different sorts of cotton and silk, a few woollen cloths, and various utensils of metal: they receive in exchange slaves, ostrich-skins, elephants' teeth, and raw hides. Strips of cotton, about three inches wide and a yard in length, are called gubbuck, and used as small coins in the retail trade; three, four, or five of these, according to their texture, go to a rottala, and ten rottalas are equal to a dollar. (Denham.)

BORODINO. [Moscow, Government of.]

BOROUGHBRIDGE, West Riding of Yorkshire, a market-town and borough in the parish of Aldborough and lower division of the wapentake of Claro, is situated on the right bank of the Ure, in 54° 6' N. lat., 1° 24' W. long., 17 miles N.W. from York, 20½ miles N. by W. from London by rail, and 21½ miles by the Great Northern railway. The population of the township of Boroughbridge in 1851 was 1095. The living is a perpetual curacy, held with that of Dunsforth in the same parish, in the archdeaconry of Richmond and diocese of Ripon.

Boroughbridge owes its origin to the circumstance of the line of the Great North road having been diverted from Aldborough, through which it had previously passed, and carried over the river Ure by a bridge which was constructed at the spot where Boroughbridge now stands. After this Aldborough declined, while Boroughbridge gradually rose; the remains of old buildings in Aldborough supplying the materials for many of the new erections in the rival town. For about three centuries Boroughbridge sent two members to Parliament, but it was disfranchised by the Reform Act of 1832. In 1321 Edward II. defeated the Earl of Lancaster and the confederate barons in a battle fought at this place; the earl and other noblemen were taken prisoners, and afterwards executed. Many British and Roman coins and other antiquities have been found in the parish. In 1831 a beautiful tessellated pavement was discovered. The most striking remains are the Arrows [ALDBOROUGH], which are at a short distance to the west of the town.

Besides the chapel of ease there are places of worship for Wesleyan Methodists and Independents. There are a National school, an Infant school, a subscription library, and a news-room. The chief business in Boroughbridge is the shipment of agricultural produce. The Ure is navigable as high as Ripon, six miles above Boroughbridge, for small craft, and several warehouses connected with its commerce stand on the right bank of the river. Boroughbridge communicates with Selby and Hull by the Ure and the Ouse; with Leeds, Wakefield, and the manufacturing districts by the Ure, the Ouse, and the Aire and Calder navigation. The houses in the town are neat and well built. In the market place there is a fluted Doric column. The market-day is Saturday: several fairs are held in the course of the year; one in June, for hardware, has now become of little importance; the other fairs are chiefly for cattle.

BOSJESMANS (literally 'Bushmen'), is the name which the Dutch colonists at the Cape of Good Hope have given to a wild and roaming race of people who live about the northern skirts of the colony and as far as the Orange River, without any settled habitations, and who do not rear cattle or constitute tribes like the Hottentots. The Bosjesmans are a branch of the Hottentot race which separated from the rest long before the establishment of Europeans in Southern Africa, and took to a wandering life in the northern and more inland parts of the country. Their language appears to bear some analogy to that of the Hottentots, although the Bosjesmans and the Hottentots do not understand each other. They have both the same clacking sound of the tongue, only the Bosjesmans have it stronger and more frequent, and they draw out more the ends of their sentences. They have the universally distinguishing features of the Hottentots—the same broad flat nose, long prominent cheek-bones, and yellow-brown hue of the skin; and their physiognomy has a similar expression to that of the Hottentots, only more wild and animated, owing to their insecure and wandering habits of life. They are neither husbandmen nor shepherds; they have no cattle or flocks, but kill wild animals with their arrows, catch fish, and also feed on locusts, snakes, ants' eggs, and insects, and upon roots and berries. They are capable of bearing hunger for a long time, and like other savages they eat voraciously when they fall in with plenty. The Bosjesmans are generally very lean and of a low stature, as if stunted in their growth. A sheep-skin fastened round the neck with the woolly part inside, a

greasy leather-cap on the head, with their woolly hair secured with grease and dust and tied in a number of knots hanging down, a jackal-skin fastened with a leather thong round the middle of the body, sandals of ox-leather bound round the feet, a bow and quiver with poisoned arrows, a gourd or broken ostrich-egg to fetch water, and two or three straw mats, which being placed on sticks form a sort of tent,—these constitute all their apparel, furniture, and utensils. They catch sea-cows in pits on the banks of the Orange River. They sleep in caves, or more commonly squat among the bushes, from whence their name. They do not associate in any considerable numbers, but wander about in small parties consisting of individuals of one family, or such as meet by chance. The advance of civilisation on all sides of them has had some effect upon the Bushmen, and many of them are now employed by the colonists of South Africa as guides or domestic servants, in which capacities they are said to behave well and faithfully. A small number of them are said to live in settled habitations on the north of the Orange River. Some of the Bushmen have been brought to profess Christianity.

BOSMERE and **CLAYDON**, a hundred in the county of Suffolk, which has been constituted a Poor-Law Union. Bosmere and Claydon hundred is bounded N. by the hundred of Hartismere, N.E. by that of Thredling, E. by the hundred of Carlford, S.E. by the liberty of Ipswich, S. by the hundred of Sandford, W. by that of Colford, and N.W. by that of Stow. The Poor-Law Union of Bosmere is not exactly co-extensive with the hundred; it contains 59 parishes and townships, with an area of 54,108 acres, and a population in 1851 of 16,351. The Union workhouse is situated in the parish of Barkham, four miles from Ipswich; it has accommodation for 500 inmates.

BOSNA-SERAJ, or **SERAJEVO**, the largest town in the province of Bosnia in European Turkey, is situated partly in a plain and partly on the slopes of hills, 135 miles S.W. from Belgrade and 31 miles S.E. from Travnik. The population is estimated variously, some placing it at 40,000 and others at 60,000. The town stands on the left bank, a feeder of the Bosna. The old walls which encircled it were destroyed and it is now an open place; it is defended however by a citadel of considerable strength, upon the ramparts of which eighty cannon are mounted. This citadel is situated some distance to the east of the town, and is usually occupied by a numerous garrison. Bosna-Sera contains 100 mosques, among which that of Chamschah with its clock is a great relic in Turkish town; it also deserves mention as a palace, erected by the Sultan Mahmud II. four Christian churches, three monasteries of the Monastic order, a number of madrasahs or schools, baths, and charitable institutions; two of the largest, second market-places, and between 14,000 and 15,000 houses, mostly built of wood, with latticed windows. The town, which covers a large surface, is handsomely built, and has a gay and elegant appearance in the number of minarets and steeples which climb high into the air. It was formerly the residence of the governors of the province; but the late Pasha committed by one of them drove the inhabitants to revolt, and he was obliged to flee to Travnik, where his successors have since continued to reside. [BOSNIA.] The manufactures of the town are carpets, silks, copper utensils, iron ware, wood and worsted stuffs, more especially cotton, &c.; there are also several factories in the town. Bosna-Sera, being the staple mart for the whole province, is a place of considerable trade. Upon the proclamation of the Hatt-i Sherif of Gul Hamid, which constitutes the Tanzimat, or reformed constitution of Turkey, the Sipahis of Bosna expected by the local regulations of the new system drove from the town the representatives of the old, who resided in Travnik, and broke out into open rebellion in defence of their feudal privileges. Upon this the vizir Vukub Pasha collected a force of 1000 regular soldiers, and defeated the rebellious Sipahis and sipahis, who were 20,000 strong, at the town of Vitez. The defeated sipahis shut themselves up in Bosna-Sera, which was blockaded by the vizir and forced to capitulate.

BOSNIA, properly *Bosna*, the most north-western capital province of Turkey in Europe, extends between 42° 40' and 45° 20' N. lat., 15° 30' and 19° 30' E. long. It is bounded N. by the Austrian Crownlands of Croatia and Slavonia, from which it is divided by the Sava and the Unna, except at the extreme north-west of the province, which is formed by a mountainous projection 30 miles long and 15 miles wide, extending northward from the Unna to the Upper Krupa and the source of the Petrinia. The province is bounded E. by Servia, from which it is divided for a long way by the Drina; S. by Albania, Montenegro, and Austrian Dalmatia; and W. by Austrian Dalmatia and Croatia. The form of the province is that of an irregular quadrilateral; the western side of which, from the Gulf of Cattaro to the most north-western point of Turkey, in the basin of the Krupa, is 230 miles in length; the eastern side measures about 150 miles; the northern side, along the Sava and the Unna, is 170 miles long; and the southern side, which is very irregular, measures in a straight line from the Har to the Gulf of Cattaro about 120 miles. The central part of the province, from the point where the Drina approaches 41° N. lat. to the southern extremity of the Pealoh Mountains on the western boundary, is only 108 miles broad. The area is about 24,000 square miles, and the population, according to the census or estimate of the Turkish government in 1844, was 1,400,000. The province touched the Adriatic at two points—namely, at the narrow

territory of Klek, behind the peninsula of Sabioncello, and at the opening of the narrow valley of the Sutiorina into the Bay of Cattaro, near the Austrian town of Castel-NUOVO; but the sovereignty of Turkey over these territories has been always disputed by Austria, and it was ceded to the latter power in 1853.

The province is very mountainous. The Dinaric Alps enter it on the west at the sources of the Una in Mount Sabor, and running from north-west to south-east, through the length of the province, and nearly parallel to the Adriatic, from which they are from 50 to 60 miles distant, form the watershed between that sea and the Save. Numerous offshoots from the main range divide the surface into a great number of secondary valleys and basins, generally of small extent, with the exception of the plain of Livno, which lies between the main range and the Prologh Mountains on the south-western border. On the southern border the offshoot called the Plessiori Mountains separates Bosnia from Montenegro, while the crest of the Dinaric Alps, farther east, forms the dividing line on the side of Albania. The northern slope of the Dinaric Alps is still more rugged than the southern; it is also furrowed into a far greater number of glens and valleys; and there is little level ground of any considerable extent, except in a few places along the lower courses of the rivers and on the right bank of the Save. The streams too are very numerous on the northern slope, and the mountains in general are covered with magnificent forests and rich pastures, so that there are few countries of Europe which can vie with Bosnia Proper in beautiful natural scenery. But on the Adriatic slope the mountains are in most parts bare and rocky; the vegetation is checked in winter and spring by impetuous winds, and in summer by a scorching sun, the effect of which is but slightly alleviated by heavy dews, and with the exception of the Neretva and the Bistritza the rivers are all small, and many of them disappear either partially or totally from view in their course through a calcareous soil.

The principal rivers of the province are the Drin, or Drina, the Bosna (which gives name to the eyalet) the Vrbitzza, and the Una, all feeders of the Save; and the Neretva, which carries off the drainage of the Adriatic slope.

The *Drina* rises in the Dinaric Alps near 43° N. lat., and runs northward between the districts of Jeni-Bazar and Travnik to near 44° N. lat., whence to its mouth in the Save, about 30 miles below Zvornik (the chief town on its left bank), it separates Bosnia from Serbia. It receives numerous feeders on both banks, and in its lower course is a deep and rapid river; in its sands particles of gold are found. The whole course of the Drina is about 180 miles in length, and it runs generally between high hills and mountains, with the exception of about ten miles above its mouth, where it skirts the plain of Orlovac. At the mouth of the Drina is the quarantine station of Raesa, on the Serbian side of the river; and on the Austrian shore of the Sava is a fortress also called Raesa.

The *Bosna*, from which the eyalet is named, is formed by several small streams that issue from Mount Ivan, a summit of the Dinaric Alps, to the south of the city of Bosna-Sera. It also runs or rather rushes northward, and for more than two-thirds of its course between parallel lines of hills "feathered with trees to their summits." It is crossed by a bridge at Zenitza, elsewhere by ferries or caïcs. On emerging from the hilly region the Bosna traverses a plain in many parts marshy and boggy, and enters the Save after a course of about 100 miles. The Bosna and the Drina are navigable some way above their mouths by heavy barges, and timber is floated down them to the Save.

The *Vrbitzza*, *Verbaet*, or *Verbas*, rises in Mount Vranja, on the northern slope of the Dinaric Alps to the south of Travnik, and near 44° N. lat. Its course is nearly parallel to those of the Drina and the Bosna, and forms the dividing line between the sanjaks of Travnik and Banjaluka to its mouth in the Save, below Gradiska, and about 50 miles W. from the mouth of the Bosna. It is a shallow stream. Its valley is fertile, well cultivated, and abounding in orchards.

The *Una* rises in Mount Sabor, which lies a little east of Mount Dinara (5500 feet), the culminating point of the Dinaric Alps; it runs first to the north-west as far as Bilacz, where it sweeps round to the north-north-east, and at Novi, where it is joined by the Sanna, it reaches the frontier of Austria, along which it runs to its junction with the Save, about 35 miles west of Gradiska. The Una is said to be from 200 to 400 feet wide, and 6 or 7 feet deep, but is not navigable. From the mouth of the Una the Save runs for 120 miles along the north of the province, and in a direction of east by south. Along its course are magnificent forests and in parts swamps, which are caused by the frequent inundations of the river. The Save is navigated by Austrian steamboats. The valley of the Save is infested in summer and autumn by mosquitoes of large size.

Besides the rivers just named the Western Morava and its feeder the *Ibar* rise in the south-eastern part of the province, the former in Mount Telemenen and the latter near the junction of the Dinaric Alps with the Balkan, in Mount Scardus, now the Tchar-Dagh, to the north of Perserin in Albania. The *Ibar* flows north-east, and on emerging from the Albania separates the Serbian sanjak of Krukhovatz from the Bosnian sanjak of Jeni-Bazar to its mouth in the Western Morava. It is a shallow stream, fordable everywhere except during the floods of winter and spring. The principal feeder of the *Ibar* is the *Raozka*, which passes the town of Jeni-Bazar.

The *Morava* at first also has a northern course for a few miles below

its source; but soon entering Serbia it turns eastward as far as Krukhovatz, where, being joined by the Eastern Morava, the united stream flows northward through the centre of Serbia on its way to join the Danube.

The *Neretva* rises near 43° N. lat., and flows in a longitudinal valley between two parallel ranges of the Dinaric Alps, and in a north-west direction to Ostrochatz (near 43° 50'), and then abruptly turning southward it passes Mostar, where it is spanned by an ancient bridge. Below Mostar the river bends rapidly to the south-west, and breaking through the Prologh Mountains crosses Austrian Dalmatia and enters the Adriatic by the channel of Neretva, behind the peninsula of Sabioncello. The valley of the Neretva is very fertile, but in many parts marshy and extremely unhealthy.

Bosnia has no lakes of any importance, the largest being the Mostarska Blato, west of Mostar. It contains a number of mineral springs, among which the baths of Novibazar and Budimir, and the acidulous waters of Lepenizza or Kiseljat, are most in repute.

Climate, Soil, and Products.—The climate is on the whole temperate. Winter however commences early and a great deal of snow falls, which lies on the lowlands for many weeks. In summer the heat is moderated by occasional heavy falls of rain. Wheat is harvested in July, and grapes are ripe in August. The air is generally healthy at all seasons except in the lowlands along the Save, the Bosna, and the Neretva, where marsh fevers prevail in autumn and summer. The dry mipping Borra, or north-east, is prevalent on the Adriatic slope especially.

The soil of Bosnia is in general of a rocky and stony nature, adapted rather for rearing cattle than raising grain; some parts of it however, particularly the plains and valleys near the rivers, are very productive. The level lands (where there are any) and the lower slopes along the rivers, especially in the valley of the Bosna, are very fertile, and in general well cultivated. In the basin of the Bosna the wheel-plough is used drawn by six oxen. Wheat, barley, maize, and rye are the chief corn crops. Peas, beans, flax, and tobacco are cultivated. Fruit is very abundant; the chestnut and mulberry are common. From the plum a species of brandy is made, and a luscious liquor, termed *pekmez*, is extracted from the pear. The wines are strong and fiery, but owing to ignorance of the art of making them, they will not keep; the best are made in the environs of Mostar and Jeni-Bazar.

The highlands and mountains of Bosnia are so densely covered with forests as in many parts to form impenetrable wildernesses; the trees of which they are principally composed are the oak, beech, pine, fir, larch, and lime. The timber-trees are of the most magnificent growth, and if there were means of transit Bosnia could furnish ship-building timber for all the navies of Europe; as it is, large quantities are floated down the Drina, the Save, and the Danube.

The Bosnian woods abound in wild animals—deer, boars, bears, wolves, lynxes, and foxes; and hunting is a favourite occupation. The breed of horses is strong and hardy; they are also admired for their beauty, but in most breeds the head is considered to be proportionally too large. Large herds of fine cattle are kept, and bullocks form a considerable article of Bosnian export. Buffaloes are fed in the sanjak of Jeni-Bazar. Many of the sheep have upright winding horns, and coarse knotted wool, and are of large size. Goats are common; swine are fed in vast numbers, and poultry is abundant everywhere. The rivers abound with fish. Much honey is made. Game is plentiful, and hawking a favourite sport.

The province of Bosnia abounds with minerals, but the Turks have not allowed the development of this source of wealth. Gold, silver, iron, quicksilver, lead, coal, and salt are found at various points. The mountains round Bosna-Sera contain gold and silver; and in a forest near Travnik, the excavations of the celebrated gold mine of Hutnizza (literally signifying gold in the Bosnian tongue) are still able. There are silver mines near Srebreniza on the Drina, Kruppa on the Una, and Kamengrad within a short distance of the Verbas. Iron-mines are worked in the vicinity of Bosna-Sera by gipsies, who have a number of smithies, in which horse-shoes, nails, locks, iron-plates, and other wares are manufactured; some iron is also raised at Vukup, Stari Muidan, Kamengrad, and a few other points. A lead mine is worked in the neighbourhood of Zvornik. There are fine quarries of freestone and mill-stones, alabaster, and marble. The most remarkable of the salt springs are at Upper and Lower Tuzla in the valley of the Spressa, a feeder of the Bosna. The water is drawn from the wells, which are 50 feet deep, by means of a windlass and buckets and then boiled in small flat cauldrons.

Bosnia possesses some inconsiderable manufactures of leather and coarse woollen stuffs. Cannon-balls are manufactured at Kamengrad, and powder at Bilacz, Ostrovacz, and Banjaluka; fire-arms, swords, and small ware at Bosna-Sera, Banjaluka, and Mostar. In Mostar Damascus blades also are made.

The exports of Bosnia comprise wool, honey, and wax, goats' hair, hides, morocco and other leather, timber and articles made of wood, worsted coverlids, soldiers' cloaks, horses, horned cattle, sheep, goats, swine, poultry, mineral water, pitch, and other domestic produce. The imports consist of linens, woollens, silks, cotton goods, glass-ware, flax, steel-ware, paper, tin, lead, copper, and iron-ware, quicksilver, drugs, indigo, colonial produce, &c. The principal seats of trade are Bosna-Sera, Zvornik, Banjaluka, Mostar, and Borbir or Turkish

Gradiska. The roads are bad and almost impassable except for horses, as is the case throughout the Turkish territories. The principal and best road is that from Brod through Travnik, and thence to Bosna-Seraï and Constantinople.

The inhabitants of Bosnia are composed of Bosniaks, Serbs, Croats, Morlacks and Montenegrins (principally situated in the sanjak of Herzek), Turks, who are settled in almost every town, and likewise people exclusively the district of Klinec in the valley of the Sanna, Armenians, a few Greeks, and lastly, Jews. About half of the population, including a large number of the Bosniaks and all the Turks are Mohammedans. The rest of the population is pretty equally divided into Catholics and followers of the Greek Church, the former slightly predominating. The number of Jews and Armenians is small.

The civil administration of Bosnia is on the same footing as that of the other eyulets of the Turkish dominions. It is governed by a Vizir, who resides at Serajevo, to whom the governors of the six sanjaks are subordinate. [TRAVNIK.]

Divisions and Towns.—The Eyalet of Bosnia includes, 1. *Turkish Croatia* which lies between the Verbitza and the Una and forms the sanjak of Banjaluka. 2. *Bosnia Proper*, which comprises the territory between the Verbitza and the Drina, the Save and the crest of the Dinaric Alps, and is divided into three sanjaks: Travnik, Sečernik, and Zvornik. 3. *Herzegovina or Herzek*, which lies to the south of the two preceding, and is sometimes called Turkish Dalmatia. 4. *Jeni-Bazar or Novi-Bazar*, which was taken from Serbia in 1815, and now forms a sanjak of Bosnia. The sanjak of Jeni-Bazar was formerly called *Racsa* it is said from the *Racsa* or *Raczka*, a feeder of the Har.

1. In Turkish Croatia, also called *Krajina*, the chief town is *Banjaluka*, which is situated on the left bank of the Verbitza, 33 miles above its mouth in the Save, 45 miles N.W. from Travnik, and has about 8000 inhabitants. The town contains 40 mosques, several colleges, two baths, a large gunpowder manufactory, and several bazars. It is defended by a strong citadel. *Bihacz*, 60 miles W. from Banjaluka, on an island in the Una, is a small town of about 2000 inhabitants but of great importance for its fortifications and its position close to the Austrian frontier. Another fortress of great importance is *Govaliska* or *Rebir*, which is situated on the right bank of the Save, opposite to the Austrian fortress of Alt-Gradiska, 30 miles N. from Banjaluka. The fortifications consist of ramparts and a citadel. About 23 miles W. from Gradiska stands the fortified town of *Dubicza* or *Doubitza* commanding the passage of the Una. The town was taken, after a long resistance, by the Austrians in 1758; population, 6000. *Jaicza*, a walled town defended by a citadel, situated on the left bank of the Verbitza, and near its confluence with the Pliva, is a small town of about 3000 inhabitants. This was formerly an important place. A large quantity of saltpetre is manufactured. The town was taken after a strong resistance by Omer Pasha from the Bosnian insurgents in the spring of 1851.

2. In Bosnia Proper the chief towns are BOSNA-SERAÏ; TRAVNIK, population about 10,000, exclusive of the garrison which sometimes numbers 8000 men; *Sečernik*, a small place 68 miles N.E. from Travnik, situated among hills which contain rich silver-mines; and *Zvornik* or *Izvorik*, which is built on a narrow strip of land on the left bank of the Drina, 55 miles N.E. from Bosna-Seraï, and has about 6000 inhabitants. This town is walled and further defended by a fortress situated on a steep hill above the town: it contains several mosques, Catholic and Greek churches, and carries on a considerable commerce with Belgrade. Some of the houses are large and surrounded by gardens. Large quantities of timber and fire-wood are floated down the Drina, the Save, and the Danube from Zvornik. There are silver-lead mines in the neighbourhood.

The towns just enumerated (with the exception of Bosna-Seraï) give names to the sanjaks into which Bosnia Proper is divided.

Among the other towns we notice the following:—*Bielina*, 20 miles N. from Zvornik, in the plain of Orlovopolje, in the north-east of the province, is a town of about 8000 inhabitants, the majority of whom are Turks. The houses are almost all built of wood. There are however a few good mansions, several mosques, and a large khan. To the west of the town lies a very hilly well-wooded country. *Brod*, a fortress on the right bank of the Save, facing an Austrian town and fort of the same name in the military frontier. There is some trade between the two places in raw hides, wool, cotton, &c. *Upper and Lower Tuzla*, two adjacent towns, famous for their salt-springs, are situated near the Spreva, a small tributary of the Bosna, 53 miles N.E. from Travnik. Lower Tuzla is the larger, and has a population estimated at 8000. It is surrounded by old walls and a ditch. On a rising ground in the centre of the town is an old castle, now dismantled, which commands a fine view of the town and the wooded hills that inclose it. The town itself consists of an assemblage of dark wooden houses, relieved only by an old konak or palace, or by the white and slender minarets of the mosques. The insurrection of the Bosniak Turks in defence of their feudal privileges, which were invaded by the introduction of the Tanzimat, commenced at Tuzla in October 1850, by the insurgents seizing the arms and ammunition in the castle to be used against the sultan's troops. The country west of Tuzla is occupied by the high Tavornik range, which extends to the Bosna. Tuzla gives title to a Greek bishop. *Vrandak*, a small town of 2000 inhabitants, is important as commanding the valley of

the Bosna, and a defile to which it gives name in the mountains westward. It is defended by an old castle, which crowns a rocky promontory 300 feet above the river. In the late insurrection of the Mohammedan Bosniaks against the sultan, Omer Pasha fought two sharp actions with the insurgents near Vrandak.

3. In the sanjak of Herzegovina, or Herzek, the chief town is *Mostar*, which is situated on the Nerenta, in 43° 22' N. lat., 17° 58' E. long., and has about 9000 inhabitants. It stands on both banks of the river, which are united by a stone bridge of a single arch. The houses are built of stone and roofed with slate. The town is inclosed by battlemented walls. It is famous for the manufacture of sword-blades and other warlike weapons. Cattle, hides, corn, wool, fruit, wax, and wine are the principal items in the trade of the town, which is considerable. *Perbigne*, 45 miles S. by E. from Mostar, is a small town, defended by a square court flanked by four towers. It gives title to a Catholic bishop. *Liano*, or *Illiano*, a town of 4000 inhabitants, 50 miles N.W. from Mostar, is situated at the base of Mount Liulaska, and on the eastern side of a ravine, in the bottom of which the Bilitza a feeder of the Nerenta flows. On the north-east of the town is a series of heights which join the plateau of Kenjria, which lies on the south side of Mount Cernagora, and forms the most southern part of Turkish Croatia. Liano is defended by a wall flanked with towers, and also by a castle. The Bilitza is spanned at Lulano by a stone bridge of five arches, over which the road to the Austrian provinces is carried. The plain of Lulano, lying between the Predjeh Mountains on the south-west and the main ridge of the Dinaric Alps on the other, is about 30 miles long and 8 miles wide; it is well watered by the Bilitza and some other streams, which are subject to considerable floods in winter and spring. The plain produces abundantly corn and pasture; the olive is cultivated; other fruits are scarce; horned cattle and horses are common.

4. In the sanjak of Jeni-Bazar the chief town is *Jeni-Bazar*, or *Novi-Bazar*, which is situated on the Racsa, a feeder of the Har, 120 miles S.E. from Bosna-Seraï, and has about 5000 inhabitants, many of whom are descendants of a colony from Russia. The town, which generally speaking is a filthy collection of hovels constructed with timber and mud, is commanded by a castle situated on a hill in the centre. The mosques, 17 in number, and the shops in the bazar, are the only objects worth naming besides the castle. An important market for various wares is held here, the situation being central between Albania, Serbia, Rascia, and Montenegro. The neighbourhood of Jeni-Bazar is fertile and well cultivated. The Racsa and its feeders drive several mills. In the wars between the Serbs and Turks Jeni-Bazar was burnt by the former. The only other place worth mentioning in the sanjak is *Wischegrad*, on the Drina, which has about 8000 inhabitants, and is defended by a strong castle.

The eastern boundary of the sanjak of Jeni-Bazar runs along the Har to its mouth in the Morava; thence south-west for several miles along the crest of the Brusnik Mountains; it then sweeps round to north-west across the Stalibor Mountains and the river Morava, to the west of which it follows the Stelatz Mountains to near 44° N. lat., where it strikes the Drina.

The towns of Bosnia and of some other parts of Turkey are built round some commanding point which is occupied by a kind of fortress and generally by the houses of the Turkish part of the population; this central part of the town, corresponding to the Greek *acropolis*, is called in Turkish '*Kale*' in Slavonian; in L. These round the *Kale* is built the trading part of the town, inhabited chiefly by Christians and Jews, and distinguished in Slavonian by the name of '*Vrandak*' in Turkish '*Bazar*.' This part of the town is generally inclosed by walls and gates, which are shut at night. Outside these walls is the '*palanka*,' or suburb, inhabited by the lowest orders, including the gipsies. The suburb is surrounded by a ditch and palisade. Some of the towns however have only two, some only one of these divisions, and they are then distinguished by the corresponding name. Outside and completely surrounding the town a considerable space is occupied by the cemetery.

The Bosnian villages, which are inhabited mostly by Slavonian Christians and in many instances by people of the same kin and name, are self-governing. They elect a *Staroshin*, or head, who treats with the administrative and fiscal officers of the sultan, directs the agricultural operations of the community, receives the contributions (levied on each head of a family in proportion to his income) for the purpose of paying the taxes imposed on the village, and decides petty differences among the peasantry. The *Staroshin* is assisted by an elected council, and if his conduct is not approved of he is deposed. In towns also the artisans form guilds, are governed by laws of their own devent, and obey a *Starost*, or elected chief, who is responsible for the guild to the authorities. In Bosna-Seraï the *Starosts* of the artisans and the *Staroshins* of the agricultural part of the population formerly possessed great privileges, the most singular of which was the right to force the vizir of the province never to remain more than three days within their walls, and the privilege of complaining to the vizir against the vizir to the corps of Janizaries at Constantinople. In the new system of administration most of their immunities have been swept away, but the form still remains, and the respective officers of the population still elect and obey their *Starosts* and *Staroshins*.

Historical Sketch.—Bosnia was included in richat Pannonia. The

Bosniaks, who are mentioned in Byzantine history under the name of Botsinaki, were the first of the Slavish tribes that settled in the Eastern empire. They were governed by petty chiefs, frequently at war with one another. In the middle ages the country was tributary sometimes to Hungary, and sometimes to Serbia, until Twarkto, Ban of Bosnia, a brother-in-law of Louis, king of Hungary, was proclaimed in 1376 king of Bosnia, Raecia, and Pomoria. He was defeated in 1389 by the Turks at the battle of Kosovo, and soon after became a vassal of the sultan, with whose territory Bosnia was finally incorporated in 1463, ten years after the capture of Constantinople. The Bosniak nobles, in order to retain their seigniorial rights and feudal privileges, renounced Christianity for the Koran, and some of the peasants followed their example. To the difference created by the feudal system between the lord and his vassals was now superadded that caused by difference of religion, which was greatly embittered by the fanatical intolerance of renegades and their descendants. In no other part of the Turkish empire was there such a wide chasm between the two classes of the population; and the history of Bosnia for now nearly four centuries presents a long continued oppression of the Christian rayas. The government of the late sultan Mahmud, desirous to extirpate the feudal system—the only obstacle to the amalgamation of the population—at last interposed to protect the Christians from their Mohammedan oppressors, who resenting the interference raised the standard of revolt. The insurrection was suppressed after much slaughter. In 1821 a vigorous but unsuccessful effort was made to destroy the power of the Sipahis, and from that time forward the province has been until very lately in a state of anarchy. In 1838-9 an energetic governor, Veljiki Pasha, was sent to Bosnia, and he commenced his government by announcing that the Christians should thenceforward be treated as the equals of the Mussulmans. The military begs and kajatani, whose offices had become hereditary, were removed, and civil servants nominated in their room. This change was first made in the sanjak of Banjaluka, but had not yet extended to the rest of Bosnia at the death of the sultan Mahmud—an event which re-animates the courage and the hopes of the Sipahis. But the promulgation of the Hatti Sherif of Gul Ham, containing the Tanzimat, or reformed constitution of Turkey, and the annoyance caused by the fiscal arrangements inherent in the new system, drove the Sipahis (who had been previously exempt from taxes) to desperation. The representative of the vizir was driven from Bosnia-Serai, and the vizir himself was dislodged from Travnik and obliged to take refuge in the mountains westward. But having collected the 4000 regular troops dispersed over the province he met the Sipahis, 20,000 strong, near the town of Vitez, and defeated them after a desperate struggle. The rebels retreated to Bosnia-Serai, which was immediately blockaded by the vizir and compelled to surrender. The leaders were executed or banished. The country was pacified; but the new system was not yet established, nor were the feudal privileges forgotten.

The fiscal burdens fall chiefly upon the rayas: the Sipahis, as before stated, and all Mohammedans possessing property only in towns paid nothing. The tithes (which were paid upon all agricultural produce) and the customs were farmed, and the feudal chiefs generally became farmers, exacting more than their due from the rayas, who also paid the usual poll-tax. In case of insurrection in the province the farmer of taxes was exempted from payment to the central government, and accordingly the feudal chiefs had a strong interest in keeping the province in a state of revolt. The new system could not work well in such a state of things.

In 1848 Tahir Pasha was sent as governor general to Bosnia, with instructions to make one great effort to establish the Tanzimat. After many artful intrigues to effect the recall of this able pasha had failed, the feudalist party broke out into open rebellion in Turkish Croatia in 1849. The vizir who marched against them to the Una was defeated at Bilhac, and retiring to Travnik died of vexation and cholera. The sultan's government, then occupied with the affairs of the Hungarian refugees, took no steps for the reduction of the Bosniak rebels till April 1854, when Omar Pasha made his appearance in the province, gained two battles at Vrandak on the Bosna, and signally defeated 15,000 rebels, who were entrenched on the hill of Vutshiak near Hercegov. After this defeat the chiefs fled to Austria, the Sipahis dispersed, and Bosnia Proper was reduced to obedience. But in the Kraina the struggle was more obstinate. The fortress of Jajce had to be taken by Omar Pasha, after a skilful and brave defence; that of Gul Hissar, situated on an island in the Verbas was stormed by Dervish Pasha in the spring of 1851. The submission of the districts of Banjaluka and Kluc followed these successes; but the rebels, who met again at Kossaritz, replied to Omar Pasha's proclamation that the Sipahis would never serve in the regular army, nor resign their feudal rights by accepting the Tanzimat. At Kossaritz accordingly they were again attacked and again defeated; and the district north of the Sanna made its submission. A short but interesting campaign followed on the Una, in the neighbourhood of Bilhac and Krupa, and the masterly passage of that river in the face of a strong rebel force put an end to the rebellion.

Bosnia has no intercourse with Serbia except at one or two points: a strict quarantine is maintained all along the Serbian frontier. (*Frontier Lands of the Christian and the Turk*, London, 1853.)

BO'SPORUS, often incorrectly written BOSPHORUS, is a pure Greek word (*Βόσπορος*): according to mythological tradition it derives its name from the passage of Io over one of the straits so called when she was turned into a cow (*Æsch. 'Prom.' 735*); the Bosphorus as thus explained literally signifying 'the passage of the cow.' Two straits are mentioned by Greek and Roman writers under this name. One sometimes called the *Channel of Constantinople*, in Turkish *Boghus*, unites the Propontis, or Sea of Marmara, to the Black Sea. This narrow channel was often called the Thracian Bosphorus, by way of distinction from the other named the Cimmerian.

The Cimmerian Bosphorus, now variously named the Strait of Kaffa, Yenikalé, or Kertsch, is the narrow passage which connects the Palus Maeotis, or Sea of Azof, with the Black Sea. [*Azov.*] A narrow strip of low and fertile land on the south-east margin of the Taurica Chersonesus, the modern Crimea, formed the ancient kingdom of Bosphorus. It extended about 60 miles in length, direct distance, from Theodosia or Theodosia, now Feodosia or Kaffa, on the west, to Panticapæum or Bosphorus, now Kertsch, on the Strait of Yenikalé. Both Theodosia and Panticapæum, the capital of this little kingdom, had good ports; and between them was Nymphæum, which also had a good harbour. Panticapæum was a Milesian colony. Besides the territory already described the Greek kings of Bosphorus possessed Phangoria, now Tmutarakan, on the peninsula of Taurai, which forms the eastern side of the Strait of Yenikalé; and finally they seem to have become masters of the whole Crimea. The quantity of grain brought from the Bosphorus to Athens was, according to Demosthenes (*'Cicero' Leptin.*) equal to all the corn imported from all other foreign places.

At a later date the kingdom of Bosphorus formed part of the dominions of the great Mithridates, who is said to have died at Panticapæum. It fell, with all the neighbouring districts, next into the hands of the Romans, who gave it to Pharnaces, the son of Mithridates. Pharnaces having invaded Pontus and exercised great cruelties towards the Roman citizens, was attacked by Julius Cæsar and defeated. He fled to his kingdom of Bosphorus, where he was immediately murdered, and his throne was given by the dictator to Mithridates of Pergamum (about B.C. 47). This kingdom of Bosphorus continued under the Roman emperors, but is only known to us from the occasional interference of the Cæsars in the nomination of a king, or in attempts to restore tranquillity. (*Facit. 'Annal.' xii. 15-21.*) A race of half Greek, half barbaric kings continued to possess the Crimea and the neighbouring coasts of the Black Sea at least to the time of the Antonines, and the kingdom of Bosphorus almost survived the Roman empire, and only expired under the ravages of the Huns.

The Thracian Bosphorus is about 17 miles in length, and at its narrowest part about 600 yards across. The general breadth varies from 700 to 1000 yards; opposite the Gate of the Seraglio, in Constantinople, it extends to 1610 yards. It has been often stated (after Pliny) that the opposite shores of the strait are within range of the human voice, and that from either shore the birds can be heard to sing and the dogs to bark on the other; but the statement is a very questionable one, although the human voice at shouting pitch may sometimes perhaps be made to sound across the strait. It is supposed that the Bosphorus has been formed by volcanic agency. The rocks on each side consist of trachyte, or trachytic conglomerate, protruding through shales and fossiliferous limestone: they contain neither coal nor iron, and are therefore of a greenish colour. The strait is divided into seven reaches or bays by as many promontories, the projections on one side having a corresponding indentation on the opposite coast. The current takes a different direction in each of the seven reaches, and there are corresponding counter-currents in one half of the channel.

(*Strabo*; Raoul-Rochette, *Antiquités Grecques du Bosphore-Cimmerien*; *Dictionary of Greek and Roman Geography*.)

BOSSINEY with TREVENNA, Cornwall, a borough and market-town in the parish of Tintagel and hundred of Looe, situated on the coast, in 50° 40' N. lat., 4° 43' W. long., distant 25 miles N. from Bodmin, and 231 miles W. by S. from London. The population of the parish of Tintagel in 1851 was 1084, of which number however the hamlet of Bossiney does not contain a tenth part. The living is a vicarage in the archdeaconry of Cornwall and diocese of Exeter.

The borough of Bossiney extends over a great part of the parish of Tintagel, and comprises about 350 English acres. The corporation had a charter from Richard, earl of Cornwall, brother of Henry III. Bossiney enjoyed the elective franchise from the reign of Edward VI. until the passing of the Reform Act, when it was disfranchised. Bossiney has a market on Thursday, and a fair, which is now held at Trevenna, principally for horned cattle, on the first Monday after the 19th of October. The town-hall is chiefly used as a school. Tintagel has become frequented as a watering-place, for which it is well adapted. The locality is very healthy. The scenery of the coast is exceedingly wild and picturesque. Bossiney is situated on a wild bleak part of the northern coast of Cornwall; but the town appears formerly to have been of some importance.

Near this place is the castle of Tintagel, supposed to have been the birth-place of the famous King Arthur. Built on a high rock that juts out into the sea, by which it is nearly surrounded, this castle must have been a place of considerable strength. In Iceland's time a chapel seems to have occupied part of the site of the keep, which he calls the dungeon of St. Ulette, alias Ulianne. The church of

Tintagel is supposed by Lysons to have been appropriated to the abbess and convent of Fontevrault in Normandy, and having come into possession of the crown, to have been given by Edward IV. to the collegiate church of Windsor. The dean and chapter of Windsor are the patrons.

BOSTON, Lincolnshire, a seaport, market-town, municipal and parliamentary borough, and the seat of a Poor-Law Union, in the parish of Boston, wapentake of Skirbeck and parts of Holland, is situated near the mouth of the river Witham, in 52° 58' N. lat., 0° 2' W. long.; 36 miles S.S.E. from Lincoln, 116 miles N. from London by road, and 107 miles by the Great Northern railway. The population of the municipal borough in 1851 was 14,733; that of the parliamentary borough was 17,518. Boston is governed by a corporation consisting of 6 aldermen and 18 councillors, one of whom is mayor; and returns two members to the Imperial Parliament. The living is a vicarage in the archdeaconry and diocese of Lincoln. Boston Poor-Law Union contains 23 parishes and townships, with an area of 97,250 acres, and a population in 1851 of 37,677.

The origin and ancient history of Boston are obscure. The great canal or drain, called the 'Car-dyke,' which extends 40 miles in length from the Welland, in the south of the county, near Lincoln, to the Witham, is generally attributed to the Romans. The 'Fosse-dyke' is a continuation of the drain from Lincoln to the Trent at Torksey, and appears to have been formed about the same time. The 'Westdyke,' another ancient drain in the parts of Holland, carries off the upland waters, by its communication with the Welland at Spalding. The old fen-dyke is a great bank erected along the coast, in order to render the drains safe from the influx of the ocean. The county of Lincoln was included in the Roman province of *Flavia Caesariensis*, and there were several military stations in different parts of the county. Lincolnshire was a part of the kingdom of Mercia during the heptarchy, and Boston is believed to be the *Ycan-ho* or *Jcan-ho*, at which, according to the Saxon Chronicle, St. Botolph built a monastery in A.D. 651, which existed till the county was ravaged by the Danes, A.D. 870.

Little worthy of notice is recorded of Boston during the early part of the Norman government. In the year 1201 when the 'quinzième' was levied (a duty which was raised on the fifteenth part of land and goods at the several ports of England), London paid the largest sum (836*l.*) of any port, and Boston was the second (750*l.*) in amount. A great annual fair was at an early period held at Boston; it was resorted to from Norwich, Bridlington, and Chaven in the 13th century. Articles of dress, wine, and groceries formed part of its commerce. In 1281 part of Boston was destroyed by fire; and in 1286 a great part of the town and the surrounding district suffered from an inundation. It was one of the towns appointed by the statute of staple (27th Edward III.), where the staple of wools, leather, woollens, and lead should be held. Many merchants from the important commercial towns of the Continent resided at Boston during this early period; it also ranked high as one of the seaports of the kingdom. The merchants of the Hanseatic League established their guild here. At the time when Leland wrote his account of Boston (1530), the commerce of the town had begun to decline. Boston was still further reduced by the dissolution of the monasteries by Henry VIII., though that monarch made some amends by granting the town a charter of incorporation; it was thus made a free borough, and enjoyed many important privileges. Philip and Mary, in the first year of their reign, endowed the corporation with a rich grant of lands and messuages. This important endowment, rendered more valuable by subsequent Inclosure Acts, has given the corporation upwards of 500 acres of land. Queen Elizabeth granted the mayor and burgesses a charter of admiralty, giving them power to levy certain duties on ships entering the 'Norman Deep.' In 1571 Boston and the surrounding district suffered much from a violent tempest, an account of which is given by Holinshed. During the latter part of the 16th century, and again in 1625, it was visited by the plague. In 1613 Boston was made the headquarters of Cromwell's army. The principal men of the district favoured the cause of the Protector. In June 1643 Colonel Cavendish defeated the parliamentary troops at Donington, near Boston, and soon after Cromwell removed his quarters to Sleaford. During the 18th century the commerce of Boston continued to decline.

The Dominicans, or Black friars, were established at Boston in the early part of the 13th century: in A.D. 1283 their church was burnt in a riot; but they were afterwards re-established. The Carmelite friars had a priory at Boston, founded in 1301. The Augustine friars had an establishment at Boston, founded in 1307; the Franciscans, or Gray friars, had also one founded in 1332, under the wardenship of the monastery at York. The sites of these houses were granted to the corporation at the Reformation. Several associations, called 'guilds,' existed in the town, some of which seem to have had a mixed character. The monks are supposed to have been their first founders. The guild of St. Botolph was a fraternity of merchants, and appears to have had only mercantile objects in view. The guild of the Blessed Mary was one of importance, and in its purposes partly religious. Its hall is now used by the corporation for their judicial proceedings, public dinners, &c. The guild of St. Peter and St. Paul was a religious establishment, and had a chapel or an

altar in the parish church. St. George's guild was a trading community. The possessions of all these guilds were vested in the corporation of Boston when the religious houses were dissolved.

The portion of the town on the left bank of the Witham consists of one long street, called Bargate, the market-place, and some minor streets. On the right side of the river is another long street called High Street. The market-place is spacious, and the market is well supplied with cattle and corn from the inland districts. An abundant supply of water has been procured for the town under the powers conferred by an Act passed in 1847. Boston is well supplied with coal, by sea from the Tyne and the Wear, and by railway from Derbyshire and Yorkshire. The old poor-house, in St. John's Row, was built in 1730; the new Poor-Law Union workhouse was constructed in 1838.

The first stone of the present church of St. Botolph was laid in 1309, but the existence of a church at Boston is recorded as early as 1090. This church is one of the largest parish churches without transepts in the kingdom. It is 245 feet long, and 98 feet wide within the walls. Its tower is one of the loftiest in the kingdom, being 309 feet high. The tower, which is visible at sea for more than 40 miles, is surmounted by an elegant octagonal lantern, which is a guide to mariners on entering the Boston and Lynn Deep. In a chamber over the south door is the parish library, which contains several hundred volumes, among which are many valuable and scarce works on divinity; it was formed by Anthony Tuckney. The church has recently undergone extensive repairs and restoration.

The chapel-of-ease which was erected by subscription in 1822 is a perpetual curacy. A new church was built in Skirbeck parish in 1848 in addition to a former church in the same parish. There are places of worship in Boston for Independents, Wesleyan and Primitive Methodists, Baptists, Unitarians, and Quakers.

A Grammar school was provided for by the rich grant of Philip and Mary in 1554. The building was erected by the mayor and burgesses in 1567; it is in the Mart yard, some distance from the great annual fair having been held in it. The school had been almost closed for several years, when in 1850 the trustees obtained a new scheme. There are four masters who are paid for in the charity estates; the head master's salary is 200*l.* a year, with a free house and other advantages. The number of scholars in 1851 was 24. The Blue Coat school, established in the year 1718, by subscription and donations, is for the education of boys and girls. There are National and British schools. Laughton's Charity school was established in 1707. There are numerous infant, Sunday, and other schools. The names of other charities sufficiently explain their object; such are the Dispensary, Bible Society, a Doves Charity, and the Poor Freemen's and Apprentices' Charities.

Boston has two subscription libraries; it possesses also a mechanics institution. A spacious court house for county and other business was built about 1813 at a heavy expense. Salt-water baths were established at Boston about the year 1830; the walks and grounds belonging to them, which are pleasantly laid out, are open to the inhabitants of the town. Over the market-house is a suite of assembly rooms. The custom-house is a plain substantial building near the quay. There is a custom bridge of elegant structure over the Witham; it has but a single arch, of 80 feet span, and its rise is so slight that the roadway over it is nearly horizontal. The cost to the corporation for this bridge and the approaches to it was 22,000*l.*

As the prosperity of Boston depended in a great degree on the Witham being navigable, considerable attention has been in past times directed to the removal of obstructions and the clearing of the river. In 1520 a vessel of 250 tons could ascend to the town; but by the year 1750 the Witham had become so choked up as hardly to allow a passage for a ship of 40 or 50 tons at a spring-tide. Under the powers of Acts of Parliament subsequently obtained great efforts have been made to maintain the Witham in a navigable state; and Boston is now a port of considerable trade. Vessels of 300 tons burden are enabled to deliver their cargoes in the heart of the town.

The foreign trade of Boston is chiefly with the Baltic, whence are imported hemp, iron, timber, tar, and other commodities. The chief exports consist of corn, particularly oats, large cargoes of which are sent to London. The gross receipts of customs in the year ending 31st January 1851 amounted to 28,776*l.* The number of vessels registered as belonging to the port of Boston on December 31st 1852 was: under 50 tons 115, tonnage 4313; above 50 tons 54, tonnage 3539; with one steam vessel of 18 tons. During 1852 there entered and cleared at the port, in the coasting trade, inwards, 753 vessels, tonnage 36,598; outwards, 522, tonnage 24,942; in the foreign trade, inwards, British vessels 12, tonnage 1630; foreign vessels 11, tonnage 1313; outwards, British 19, tonnage 1472; foreign 13, tonnage 1230.

The manufactures carried on within and around the town consist chiefly of ships, sails, canvass, sackings, iron and brass work, cooperage, ropes and cordage, leather, hats, bricks, whining; there are also breweries and malthouses.

By means of the Witham and the canals connected with it Boston has a navigable communication with Lincoln, Gainsborough, Nottingham, and Derby, and by them with all the inland towns. The East Lincolnshire railway connects Boston with Louth, Grimsby, and other towns in the north; the Great Northern places it in connection with

London and the south; the 'loop-line' of the same company extends from Boston to Lincoln and Gainsborough: while the Boston, Stamford, and Birmingham, and the Nottingham and Boston railways (if constructed according to the Acts), will connect Boston with the west.

Immense numbers of sheep and horned cattle are sold at the Boston markets, and there are convenient areas in several adjacent parts of the town, where the cattle are folded and penned during the time of sale. The drainage and inclosure of the neighbouring fens have materially increased the internal wealth of Boston by enabling it to bring to market very large quantities of agricultural produce.

Two interesting remains of antiquity exist near the town—the Kyme Tower and the Hussey Tower. Kyme Tower is situated about two miles east from Boston; it is of brick, quadrangular, and has an octagonal turret at its south-east angle containing a flight of about twenty steps. It is now the property of the Dean and Chapter of Westminster. The Hussey Tower is situated in the town, near St. John's Row, and is all that remains of a baronial residence of Lord Hussey.

(Reynolds, *Commentary on the Itinerary of Antoninus*; Tanner, *Notitia Monastica*; Thompson, *Collections for a History of Boston*.)

BOSTON, United States of America, capital of Suffolk county and of the state of Massachusetts, is situated in 42° 21' N. lat., 71° 4' W. long., 432 miles N.E. from Washington, at the bottom of Massachusetts Bay, on a peninsula above two miles long, and in its part more than one mile broad. The narrow isthmus by which the peninsula is joined to the mainland is called Boston neck, and the arm of the sea which washes the peninsula on its north and west sides is named Charles River.

Boston was founded about the year 1630 by the settlers established at Charlestown, on the shore of Massachusetts Bay, contiguous to Boston peninsula. Its Indian name was Shawmut, from the springs which were in the locality: it was also called Trimountain, from three lofty hills on and around which it is built. The name of Boston was given in compliment to the Rev. John Cotton, who had been a clergyman at Boston in Lincolnshire, from which place he was driven by the religious persecution to which the original settlement of the New England colonies must be ascribed.

The early settlers claimed, and by their voluntary expatriation took effectual means for securing the right of regulating their own church discipline and doctrine, but they did not learn the justice of tolerating religious systems different from their own: the very first court of election held in the colony passing a law by which none but church members could be admitted to any share in the government, or be capable of being chosen as magistrates or serving as jurymen.

The scheme of taxing America by the British Parliament met nowhere with a more decided opposition than in Boston. The Stamp Act was to come into operation on the 1st of November, 1765; but previously to that day serious riots took place in the streets of Boston; the building intended for the reception of the stamps was pulled down, and the lieutenant-governor was forced to quit the city. On the arrival of some consignments of tea at the port in December 1773, a party of the men of Boston, disguised as Mohawk Indians, proceeded on board the tea ships then lying at the wharf, and emptied the contents of every chest into the sea. The British Parliament in consequence passed an Act making the landing and shipping of goods at the town or harbour of Boston illegal, until full compensation should be made by the town to the East India Company, and until the king in council should be satisfied of the re-establishment of order in the town. A subsequent Act vested in the crown the appointment of all municipal and judicial officers; by a third Act, the governor was invested with power to send for trial to England all persons accused of offences against the revenue, or of rioting in the colony.

Early in the revolutionary war Boston became the scene of hostilities. In June 1775 a battle took place at Bunker's Hill, an eminence north of Charles River, between the Royalist forces under General Howe, who then occupied the town of Boston, and the Americans under General Putnam. The English after having been twice repulsed in their attempts at last succeeded in dislodging their opponents from their position, but with a loss of 1100 killed and wounded, including 89 officers. An obelisk has been erected on Bunker's Hill to commemorate the battle. In the following month General Washington arrived before Boston, which he continued to invest until the following February. He then commenced offensive operations, and having with a considerable force obtained possession of the heights of Dorchester to the south of Boston, and thrown up some works by which the town was commanded, the British general was forced to evacuate the town, which Washington entered on the 17th of March, 1776.

Boston consists of three parts—Old Boston on the peninsula, South Boston, and East Boston. Several bridges afford the means of communication in various directions from Old Boston. The largest of these are West Boston Bridge and the Canal Bridge; the former is 2758 feet long, rests on 180 piers, and is continued by a causeway 3432 feet long, the whole connecting the peninsula with Old Cambridge. Craigie or Canal Bridge, 2796 feet long and 40 feet broad, forms the communication with East Cambridge; the Western Avenue, a solid

structure of granite, filled in with earth, a mile and a half long, leads to Brookline, and constitutes a dam about 600 acres in extent, which affords by the flowing of the tide a great water-power. The bridges are well lighted with gas, and most if not all of them have a 'draw' in the centre to allow the passage of shipping. There are also several railway bridges or viaducts over the river. Boston is the centre of an extensive system of railway communication, reaching to Canada and the Mississippi. There are seven railway termini, or depots as they are called: the finest of these buildings is the Fichtelberg in Causeway Street; it is built of stone. These seven depots are the termini of the great trunk-lines which a few miles from Boston throw off numerous branches. In November 1853 no less than 128 trains daily left the city. The Atlantic and St. Lawrence railway, now partly open, will when completed afford direct railway communication between Boston and Montreal; and another line running by Concord, New Hampshire, and Haverhill, forms a junction with one of the Montreal lines. From Boston the Middlesex Canal runs to the Merrimack River at Chelmsford.

With the exception of a spot in the south-western part of the city, called the Common, containing about 48 acres, planted with trees, furnished with seats, and forming a fine promenade and place of recreation for the residents, the Public Garden, a space of about 12 acres, and several open squares, the whole of the peninsula is occupied by buildings. Many of the best houses and public buildings are built of granite, many of the streets are paved with granite, and the city is often named by way of compliment 'the Granite City.' The older houses are of wood; those of later erection are generally of brick or stone. The city is lighted with gas. Those streets which remain as they were originally planned are narrow and crooked, and the old wooden houses in them are of small dimensions. In the modern part of the city the streets are wide and straight, and the houses spacious. The original inequality of the surface has been preserved, and there are numerous eminences which rise from 50 feet to upwards of 100 feet above the sea, giving a picturesque appearance to the town. Among the public buildings are the State House, in which the Legislature of Massachusetts holds its sittings; the County Court House; the City Hall, or Old Court House; Faneuil Hall, a brick edifice erected about 1740, named after the Boston merchant who presented it to the city, known as the 'cradle of liberty,' because in it were generally held the meetings preceeding and connected with the revolution, and still the favourite place for public meetings for the citizens: the hall in which public meetings are held is 76 feet square and 28 feet high, with galleries on three sides supported by two ranges of Ionic columns; the Custom House, built in the form of a cross, and having fine porticoes in front; the Exchange, erected in 1842; the Massachusetts Hospital; the House of Industry; Quincy Market, a granite building 500 feet by 38 feet; the House of Correction; three theatres; a museum; two buildings of granite, which are used for concerts and lectures; and several halls belonging to different associations. The State House stands on an eminence called Beacon Hill, 110 feet above the level of the sea, commanding an extensive view of the bay and surrounding country. In the building is a fine statue of Washington. The Boston Athenaeum has two large buildings, one of which contains a library of about 30,000 volumes; the other contains rooms for lectures, &c., and a picture-gallery. There are in Boston 100 places of worship, 15 belonging to Congregationalists; 12 to Baptists; 12 to Episcopalians; 11 to Methodists; 12 to Roman Catholics; 20 to Unitarians; and 5 to Universalists; and the remainder to various minor denominations. Some of the churches are handsome buildings. St. Paul's church in Common Street contains a monument to the memory of Dr. Warren, who was killed at the battle of Bunker's Hill. Franklin who was born in Boston has a monument erected to his memory in the old burying-place known as the Granary-ground.

South Boston, extending along the south side of the harbour for about two miles, contains about 600 acres regularly laid out in streets and squares. Near the centre of this division of Boston are the Dorchester Heights, 130 feet high.

East Boston is an island which contains about 660 acres of land, with a large quantity of flats. Constant communication is kept up with Old Boston by a ferry. It is connected with Chelsea on the mainland by a bridge 600 feet long. East Boston has arisen within the last 20 years, and now has a population of 20,000.

The progress of the city will be seen from the following statement of the amount of its population at various dates from the beginning of the last century:—

Year.	Population.	Year.	Population.
1700	7,000	1820	43,298
1752	17,574	1830	61,392
1763	15,520	1840	93,383
1790	18,038	1845	114,360
1800	24,937	1850	134,788

It thus appears that in 1850 the population of the city was nearly six-fold its amount in 1800. Within a short distance of the city are numerous towns and villages, many of which have piers and landing-places, including Hingham, Hull, Quincy, Milton, Dorchester, Roxbury, Brookline, Brighton, Newton, Watertown, Cambridge, Charlestown, Chelsea, Malden, Medford, and Somerville. Indeed as a

metropolitan district Boston may be considered as extending nine miles around the Exchange, within which bounds the population in 1850 was 269,874. All the citizens are free, the constitution of the state having declared that 'all men are born free and equal,' which declaration was decided by the Supreme Court of Massachusetts in 1783, to be equivalent to the abolition of slavery. The city is governed by a mayor, 8 aldermen, and 48 common councillors. The General Court of Massachusetts meets at Boston twice a year, and the Supreme Courts of Judicature for the state are held there. The city has a court styled the police court for the city of Boston, consisting of three justices, and there is a municipal court consisting of one judge, who has cognisance of all crimes not capital committed within the city and the county of Suffolk. The judges of the police court hold a justices' court every Wednesday and Saturday.

Boston Bay or harbour is formed by numerous small islands, on one of which at the entrance is a lighthouse 65 feet high, with a revolving light. The harbour extends 14 miles from Point Alderton to Medford, and from Chelsea to Hingham is at least 8 miles wide, covering an area of 75 square miles. There is in general sufficient depth of water within the bay at all times of the tide to enable the largest vessels to reach the wharfs and docks, of which there are in all about 200. Contiguous to the wharfs and docks are extensive ranges of warehouses four or five stories high, and from 50 to 80 feet in breadth. Vessels lie here in perfect safety, from whatever quarter the wind may blow. The entrance to the harbour is so narrow as scarcely to admit two ships abreast; it is defended by Fort Independence on Castle Island, and Fort Warren or the Citadel on Governor's Island. For the protection of the external harbour there is a strong fortress on St. George's Island. Boston is the second commercial city of the United States. It has 32 banks. Its trade is very extensive both with foreign countries and with the southern states of the Union, to which it sends large supplies of salted meat and cured fish, as well as domestic and European manufactures, receiving in return cotton, rice, tobacco, staves, and flour. It has also a considerable trade with the western states. The tonnage of vessels belonging to the port amounted in 1841 to 227,608 tons, in 1842 to 193,502 tons, in 1850 to 320,687 tons, in 1851 to 343,305 tons. The aggregate burden of the ships built at the port in 1849-50 was 23,480 tons. The arrivals from foreign ports during 1850 included 2879 ships of 478,859 tons, and the foreign clearance 2839 ships of 437,760 tons. In 1849 the value of imports amounted to above five millions of pounds sterling; the exports were under two millions. The imports consist chiefly of woollen, cotton, linen, and silk manufactures, sugar, coffee, indigo, grain, flour, pork, hides, hemp, anthracite, and lead. The exports consist of fish and fish oils, salted meat, ice, soap, candles, paper, cordage, hardware, and furniture, with a small quantity of the cotton manufactures of the country. Besides the foreign trade there is a very large local and coasting trade. In the coasting trade 6100 vessels arrived at Boston in 1849, exclusive of sloops and schooners bringing wood, stone, and sundries which are not entered at the custom-house. Lines of packets ply to all the seaboard cities. There is a considerable trade with California. Several large steam-vessels form a regular line of communication between Boston and Great Britain, stopping at Halifax, and performing the voyage in some instances in about ten days.

Boston has an abundant supply of water from Cochituate Lake, formerly called Long Pond, about 20 miles from the Exchange. The aqueduct was opened in 1849. An elliptical brick conduit, 6 feet 4 inches by 5 feet, conveys the water to Brookline, more than 14½ miles, where is a pond of 22 acres, containing 100,000,000 gallons. Two parallel pipes, 30 inches in diameter, convey the water across Clark's River. A large reservoir is on Beacon Hill, and another on Mount Washington in South Boston. Cochituate Lake extends over an area of 659 acres, and has a depth in some places of 70 feet; its elevation is 121 feet above tide-water in Boston harbour. It will be observed therefore that in case of fires (which on account of the numerous wooden buildings are far from infrequent in Boston) the water needs no forcing. The fire-bells in the different wards of the city are electrically connected and strike simultaneously the number of the ward where a fire has broken out, so that the firemen know where their services are required.

Boston is generally regarded as the literary metropolis of the United States. Its literary, scientific, and educational institutions are indeed such as few cities of its size, even in the Old World, can equal. Besides the Atheneum, already named, with its library, the Massachusetts Historical Society, the Boston Library Society, and the Columbian Library, have each good collections of books. The various public libraries of Boston include an aggregate of about 150,000 volumes. A noble library has just been founded in Boston by Mr. Bates of London, one of the eminent firm of Baring Brothers, and a native of Massachusetts. The Lowell Institute, founded by a Mr. Lowell, who died at Bombay in 1836, provides for the delivery of regular courses of popular lectures on science and art. The lectures, which are all free, are delivered in the winter months from October to April. The New England Museum is one of the most extensive in the United States. There are besides a Gallery of Fine Arts, an Academy of Arts and Sciences, a Mechanics Institution, a Society of Natural History, founded in 1830, which has small but well-arranged

collections, and other similar establishments, which are in general liberally supported. An interesting feature of the environs of Boston is the cemetery at Mount Auburn, opened in 1831, and occupying an area of 118 acres, laid out with considerable attention to the beautiful and picturesque in appearance. The cemetery contains numerous fine monuments, many of which are of marble. An elegant chapel has been erected in the grounds.

The public charitable and benevolent institutions of the city are numerous. Besides the Massachusetts General Hospital, already named, we may mention the Hospital for the Insane, and the House of Industry. The Institution for the Education of the Blind, established in 1833, is perhaps one of the best of its kind in the world. Besides being taught various branches of learning, the pupils are trained to industrial occupations, by which they may be enabled to procure the means of support for themselves in after life. The institution possesses a printing-press, at which have been printed, with the assistance of the pupils, several works in raised characters for the use of blind persons.

Great attention is paid to the education of the young in the state of Massachusetts, and particularly in Boston. The number of primary schools in the city is 41; of more advanced schools, 23. The school-houses are built and maintained, and the salaries of teachers, with all other expenses, are defrayed as a regular branch of the public expenditure, so that the schools are free to all. In the Primary schools of Boston in 1850 there were 11,376 scholars; in the Grammar school, 9154; and in other schools, 471. The public Latin school, originally established in Boston by the first settlers in 1635, within five years after their landing, is considered as preparatory to the university, and has about 200 scholars under five teachers. The public High school, which provides instruction in French, mathematics, and other studies preparatory to a commercial career, is under the care of four teachers, and is attended by about 200 pupils. The head master of the Latin school and the head master of the High school receive each 2400 dollars, or about 500*l.* a year, being only 100 dollars a year less than the salary of the governor of the state. A normal school for girls has about 200 pupils, and qualifies every year nearly 100 teachers for schools attended by young children.

Harvard University, founded in 1638, the best endowed institution of the kind in America, is at Cambridge, 3 miles north-north-west from Boston. This college in 1851 had 20 instructors, 6342 alumni, and 293 students. The library contained 84,200 volumes. The Divinity school of the Congregational Unitarian body at Harvard University, commenced in 1816, had 2 professors and 23 students in 1842-50; the library contained 3000 volumes. The Law school had 3 professors and 98 students. The Medical school, founded in 1782, had 6 professors and 117 students.

The first Anglo-American newspaper, entitled 'The Boston News Letter,' was published in this city on the 24th of April 1704; it continued to be published during seventy-four years, and for fifteen years of that period was the only newspaper printed in the English colonies in America. The second of these papers in point of time was likewise printed in Boston. The third Boston paper, first published in 1721, was printed by James the brother of Benjamin Franklin, in whose name the publication was for some time carried on, in consequence of some difficulties in which James Franklin was involved with the government. Some of the earliest writings of Franklin were given to the world in the columns of this paper, which was called 'The New England Courant.' The number of newspapers printed in Boston in the present month (November 1853) is stated to be 13 daily; 13 semi-weekly; and 67 weekly, bi-weekly, and monthly. The first daily paper was published in 1813.

Numerous periodical works are published in Boston. Among these may be mentioned 'The North American Review' (quarterly), and 'The American Almanac and Companion,' a valuable work commenced in 1829, and conducted on the model of the 'British Almanac and Companion.' The principal English periodical works are regularly reprinted in Boston.

Various warlike establishments of the United States government are located in Boston harbour. Besides the fortresses mentioned above there are here an arsenal, an extensive navy yard, a dry dock, rop-walks, depots of cannon, arms, and naval stores, and hospitals for sick and infirm seamen.

The Massachusetts state prison, which is said to be well regulated, is situated in Charlestown. Only male convicts are received into this building. It appears that the profits derived from the labour of the convicts are sufficient to provide for the expenses of the establishment, and to leave a balance of profits.

BOSWORTH (commonly called MARKET-BOSWORTH, to distinguish it from Husband's Bosworth, in the hundred of Gartree), Leicestershire, a market-town and the seat of a Poor-Law Union, in the parish of Market-Bosworth and hundred of Sparkenhoe, is situated in 52° 38' N. lat., 1° 24' W. long.; distant 13 miles W. from Leicester, and 106 miles N.W. by N. from London. The population of the township in 1851 was 1058. The living is a rectory in the archdeaconry of Leicester and diocese of Peterborough. Market-Bosworth Poor-Law Union contains 31 parishes and townships, with an area of 44,891 acres, and a population in 1851 of 13,516.

The town of Bosworth is pleasantly situated upon an eminence, in

the centre of a very fertile district, and contains several good houses. The manufacture of worsted stockings affords occupation to many persons here and in the neighbourhood. The Ashby Canal, which passes within a mile of the town, gives facilities for obtaining coal and other commodities. This canal is the property of the Midland Railway Company, and connects the line of traffic to and from the Leicester and Burton railway with the Grand Junction Canal near Coventry. There are two annual fairs for cattle held at Bosworth on the 8th of May and the 10th of July. The market, chiefly for corn, is held on Wednesday. There is a rural police force in the parish. A county court is held in the town.

Bosworth church, dedicated to St. Peter, a large and handsome edifice of the 15th century, in the perpendicular style, was restored in 1845. The tower is surmounted with a lofty and well-proportioned spire. The interior contains some interesting monuments. There are places of worship for Independents and Baptists.

The Free Grammar school, founded by Sir Wolstan Dixie, lord mayor of London, in 1585, has an endowment which now produces about 1000*l.* per annum. Sir Wolstan founded two fellowships and four scholarships at Emmanuel College, Cambridge, for the benefit of persons either related to the Dixie family or educated at the school. Four additional scholarships were founded from the charity revenues by order of the Court of Chancery in 1835. Schools for girls and for boys under seven years of age have been opened in the four chapels comprised within the parish, and also in the parish of Cadeby.

The decisive battle between Richard III. and the Earl of Richmond, which by the death of Richard after a sanguinary struggle terminated the long strife between the houses of York and Lancaster, was fought August 22nd 1485 on a plain commencing about one mile south of the town. This fine and spacious plain, which is nearly surrounded by hills, was formerly called Rednors Plain, from the colour of the soil; but since the battle it has been designated Bosworth Field, from the name of the nearest town. The plain, which is somewhat of an oval form, about two miles in length and one in breadth, was cultivated at the time of the battle: timber has since been grown upon it, and nothing of its former appearance remains except the general form of the ground. The spot where Lord Stanley placed the battered crown upon the head of Richmond and hailed him king, is now known as 'Crown Hill.' Dr. Parr, who visited the spot in 1812, procured a subscription for the purpose of raising a suitable monument on the spot, for which he furnished an appropriate Latin inscription. Numerous relics of the battle have at different times been turned up in digging and ploughing the soil.

Several eminent persons have been born at Bosworth, amongst whom Simpson, the self-taught mathematician, occupies the first place. Dr. Johnson was for a short time usher in the Free school: in the same school Richard Davies, the celebrated Greek critic, and Salt, the Abyssinian traveller, were educated. In the vicinity of the town is Bosworth Hall, the seat of Sir W. W. Dixie, Bart., a fine old brick mansion of the Elizabethan age and style.

BOTANY BAY is situated in New South Wales, in 31° S. lat., 151° 10' E. long. The entrance is little more than a mile broad, but the bay afterwards enlarges to about three miles in width. The great quantities of plants found there by the naturalist who accompanied Cook when this bay was discovered, induced him to call it Botany Bay. The bay is extensive, and good anchorage is found in from four to seven fathoms' water; but both on the north and south sides and on the bottom of the bay flats extend to a great distance from the shore, having only four or five feet water on them. Of the connection of Botany Bay with a peninsular settlement, see WALES, NEW SOUTH.

BOTESDALE. [SUFFOLK.]

BOTHNIA, or BOTTENA, is a name which was given at some remote period to the countries on both sides of the Gulf of Bothnia as far south as the straits called the Quarken. It was formerly divided into Eastern and Western Bothnia, but the former has been ceded to Russia, and constitutes the greater part of the government of Uleaborg.

Western Bothnia constitutes with Lapland the most northern portion of Sweden. It is bounded N.E. by Russia, from which it is divided by the rivers Muonio-Elf and Tornea-Elf; N. and N.W. by the range of the Kiölen (pronounced Tiölen) Mountains which separates it from Norway; on the S. it joins the Swedish provinces of Jämtland and Angermanland, and the remainder of its boundary on the S.E. and E. is formed by the Gulf of Bothnia. It lies between 63° 30' and 69° 0' N. lat., 14° 20' and 24° 0' E. long., and has an area of about 62,500 square miles.

The plain which occupies the northern part of the province is the most extensive plain in Sweden. The lowest part of the plain runs along the boundary of Russia on the banks of the Muonio-Elf and Tornea-Elf. At the foot of the rocky range which divides it from Norway it is about 1300 feet above the level of the sea, and presents to the eye nearly a level surface covered with swamps and innumerable small lakes, with a few intervening hills of small elevation. The summits of the hills are covered with white rein-deer moss, and between the lakes are bushes of dwarf birch. The country then lowers rapidly, and the birch soon presents itself as a full-grown tree, and mingles with the pine (*Pinus sylvestris*); lower down grows the fir (*Pinus abies*).

About half way towards the gulf, and before the Muonio-Elf falls into the Tornea-Elf, the country is less than 400 feet above the sea, and is covered with forest-trees, except along the banks of the rivers, where agriculture has made considerable progress. Along both banks of the Upper Tornea-Elf are some hills of considerable height. These hills are immense heaps of iron-ore, nearly useless to man on account of their situation. The term 'elf,' a Swedish word meaning river, is generally affixed to the rivers of Bothnia. The Tornea-Elf rises in the Lake of Tornea (Tornea-Träsk), which is imbedded in the rocky mountains of the Kiölen, and extends about 38 miles in length, with an average breadth of 10 miles, its north-eastern extremity approaching within 15 miles of a lake in Norway which communicates with the North Sea. From the Lake of Tornea the river runs between hills of iron-ore, forming numerous rapids and small cataracts, with one remarkable cataract near its confluence with the Muonio, where the river in a distance of about 1000 feet descends 72 feet in perpendicular height. The Muonio, which through its whole course is the boundary between Russia and Sweden, is called in its upper part Kängnäs, and is navigable for many miles above its mouth, though it has some rapids. Before the Tornea-Elf turns to the east to unite with the Muonio-Elf it sends off a branch to the right called the Tärnede-Elf, which after a tortuous course of about 30 miles to the north joins the Calix-Elf, forming in this way a natural canal between two river systems. After the junction of the Tornea-Elf and the Muonio-Elf the united stream, bearing the name of the Tornea-Elf, continues to form the boundary between Russia and Sweden. The Tornea-Elf has a course of upwards of 230 miles, and falls into the northern part of the Gulf of Bothnia, a few miles below the town of Haparanda. This town, which is rising into importance, was founded in 1809. It possesses a good trade in fish, furs, iron, timber, tar, &c. A steamer sails between this place and Stockholm two or three times during the season.

The Calix-Elf rises at no great distance to the south of Tornea-Träsk in the Kiölen Mountains, whence it carries off the waters of four or five large lakes. It descends on the same plain to the south of the great group of iron hills, and runs nearly parallel to the Tornea-Elf east-south-east for about half its course. After receiving the Tärnede-Elf it runs southward. It is less rapid than the other large rivers of Bothnia; it reaches the most northern part of the Gulf of Bothnia after a course of nearly 250 miles.

The country between the Calix-Elf and the Lulea-Elf forms the southern part of the plain, which may be considered as terminating near the banks of the Lulea-Elf, where enormous rocky masses rise which skirt its banks as far as its confluence with the Lilla (Little) Lulea-Elf. These high rocks are called Norra Anocks. In the middle of the plain rises Mount Dundur, which is never entirely free from snow. To the north of it lies another group of iron hills less extensive than that on the banks of the Tornea-Elf. The heights divide the plain into two portions different in character. Between it and the Kiölen range the country is covered with swamps, and here and there with rein-deer moss; the dwarf-birch is rarely met with. The country between Mount Dundur and Norra Anocks, called Stora Maddus, is a swamp extending above 20 miles in every direction. The eastern portion of the plain is partly covered with forest-trees, and cultivated along the water-courses. Its soil is much inferior to that on the other side of the Calix-Elf, except where it approaches the sea.

The Lulea-Elf is the most rapid of the rivers of Sweden. Rising on the eastern declivity of the Kiölen Mountains it soon enters a succession of lakes situated at different levels and united by short channels, which are generally cataracts of considerable height. Some miles after the river has left the last lake its waters are narrowed by steep rocks on each side, and rush down 400 feet in the space of less than one mile. This remarkable cataract is called Niammelasakas (the Hare's Leap), where the vapours arising from the water are directly condensed and freeze in winter, forming a vault strong enough to afford a passage to horses. (Selander's 'Reise,' p. 362.) Further down the river runs between two ranges of high rocks, and here the first solitary habitation is found about 120 miles from the boundary of Norway. It enters the Gulf of Bothnia about 2 miles below the town of Lulea after a course of 200 miles. It is navigable for only a few miles from its mouth. Its largest tributary, the Lilla Lulea-Elf, which likewise rises in the Kiölen Mountains, traverses a succession of seven large lakes extending upwards of 80 miles from west to east, and afterwards runs above 20 miles before it joins the Lulea-Elf. Its bed lies in a deeper valley; its banks are imbedded in several places. The town of Lulea contains about 800 inhabitants. An older town was built farther inland by Gustavus Adolphus, but in consequence of the sea having receded from it the present site was chosen for a new town.

The country between the Lulea-Elf and Skelleftea-Elf is nearly equally divided between mountains and plains. In this part the Kiölen range rises to its greatest height in Mount Sulitelma, and extensive ranges of it are always covered with snow. The ridges branching off from it eastward are divided by wide valleys, which in their upper parts are only covered with swamps and rein-deer moss. In their lower parts forests of pines, fir, and birch are frequent, and the habitations of men begin to appear, but the soil is generally unfit for cultivation. Along the water-courses the pastures

is good. About 60 miles from the shore agriculture begins to be the principal occupation of the inhabitants, and villages are more numerous; but even here woods cover the greatest part of the country.

The Pitea-Elf rises in the extensive lake of Ponkejaure, which is inclosed by high mountain rocks, and running through the mountainous country in a south-eastern direction, traverses many smaller lakes. Here it forms numerous rapids and some considerable cataracts. About 60 miles from the coast it turns due east and falls into the sea a little below the town of Pitea, after a course of about 180 miles. It is only navigable a few miles from its mouth. The town of Pitea occupies an agreeable site on the coast: the population is about 1200. The trade of the place is chiefly in timber.

The Skelleftea-Elf rises in the north-eastern declivity of the Nasafjäll, in which there are some mines of silver which for nearly half a century past have not been worked. In the mountainous country this river traverses some lakes, and receives the waters of others by narrow channels. In the plain it takes an east-south-eastern direction to its mouth below the church of Skelleftea. The rapids in this river are more numerous than in the others, but it has fewer cataracts, so that the salmon ascend nearly to its sources. The river is only navigable for a few miles above its mouth. Its course is about 180 miles. On the banks of this river the great plain of Bothnia ceases, the country south of it being entirely hilly or mountainous, with few level tracts. The hills inland rise into mountains, with declivities covered with forests consisting chiefly of pine, birch, and fir. The level tracts along the rivers afford pasture, and are sometimes cultivated. Agriculture is more attended to in the eastern and hilly parts of the country.

In the southern portion of Bothnia the mountains in the western districts form ranges rather than groups. Some miles north of 65° N. lat. a range branches off from the Kiölen chain, which running nearly east traverses almost the whole of the Scandinavian peninsula, terminating about 30 miles west of the mouth of the Umea-Elf. This range, called the Stötting-fjäll, approaches the snow-line; and though its summits are formed of barren rocks the sides are clothed with fir, birch, and aspen, and afford good pasture. To the north of this chain runs the Oran-Elf, a considerable river, rising at some distance from the Kiölen, and running nearly east and parallel to the Stötting-fjäll. It turns to the south-east where this mountain range terminates, and soon after enters Angermanland, where after a further course of about 45 miles it falls into the sea between the villages of Angersjö and Lefvar. Its whole course may be upwards of 150 miles. To the north of the Oran-Elf runs the Umea-Elf, which rises in the Kiölen range about 66° N. lat. It first runs south, traversing some lakes; and then turns to the south-east, traverses the large lake of Stora Umea, is joined by the Windel-Elf, and falls into the gulf after a course in all of about 180 miles. The town of Umea, situated at the mouth of the river on its left bank, is the capital of Westerbothnia: its population is about 1500. It is the residence of the governor. In the neighbourhood are some mineral springs. The Windel-Elf, which rises in the Kiölen range about 66° 30' on the south declivity of the Nasafjäll and descends in a south-eastern direction with numerous bendings, is more free from cataracts than the other rivers of Bothnia, and a considerable part of it has been rendered so far navigable that timber and wood may be floated down.

Bothnia, extending on both sides of the polar circle, has of course a very cold climate, though it is much milder than other parts of the globe in the same latitude. Winter lasts in general eight months, from the beginning of October to the end of May, and the cold is very severe. It is followed almost immediately by summer, a few moderate days only intervening between the frost and a great degree of heat. In the beginning of June all traces of winter have disappeared, and the grain is sown. The great heat produced by the long days of eighteen or twenty hours, united to the moisture which has accumulated during the long winter, gives rise to a very rapid vegetation. Corn is sown and reaped in some places in the course of seven or eight weeks, and nowhere remains in the ground more than ten weeks. Nevertheless it is sometimes destroyed by night frost, which generally appears about the 20th of August for three or four nights in succession. These nights are called 'iron nights,' and are followed by about six weeks of moderate warmth. The quantity of snow which falls during the winter is very great; but in summer rain is scarce. The rivers of Bothnia overflow the low tracts along their banks twice a year; the first time in the beginning of June, after the melting of the snow in the lower parts of the country; the second towards the middle of July, when a succession of long days has produced the same effect on the mountains. The latter inundation is more favourable to the growth of grass than the former, and enables the inhabitants to maintain a large stock of cattle during the eight winter months. The soil is of an indifferent quality, sandy and stony, except along the Tornea-Elf and Muonio-Elf, where it is rather good, especially towards the shores of the gulf. Along the shores of the Gulf of Bothnia the land is better.

Wheat is only cultivated at one place, in the most southern corner of the province, and here hardly a few bushels are annually obtained. Rye is grown nearly up to 66° N. lat., and oats and barley even to 68°.

GEOL. DIV. VOL. II.

Potatoes generally succeed very well; turnips and cabbages do not thrive.

Black cattle form one of the principal sources of wealth in the provinces, but the stock is limited by the scarcity of meadows; the pasture-lands however are extensive. Butter and hides, which are the principal articles of export, are sent to Stockholm. Horses are rather numerous, and of a middling size. Sheep are only found in the south districts, and their wool is coarse. The Laplanders have considerable herds of rein-deer, and live upon their flesh and other produce.

The inhabitants of the more inland districts gain their living chiefly by fishing in the lakes, which abound in many kinds of fish, as pike, tench, trout, but especially the *Salmo lucifera*. The salmon ascends those rivers which have not high cataracts, and the number of fish taken is considerable.

The high plain between the Calix-Elf and Umea-Elf, the upper parts of the mountains, and the higher valleys, are in general covered with rein-deer moss; the remainder of the district forms nearly an interminable forest, especially in the inland country. The most common trees are birch, pine, fir, alder, and aspen. The inhabitants have hitherto derived very little advantage from this vast treasure, owing to the rivers not being navigable. In some parts along the coast tar and pitch are made for exportation.

Three nations inhabit Bothnia, the Finlanders, the Laplanders, and the Swedes. The Finlanders have settled chiefly along the banks of the Muonio-Elf and Tornea-Elf. They apply themselves especially to the rearing of cattle, and are distinguished by their skill in the management of the dairy. The Laplanders inhabit the inland district, and conduct their herds of rein-deer in the summer to the upper valleys in the mountains, and even to Norway, but in winter they descend to the lower plains on the shores. Some of them have become agriculturists, and partly adopted the manners and customs of the Swedes. The Swedes occupy the country along the shores, and the valleys on the sides of the larger rivers. They occupy themselves nearly exclusively with agriculture, except a few families in the inland districts, who gain their sustenance by fishing in the lakes.

Bothnia with Lapland is politically divided into two lands, or districts, of which the south is called Westerbothnen, or Umea Län, and the north Norrbotten, or Pitea Län.

(Buch, *Travels*; Schubert, *Travels in Sweden*; *Maps of Baron Hermelin*.)

BOTHNIA (the Gulf of), the most northern part of the Baltic Sea, extends from 60° to nearly 66° N. lat. Between 60° and 64° it lies due S. and N., but the remainder declines to the N.E. Its whole length is rather more than 400 miles.

Its entrance is formed by a strait called Alands Haf, which divides the Scandinavian peninsula from the Aland Islands that belong to the Russian government of Åbo, a part of the ancient province of Finland. This strait is from 36 miles to 50 miles wide. North of it the gulf widens suddenly, the coast of Sweden trending to the north-west, so that before it reaches 61° it has attained a width of upwards of 240 miles, which breadth it preserves nearly to 62°. Farther north it narrows gradually, till near 64° it forms another strait, called the Quarken. That portion of the gulf extending from Alands Haf to the Quarken is called Bottniska Haffet (the Sea of Bothnia). At the Quarken the coast of Sweden is about 60 miles from that of Russia, but the straits are still farther narrowed by the Swedish island Holmöe and the Russian islands Walloe, so that the free passage is only about 25 miles wide. To the north of the Quarken the gulf preserves a width of from 50 to 60 miles for some distance, but it afterwards widens to about 100 miles, which breadth continues to its northern termination. The portion of it north of the Quarken is properly called Bottniska Wicken (the Gulf of Bothnia). The coasts south of the Quarken are rocky though not high on both sides of the gulf, but in general higher on the western side, where at a few places they rise to 60 feet and upwards. To the north of the Quarken the coasts are low and sandy, with the exception of a tract near the strait on the Russian side, where they are rocky but likewise low. The largest part of the coasts of this northern portion is formed by an alluvial deposit brought down by numerous rivers. There is no want of good harbours in the gulf; but the navigation is interrupted by the ice for five months in the year to the south of the Quarken, and for six months in the year to the north of it. The southern part of the gulf is however annually navigated by some English vessels, which export timber and naval stores. Swedish and Norwegian vessels also bring these articles to England. A kind of small herrings, called by the Swedes 'strömmings,' appears in summer in great numbers on the west coast of the gulf, especially south of the Quarken, where most of the inhabitants of the coast south and north of Hernösand are occupied in catching them. The greater part are dried, but a considerable portion undergo a fermentation in a closed cask, after having previously been a little salted, and exposed to the air for a short time. The fish thus acquires a sour taste, and is called 'surströmming.' Both the dried and sour strömmings are exported to the neighbouring countries, and are used by the lower classes in a great part of Sweden. [BALTIC SEA.]

BOTHWELL, Lanarkshire, Scotland, a village in the parish of Bothwell, situated on the right bank of the river Clyde, in 55° 48' N. lat., 4° 5' W. long.; 8 miles E.S.E. from Glasgow, and 38 miles W.S.W.

from Edinburgh. The population of Bothwell parish, including the villages of Bellshill, Bothwell, Chapelhill, Holytown, Newarthill, and Uddingstone, was 15,283 in 1851.

There are interesting historical associations connected with Bothwell and its vicinity. Edward I. occupied the castle for a few days in 1301; Edward III. made it his residence for about four weeks in 1336. Dr. MacCulloch says of this castle that it is perhaps the most magnificent ruin in Scotland; Wordsworth gives a striking description of it in a note to one of his poems. Its large and bold front to the south, with the circular towers at each end, rising from the steep and wooded banks of the Clyde, produces a grand and impressive appearance. On the opposite bank of the Clyde are the ruins of the ancient priory of Blantyre. The old church of Bothwell, which was used as a place of worship till 1828, is a gothic structure of the 14th century; it is roofed with large flags of stone. Bothwell Bridge was the scene of the memorable encounter between the Covenanters and the royal forces under the Duke of Monmouth in 1679. The roadway of the bridge was then only 12 feet wide; and in the middle of the bridge was a portal with gates. These have long been removed; and a very handsome new bridge has been erected. The road has also been much widened. Near Bothwell Haugh is a bridge over the South Calder, which some writers have supposed to be of Roman construction. The Roman 'Watling Street' went through this part of the country for several miles on the north-east bank of the Clyde. The parish church, a fine gothic edifice, with an elegant tower 120 feet high, erected in 1833, will accommodate about 1200 persons. There is a chapel-of-ease at Holytown; and there are in Bothwell parish several chapels belonging to the Free Church and the United Presbyterian Church. Extensive fields of coal exist in the parish of Bothwell; iron-stone is also found in considerable quantities. There are extensive coal-pits and iron-works, with several quarries of freestone, which give employment to many of the inhabitants. By the Caledonian and other lines of railway Bothwell has communication with Edinburgh, Glasgow, Aberdeen, and Ayr; and also with England. Agricultural pursuits are skilfully and successfully followed. The climate is salubrious, and the soil is fertile. Organic remains of an interesting description have been found in the neighbourhood. William Aiton, author of 'Hortus Kewensis,' was a native of this parish. Joanna Baillie, the eminent poetess, was born in Bothwell Manse, her father, Dr. Baillie, being minister of the parish.

BOTTESFORD. [LINCOLNSHIRE.]

BOTZEN. [TYROL.]

BOUCHAIN. [NORD.]

BOUCHES-DU-RHÔNE, a department in France formed out of Basse-Provence, is bounded N. by the department of Vaucluse, from which it is separated by the Durance, E. by the department of Var, S. by the Mediterranean, and W. by the Rhône, which separates the department from that of Gard. It lies between 43° 9' and 43° 50' N. lat., 4° 13' and 5° 40' E. long.; its greatest length is along the coast, where it measures in a straight line 70 miles, but following the windings of the coast 120 miles; its greatest breadth from north to south is about 40 miles. The area is 1985 square miles: the population in 1851 was 428,989, which gives 216.12 to the square mile, being 41.40 above the average per square mile for the whole of France.

Surface, Hydrography, &c.—The department takes its name from its situation about the mouths of the Rhône (Bouches du Rhône). The northern and eastern districts are hilly, being covered by the western acclivities of the Maritime Alps, which subside with gentle slopes into the basin of the Rhône, but send out southward several calcareous ridges, which terminate abruptly. A ridge of low naked hills called Alpines runs along the Durance to its mouth in the Rhône. The hill ridges inclose numerous small basins, and from their bases plains of considerable extent stretch with gentle slope to the sea-shore. Along the shore are several lakes, separated from the sea by narrow spits of land with one or more openings. The shore to eastward is high and steep.

The rivers of the department, except those mentioned on the boundaries, are small. The Huveaune rises in the department of Var, runs through a very fertile valley between the Sainte-Baume ridge on the south, and the Étoile Mountains on the north, and falls into the sea near Marseille, to which city part of its waters are carried by an aqueduct. A high plain between the Étoile and the Sainte-Victoire Mountains is watered by the Arc, which rises near St. Maximin in the department of Var, and running west past Aix falls into the shore-lake of Berre. This river is subject to inundations, which often cause great ravages; its waters are used for purposes of irrigation and as a moving power for machinery. From the highest point of the Sainte-Victoire Mountains, which have been so named to commemorate the victory gained by Marius over the Teutones and Cimbri, a ridge called Trévaresse runs south-westward and terminates in the stony plain of Crau. The river Touloubre rises from the same point, and flowing west past Pélissane and Salon then turns south and falls into the shore-lake of Berre.

The west and south-west of the department is flat, low, and in many places marshy. At Arles the Rhône divides into two channels,

forming a delta, which is called Ile de la Camargue. One branch, called the Grand Rhône, runs to the south-east, and enters the sea below Tour St.-Louis, where it has commenced the formation of another delta. Tour St.-Louis was built about 130 years ago at the mouth of the river; it is now above three miles from the sea; and the new delta, consisting of the two *lacs* or islands of Bigne and Béricle, have been formed within that period by the deposits of the river. The Grand Rhône contains numerous islands which greatly impede the navigation; but vessels making for Arles enter the Canal-des-Martigues, which forms the entrance to the shore-lake of Berre, and immediately opposite the lighthouse called Tour-de-Bouc passes into the navigable canal de-Bouc which runs across the plain of Crau, and nearly parallel to the river up to Arles. The other branch of the Rhône is called Petit-Rhône, which runs in a very winding channel into the Mediterranean, a little to the west of the ancient village of Les-Saintes-Maries, famous for its old battlemented church. This branch of the Rhône is but a small stream, and vessels making for the interior from western ports pass out of the Mediterranean into the Beaucaire Canal.

The *Camargue*, which is entirely of alluvial and deltoid formation, and which it is supposed had no existence in the time of Julius Cæsar, contains nine villages, a great number of country houses, and is divided into about 350 farms. Its whole area is about 136,000 acres, part of which is cultivated along the channels of the Rhône, and the greater part of the remainder is covered in winter and spring with rich pastures. The island is protected from the inundations of the river by great dykes, and it is sheltered from the sea by hills of sand. The soil is a rich alluvium resting on a bed of sand, which in the lower grounds of the interior of the island is so strongly impregnated with salt as to affect the herbage and in some places prevent its growth. The interior of the island contains many reed-marshes, and large lakes, which have communication with the sea; the largest of these is the shore-lake of Valcaros. All kinds of southern produce, corn, fruits, and timber are grown in the island; the vine, the olive, and the mulberry flourish; madder and wood are grown; and on its rich pastures vast numbers of sheep, cattle, and small horses are reared. The increase afforded by the flocks and herds of the Camargue is stated at 40,000 lambs, 3000 calves, and 3000 horses annually. The sheep are of the trashumantes or restless breed. They winter in the Camargue, and are driven in spring into the plains of Crau, where lambing takes place; in May they begin to ascend the Alps, whence they return to the Camargue about the end of October. The culture of rice was introduced into the Camargue from Lombardy in 1847 with great success. The island abounds with water-fowl; locusts often do great damage to the green crops; and in summer the Camargue as well as the rest of the department is infested by mosquitoes. There is a lighthouse with a fixed light 128 feet high on the left bank of the eastern branch of the Rhône, in 43° 20' N. lat., 4° 40' 22" E. long.

Between the eastern channel of the Rhône and the shore-lake of Berre, the Alpines hills, and the sea, lies a vast triangular and arid plain called the Plain of Crau. Its surface is not level; nor is its slope towards the sea, but towards several points of the compass. Its highest part near Istres is 100 feet above the sea-level; and in various directions from this point the surface subsides into hollows, some dry, some filled with water. The central part of its area consists of a reddish-brown clay covered with silt; but there are grassy and woody spots here and there, and its borders and lowest levels are cultivated with success by a system of irrigation maintained by a branch of the Crapeyronne Canal which traverses the plain. The stones on the desert part of the Crau vary from the size of a pea to the bigness of a man's head; under and between these there is some scanty vegetation, on which during the spring large flocks of sheep feed, turning over the stones with their muzzles as they advance. In the cultivated spots, besides common products, the vine, olive, mulberry, and other fruit-trees flourish.

The department contains several extensive salt-lakes, which communicate with the sea by natural channels or by canals. The largest of these is the shore-lake of Berre, which is 12 miles long and 40 miles in circuit. It is entered by the harbour of Tour-de-Bouc, which has a lighthouse and several strong defences. The lake contains vast quantities of eels and other fish. There are several small islands inhabited by a few fishermen along the coast; the most important are those of Pomègue, Ratoneau, and If, famous for its strong fortifications and its prison at the entrance of the port of Marseille. A little south-west of these is the Isle of Planier, on which there is a lighthouse.

Communications.—The department is crossed by several canals, the most important of which is the Crapeyronne Canal, which has its summit level in the Durance, and by its branches communicates with the shore-lake of Berre and the Rhône. The Alpine or Boigelin Canal has its summit level in the Durance also, at Mallemort; it crosses the north-west of the department, and divides into several branches, which are distinguished by different names from the districts irrigated by them. The department is traversed by 5 royal and 15 departmental roads, which give a total of about 500 miles of common roadway. A railway passing through Berre and St.-Chamas runs in the department from Marseille to Arles. The aqueduct destined to convey a supply of water from the Durance to the city of Marseille

is one of the greatest works of the kind ever undertaken. It leaves the Durance at the north-eastern angle of the department; crosses highways, watercourses, and valleys; pierces three mountain ranges and several offshoots from them by tunnels; and reaches the boundary of the arid basin around Marseille at a height of nearly 500 feet above the sea. There are in all 78 tunnels, the total length of which is about 15 miles (three of them are each a league in length); and about 500 artificial constructions, including embankments, bridges, aqueducts, and cuttings. The greatest of these works is the bridge-aqueduct across the valley of the Aro, within five miles of Aix. This structure consists of three rows of arches, one above another; the piers of the two lower rows are built of cut stone, and measure 48 feet by 20 feet. The lowest row contains 12 arches, the middle 15, and the topmost, which supports the water-channel, 49 arches. Some of the stones used in the construction of the lower piers exceed 17 tons in weight. The total length of the aqueduct is 51 miles. The canal is 30 feet wide at top, 10 feet wide at bottom, and 7 feet deep. From the Durance to the edge of Marseille basin the fall is 125 feet, and it is said that this fall will admit of the delivery of 11 tons of water per second. This great work, which if not already finished, is rapidly approaching completion, besides furnishing Marseille and the numerous bastides or country houses round it with water, will afford a vast and ever-ready supply of water-power for driving machinery; and give means for irrigating a surface of nearly 25,000 acres of land, which for want of water during summer is like a parched desert.

Climate.—In December, January, and February the climate and face of the country are delightful. Frost and snow are rare. During the rest of the year the heat is very great, especially from July to the end of September. Rain seldom falls in summer, and then the scorching heat alternates with a violent cold dry wind called 'mistral,' from the north or north-west, which is very injurious to vegetation, and so impetuous as frequently to unroof houses and blow down trees. Except in the low valleys, the irrigated grounds, or in the neighbourhood of the marshes, vegetation in the summer season seems dead, and the whole surface of the ground is covered with dust. In the intervals of the mistral mosquitoes appear in countless numbers, and from these there is no respite night or day between the months of May and November. The people sleep under wire or gauze frames to keep off these restless enemies. Scorpions are not uncommon. The climate is generally healthy; but in the corn lands of the arrondissement of Arles there are many deaths among the labourers at harvest time, owing to the proximity of the marshes.

Soil and Products.—The surface of the department covers 1,270,330 acres, divided into 1,169,862 parcels. Of this area 530,000 acres are arable, 97,584 vineyards, 157,700 underwoods and forests, and 410,157 acres are heaths, marshes, and waters. Owing to the heat of the climate, the soil is in most places arid and parched, and produces nothing without irrigation. Corn is grown in large quantities only in the arrondissement of Arles. In 1846 the quantity of wine produced in the whole department amounted to 13,750,000 gallons, about one-half of which is used for home consumption, and the remainder is exported or converted into brandy. The white wines of Cassis and Ciotat, the red wines of Séon and St.-Louis in the arrondissement of Marseille, and those of Château-Regnard and Saintes-Maries in the arrondissement of Arles are the most esteemed sorts. The number of mulberry-trees for the production of silk exceeds a million. The olive is extensively cultivated, and the oils of this department are the best in France. Pomegranates, pistachios, almonds, figs, melons, citrons, capers, &c. are abundant. The cypress, myrtle, tamarisk, rose-laurel, and other odoriferous plants and herbs flourish. Great numbers of light active horses are reared; cows and goats are numerous; the number of sheep is stated at 700,000. These last are fed in the department only in the winter; during the rest of the year they pasture on the Alps. The cultivation of tobacco which had been prohibited was re-introduced in 1852.

Manufactures.—The manufacturing industry of the department is great. The most important products are brandy, soap, vinegar, soda, chemical products, broadcloth, leather, hats, and perfumes. There are several sugar-refineries, glass-works, tile and brick fields, silk, cotton, and tobacco factories, and important salt-works along the coast and on the several shore-lakes. The commerce of the department is very active with all the southern departments, with the Levant, the coasts of Africa and Spain, and the West Indies. The exports consist of the industrial products named, and dried fruits, cork, and colonial produce. The minerals include coal, iron, lead, marble, alate, gypsum, chalk, alabaster, and potters' clay. At Aix and at Camoins near Marseille there are mineral springs.

The department is divided into three arrondissements, which, with their subdivisions and population, are as follows:—

Arrondissements.	Cantons.	Communes.	Population in 1851.
1. Marseille . . .	9	22	229,214
2. Aix	10	53	112,026
3. Arles	8	33	87,749
Total	27	108	428,989

1. In the arrondissement of Marseille the chief town is MARSEILLE, which is also the capital of the department. *Aubagne*, 10 miles E. from Marseille, is built on the slope and at the foot of a hill on the left bank of the Huveaune. Coarse woollens, china, pottery, brandy, leather, and paper are manufactured. The town has a large magnanerie, or establishment for rearing silk-worms; and there is a good trade in the wines of the neighbourhood and in dried fruits: population, 6208. *Cassis*, a small well-built town on the coast, has a harbour formed by a jetty. The entrance of the harbour is dangerous in rough weather, but within it is deep: it is defended by several batteries, and on the left of it there is a lighthouse with a fixed light 90 feet high, in 43° 12' N. lat., 5° 32' E. long. The town has a population of 2100, who are employed in the coasting-trade and in ship-building. *La Ciotat* is situated 20 miles S.E. from Marseille, in a district covered with plantations of the olive, the pomegranate, and the orange, and at the bottom of a bay on the western side of the Gulf of Lècques. The town is well built, and has a harbour defended by a castle on the left, and by batteries on the small island of Ile-verte. The harbour, which admits vessels of 300 tons, is formed by a mole on which there are two lighthouses. The coasting-trade in the wines, dried fruits, and white figs of the neighbourhood, ship-building, and the manufacture of cotton-yarn, give employment to the population, which amounts to 5902. *Roquevaire*, 14 miles E. by N. from Marseille, is on the Huveaune, and has a population of 4143. The environs of this town furnish the best white and red muscadine wine and grapes of the department. *Auriol*, an irregularly-built but rather pretty village, 3 miles N. from Roquevaire, has 5103 inhabitants, who manufacture woollens, soda, bricks, tiles, brandy, paper, and raise a good deal of silk. Mines of gypsum, coal, alabaster, and red ochre are worked in the vicinity. The town is ancient. Several Roman remains have been found in it.

2. In the arrondissement of Aix the chief town is AIX. *Berre* is a small well-built walled town on the north shore of the lake of Berre; it is a station on the Arles-Marseille railroad, and has a harbour and a population of 1926, who carry on a brisk trade in salt, made in extensive saltworks along the shore, which however render the site unwholesome. *Gardanne*, 7 miles from Aix, has 509 inhabitants, who are chiefly engaged in the coal-mines, in the manufacture of brandy and tiles, and in the cultivation of melons and beet-root. *Istres* is on the south shore of the Lake Olivier, which is joined to the Etang de Berre by a canal. The town has a population of 3122. It is surrounded by old fortifications. *St.-Chamas*, a first-class station on the Arles-Marseille railway, is situated at the north-eastern extremity of the shore-lake of Berre, and near the right bank of the Touloubre, which is crossed by a bridge of Roman construction: it has a population of 2443, who trade in the produce of the country. *Lumbee*, 13 miles N.W. from Aix, on the road to Avignon, has a population of 3587, who manufacture oil, soda, and soap. The town has also establishments for reeling silk. *Les-Martigues*, 25 miles S.W. from Aix, is situated on three islands united by bridges at the extremity of the channel which joins the harbour of Tour-de-Bouc to the Berre Lake. It is well built, contains a fine church, an hospital, and several good streets, and has a population of 7772. Its position on islands has obtained for it the name of 'Provençal Venice.' Its port is frequented by small craft from Arles and the coast of Genoa. The inhabitants are largely engaged in the tunny and pilchard fishery. *Salon*, 20 miles W. from Aix on the road to Arles, is situated in a fertile plain, irrigated by the Canal de Craonne, and has a population of 5617. It is irregularly built, but contains some good houses and two very ancient churches. There are oil-mills, soaperies, and establishments for bleaching wax and reeling silk. *Trets*, an ancient town, 11 miles S.E. from Aix, has 3039 inhabitants, who manufacture brandy, tiles, and sugar-of-lead. A coal-mine is worked near Trets.

3. In the arrondissement of Arles the chief town is ARLES. *Château-Regnard* is 17 miles N.E. from Arles, on the left bank of the Durance. It takes its name from an old ruined castle on a hill above the town: the population is 4744. *Eyguières* is situated amidst olive-plantations near the Craonne Canal, and has 2920 inhabitants. *Orgon*, 22 miles N.E. from Arles, is built on the slope of a hill, the summit of which is covered with the ruins of an ancient castle. Between the hill and the Durance there is only room for the high road and the Boisgelin Canal to pass. The town has 2748 inhabitants, who are chiefly employed in agriculture. *St.-Rémy*, 13 miles N.E. from Arles, stands in a plain covered with olive-plantations, and has a population of 5930. It is irregularly built, but contains many good houses of an ancient style of architecture. Wool, silk, and agricultural produce are the chief articles of trade. There are several Roman remains here. *Tarascon-sur-Rhône* (the Roman Tarasco), 10 miles N. from Arles on the left bank of the Rhône opposite Beaucaire, to which it is joined by a suspension-bridge, is a walled town defended by towers, and entered by three gates. It is commanded by an ancient castle, built on a rock above the Rhône. Tarascon is a well-built town. The ancient church of Sainte-Martha, the town-hall, court-house, theatre, the two hospitals, and the barracks, are the most important public buildings. A tribunal of first instance sits in the town, which has also a college and a public library. Woollens, serge, silks, calico, vermicelli, soap, cordage, starch, brandy, bricks, tiles, and leather are manufactured. Small vessels for the river traffic are built. The

articles named, together with wine, oil, wood, coal, almonds, madder, teasels, medicinal plants, seeds, &c., form the items of a brisk trade. The town has about 10,000 inhabitants.

The arrondissement of Marseille forms the bishopric of Marseille. The rest of the department forms the archdiocese of Aix. The whole department is under the jurisdiction of the High Court and University Academy of Aix, and belongs to the 9th Military Division, of which Marseille is head-quarters.

(*Dictionnaire de la France*, 1845.)

BOUFARICK. [ALGERIE.]

BOUGAINVILLE ISLAND. [NEW GEORGIA ARCHIPELAGO.]

BOUGHTON, GREAT, Cheshire, a township and the seat of a Poor-Law Union, in the parish of St. Oswald and hundred of Broxton, one mile E. from Chester, and 182 miles N.W. from London by road. The Chester and Crewe railway passes through the parish: the population of the township in 1851 was 1164. The living of St. Oswald's is a vicarage in the archdeaconry and diocese of Chester. Great Boughton Poor-Law Union contains 100 parishes and townships, with an area of 97,109 acres, and a population in 1851 of 26,570. Great Boughton is becoming a suburb to the city of Chester. It contains some good residences. There is a National school at Great Boughton.

BOUILLON, the capital of the ancient duchy of Bouillon, now forming the western part of the Belgian province of Luxembourg, is situated near the French frontier on the left bank of the river Semois, and 14 miles from its junction with the Meuse, in 49° 48' N. lat., 4° 59' E. long.: population, 2800. The duchy is a hilly district lying in the middle of the Ardennes, and between the former grand duchy of Luxembourg and Champagne.

The town is small but neatly built. The castle of Bouillon, which was formerly thought to be impregnable, is built upon a steep rock overlooking the town: it has been recently repaired, and is now used as a military prison. The dungeons are hewn out of the solid rock.

The town and duchy of Bouillon were the hereditary possessions of Godfrey, the leader of the first Crusade and king of Jerusalem, which city he took in 1099. To provide funds for his expedition, Godfrey sold the duchy to Albert, bishop of Liège, subject to the right of redemption on the part of the vendor or his immediate heirs. Godfrey having died in the Holy Land, this sale became cause of dispute between his heirs and the bishop, each party having recourse to arms in support of their pretensions. After this petty war had been renewed at so many different times as to obtain for the duchy the name of 'the Debatable Land,' it remained for some time in the peaceable possession of the prince bishop of Liège. The bishop having taken part in the war against France, Louis XIV. caused the town and castle of Bouillon to be seized in 1672, and at the congress of Nimueggen in 1678 it was stipulated that France should retain possession until arbitrators to be appointed for the purpose should have decided between the claims for the duchy set up by the descendants of the heirs of Godfrey and the Bishop of Liège. In the meanwhile Louis had invested the family of La Tour d'Auvergne with the duchy. A descendant of that house, Philip d'Anvergne, a captain in the English navy, assumed in 1792 the title of 'Prince de Bouillon,' which he continued to bear until his death in 1816. The long-disputed territory was adjudged by the congress of Vienna in 1815 to the king of the United Netherlands, as duke of Luxembourg: in the division of that duchy, consequent upon the revolution of 1830, Bouillon fell to the share of Belgium.

BOUILLY. [AUBE.]

BOULAC. [CAIRO.]

BOULOGNE. [SEINE, Department of.]

BOULOGNE-SUR-MER, a seaport town in the department of Pas-de-Calais in France, stands in 50° 44' N. lat., 1° 35' E. long., at the mouth of the Liane, which falls into the English Channel and forms the harbour. It is 170 miles distant N.N.W. from Paris by railroad through Amiens and Abbeville, and 29 miles from Folkestone on the coast of Kent: the population is said to exceed 30,000, about one-fifth of whom are English.

Boulogne occupies the site of the ancient *Gesoriacum*, which was in the territory of the Morini, a tribe of the Belgæ. (Mela, iii. 2.) It became, under the Romans, the chief port of embarkation for Britain. Some writers have maintained that Julius Cæsar embarked from *Gesoriacum* for Britain; but D'Anville and other high authorities identify the *Portus Itius* of Cæsar with Witsand or Wissant, a small town to eastward near Cape Grinez. D'Anville thinks it was at *Gesoriacum* that the tower was erected by Caligula, when he marched to the coast of Gaul in order to invade Britain; and according to Suetonius the emperor Claudius embarked here for that island. The port in Britain with which a communication was maintained was Rutupin, now Richborough, near Sandwich. About the time of Constantine, the name of Bononia was substituted for that of *Gesoriacum*. In 1231 Philippe, son of King Philippe Auguste of France, caused new walls to be built, inclosing a smaller space than had been occupied by the Roman town. This inclosure was that of the upper town, at the eastern angle of which a citadel was built by the same Philippe. Boulogne had before this time been erected into a county, of which Philippe had acquired possession by marriage. In 1544 the town was taken by Henry VIII., who added

greatly to its defences. Edward VI. restored Boulogne to France in 1550. The ramparts of the upper town are still standing: they are planted with a double row of trees, and command a view of the lower town, the sea, and in fine weather of the coast of England. The upper town is entered by three gates. The citadel is used as an armoury and barrack, and its vaults are converted into a powder magazine. Boulogne was in 1804 the central rendezvous of the army which Napoleon had assembled for the invasion of England. A Doric column erected on the cliff about a mile from the town was commenced by the grand army, but not completed till after the restoration of the Bourbons—an event which it was then made to commemorate. In 1841 it was restored to its original purpose, and surmounted by a statue of Napoleon 16 feet high. The height of the column, which is built of marble, is 164 feet.

Since the peace of 1815 Boulogne has much increased in extent and population. It is much resorted to as a bathing-place, and many English families have made it their permanent residence. The upper town is the most ancient part of Boulogne; it has for the most part narrow irregular streets, but good houses. A house in the street leading to the Calais gate is marked with an inscription as the birthplace of Le Sage, author of 'Gil Blas.' (The English poets Churchill and Campbell died in Boulogne.) The lower town, which is connected with the upper town by a long, wide, and well-built but steep street called the Grande Rue, extends down the slope of the hill to the river. This part is regularly built. There is also a large suburb called *Capécure*, on the left bank of the Liane. The lower town is larger, more populous, and more commercial than the upper town. The supply of water is by means of fountains, of which there are 5 in the upper town, and 12 in the lower. The town is well lighted with gas. There are promenades on the ramparts of the upper town; and there is an open space called the *Tintilleries*, on the north side of the lower town which is bordered with trees, and surrounded with new streets and elegant houses, inhabited very generally by English families. The sands are of considerable extent, and form an excellent promenade at low water.

Among the public buildings of the upper town are the town-hall, which occupies the site of the palace of the counts of Boulogne; the Belfroi, an ancient tower 140 feet high, commanding from its summit a fine view of the town and harbour; the court-house; the former episcopal palace, now used as a boarding school; and the prison. The finest building however in the old town is the cathedral of Notre-Dame, which was commenced in 1827, and is now completed. It stands on the site of the cathedral which was destroyed in the first revolution. In the lower town are the hotel of the sub-prefect; the church of St. Nicholas; the building formerly a seminary for the priesthood, and now occupied by several institutions for the promotion of science; the barracks; the great hospital; a museum (in the Grande Rue) which contains collections of natural history and antiquities, paintings, casts, and also the public free library of 25,000 volumes. There are in Boulogne several churches; three convents, the nuns of which educate a vast number of young children, who attend the different schools under their direction; several Protestant chapels; an infant asylum; a humane society; several elementary schools under the direction of the Christian Brothers; a free school for navigation; and several boarding schools. Of places of amusement may be mentioned the theatre, and the splendid bathing establishment which contains music, reading, and card-rooms. Boulogne is the seat of tribunals of first instance and of commerce. The railway station is situated on the left bank of the Liane near Place Bellevue.

Boulogne is a tide harbour. The entrance to it is formed by two piers, of which the western extends 2204 feet into the sea, and the eastern 1640 feet. The depth of water between them is at high tides as much as 30 feet. Having passed this channel, vessels reach an inner basin surrounded by quays, which extend a good way up the Liane. Above the basin a considerable body of water is kept in the bed of the Liane by means of sluices for the purpose of cleansing the harbour. At low water the inner basin is empty, and vessels rest on the mud: it has lately been proposed to convert it into a wet dock. The entrance to the harbour is defended by forts and batteries. The trade of the town is considerable. The herring and mackerel fisheries call into employment a considerable capital, and several vessels are fitted out for the Newfoundland cod fishery. Coarse woollens, sailcloths, pottery, nets, and tulles are manufactured. There are also a linen-yarn factory which contains 3000 spindles, glass-bottle works, rope-walks, gin distilleries, sugar refineries, tanneries, tile and brick works. The coasting trade is active. There is constant communication with London, Dover, and Folkestone by steamers. Boulogne is one of the principal ports for the passenger traffic between England and France: the number of passengers from and to England in 1849 and 1850 amounted to 64,997, and 86,415 respectively.

Several Roman antiquities including medals and tombs have been discovered at Boulogne. On a cliff to the left of the entrance to the port stood Caligula's tower. It was an octagon; each side is said to have been about 26 feet at the base, and it rose to the height of 125 feet. It had 12 stages or floors, and the diameter of the tower appears to have diminished 3 feet at each stage, so as to form so

many external galleries of a foot and a half in width; going all round the tower. On the top of the tower lights were placed, so that it served as a lighthouse to vessels navigating the channel. The tower was built with iron gray-stone, three tiers together, succeeded by a double tier of a yellow stone of a softer texture, and on this a double tier of very hard and red bricks. At the time of its erection it stood more than a bow-shot from the sea, but the cliff was so much excavated by the waves, and fell in so far, that the tower was at last undermined and overthrown in the year 1644. It had been repaired by Charlemagne in the early part of the 9th century; and when the English were in possession of Boulogne they surrounded this tower with a wall and towers, so as to convert it into a donjon or keep of a fortress. These walls and towers shared the fate of the original Roman work in being overthrown by the advance of the sea. The tower was named in the middle ages 'Turre Ordans' (supposed to be a corruption of 'ardens,' burning) or Ordensis; and the cliff in this direction is still spoken of as the Tour d'Ordre.

BOULONNAIS, a district in the former province of Picardie, which now forms the arrondissement of Boulogne, in the department of PAS-DE-CALAIS.

BOURBON, THE ISLE OF, is situated in the Indian Ocean, to the eastward of Madagascar. St-Denis, the chief town on the island, stands at its north-western extremity, in 20° 52' S. lat., 55° 57' E. long. From Point des Galets near St-Denis the island, which is in form an irregular oval, extends upwards of 40 miles to Point de la Table at the south-eastern extremity.

This island was discovered by the Portuguese navigator Mascarenhas in 1542, and at that time was not inhabited. It received the name of Mascarenhas or Mascareigne. The French in 1642 sent some criminals from Madagascar to it, and settled a colony in 1649, when they gave it the name of Bourbon, which at the beginning of the French revolution was changed into that of Réunion, and afterwards into Bonaparte and Napoleon. In 1815, on the restoration of the Bourbons, the island resumed its old name of Bourbon. After the revolution of 1848 it again received the name of Réunion.

Probably all the island owes its origin to volcanic agency. The greater part of its surface consists of lava, basalt, and other volcanic productions, and on the remainder traces of such rocks are frequent. The island consists of two systems of volcanic mountains and rocks, and a kind of plain which divides them. The north-western mountains form the larger system and cover about half the surface of the island. Nearly in their centre rises a huge mass of lava with three inaccessible peaks, called the Salazie, whose absolute elevation is estimated by Bory de St. Vincent at nearly 1500 toises, or 9600 feet. The country surrounding this mass exhibits large tracts of lava or basaltic rocks of the most various description, and between them some basins or vales. The basaltic prisms are frequently disposed in regular columns, but these as well as the lava rocks are frequently split by deep narrow crevices. There is here an excellent mineral spring, the Salazie, at an elevation of 2861 feet. Another spring called the Cilaos or Silhaus is at an elevation of 3655 feet. The principal eminence on the island, the Peton des Neiges, or the Snowy Peak, is situated near the centre of the island and forms the crest of a bold rocky ridge dividing the Cilaos from the Salazie ridge of mountains. The rivers are only torrents, which descend from a great elevation. Sometimes they are nearly dry; at others they carry great volumes of water, which they pour down the steep declivities with incredible impetuosity. Their course is through extremely narrow gorges, and in deep beds. Between St-Denis and the 'burnt land' on the windward or north-east side of the island there are fifteen streams, of which the eight named as follows may be regarded as rivers:—The river of the East, the river of Maronière, the river of Rocks, the Dumas or Du Mat, the St-Jean, the Ste-Suzanne, the river of the Rain, and the river of St-Denis, which flows into the sea at a short distance west from the town. On the leeward side of the island are five streams, of which the river Des Galets and the river St-Stephen are the principal.

The shores of the island are rocky, but not generally very high, except along the south-west coast between St-Paul and St-Petre. In a few places a narrow beach separates the rocks from the sea; it is composed of pieces of basalt and broken lava, which have undergone trituration in the sea, and afterwards been thrown ashore, intermixed with some calcareous pebbles and shells.

The plains which separate the volcanic region in the north-west from that in the south-east district of the island, occupy perhaps one-third of the island. The two principal plains which extend across the island, the plains of the Kaffirs and of the Palmists, are divided by a rampart of volcanic rocks, and are at a considerable elevation above the level of the sea. From the south shores the country rises gradually for some miles, and then extends in a kind of uneven plain, called the plain of the Kaffirs. Its surface is a succession of small plains, rising above one another and intersected by hillocks. At the south extremity this plain is 3600 feet above the sea, but where it joins the plain of Cilaos towards the south-east volcanic region, its elevation may be nearly 5000 feet. To the north of it extends the plain of the Palmists, which rises to about 3000 feet. It is a perfect level, in the form of a circus, inclosed on all sides, except towards the shores on the north, by a nearly perpendicular

wall of mountains from 1500 to 2000 feet elevation, which are partly covered with high trees and rich vegetation: on the plain itself many trees are found, among which the species of palms abounds, from which it derives its name. The descent to the shore is somewhat longer than on the south declivity of the island. The traveller ascends from the plain of the Kaffirs to the south-east volcanic region by two other extremely sterile plains, those of Cilaos and of the Sands (aux Sables).

This volcanic region at the south-east extremity, which probably does not occupy more than one-seventh of the island, is called the burned land (pays brûlé), from its soil being entirely composed of recent lava. There are few places in which signs of vegetation are seen. Nearly in its centre is the present crater of the volcano, which nearly every year changes its place over an extent of 5 to 6 square miles. This centre of volcanic agency is only from 8 to 9 miles from the south-west extremity of the island, and the high mountains near it are estimated to have an absolute elevation of about 8000 feet. In November 1828 the volcano was in a state of activity, and the summit of the mountain was visible above the horizon from a distance of nearly 100 miles.

A soil so arid as that of Bourbon could not maintain a vigorous vegetation if it were not continually supplied with sufficient moisture by the regular succession of land and sea-breezes. The first, blowing from the high mountains of the interior, are always cool, frequently cold; and in the gorges they blow with great force. It ceases at about 10 o'clock in the morning, and is succeeded by the sea-breeze, which brings with it fogs. These fogs are afterwards dissipated by the rays of the sun, and driven again to the sea. This circulation of the vapours produces a great humidity, and a considerable quantity of rain falls. But in despite of this humidity, the climate is one of the most pleasant and most healthy to be found. The mean minimum of temperature as ascertained by observations was 72° in 1818, and 71° in 1819; the mean maximum in 1818 was 82°, and the same in 1819. The mean temperature throughout the year in 1818 was 77°; in 1819 it was 76°75°. A considerable difference is observed between the temperature in the sun and in the shade, the difference amounting to nearly 50° Fahrenheit. The difference in length of the longest and the shortest day is about two hours and a half, the longest being 13 hours, 16 minutes, and the shortest 10 hours, 44 minutes. On June 12th and December 12th the sun rises at 38 minutes past 6, and sets at 22 minutes past 5 o'clock. During the winter the highest peaks on the island are covered with snow. Hurricanes which are generally very violent and occasion much damage occur twice or thrice a year.

Except in one or two places the interior of the island is not inhabited, and perhaps not habitable on account of the sterility of its soil. The cultivated ground extends only about five or six miles from the sea. Among the productions of the island are maize, manioc, sweet potatoes, ignames, haricots, mangoes, mangosteens, strawberries, grapes, plantains, pine-apples, and custard apples. Vanilla and chocolate plants flourish; coffee and cinnamon grow well, although not now much cultivated, the attention of cultivators having been of late years chiefly directed to the production of sugar. Almost every variety of tropical fruits can be grown in perfection. In many parts of the interior, particularly at the feet of the higher mountains, are extensive forests of timber-trees. The sugar cultivation is now entirely carried on by means of Coolies from the Malabar Coast. Of these Indian labourers there are about 20,000 on the island. Many of these who were formerly slaves, and who were emancipated by the decree of the provisional government of the French Republic in April 1848, have squatted on patches of ground in various parts of the island, living on the produce of their small plots, from which they obtain often a very insufficient amount of provisions for the support of themselves and families.

There are very few European families on the island. The entire population was returned in 1841 as 106,632, of whom 65,993 were then slaves. We have no recent information of a definite character respecting the number of the population. The Governor resides at St-Denis, where the supreme courts of the island are held. The field force of regular troops amounts to about 2000 men, including upwards of 100 gens-d'arme who are employed throughout the island as a mounted police. There is also a considerable military force. Two great roads are carried round the entire circumference of the island, except where interrupted for a short interval by the rocky character of the coast. One of the roads follows the line of the seaboard; the other is a little inland. There are also many good roads in the interior, some of which pass along the sides of high hills and cross numerous ravines and river channels by bridges generally made of wood, some on the suspension principle, and others of more or less elaborate construction.

As the island does not produce much of importance besides sugar, which is raised for exportation, the inhabitants are obliged to import a considerable amount of provisions. Beef is brought from Mauritius, mutton and corn from the Cape of Good Hope, and rice with some gram from India. Wines and general merchandise are brought from France, and horses from the Cape.

The town of St-Denis has a population of about 8000. It has no harbour, and only an open and dangerous roadstead. There are two

piers: not one of these, which is secured by iron chains, passengers land from the boats, ascending to the pier by a ladder placed for the purpose, a process which as might be expected is often attended with danger. In other parts of the island however the nature of the coast is such that persons wishing to land must first jump into the water. The roadstead at St.-Paul is perhaps rather better than that at St.-Denis, but there is no other place round the island where vessels may obtain an anchorage. The town of St.-Denis is neatly and regularly laid out at the foot and on the side of a hill which ascends with a gradual slope, affording facilities for drainage. The houses are generally constructed of wood, with a shingle roof. The public buildings include the Governor's house, the Palais de Justice, or Supreme Court of the island, three churches, the Central College, or Lycée Colonial, the military barracks and hospital, and a small theatre. A Roman Catholic bishop has been lately appointed to the island. The village of St.-Andre is situated on the road from St.-Denis to the Salazie spring. The valley in which the Salazie spring is situated contains a population of about 3000. The Island of Bourbon is the only settlement which the French now possess between Africa and India.

(Bory de St. Vincent, *Voyage dans les Quatre Isles de la Mer Africaine*; Thomas, *Essai de Statistique de l'Isle de Bourbon*; *Rough Notes of a Trip to Réunion, Mauritius, and Ceylon*, by Fred. J. Mouat, M.D., Calcutta, 1852.)

BOURBON L'ARCHAMBAULT. [ALLIER.]

BOURBON-LANCY. [SAÔNE-ET-LOIRE.]

BOURBON-VEKDÉE. [VENDÉE.]

BOURBONNE LES BAINS. [MARNE, HAUTE.]

BOURBONNOIS, a district of Central France, one of the 32 provinces or military governments into which, before the revolution, that kingdom was divided. It was bounded N. by Berri and Nivernois; E. by Bourgogne; S.E. by Lyonnais; S. by Auvergne; S.W. by La-Marche; and W. by Berri. Its greatest length was 92 miles, and its greatest breadth was 56 miles. It now forms the department of Allier, and the arrondissement of St.-Amand in the department of Cher.

Moulins, on the Allier, was the capital. The other chief towns were Bourbon l'Archambault, Gannat, and Montluçon. [ALLIER; CHER.]

BOURBOURG. [NORD.]

BOURÉ. [BAMBARRA.]

BOURG, the name of several places in France, which are distinguished from each other by some surname, and will be found noticed in the following departments—AIN; ARDÈCHE; DRÔME; GIRONDE; INDRE; ISÈRE; LOIRE; LOIRE-INFÉRIEURE.

BOURGAÑEUF. [CREUSE.]

BOURGÉS, a city of France, formerly capital of the province of Berri, now of the department of Cher, is situated at the junction of the Auron, the Yèvre, and the Yèvrete, which throw their united waters into the Cher. It stands in 47° 5' N. lat., 2° 23' 43" E. long., at a distance of about 70 miles S. by E. from Orleans by railroad: population, 22,826.

This city is built on the site of Avaricum, which was the capital of the Bituriges Cubi. Avaricum was besieged by Julius Cæsar in the war against Vercingetorix, and taken by storm after a most determined resistance on the part of the inhabitants, who were all put to the sword without respect to age or sex. ('Bell. Gall.' vii. 13-38.) It was afterwards fortified by the Romans, and became at an early period of the Christian era the seat of a bishop. Towards the close of the Roman period it lost the name of Avaricum, which was taken from the Avari, now the Yèvre, and assumed that of Bituriges, from which the modern name is derived. In 475 the town came into the hands of the Visigoths, from whom it passed to the Franks, in consequence of the victory of Clovis at Vouillé. In the early ages of the French monarchy Bourges suffered much from the ravages of war, but it was repaired by Charlemagne, and afterwards by Philippe Auguste. In the disputes of the houses of Bourgogne and Orleans it stood a long siege directed by Charles VI. in person. In 1562 it was seized and garrisoned by the Huguenots, who were driven out of it by the royal troops on the 1st of September of the same year.

Bourges is divided into an old and a new town, the latter extending on every side round the former, which stands on a hill. The streets are crooked; and the gable ends of the houses, which are low and roofed with tiles, give the town a very homely aspect. Bourges was formerly surrounded by ramparts, which were defended by 24 towers. Some of the towers are still standing, but the ramparts have been levelled and converted into promenades. Within the circuit of the ramparts are several gardens and many open spaces laid out in walks and planted with poplars and limes. Many of the streets present only dead walls to the view; but within these are good mansions with court-yards and gardens. These mansions are inhabited chiefly by gentry of the old regime, a class of which Bourges possesses a greater number than perhaps any other provincial town in France.

Bourges formerly had a university of great repute, which was suppressed at the revolution, when the town suffered greatly from the excesses of that period. The cathedral of St.-Étienne, which escaped the ravages of the revolution, is one of the noblest gothic edifices in Europe. It stands on the highest spot in the city; its west front, which is flanked by two massive towers, is pierced by five deeply-recessed portals all richly ornamented, the central one presenting a sculptured representation of the last judgment. The edifice

is 370 feet long and 131 feet wide. The vaulted roof of the nave, which is 121 feet high and 40 feet wide, is supported by columns 35 feet high, and of great delicacy of workmanship. The interior is lighted through 59 magnificent painted windows, some of which are as old as the 12th century. The town-hall was formerly the house of Jacques Cour, the richest subject of his time, whose treasures enabled Charles VII. to re-conquer the country from the English. This edifice is in the richest style of the architecture of the 15th century. The archiepiscopal palace is a building of great magnificence: the garden attached to it is used as a public promenade. The other remarkable buildings are the churches of Notre-Dame and St.-Bonnet, the prefect's house built on the site of the old palace of the dukes of Berri, the former ecclesiastical college, now used for barracks, and the house of Louis XI., a beautiful structure of the Renaissance style.

Bourges is the seat of an archbishop whose see consists of the departments of Cher and Indre, and whose suffragans are the bishops of Clermont, Limoges, Le-Puy, Tulle, and St.-Flour. The archbishop formerly took the title of patriarch and primate of Aquitaine. The bishopric of Bourges dates from A.D. 252.

Bourges is the seat of a High Court and a University Academy. It is also the head-quarters of the 19th Military Division which includes the departments of Cher, Nièvre, Allier, and Indre. There are in the town a public library containing 20,000 volumes, an ecclesiastical college, a theatre, several hospitals, a museum of antiquities, &c. In the neighbourhood there is a mineral spring. The chief manufactures are broadcloth, blankets, cutlery, saltpetre, jewellery and plate, beer, and leather. Of these articles, and of corn, hemp, wool, skins, and wood, the trade of the town consists. Tribunals of first instance and of commerce are held in the town.

BOURGOGNE (*Burgundy*), a former province of France, was bounded N. by Champagne, E. by Franche-Comté, S. by Beaujolais, and W. by Bourbonnois and Nivernois. Its length from Bar-sur-Seine to Mirebel, near Lyon, was 150 miles, and from Auxonne to Vézelay it measured 80 miles. Before the revolution it formed one of the most important governments of France. It was divided into several territories, of which the principal were—*Dijonnais* of which Dijon was the capital; the territory of *Montagne*, which had Châtillon for its chief town; *Bresse*, of which the capital was Bourg; the district of *Ger*, of which Gex was the capital; and the principality of *Dombes*, the chief town of which was Trévoux. Bourgogne now forms the departments of Côte-d'Or, Saône-et-Loire, Yonne, and part of those of AIN and AUBE. The capital of the province was Dijon. Bourgogne is very fertile, and is particularly famous for its wines, the best kinds of which are those of Volnay, Meursault, Romanée, Clos-Vougeot, Chambertin, Nuits, and Pomard.

This country was in ancient times inhabited chiefly by the *Ædui*, a powerful Celtic tribe, whose capital was Bibracte, the modern Autun. In the division of Gallia under Augustus into four provinces it was comprised in Gallia Lugdunensis. Early in the 5th century the Burgundiones, a Vandalic horde, established themselves in the country and founded a powerful kingdom, which was from them named Bourgogne. This kingdom did not coincide in extent with the province of Bourgogne, but was much larger, including also the basin of the Rhône, and part of that of the Loire, together with Savoy. About the year 1032 the kingdom of Burgundy, or of Arles, as it was then called, terminated, having come into the possession of Conrad, emperor of Germany. Somewhat later Burgundy was governed by hereditary dukes, the last of whom was Charles the Rash, who fell at the siege of Nancy in 1477. As he left no male issue the duchy, which was then nearly co-extensive with the province of Bourgogne, reverted to the crown of France, and has ever since belonged to that country. The history of Bourgogne belongs to another department of the 'English Cyclopædia.'

BOURGOIN. [ISÈRE.]

BOURNE, Lincolnshire, a market town and the seat of a Poor-Law Union, in the parish of Bourne, wapentake of Aveling and parts of Kesteven, is situated on the road from London to Lincoln, in 52° 47' N. lat., 0° 22' W. long., 35 miles S. by E. from Lincoln, and 97 miles N. by W. from London. Spalding station on the Great Northern railway, which is about 9 miles from Bourne, is 93 miles from London: the population of the town of Bourne in 1851 was 2789. The living is a vicarage in the archdeaconry and diocese of Lincoln. Bourne Poor-Law Union contains 37 parishes and townships, with an area of 84,962 acres, and a population in 1851 of 22,435.

Bourne had in Saxon times a castle, which was the seat of a lordship of some note. A bourn or brook rises on the western side of the town, and after a circuitous route joins the Gradyke, which is navigable for small craft to Market-Deeping and Stamford. The church, formerly an abbey church, is in the Norman and early English style with two towers: of the towers, the one which is standing is ruinous. There are places of worship for Baptists, Wesleyan Methodists, and Independents. The endowed Grammar school, founded by a Mr. Trollope in 1636, has an income from endowment of 30l. a year, and had 14 scholars in 1852. There are National schools for boys and girls, and a mechanics library. Bourne chiefly consists of four streets which diverge from the spacious market place. In the

centre of the market place is the town-hall, a substantial building erected in 1822 at a cost of 3600*l*. The quarter-sessions are held in this building. The streets are lighted with gas. A county court is held in Bourne. The population of Bourne is chiefly agricultural. There are breweries, malt-houses, and tanneries in the town. A tessellated pavement and some Roman coins have been dug up in the neighbourhood.

BOUSSU. [HAINAULT.]

BOW ISLAND (HE-OW), the largest of the coral islands in the Dangerous Archipelago, was discovered by Bougainville in 1768, who gave it the name of La Harpe; it was visited in the following year by Cook, who gave it the present name. It lies north-west and south-east, is very irregular in shape, and 30 miles in length, with an average breadth of 5 miles. The form is the same as that of other coral islands, confining within a low narrow band of coral, about a quarter of a mile wide, a spacious lagoon studded with knolls, and an average depth of about 120 feet between them. The windward (eastern) side is higher than the other, which, with the exception of a few clusters of trees and heaps of sand, is little more than a reef, over which the sea washes into the lake; but there is no passage even for a boat, except in one spot which may be entered by a large ship. This opening lies at the north end of the island, and is only 115 feet broad from reef to reef, with a coral knoll in the centre. Within the lagoon the anchorage is perfectly secure; the bottom is generally of a fine white sand. Water may be got by digging through the sand into the coral rock. Wood may also be procured, chiefly of the pumphia acilula, of a dark-red colour, and very hard; there are also cocoa-nut, palm, and pandanus trees. The lagoon abounds in shell-fish, particularly of the pearl-oyster kind. The inhabitants of the island are an indolent ill-looking race, with broad flat noses, sunk eyes, thick lips, and long bushy hair matted with dirt and vermin. Their stature is above the middle size, but they are generally crooked; their limbs are long, muscles flaccid, and their only covering is the mato round the waist. They appear to have been cannibals. They still show a partiality for raw food, in which state they devour fish, or turtle which are sometimes found on the shore. (Beechey, *Voyage to the Pacific and Behring's Straits*.)

BOW, STRATFORD-LE. [MIDDLESEX.]

BOYLE, county of Roscommon, Ireland, in the parish and barony of Boyle, a post-town and the seat of a Poor-Law Union, is situated in 53° 57' N. lat., 8° 16' W. long.; 108 miles W.N.W. from Dublin on the leading road to Sligo. The population in 1851 was 3483 exclusive of 872 persons in the Union workhouse. Boyle Poor-Law Union comprises 83 electoral divisions, with an area of 159,680 acres and a population in 1841 of 68,490, in 1851 of 47,805.

The town is built on both banks of the Boyle River, a mile above its expansion into Lough Key, and 10 miles west of its junction with the Shannon at Carrick-on-Shannon. Three bridges cross the Boyle, which here flows from west to east between steep banks and through a picturesque country. On the right side of the river is the more modern part of the town, containing the sessions house situated in a handsome area, of which one side is formed by a crescent, and remarkable for the neatness of many of the houses. In the older section of the town on the left bank of the river, the picturesque ruins of the Abbey of Boyle, and the manorial residence of the King family, now converted into a barrack, constitute the principal objects. The town is well-built, chiefly of limestone; but red sandstone is employed in the abbey and the public buildings. Lord Lorton's magnificent seat of Rockingham lies immediately adjacent on the banks of Lough Key. The town carries on a considerable retail trade in the supply of imported articles to the neighbouring districts of Roscommon and Sligo, and has a large market for corn and butter. The adjoining country has been much improved. The Irish Annals of Boyle, which have been published in Latin and English, commence A.D. 420 and terminate about the period of their compilation in A.D. 1245. The abbey is a structure of the latter end of the 12th century. Its remains are considerable. The nave is 131 feet in length by 25 feet in breadth, exclusive of the side aisles which have disappeared. The building was reduced to its present ruined state by the army of the Earl of Tyrone in 1595. Boyle returned two members to the Irish Parliament; it retains a manor court of small jurisdiction the only remnant of its former municipal privileges.

BOYNE, a river of Ireland, rises near Carberry, in the barony of Carberry and county of Kildare, whence flowing west not far from Edenderry in the King's County, it receives the waters of that portion of the bog of Allen lying immediately north of the line of the Grand Canal; thence turning to the north-east, it receives the Yellow and Milltown rivers out of the bogs extending from Croghan Hill to Tyrrell's Pass in the county of Westmeath. Soon after this it enters the county of Meath at Clonard, crosses the Royal Canal, and receives the Doel, a large stream flowing parallel to the Yellow River from Mullingar in Westmeath. The Boyne having now left the district of the bog of Allen, flows through the rich plains of Meath, receiving the waters of many small rivers, till passing Trim, where its banks are crowned with the lofty ruins of numerous abbeys and castles, it sweeps past the base of Tara Hill in a more northerly direction to Navan, where it meets the Blackwater, descending by a south-east course from the Lake of Virginia on the confines of Cavan. The

united rivers now become navigable at a distance of 25 English miles direct from the sea, and resuming a more easterly course by Slane and Oldbridge, proceed along the south part of the county of Louth to Drogheda, and thence to the Irish Channel, which the Boyne enters after a winding course of about 60 miles from its source. The navigation of the Boyne from Drogheda to Navan was effected by a company in 1770, and is now vested in the Irish Board of Works. The principal articles carried are coals, wheat, flour, and timber. The revenue is small, the tolls in 1850 being 463*l*. 9*s*. 9*d*. This amount is considerably less than that received in previous years, in consequence of the opening of the Drogheda and Navan branch railway, which runs near and almost parallel to the line of water-carriage. The rate of toll on the Boyne navigation was in 1850 considerably reduced to accommodate the traffic. The Boyne divides the county of Meath diagonally into two nearly equal parts. Its whole course through this county affords rich landscape scenery, the descent of the river being in general gradual, and the sloping banks abounding in historical interest. The river has been called the 'Boyne of Science,' from the number of monastic institutions on or not far from its banks, among which may be enumerated Clonard, Trim, Bective, Donaghmore, Slane, Mellifont, Monasterboice, and the various religious foundations of Drogheda. The Boyne however derives its chief interest from the important battle fought on its banks on the 1st of July, 1690, between the English army under William III. and the Irish under James II. An obelisk of grand proportions was erected in commemoration of it in 1736. It immediately faces the ford at Oldbridge, marking the spot where William received his wound on the evening before the engagement. It is 150 feet in height by 20 feet at the base. Oldbridge, although only a ford in 1690 had been the site of a bridge at a very early date, for its name, which indicates as much, is found in the patent rolls as far back as the reign of Richard II. The Boyne is also rendered famous in more ancient history by the invasion of Turgesius the Dane, who sailed up it with a fleet of Norwegians to the plunder of Meath A.D. 838. It is a deep and wide river at Drogheda, navigable for vessels of 250 tons, and would be capable of receiving vessels of much greater burden were the bar which now obstructs its entrance partially removed. The total descent of the river is 336 feet.

(*Statistical Survey of Meath*; Wilde, *Beauties of the Boyne and Blackwater*, Dublin, 1849.)

BOZOULS. [AVEYRON.]

BRABANT, DUCHY OF, formerly one of the most important provinces of the Netherlands, was bounded N. by Holland and Gelderland, E. by Gelderland and Liège, S. by Hainault and Namur, and W. by Flanders and Zealand.

Under the successors of Charlemagne, the dukes of Brabant were possessed of considerable power and influence over the rulers of the other Netherland provinces. Joan, eldest daughter of John III., the last duke of Brabant, bequeathed the duchy to Anthony, second son of Philip the Bold, duke of Burgundy; and by degrees, through intermarriages, inheritance, and purchase, the various Netherland provinces which composed the 'Circle of Burgundy' came under the dominion of the dukes of that name. At the death of Charles the Bold, the last of these dukes, whose daughter Mary was married to Maximilian, the son and successor of Frederick IV., emperor of Germany, Brabant passed under the dominion of the house of Austria. In 1516 Charles V., emperor of Germany and grandson of Maximilian, became king of Spain, and his Netherland dominions were united with the crown of Spain.

The religious persecution instituted in the reign of Philip II. against all who would not profess the Roman Catholic religion, caused the inhabitants of the seven northern provinces to rise in defence of their liberties; and in 1581 these provinces were formed into an independent union under the title of 'The United Provinces,' Prince William of Orange being declared Stadtholder. The seven provinces thus allied stood anciently in the following order as regarded their rank: Gelderland, Holland, Zealand, Utrecht, Friesland, Overijssel, and Groningen. To these were afterwards added, by conquest and under treaties, Drenthe and the 'Généralité-lands,' so called on account of their belonging to the States General of the United Provinces. In these Généralité-lands was included the existing province of North Brabant.

The remaining Netherlands provinces, including South Brabant, continued united with the crown of Spain until 1706, when after the battle of Ramillies they acknowledged for their sovereign Charles VI., afterwards emperor of Germany, and were thenceforward known as the Austrian Netherlands.

In the progress of these events the Duchy of Brabant was not only divided in the manner described in separate provinces, but it was also limited in extent by the erection of part of its territory into the province of Antwerp. In the course of the war which broke out in 1793 the whole were united to France. In 1806 the United Provinces were erected into a separate kingdom under Louis Bonaparte, who resigned his crown in 1810, when the territory was re-annexed to France.

At the Congress of Vienna the whole of the seventeen provinces of the United Netherlands, including both North and South Brabant, were erected into a kingdom under the King of Holland; but at the

BRABANT, NORTH.

revolution of 1830 South Brabant joined the revolt of the provinces which had formerly constituted the Austrian Netherlands, and it has since formed part of the kingdom of Belgium.

BRABANT, NORTH (Noord Brabant), a province of the kingdom of Holland, is bounded N. by the provinces of Holland and Gelderland, from both of which it is divided by the Maas; E. by Limburg and the Rhenish provinces of Prussia; S. by the Belgian provinces of Limburg and Antwerp; and W. by the Dutch province of Zealand. North Brabant lies between $51^{\circ} 12'$ and $51^{\circ} 50'$ N. lat., $4^{\circ} 12'$ and $6^{\circ} 0'$ E. long. Its area is 19,768 square miles, and the population on the 31st of December 1852 was 403,687, above 7-8ths of whom are Roman Catholics. The surface of the province is generally level, but on the north and west there is some rising ground; it is politically divided into three arrondissements—Bois-le-Duc, Breda, and Eindhoven; and into nineteen cantons.

The principal rivers of North Brabant are the Maas, which forms its north and north-eastern boundary, and the Dommel, which has its source at Peer in Limburg, enters North Brabant near the village of Valkenswaard, and flows north past Eindhoven to Bois-le-Duc, after which under the name of the Diezen it joins the Maas at Crevecoeur. At Bois-le-Duc the Dommel is joined by the Aa, which rises in the province of Antwerp about four miles north-north-east from Turnhout, and enters North Brabant at the commune of Hoogeuseide. The Mark or Mork has its source also near Turnhout, and running from south to north enters North Brabant near to Moerle: it falls into Hollands-Diep opposite the island of Goeree, having passed through the town of Breda. This province is also washed on the west by the channel which joins the East and West Schelde, and which separates the islands of Zealand from the continent; and on the north by the arm of the sea called Hollands-Diep, and its continuation the Biesbosch.

The principal towns are BOIS-LE-DUC, BREDA, and BERGEN-OP-ZOOM; the more important of the other towns are here noticed.

Eindhoven, situated on the river Dommel, 19 miles S.S.E. from Bois-le-Duc, was formerly the capital of the province. It has a grammar school and manufactures of cotton, linen, woollens, and leather. Its grain market is considerable: population, 3000. *Geertruydenburg*, a small fortified town, 9 miles N.N.E. from Breda, on the south side of the Biesbosch, has a small harbour, salmon fisheries, and about 1700 inhabitants. *Grave* or *Graaf*, situated on the left bank of the Maas, 19 miles N.E. from Bois-le-Duc, is a fortified town, and is considered as the key of Gelderland, on the borders of which it stands. It was taken by the Duke of Parma in 1586, and submitted to Prince Maurice in 1602. It capitulated after a stout resistance to the French in 1794: population about 2500. *Helmond*, 8 miles E. from Eindhoven, on the Aa, is famous for its manufacture of damask napkins; it contains also manufactories of woollen, cotton, and linen goods: population, 2000. *Heusden*, a fortified town commanded by a strong citadel, is situated near the Maas, 8 miles W. by N. from Bois-le-Duc: population about 2000. *Oosterhout*, a large market-town 6 miles N.E. from Breda, has a population of 8000, manufactures of tiles and pottery, and a grammar school. *Tilburg*, 13 miles E.S.E. from Breda and the same distance S.W. from Bois-le-Duc, is a large town with about 14,000 inhabitants, who manufacture woollen cloths extensively. It is situated on the left bank of the Ley, a small feeder of the Dommel, and all round it are extensive heaths. *Willenstad*, built by William I., Prince of Orange, on the Hollands-Diep, 16 miles N.W. from Breda, is also fortified: it has a good harbour and about 1900 inhabitants.

North Brabant, in common with all the Dutch provinces, has its particular States Assembly, the members of which are elected by the nobles, the towns, and the royal municipalities. This assembly meets annually; its functions are the regulation of local affairs and the imposition of provincial taxes.

BRABANT, SOUTH, the metropolitan province of the kingdom of Belgium, is bounded N. by the province of Antwerp; E. by those of Liège and Limburg; S. by those of Hainault and Namur; and W. by East Flanders. It lies between $50^{\circ} 32'$ and $51^{\circ} 3'$ N. lat., $3^{\circ} 53'$ and $5^{\circ} 10'$ E. long. The area of the province is 1267.7 square miles, and the population on January 1, 1849, was 711,332.

The province, which is almost uniformly level, except towards the south, contains 811,333 acres, and the greater part of the surface is cultivated or productive. The forest of Soignies, part of the remains of the great forest of Ardenne, is contained within the province, and occupies 29,611 acres. This forest is situated between Brussels and Nivelles, commencing about 2 miles to the south of Brussels and extending to beyond the village of Waterloo, a distance of 8½ miles. The inhabitants are chiefly Walloons, who speak a dialect differing from both the Dutch and the Flemish, and akin to the Slavonic. The province is divided into three arrondissements—Brussels, Louvain, and Nivelles—which are subdivided respectively into 118, 110, and 106 communes.

The province is connected by canals and by high roads with the coast and the chief industrial sites of Belgium; railroads also cross it in various directions, connecting it and the capital with Liège, Malines, Antwerp, Ostend, and the French and Prussian frontiers.

The principal towns are BRUSSELS, the capital of the province and of the kingdom of Belgium, and LOUVAIN.

BRACKLEY.

Among the other towns in the arrondissement of Brussels the following may be here noticed:—*Asseke*, a small town of 4000 inhabitants, is situated 8 miles N.W. from Brussels, on the high road to Ghent. It is famous for its sweet cakes, euphronically called in Flemish 'Suiker Koekjes.' *Hal*, 12 miles S. by W. from Brussels by the railway to Mons, is situated on the Senne and the Charleroi Canal, and has about 5000 inhabitants. It contains a beautiful gothic church, dedicated to Saints-Mario, and celebrated for its miraculous image of the Blessed Virgin. The grand altar in this church, constructed of white marble, surmounted by a gorgeous tabernacle, and ornamented with beautiful sculptured bas-reliefs, the whole crowned by a figure of the pelican, a mediæval symbol of Christ, is said to be unequalled even in Belgium. In the baptistery the font of gorgeous brass is placed under a spire, adorned with statues and groups in high relief. The church was formerly dedicated to Saint Martin. *Lenninck*, 9 miles S.W. from Brussels, has a population of 2000. *Vilverde*, 6 miles by railway N. by E. from Brussels, is situated on the road to Malines, and has about 2700 inhabitants. There is a large penitentiary outside the town and in the vicinity are many pretty country seats, dotted along the broad canal that runs up to Brussels.

In the arrondissement of Louvain are the following towns:—*Aerschot*, 9 miles N.E. from Louvain, on the Demer, has a good corn-market, distilleries, and about 4000 inhabitants. *Diest*, a walled town a little farther east, also on the Demer, 16 miles E.N.E. from Louvain, has manufactures of woollen cloth and woollen hosiery, beer, and spirits, and about 8000 inhabitants. A great horse fair is held in Diest. The town was taken in 1705 by the Duke of Marlborough. *Grez*, 11 miles S. from Louvain: population, 2000. *Tirlemont*, 12 miles S.E. from Louvain by the railway to Liège; is a walled town entered by ancient-looking gates. The town is tolerably well built, the principal streets abutting on a large central square, in which are the church of Notre-Dame and the town-hall, the best buildings in the town. The church of Sainte-Germaine, which is built on a height, dates from the 9th century, and is one of the oldest churches in Belgium. The massive tower which surmounts it was erected in the 12th century. Outside the Maestricht gate are three large sepulchral barrows, supposed to be of very remote antiquity. The walls, which are above four miles in circuit, inclose a considerable space not occupied by buildings but as gardens, orchards, and fields; indeed the town was formerly much larger than it now is. Successive sieges and sacks during the Spanish wars in the low countries, and during the wars that immediately followed the first French revolution ruined it. Tirlemont was formerly a strong fortress; it was dismantled in 1804. The town stands on the Goete, a feeder of the Demer, and has about 9000 inhabitants, who manufacture woollen stuffs, hosiery, spirits, beer, soap, and paper.

In the arrondissement of Nivelles the chief town, *Nivelle*, is situated 18 miles S. from Brussels, and has about 8000 inhabitants. The town is well built, and contains a fine church dedicated to St. Gertrude, daughter of Pepin, who founded an abbey here, the superiorities of which were styled princesses, and enjoyed great privileges. The church contains the shrine of St. Gertrude and two pulpits of beautiful workmanship; under the tower there is a fine crypt. The smaller tower of the church contains the chimes; the hour is struck by a colossal figure of an armed knight. The cloister of the old abbey still remains. Fine linen, lace, woollen stuffs, paper, &c., are manufactured at Nivelles. Between Quatre-Bras, a place on the south border of the province where four roads meet, and Nivelles, is the estate presented by the King of Holland to the Duke of Wellington. *Genappe*, a few miles E. from Nivelles, is a small place with about 2000 inhabitants. Near it the Prussians captured Napoleon's carriage on the night after the battle of Waterloo. At *Quatre-Bras*, 5 miles S.W. from Nivelles, the Duke of Brunswick fell in the engagement between the French and the Allies, June 16, 1815. *Warre-on-the-Dyle*, 15 miles S.E. from Brussels, has 5000 inhabitants. Tobacco is cultivated in the neighbourhood of this town, which has several breweries and tanyards, and a good trade in corn and cattle.

The following places may also be mentioned:—*Tervuren* or *Tervueren*, a few miles E. from Brussels, is the site of the summer palace of the Prince of Orange. *Lacken*, or *Lacken*, is a beautiful village 3 miles N. from Brussels: near it is the country palace of the royal family of Belgium. *Waterloo*, famous for the defeat of the French (June 17-19, 1815), is a long straggling village 10 miles S. from Brussels, on the outskirts of the forest of Soignies. Near it is a vast mound, surmounted by a colossal lion, in commemoration of the great victory. *Braine-la-Lécul*, a little S. of Waterloo, has 3000 inhabitants, large glass works, and woollen manufactures. *Tubize*, on the railway to Brussels, N.W. of Nivelles, has about 3000 inhabitants, who manufacture beer and woollen stuffs: there are valuable stone quarries in the neighbourhood.

BRACCIANO, Lago di. [ROMA, COMARCA DI.]

BRACKLEY, Northamptonshire, an ancient borough and market-town, and the seat of a Poor-Law Union, in the hundred of King's Sutton, is situated in $52^{\circ} 1'$ N. lat., $1^{\circ} 10'$ W. long., distant 20 miles S.W. by S. from Northampton, 63 miles N.W. by N. from London by road, and 68½ miles by the North-Western and Bletchley Junction railways. The livings are in the archdeaconry of Northampton and diocese of Peterborough. The population of the town in 1851 was

2157. Brackley sent two members to Parliament from the time of Edward VI. till it was disfranchised by the Reform Act. Brackley Poor-Law Union contains 29 parishes and townships, with an area of 53,762 acres, and a population in 1851 of 13,747.

Brackley is a town of considerable antiquity. It early possessed a large trade in wool. In the seventh year of Edward III. it was required to send up three merchant staplers to a council concerning trade held at Westminster. The town is built on a gentle acclivity on the left bank of one of the head streams of the Ouse—here a mere rivulet—over which the roadway is carried by a bridge of two arches. The principal street of Brackley is nearly a mile long; the houses are mostly constructed of unhewn stone. The town-hall is a handsome building erected in 1706 by Scroop, duke of Bridgewater. The parish church is an ancient edifice. St. James's church, which is regarded as a chapel-of-ease, was spoken of in Leland's time as an old church. There are places of worship in the town for Independents and Wesleyan Methodists. The Free Grammar school was founded about 1447 by William of Waynflete. There is also an Infant school. The chapel of an ancient hospital founded in the 12th century by Robert Bosu, earl of Leicester, is still standing, having been repaired about the middle of last century by Mr. John Welchman, who also left funds to provide a stipend for a service in the chapel every alternate Sunday. There are almshouses for six poor widows founded in 1663 by Sir Thomas Crowe. A county court is held at Brackley. There is a manufactory of boots and shoes; pillow-lace is extensively made. The market, of which the first distinct notice is in 1217, is now held on Wednesday for corn. There are nominally five fairs, but the only one of consequence is that held on St. Andrew's Day.

BRADFELD, Berkshire, a village and parish, and the seat of a Poor-Law Union, in the hundred of Theale. The village is situated on the Pang brook, here called Kimberhead, which falls into the Thames at Pangbourn, in 51° 27' N. lat., 1° 7' W. long., 7 miles W. by S. from Reading, 46 miles W. by S. from London: the population of the parish in 1851 was 1216; of this number 222 were inmates of the Union workhouse. The living is a rectory in the archdeaconry of Berks and diocese of Oxford. Bradfield Poor-Law Union contains 29 parishes and townships, with an area of 66,635 acres, and a population in 1851 of 16,159.

The village is pleasantly situated; the inhabitants are chiefly agricultural. The church, which has some portions of the Norman and decorated styles, has been rebuilt and enlarged at the expense of the Rev. T. Stevens, the rector and lord of the manor, who has also erected an elegant gothic chapel for the inmates of the Union workhouse, and built and endowed a Free school. St. Andrew's College, founded in 1849, of which the rector of the parish is warden, is under the charge of a sub-warden, head and second master, with assistants, and had 36 scholars in 1852. It possesses 3 scholarships of 20*l.* a year for 5 years for sons of clergymen; and an exhibition of 30*l.* a year for 3 years at Oxford University. There are some parochial charities. The Primitive Methodists have a place of worship at Bradfield. In the neighbourhood are many excellent mansions.

BRADFORD, GREAT, Wiltshire, a market-town, borough, and the seat of a Poor-Law Union, in the parish of Great Bradford and hundred of Bradford, is situated on both banks of the Avon, in 51° 20' N. lat., 2° 14' W. long., distant 12 miles W. from Devizes, 100 miles W. from London by rail, and 107 miles by the Great Western railway: the population of the town in 1851 was 4240. The living is a vicarage in the archdeaconry of Wilts and diocese of Salisbury. Bradford Poor-Law Union contains 8 parishes and townships, with an area of 19,680 acres, and a population in 1851 of 11,356.

The name Bradford is a contraction of the Saxon term Bradan-ford, or the 'Broad Ford'; the town having been built on both sides of the river Avon, where was a broad ford. The town was the site of a monastic institution founded by St. Adhelm, who was himself the abbot until appointed Bishop of Worcester in 705. Bishop Gibson says the monastery was destroyed by the Danes. In 954 the celebrated St. Dunstan was elected Bishop of Worcester at a synod held at Bradford. Bradford is mentioned among the towns which received from Edward I. the privilege of sending members to Parliament, a privilege which does not appear to have been exercised more than once.

Bradford is pleasantly situated: the banks of the river below the town abound in beautiful and picturesque scenes, and well-wooded hills rise in some places boldly from the margin of the river. There are here two bridges over the Avon, both of which are of very old date. The houses in Bradford are built with stone, but the streets are with few exceptions narrow. The older part of the town is on the right bank of the Avon, a portion of the buildings being arranged in three streets or terraces on the brow and slope of a hill which rises abruptly from the side of the river. The lower of the terraces is called the New Town. The town is lighted with gas.

The church, which stands at the foot of the hill, is a large and handsome edifice, partly Norman and partly of the transition period from early English to decorated; but the greater part is perpendicular. A neat district church in the perpendicular style was erected in 1840, and near it a substantial and commodious school was built, with a house for the master and mistress. There are in the town places of worship for Independents, Baptists, and other Dissenters; a

Free school, opened in 1712; National schools for boys and girls; a British school; and an Infant school. Two sets of almshouses, besides sundry small benefactions for the relief of the poor, have long existed in Bradford. In the town and neighbourhood are several interesting remains of ecclesiastical edifices.

The town has for many centuries been noted for its fine broad cloths, which have at all times formed its principal manufacture. A market for corn and cattle is held every alternate Tuesday, and a small weekly market on Saturday for provisions. Bradford possesses a savings bank. A county court is held in the town.

The prosperity of the place is much promoted by the Kennet and Avon Canal which passes by Bradford, and opens a communication by water with the cities of Bath, Bristol, and London, and with the towns of Trowbridge, Devizes, Hungerford, Reading, &c. There is a station at Bradford belonging to the Wilts, Somerset, and Weymouth railway, but it is not yet in use. An india-rubber factory has been established by Mr. Stephen Moulton, which promises to be of advantage to the town.

BRADFORD, West Riding of Yorkshire, a manufacturing town, parliamentary and municipal borough, and the seat of a Poor-Law Union, in the parish of Bradford and wapentake of Morley, is situated in a valley, in 53° 47' N. lat., 1° 45' W. long., 34 miles S.W. from York, 196 miles N.N.W. from London by road, and 219½ miles by the North-Western and Lancashire and Yorkshire railways. The population of the parliamentary and municipal boroughs, which are co-extensive, was 103,778 in 1851. Bradford returns two members to the Imperial Parliament. The town is governed by 14 aldermen and 42 councillors, one of whom is mayor. The living is a vicarage in the archdeaconry of Craven and diocese of Ripon. Bradford Poor-Law Union, which corresponds in extent and population with the borough, contains an area of 5708 acres.

Bradford is situated on a small brook which falls into the Aire. This town is mentioned in the Domesday Survey. In Saxon times Bradford formed part of the extensive parish of Dewsbury; it was afterwards included in the rich barony of Pontefract, which was in the possession of the Laceys. This powerful family had a castle at Bradford. The early history of the town is connected with that of its castle. Alice, the last of the Laceys, married the Earl of Lancaster; and Bradford, in common with the other possessions of her family, went to increase the estates of that duchy. During the civil wars between the Royalists and Parliamentarians, Bradford, which espoused the Parliamentary cause, held a severe contest with and twice defeated the Royalists. They were however themselves defeated by the Earl of Newcastle, on Adwalton Moor, with immense slaughter. After these wars Bradford made little progress for a long time, and trade was much depressed during the American revolutionary war. In 1812 a spirit of insubordination was diffused through the wide and densely-populated district of which Bradford is the centre, in consequence of the introduction of certain kinds of machinery: the riot of the 'Luddites' resulted, which ended in the conviction of sixty-six persons and the execution of seventeen. In 1825 occurred a strike for wages, which was protracted during ten months, at an immense expense to the trades' unions, and at a dreadful sacrifice of comfort on the part of the operatives, who were plunged into a state of poverty from which they were long in recovering. Since that time the history of Bradford has been one of continued prosperity, and it may be regarded now as the most rapidly advancing town in Yorkshire.

The parish church of Bradford, dedicated to St. Peter, was erected in the reign of Henry VI.; the tower is of later date. It is principally of the perpendicular style of architecture, but has no remarkable exterior attraction. Christ church was erected in 1813; its interior is commodious, but externally it is heavy; it was enlarged in 1823 and 1836. Other churches of recent erection in the town or vicinity are:—St. Jude's, erected in 1843 in the town of Bradford; St. Paul's, built in 1847 in Manningham township; St. James's, 1837, and St. John's, 1839, both in Horton township, in addition to an older chapel-of-ease in the same township; St. Paul's, built in 1841, in Bowling township; Bankfoot, 1850, and Shelf, 1851. The number of places of worship belonging to Roman Catholics, Presbyterians, Independents, Baptists, Wesleyan and Primitive Methodists, Unitarians, Quakers, &c., in the whole borough, is about thirty. A neat Presbyterian chapel was built in 1849.

The academic establishment called Airedale College, at Undercliffe, adjacent to Bradford, is for the preparation of young men for the ministry in the Independent churches. This academy has been several times removed since its first establishment in 1685. It has been placed in connection with the University of London. Its endowments have been much enlarged by a benevolent lady of Bradford. The annual revenue from funded property amounts to nearly 500*l.* a year. It is under the care of three professors, one of whom is president. The number of students in 1851 was 22. The Baptists have a college at Horton which was established in 1805. Its income in 1848 was about 1200*l.*; the number of students was 26. The Wesleyan Methodists have one of their seminaries for the education of the sons of ministers at Woodhouse Grove, near Bradford; it was founded in 1812, and is said to have been found extensively useful. Its design is to "supply the children of ministers with an education suitable to

the station which their fathers hold in society." The Grammar school of Bradford was in existence in the time of Edward VI. By the charter of 1663 it is called the 'Free Grammar School of Charles II. at Bradford.' The income from endowment is upwards of 400*l.* a year. The number of scholars in 1852 was 57. This school is one of those that have the privilege of sending a candidate for Lady Elizabeth Hastings' exhibitions at Queen's College, Oxford. There are in Bradford and its surrounding townships many National and British schools; also Industrial, Infant, and numerous other schools.

In 1844 a new infirmary was built at a cost of 10,000*l.*; it is a fine structure in the Tudor style. The dispensary, established in 1826, is liberally supported and well managed. Bradford has several minor charities for the sick and poor. There is a mechanics institution, with a good library and lecture-rooms. An Odd Fellows literary institution is well supported, and has a good library and news-room. There are two clubs in the town, a Conservative and a Reform club; both have news-rooms, and the former has a good library.

Bradford contains many good streets, and improved local arrangements are gradually being introduced. The town is lighted with gas, and water is supplied under arrangements made in accordance with the terms of Acts of Parliament passed in 1842 and 1845. The market, a plain but extensive building, was opened in 1824. The savings bank of Bradford is extensively used. The first English temperance society was founded in this town. The present Piece Hall was for many years used as a court-house for the meetings of the magistrates; but a new and ornamental building was finished about 1834 for the purpose of a court-house. The Piece Hall is like the cloth-halls at Leeds—a market for woven woollen goods. The fine light freestone employed in most of the buildings of Bradford helps to give a cheerful and clean aspect to the streets. The country to the north and west is open and picturesque, and is studded with the residences of the more opulent merchants and manufacturers.

The chief manufacture of Bradford and the neighbourhood is of worsted stuffs. The spinning of worsted yarn employs a great number of persons, and the stuffs are woven from the yarn. Woollen yarn for the manufacture of cloths, broad and narrow, is also spun and woven at Bradford in considerable quantities; but the worsted manufacture is the staple employment of the place, Leeds and its dependencies being the more immediate seat of the woollen manufacture. The stuffs manufactured in Bradford are chiefly dyed in Leeds, the proprietors of the dye-houses being among the largest purchasers in the Bradford market. Many of the woollen and wool merchants have lately left Leeds and opened warehouses in Bradford. Several of the large firms of Manchester and Huddersfield have also recently opened warehouses in this flourishing town. The central situation of Bradford, with reference to the other clothing towns, has probably been a chief cause of its recent and rather rapid advancement.

The iron trade has long flourished in the neighbourhood of Bradford; indeed it is supposed that the Romans worked iron mines near this spot. Mr. Hunter, the historian of Sheffield, mentions the "remarkable fact, that in the midst of a mass of scoria, the refuse of some ancient bloomery near Bradford, was found a deposit of Roman coins." There is an abundant supply of iron-ore and coal, both of excellent quality; and the well-known iron-works at Bowling and Low Moor are only a short distance from Bradford. At these foundries some of the most ponderous works in cast-iron are executed. Vast numbers of workmen are employed in the different departments of the establishments—from the raising of the ore and coal to the various marketable states of the metal. The principal merchants and manufacturers in Bradford are wool-staplers, wool-combers, worsted-spinners and manufacturers, worsted-stuff manufacturers, and woollen-cloth manufacturers. Several trades carried on are dependent upon the woollen and worsted trade, among which are the manufactures for combs, shuttles, and machinery. A septennial festival is held in Bradford in honour of Bishop Blaise, to whom the invention of wool-combing is attributed.

As a seat of commerce Bradford possesses many facilities. By the Leeds and Liverpool Canal it has an unimpeded communication with Hull and the German Ocean, and with Liverpool and the Irish Sea. By the Aire and Calder navigation Leeds and the neighbouring towns are connected with Goole and Hull. The Leeds and Bradford railway places it in connection with the districts in the east and west; the Leeds and Thirsk railway gives it an outlet to the north; while the various branches of the West Riding Union railway connect it with Halifax, Huddersfield, Barnsley, and the whole of the West Riding manufacturing towns.

BRADING. [WIGHT, ISLE OF.]

BRADNINCH, or **BRAINES**, Devon, a decayed borough, formerly a market-town, in the parish of Bradninch and hundred of Hayridge, is situated in 50° 49' N. lat., 3° 26' W. long., 9 miles N.E. by N. from Exeter, and 163 miles W.S.W. from London by road. Here station on the Bristol and Exeter railway, which is about a mile from Bradninch, is distant from London 185 miles. The population of the parish in 1851 was 1834. The living is a perpetual curacy in the archdeaconry and diocese of Exeter.

The legal designation of the borough is *Bradracis*, otherwise *Bradninch*. The corporation claim to be a corporation by prescription. The governing body consists of thirteen masters, one of whom is

mayor. Bradninch sent members to one parliament in the reign of Edward II. Petty and quarter sessions are held regularly in the town. The church, dedicated to St. Denis, was built in the time of Henry VII., and is of the late perpendicular style. It has a handsome screen, erected in 1528. There are places of worship for Baptists and Wesleyan Methodists; a National school; and a parochial library. A new guildhall, a borough jail, and a court-house were built a few years ago. Bradninch has several times suffered from conflagrations. The fires which have frequently occurred in the towns of Devonshire have been chiefly owing to the use of thatch in roofing dwelling-houses: slate is now very generally substituted. Bradninch has been very much improved since the last fire. The town is well supplied with water. About one half of the population is engaged in agriculture. Two paper mills and a small woollen factory in the neighbourhood give employment to some of the inhabitants. There are several charities in the town.

BRAEMAR. [ABERDEENSHIRE.]

BRA'GA. [ENTRE-DOURO-E-MINHO.]

BRAGANCA. [TRAS-OS-MONTES.]

BRAHLOW. [IBRAIL.]

BRAHMAPUTRA, one of the largest rivers of Asia, and in many respects one of the most remarkable on the globe. The farthest branches of this river rise between 28° and 29° N. lat., and between 97° and 98° E. long. Here stands a snow-capped mountain range, which in the present state of our geographical knowledge must be considered the most easterly portion of the Himalaya range. The Taluka, the most northern of the sources of the Brahmaputra, has its origin in these mountains. At some distance from its source it joins the Taluding, a river not inferior in size, which descends from the mountains of Namhio (28° N. lat.), a ridge belonging to the Langtan chain, which latter divides the upper branches of the Brahmaputra from those of the Irawaddi. After the junction of the Taluka and Taluding the river continues its course to the south-south-west between high mountains, and flows impetuously over a rocky bed. After many windings the river issues from the mountains by a narrow pass, called Prabhu Kuthar, in which the river is about 200 feet wide, and runs with great violence. Near this pass, on the south banks of the river, is the Brahma-koond (Source of the Brahma), or Deo Páni, a place of pilgrimage among the Hindoos. It is merely a good-sized pool, 70 feet long by 30 feet wide, inclosed by high projecting rocks, from which two or three rills descend into the pool. From this place the river has obtained its sacred name of Brahmaputra, the 'offspring of Brahma,' though it is commonly called by the natives Lohit, or Lohitiya (Lauhitiya in Sanscrit, the 'red river').

After passing the Prabhu Kuthar the Lohit enters the valley of Upper Asam or Sadiyah, where, though conveying a great volume of water, the river is too much filled with stones to be easily navigable. Near 27° 51' N. lat., and 96° 15' E. long., the river divides into two branches, of which the north and larger is called the Lohit or Buri Lohit, and the south Sukato: these branches unite again about 10 or 12 miles farther downward. The island thus formed is about 2 miles wide. Between Prabhu Kuthar and Sadiyah the river is increased by the confluence of several small streams, and of a larger one called the Noa Dihing. Nearly opposite the mouth of the Noa Dihing the Kundil joins the Lohit. On the banks of this small river stands Sadiyah, the capital of Upper Asam: the Lohit is here about 1200 feet above the level of the sea. Near Sadiyah the Lohit is joined by the Dihong, which brings down an immense volume of water; it is supposed that this Dihong is the same river as that which in Tibet is called Sampoo, or Yaru Tzangbotsin.

After its junction with the Dihong, the Lohit flows in a south-west direction, and forms numerous islands, so that hardly in any place does the whole volume of its waters run in one bed. Here it receives on the south the Buri Dihing, a considerable river, whose origin is near the banks of the Noa Dihing. A few miles after this junction, the Lohit divides into two large branches, the northern of which is called Buri Lohit, and the southern Buri Dihing. These branches include the fertile island of Majuli, which extends from 94° 30' to 93° 40' E. long., about 50 miles in length, with an average breadth of 9 miles. Opposite this island the Buri Lohit is joined by the Suban Shiri, a river not inferior in volume of water to any of the tributaries of the Brahmaputra, except the Dihong. Into the Buri Dihing falls the small river Dikho, on which the present capital of Asam, Jorhath, is situated, and lower down, near the place where both branches reunite, the Dhunsiri, which rises at a great distance to the south in the territories of the Raja of Moonipore. After the Buri Lohit and the Buri Dihing have reunited and flowed down for nearly 30 miles in one channel, divided only at a few places by small islands, the Brahmaputra divides again at the town of Bishenath (93° 15' E. long.) into two large branches, of which the northern and larger retains the name of Lohit, and the southern is called Kullung or Kolong. The island inclosed by these two branches of the Brahmaputra extends in length upwards of 75 miles, with a width of 20 or 25 miles in the middle. The Kullung branch, after receiving the Deyong, reunites with the Lohit a few miles above Gowhatty. The Brahmaputra runs here with an undivided stream, and is hardly 1200 yards wide, which is its smallest breadth after its junction with the Dihong. Its stream is so exceedingly rapid, that in the rainy season vessels are obliged to wait for a strong

westerly wind, to enable them to stem the force of the current. Below Goalpara the Brahmaputra enters the plains of Bengal, where it is only about 120 feet above the level of the sea.

The general direction of the Brahmaputra from the western extremity of the island of Kullung to its entry into the plains of Bengal lies due east and west, and it preserves this direction still farther down to the town of Rangamatty. Below Goalpara it receives on the right the Tehin-tchien or Guddada, a considerable river which traverses the eastern portion of Bootan. Near Rangamatty the Brahmaputra declines to the south-west, and shortly afterwards takes a due southern course to 25° N. lat., where it begins to run to the south-east. Between 26° and 25° the first communication with the Ganges commences. A small branch of the Brahmaputra running due south falls into the Issamutty, a branch of the Teesta, which joins the Ganges near Jaffiergunge; and another water-course, which branches off from the Brahmaputra a little lower down, and is called Lobnee, falls into the ancient bed of the Ganges below Jaffiergunge.

The Brahmaputra continues its south-eastern course nearly to 24° N. lat., where it is joined by the Barak, or river of Silhet, which comes from the mountains of Tiperah. From this point of junction the Brahmaputra runs south-south-west, with large bends until it reaches the neighbourhood of Fringybazur, where its channel widens greatly. The Brahmaputra and the Ganges at present have separate embouchures, though they approach so near one another that their beds at some places are hardly two miles apart. Even after they have left the continent their currents are still divided, that of the Ganges running to the west of the island of Shabazpore, while the Megna (the name which the Brahmaputra bears below Fringybazur) sends its waters to the Gulf of Bengal by the channel between the islands of Shabazpore and Hattia.

The whole course of the Brahmaputra, as here described, may be estimated at 860 miles, of which 160 miles belong to its upper course east of the mouth of the Dihong, 350 miles to its middle course to Goalpara, and the remainder to its lower course to the island of Hattia. The Ganges runs 1350 miles, and therefore exceeds the Brahmaputra by near 500 miles; but the Brahmaputra carries down a much greater volume of water. It was found, in January 1828, that it discharged near Goalpara below the mouth of the Bonash, in one second, 146,188 cubic feet of water, while Rennell calculated that the principal branch of the Ganges in the dry season discharges only 80,000 cubic feet. The length above given is based on the assumption, supported by Julius Klaproth and other eminent geographers, that the Great Tibet river Sampoo empties itself into the Irawaddi; but if, as is now more generally believed, the Sampoo and the Dihong are the same river, and an affluent of the Brahmaputra, then it will increase the length of the last-named river by more than 1000 miles: a supposition rendered the more probable by the immense body of water brought down by that river.

(Rennell; Francis Hamilton; Klaproth, *Mémoires*; Neville and Wilcox in *Asiatic Researches*; Ritter, *Asien*; *Maps of Klaproth*, Berghaus, and Wilcox.)

BRAIDA. [ALBA.]

BRAIN-LE-COMPTÉ. [HAINAULT.]

BRAINTREE, Essex, a market-town and the seat of a Poor-Law Union, in the parish of Braintree and hundred of Hinckford, is situated on the high road from London to Norwich, through Bury, in 51° 53' N. lat., 0° 33' E. long., distant 11 miles N. by E. from Chelmsford, 40 miles N.E. from London by road, and 44½ miles by the Eastern Counties railway. The population of the town in 1851 was 2836; that of the parish of Bocking, which is contiguous to and usually associated with Braintree, was 3846. Braintree is governed by a select vestry of 24 parishioners, who as early as 1584 were styled governors and town magistrates. The living of Braintree is a vicarage, that of Bocking is a rectory; both are in the archdeaconry of Colchester and diocese of Rochester. Braintree Poor-Law Union contains 14 parishes and townships, with an area of 41,580 acres, and a population in 1851 of 17,576.

Braintree was constituted a market-town by King John. The growth of the place is to be ascribed to its situation on one of the high roads from London into Norfolk and Suffolk, and to the building of inns and lodging-houses for the reception of the numerous pilgrims to the shrines of St. Edmund at Bury, and our lady of Walsingham in Norfolk. At the Reformation this source of its prosperity failed; but the town and the adjacent village of Bocking obtained importance by the settlement of the Fleming who fled from the tyranny of the Duke of Alva, and established here the manufacture of baize and other light woollens, which for some time constituted the staple manufacture of the place, but is now entirely superseded by that of silk.

Bocking church and Church Street are one mile and a half from Braintree, on the north-east bank of the Pant or Blackwater. The two may be said to form one town, the main street of which covers two-thirds of the extent between Pod's Brook and the river Pant, and stretches about a mile. The streets are inconveniently narrow; many of the houses are of wood, and of considerable antiquity. Braintree church is large, built chiefly of flint, and mostly in the perpendicular style; the tower at the west end, which is early English, is surmounted by a lofty shingled spire of much later date. There

are places of worship for Independents, Baptists, and Quakers; two Endowed schools; and a mechanics institute. The town is partially lighted with gas. The manufacture of silk and crape is carried on to a considerable extent, employing about 1000 persons. There is a brush manufactory, and some trade is carried on in straw plait. There are several corn-mills on the Pant. The market is on Wednesday for corn, eggs, poultry, cattle, and live stock of all kinds. A fair is held in October which is much resorted to, and well supplied with cattle. A county court is held in the town. Some coins, sepulchral urns, and other Roman antiquities have been found in the parish. Braintree has been frequently ravaged by the plague. In the great plague of 1665-6, which continued in Braintree for upwards of twelve months, nearly 700 persons were attacked, of whom it would appear that not one in thirty recovered.

Bocking church is a spacious and handsome edifice, chiefly in the perpendicular style; the tower is lofty and well designed. The houses at Bocking seem of a better character than those of Braintree. At Bocking is an almshouse or hospital with an endowment from the benefactions of several individuals.

BRAISNE. [AISNE.]

BRAMBER. [SUSSEX.]

BRAMPTON, Cumberland, a market-town and the seat of a Poor-Law Union, in the parish of Brampton and ward of Eskdale, is situated in 54° 57' N. lat., 2° 44' W. long., 9 miles E.N.E. from Carlisle, 311 miles N. by W. from London by road, and 316 miles by the North-Western and Newcastle and Carlisle railways: the population of the town of Brampton in 1851 was 3074. The living is a vicarage in the archdeaconry and diocese of Carlisle. Brampton Poor-Law Union contains 14 parishes and townships, with an area of 95,520 acres, and a population in 1851 of 11,148.

Brampton is a very ancient town. The parish church, erected with part of the materials of the old church which was dismantled in 1788, is a neat and commodious structure. It was repaired and enlarged, and a tower added, in 1827. The chancel of the old church still stands, and in it the burial service is read on occasion of interments. The Presbyterian meeting-house was erected in 1722, and there are chapels for Independents, and Wesleyan and Primitive Methodists. There are National schools for boys and girls, a Congregational school, and an Infant school. The town-hall, a neat building of an octagonal form, was erected by the late Earl of Carlisle in 1817. The town is lighted with gas. The principal occupation is the weaving of checks and gingham for Carlisle manufacturers. The collieries of the Earl of Carlisle afford some employment. There are several corn-mills near Brampton. The market, held on Wednesday, is well supplied with corn and provisions.

About two miles south from Brampton is a rock on which is a Roman inscription; the supposed date is A.D. 207. At the east end of the town is a lofty natural mount, the summit of which commands an extensive prospect. About two miles to the east is Lanercost Abbey, founded in 1116. The nave has long been used as the parish church. The rest of the edifice is in ruins. Naworth Castle, two miles and a half north-east from Brampton, the baronial mansion of the lords of Gilsland, now the property of the Earl of Carlisle, had been kept in a state of good preservation till 1844, when three sides of the quadrangle were destroyed by fire: it has been since restored, in excellent taste. The great baronial hall, which is in the gothic style, is 70 feet long by 24 feet broad.

BRAMPTON. [DERBYSHIRE.]

BRANCASTER. [NORFOLK.]

BRANDENBURG, the metropolitan province of Prussia, derives its name from the Mark of Brandenburg, the ancestral dominions of the reigning family; the Mark itself being indebted for its own denomination to the ancient town of that name. Its component parts, however, are not what they were in former days; for the Kurmark and the Alt-mark have been incorporated with the province of Saxony, and the northern parts of the Neumark have been united with Pomerania. In exchange for these, several minor circles, bailiwicks, and other parcels of land, all of them once forming a portion of the districts of Wittenberg, Meissen, Querfurt, &c., in the kingdom of Saxony, are now comprised in Brandenburg. The province is bounded N. by Mecklenburg and Pomerania, E. by the provinces of West Prussia and Posen, S. by those of Silesia and Saxony and the Anhalt principalities, and W. by the province of Saxony and Hanover. It extends between 51° 10' and 53° 37' N. lat., 11° 13' and 16° 12' E. long. Its area is 15,534 square miles. The population at the end of 1849 was 2,129,022, of whom about 17,000 are Jews, about double that number Catholics, 14 Mennonites, and 100 Greeks; all the rest are Protestants of different sects included in the National Evangelical Church of Prussia.

The whole of Brandenburg is an almost uninterrupted plain, slightly elevated above the surface of the Baltic. Its soil is composed of river sand, in some quarters mingled with ferruginous earth, loam, or clay; and hence arises so great a diversity in its character that a general failure of crops is almost unknown, for a season unfavourable to one part is usually found proportionably beneficial to another. The more elevated and undulating parts of the surface are in the southern districts, between Frankfurt on the Oder and the Silesian frontier. The hills in this direction rise to between 300 and 400 feet in height;

they form prominent features in the midst of a wide and wearisome flat, and intermingling with numerous lakes, many of them lying in deep hollows, form landscapes of considerable variety. Although Brandenburg contains much fertile land, yet the surface is disfigured by many extensive heaths and moors, which are a collection of drift sand, the cultivation of which has baffled the utmost efforts of industry. The climate of Brandenburg is temperate, but exceedingly variable: the maximum heat of summer ranges between 86° and 88° Fahr.; the maximum of cold is indicated by 18° below freezing point. There are about 210 clear dry days and 155 damp and rainy days in the year.

The *Elbe* traverses the north-west of Brandenburg from Sandau to Dömitz, and receives on its right bank the Havel, Stepnitz, and Elde. The tracts of land lower than its surface, which abound in this quarter, are protected from inundation by dykes. The *Havel*, which is a channel for the efflux of the Hübilitz and other small lakes in Mecklenburg-Strelitz, becomes navigable at Fürstenberg, below which point it enters Brandenburg; it then flows southward to Spandau; and thence taking a westerly direction through Potsdam and the town of Brandenburg, it turns to the north-west at Plauen, where it is joined by the canal of that name, skirts Rathenau and Havelberg, and falls into the Elbe by two arms, between Havelort and Quitzöbel. It passes through a low tract of country, in which sand, woodlands, and pasture-grounds alternate: its width at Oranienburg is 100 feet, and at Spandau 2000 feet, in consequence of passing through several lakes: below Brandenburg it narrows again to 200 feet, and at its mouth increases to 500 feet. A branch of it strikes off at Brandenburg and flows into Lake Plauen. The *Stepnitz* rises on the Mecklenburg frontier, and flows past Meyenburg and Perleberg until it reaches Wittenberge, where it falls into the Elbe. The *Elde* issues from Lake Plauen, and forms the boundary-line between Brandenburg and Mecklenburg, until it joins the Elbe near Dömitz in Mecklenburg. The principal tributary of the Havel is the *Spree*, which comes down from the Lusatian Mountains, and passes through Bautzen (north of which it enters Brandenburg), Kottbus, and Berlin in its course towards the Havel, into which it falls at Spandau. The *Spree* is 100 feet broad where it is joined by the Mühlrose Canal (which connects it with the Oder), and about 200 feet at Berlin, and it is navigable from Cossenblatt. The Rhin and Dosse, which rise on the borders of Mecklenburg, are also tributaries of the Havel, and useful for floating rafts and timber. The east of the province is drained by the *Oder*, which leaves the Silesian territory and enters the province a little south of Züllichau, winds north-westward past Crossen, Frankfurt, and Küstrin; quits Brandenburg to the north of Schwedt, above which it turns north by east, and enters the province of Pomerania. From Küstrin northward it divides into several branches, and forms a succession of islands. About twenty miles below Küstrin it separates into two large arms, of which the eastern is the more considerable; this arm, called the New Oder, rejoins the western arm or Old Oder north of Freienwalde, and is connected by a canal also with the Old Oder at a point lower down to the south of Hohenstaden, near which also a canal runs westward from the Oder to the Havel. Lowlands occupy a space above twenty miles in breadth between these two arms, and nearly the whole line of the Oder below Frankfurt is bounded on each bank by meadows and lowlands which are dyked in at many points. The lowlands along the Oder are occasionally skirted by high ground in the neighbourhood of Frankfurt and Freienwalde. There are bridges across the Oder at Crossen, Frankfurt, Küstrin, and Freienwalde. The chief feeders of the Oder in Brandenburg are—the *Bober*, which descending from Silesia enters Brandenburg at Naumburg, and flows north-west to Crossen, where it joins the Oder; its banks are flat, and the pasturage-grounds about it subject to inundations: the *Neisse*, which also descends from Silesia, enters the province below Muskau, pursues a northerly course to Guben, and falls into the Oder about fifteen miles west of Crossen; the lands along its banks are low meadow grounds; it is navigable from Guben downwards, and great quantities of fruit are sent by it to Berlin. The *Wartha* enters Brandenburg from the province of Posen, where it is 400 feet broad, passes Landsberg on its right bank, and flows south-west through the marshy districts of Warthabuch to Küstrin, where it widens to 600 feet, and is received by the Oder. It is navigable along its whole line in this province, and most of the lowlands upon its banks have been brought under cultivation. There are several smaller rivers in the province which are useful for commercial or manufacturing purposes. The slope is so gentle, and the fall in the water-courses in this province so inconsiderable, as to occasion the formation of a number of small lakes as well as the overflowing of large tracts of land near the rivers.

The Plauen Canal connects Brandenburg and the Havel with the Elbe, and shortens the distance between Berlin and Magdeburg by about fifty-five miles. The Ruppın Canal, which lies between the Rhin and Havel, unites Lake Ruppın with the Havel at Oranienburg; it is about twenty miles long, and is very useful for the conveyance of peat. The Havel and Oder are connected by the Finow Canal, which joins the Oder near Oderberg. Between the Spree and Oder there is the Mühlrose or Frederick William Canal. There are many other canals in the province. Brandenburg is much favoured by the water communication which exists between the Elbe, the Oder, and

the Vistula: this is effected by the line of the Wartha which falls into the Oder, by the flowing of the Netze into the Wartha, and by the connection of the Netze and Vistula through the Bromberg Canal. There are a few mineral springs in the province, but only two of any note—that of Freienwalde and another near Berlin.

The principal productions of the province are corn of all descriptions, besides huck-wheat, vegetables and fruit, hay and clover, &c., flax, hemp, tobacco, a little bad wine, timber, the common domestic animals, game, fish, honey and wax, bog-iron, coals, lime, gypsum, peat, and potter's clay.

The majority of the inhabitants are of German descent; some are also of Wend extraction, and not a few of French. Most of the French are settled in Berlin; the Wend colonists, in number about 160,000, reside in Lusatia, the bailiwicks of Senftenberg and Fürstenwalde, and the circle of Kottbus in the New Mark; and in some few parts there are Herrnhuthers and Meunonites, particularly at Berlin.

It has been estimated that the number of acres in Brandenburg under cultivation is about 7,000,000. Potatoes as well as other vegetables are raised in abundance, and the quantity of land employed as garden-ground is said to be 63,000 acres. More flax is produced than is sufficient for domestic consumption, but hemp is of limited cultivation. The crops of fruit are not adequate to supply the demand. The woods and forests are estimated to cover 3,300,000 acres; the sandy eminences and plains produce mostly firs and pines, but there are forests of oaks which yield a very superior description of ship-timber; the largest tracts of woodland lie in the districts north of the Wartha and Netze, in the New and Ucker Marks, and the southern and western districts of Brandenburg. Considerable quantities of tar and potashes are manufactured.

Great attention is paid to the rearing of cattle; the most thriving branch is sheep-breeding. The wool produced in the New Mark, the flocks of which constitute about one-third of the whole stock, is considered the finest in the Prussian dominions. Until of late years the breed of horses was but indifferent; much has however been done to improve it, both by the government and private individuals. The total number of sheep in the province exceeds two millions and a half. The greatest number of horned cattle are bred on the reclaimed grounds and in the marshes along the rivers, but the breed is indifferent and small in size. Swine are not reared in any considerable numbers; in 1801 they consisted of 298,189 heads, and in 1821 did not exceed 187,187. Much honey and wax is produced, particularly in the six Lusatian circles, the heaths of which afford abundance of flowers for the bee. The inland consumption is amply provided with fish, especially eels and crabs, but none are exported; and the woods and forests abound in game.

Brandenburg possesses considerable manufactures. The woollen manufactures, which are the most important, are established in most of the towns in the Old and New Marks and in Berlin. The manufacture of linens, chiefly of the middling and coarser sorts, is extensively carried on in the Lusatian districts and the circle of Frankfurt; that of silks and cottons is mostly confined to Berlin. There are large tanneries in several quarters, particularly in Kottbus and other towns in the circle of Frankfurt. Tobacco manufactories exist in most of the towns. Iron and steel ware and cast-iron goods are principally manufactured at Berlin. [BERLIN.] There are also iron smelting-furnaces, and their industrial products are plate-glass, porcelain, and earthenware; copper foundries, paper mills, gunpowder mills, and distilleries of spirits from potatoes, grain, &c.

The trade of Brandenburg is greatly favoured by the multitude of its navigable rivers and canals. The main outlets of this trade are through Hamburg by the Elbe, and through Stettin by the Oder. Berlin is the great centre of commercial enterprise; and next in importance to it is Frankfurt on the Oder, the fairs of which are still of considerable magnitude. Brandenburg, Guben, Havelberg, Küstrin, Landsberg, Potsdam, Prenzlau, Rathenau, and Züllichau are also places of considerable trade. The province is traversed by several railroads which radiate from Berlin, and connect that city with Stettin; with Frankfurt, Guben, and Breslau; with the small Saxon states; with Leipzig and Dresden; with Potsdam, Brandenburg, Magdeburg, Hanover, and the Rhine; and with Hamburg.

Brandenburg is divided into two circles, Potsdam and Frankfurt. It is governed by a chief president, whose authority also extends over ecclesiastical matters, all establishments for education, the boards of medicine, military and civil works, and the department of mills. Brandenburg forms the third Military Division of Prussia; the fifth and sixth divisions (forming the 3rd corps) of the Prussian army, have their respective head-quarters at Frankfurt and the city of Brandenburg.

The circle of Potsdam covers an area of 8128 square miles. The chief towns are:—BERLIN, POTSDAM, BRANDENBURG. *Angermünde*, a small town of 4500 inhabitants, is situated on lake Münde, 41 miles N.N.E. from Berlin by the Berlin-Stettin railroad, on which it is a station. The town is the capital of a circle of the same name in the government of Potsdam. Its manufactures are hats, woollen-stuffs, linen, and tobacco. *Charlottenburg*, on the Spree, within a mile of Berlin, to which it is joined by a fine wide avenue lighted with lamps; it contains a royal palace and a magnificent park, in which is the mausoleum of Queen Louisa, who died in 1810:

the population is above 7000. *Luckenswalde* on the Nuthe, manufactures linen, woollen-stuffs, leather, scythes, arms, beer, spirits, &c., and has a population of 6300. *Prenslaw* on the Ucker (which rises in the Ucker-see and falls into the Stettiner-Haff) has some woollen factories, a good trade in corn, a gymnasium, and a population of 11,000. *Rathenau* on the Havel, 45 miles W. from Berlin, consists of an old town girt with walls, and a new town. The population amounts to 5500, and the industrial products comprise woollens, cotton, linen, leather, and optical instruments. *New-Ruppin* on the Ruppin-see, which communicates with the Havel and the Elbe by means of the Rhin and several canals; the town is well built, contains a gymnasium, several linen factories, breweries, and a population of 10,000. *Schwedt* on the Oder, has a royal palace, starch, leather, and tobacco factories, and has a population of 7000. *Spandau*, at the influx of the Spree into the Havel, is strongly fortified; the citadel is built on an island in the Havel. The town is entered by nine gates; it contains four churches, an hospital, house of correction, and a manufactory of arms: woollens, linens, silks, pottery, beer, spirits, and leather, are the principal manufactures. The situation of this town on two navigable rivers, and on the railroad from Berlin to Hamburg, makes it a place of considerable trade: population, 6800. *Wittstock*, at the junction of the Glina and the Dosse, has numerous woollen and linen factories, and a population of 6200. *Wrietzen*, a walled town, 33 miles E. from Berlin, not far from the Oder, has a population of 6000, who manufacture broadcloth, woollen hosiery, tobacco, and leather.

The circle of Frankfurt contains 7406 square miles. The principal town is *FRANKFURT*. *Guben*, a walled town on the Neisse, has a lyceum, manufactures of leather, woollen cloths, linen, hosiery, worsted yarn, and several water-mills, copper foundries, and a market for wool and cattle: population, 9800. *Königsberg* on the Rürke, a feeder of the Oder, contains a gymnasium, woollen and starch factories, tanneries, spirit distilleries, and a population of above 5000. *Kottbus* on the Spree, has a gymnasium, woollen and linen factories, white-beer breweries, and a population of 8316. It is defended by walls, outside of which are several suburbs. The town contains a royal palace, a college, and an orphan asylum. *Küstrin* is a strong fortress at the junction of the Wartha with the Oder, which is here crossed by a long wooden bridge. The manufactures of this town consist of woollens, hosiery, starch, brandy, and beer; it contains two churches, a gymnasium, an hospital, a bridewell, and a population of 6500. The French took Küstrin in 1806. *Landsberg*, a walled town on the Wartha, which has an orphan-house, a house of correction, wherein the inmates are instructed in the woollen manufactures, several spirit distilleries, paper-mills, tan-yards, a large corn and wool market, and a population of 11,500. Near this town, in the village of Vietze, are extensive iron-works belonging to the government.

BRANDENBURG, a town in the Prussian province of Brandenburg, stands in 52° 30' N. lat., 12° 32' E. long., at a distance of 38 miles W. by S. from Berlin by the railroad from Berlin to Magdeburg, and has a population of 17,000. It is situated upon the Havel, which divides the old from the new town; an island lies between them, on which stand the castle, cathedral church, and equestrian college. Between these two quarters of the town lies a swampy district, which, from the houses being built upon piles, is called Venice. Each town is surrounded by a wall, but the new town has a rampart in addition. The old town has five gates, besides a smaller outlet for foot passengers, and the new town four gates: the streets in the old town are narrow and crooked, but in the new town broad and straight. Brandenburg contains eight churches, a court of justice, a gymnasium, and several schools. On the island stands a cathedral of the 14th century and some other buildings of that date. The manufactures comprise broadcloth, linen, hosiery, paper, beer, leather, &c. Boats are built, and there is an active transit trade. Brandenburg was once the capital of the electorate of Brandenburg.

BRANDENBURG, ELECTORATE OF. The first known inhabitants of this province were the Suevi, a very warlike tribe. When the Suevi and the Longobardi invaded Italy in the decline of the Roman power, the Slavonians invaded and settled in Brandenburg. The Slavonians and the Franks subsequently contended for the possession of Brandenburg. In 789 it fell into the power of Charlemagne, under whom and his successors Brandenburg was governed by counts under the empire. Many contests took place between the Slavonians and their Frankish conquerors. In 1144 Albert, count of Anhalt, became the first margrav of Brandenburg. His line lasted till 1320, from which date till 1417 Brandenburg was in a state of anarchy. Frederick of Nürnberg was made elector of Brandenburg in 1417; and being a prince of ability he laid the foundation for the future prosperity of his dominion. Most of his successors ruled with judgment. Joachim II. introduced the reformed religion into Brandenburg in 1535. No interruption of the line took place until 1618, when the duchy of Prussia came into the same hands as the electorate of Brandenburg. From this date the history of the latter merges into that of the present kingdom of Prussia. [PRUSSIA.]

BRANDENBURG, NEW. [MECKLENBURG.]

BRANDON, Suffolk, a market-town in the parish of Brandon and hundred of Lackford, stands on both sides of the Little Ouse, or Brandon River, which here divides the counties of Norfolk and Suffolk, in

52° 26' N. lat., 0° 37' E. long., 43 miles N.W. by N. from Ipswich, 78 miles N.N.E. from London by road, and 88½ miles by the Eastern Counties railway: the population of the town in 1851 was 2022. The living is a rectory in the archdeaconry of Sudbury and diocese of Ely. The church has a Norman porch, and some other ancient portions. The Wesleyan and Primitive Methodists have chapels. The Free Grammar school, founded in 1646, has an income from endowment of 544, a year, and had 20 scholars in 1852. There is a National school. The town possesses almshouses and other charities. The making of gun-flints is carried on to a small extent. There is a considerable trade in corn, malt, and timber. Thursday is the market-day. Fairs are held on February 14th, June 11th, and November 11th.

BRANDYWINE RIVER. [PENNSYLVANIA.]

BRAUNSBURG, in the government of Königsberg, province of East Prussia, is a walled town on the Passarge, about five miles above its mouth in the Frische-Haff, 389 miles by railway N.E. from Berlin, in 54° 19' N. lat., and 19° 54' E. long., and has about 8500 inhabitants. It is divided by the river into the old and new towns. The Roman Catholic bishop of Ermeland has his residence here: the old castle is used in part for public offices. Braunsberg possesses a college, with faculties of Roman Catholic divinity and philosophy, a Roman Catholic gymnasium and theological seminary, a normal training-school, four Roman Catholic churches, one Protestant church, and three hospitals. Woollens, linens, and leather are manufactured. The trade of the town consists principally in yarn, ship-timber, and grain. The Passarge is navigable from Braunsberg to its mouth. Braunsberg is the birthplace of Baron Trenck. A little to the west of it is *Frauenburg*, on the Frische-Haff, at the foot of a hill (the Domberg), on which the cathedral of the diocese of Ermeland and the residences of the members of the diocesan chapter are situated. It is an open town, with a population of 2400. Copernicus, who was a member of the chapter, and who died here in 1545, was buried in the cathedral. There are several memorials of him in the town.

BRAVA. [CAPE VERDE ISLANDS.]

BRAY. [BERKSHIRE.]

BRAY. [WICKLOW.]

BRAZIL, Empire of, comprehends the eastern portion of South America. Its most northern point, at the sources of the Rio Branco, nearly reaches 5° N. lat.; and the mouth of the Rio Oyapock, which divides it from French Guyana, extends nearly as far north. The most southern boundary-line cuts the Lake of Mirim, in 32° 30' S. lat. The most eastern projection, Cape Augustinho, is in nearly 35° W. long. Brazil extends west to the river Hyabary or Yavari, where its boundary-line falls in unknown countries, and probably passes 70° W. long. Its vast extent brings it in contact with all the countries of South America, except Chili and Patagonia. At its southern extremity it borders on the republics of Uruguay, Paraguay, and Corrientes, one of the members of the Argentine Confederation. It is bounded W. by Bolivia; N.W. by Peru and Ecuador; N. by British Guyana, Dutch Guyana, and French Guyana, or Cayenne. On the N.E. and E. Brazil is bounded by the Atlantic Ocean.

Area, Surface, &c.—The empire of Brazil extends about 2600 miles from north to south, and 2400 miles from east to west; its surface is variously estimated at from 2,500,000 to 2,750,000 square miles, or even more; an area above twelve times as large as that of France. The following table shows the provinces into which it is divided with the area and population of each, according to the latest and most trustworthy estimates; but it must be borne in mind that all the estimates hitherto published are very vague, and difficult to reconcile with each other; they must therefore be regarded only as rough approximations:—

Provinces.	Chief Towns.	Area.	Population.
Rio Grande do Sul . . .	Porto Alegre . . .	180,000	175,000
Santa Catharina . . .	N. S. de Desterro . . .	50,000	70,000
San Paulo . . .	San Paulo . . .	200,000	340,000
Rio Janeiro . . .	Rio Janeiro . . .	50,000	700,000
Espirito Santo . . .	Victoria . . .	40,000	65,000
Bahia . . .	Bahia . . .	80,000	750,000
Pernambuco . . .	S. Christovão . . .	30,000	200,000
Alagoas . . .	Mació . . .	10,000	200,000
Pernambuco . . .	Pernambuco . . .	50,000	400,000
Parahyba . . .	Parahyba . . .	25,000	100,000
Rio Grande do Norte . . .	Natal . . .	30,000	70,000
Ceará . . .	Fortaleza . . .	35,000	180,000
Piahy . . .	Oeyras . . .	70,000	70,000
Maranhão . . .	Maranhão . . .	70,000	220,000
Pará . . .	Pará . . .	250,000	150,000
Alto Amazonas . . .	Barra do Rio Negro . . .	400,000	100,000
Matto Grosso . . .	Cuyabá . . .	460,000	100,000
Goyas . . .	Goyas . . .	320,000	100,000
Minas Geraes . . .	Ouro Preto . . .	200,000	760,000
Total	2,550,000	4,750,000

The coast, which is probably little short of 4000 miles, presents various appearances. From Cape S. Maria in Uruguay to the Morro de S. Marta (about 31° S. lat.), an extent of upwards of 300 miles, the coast is low, sandy, and intersected by the outlets of numerous

miles inland, as between the Rio Doce and the Bahia de Todos os Santos. In other places the mountains approach the sea within 15 or 20 miles, as between the Bay of Santos and Cape Frio. North of the Rio Doce a level country extends upwards of 80 miles inland, but to the west of Cape Frio the hills approach so near the sea that their lower extremity is washed by the high tides, and the traveller can only pass at low water.

Except the comparatively small tracts which have been cultivated by European settlers and their descendants, the sides of the mountains and the hills and plains are covered by interminable forests, extending even in the valleys along the banks of the rivers nearly to their sources on the high land. North of Cape Frio the trees and plants peculiar to a tropical climate are common, but south of it they occur less frequently. The soil is in most places of great fertility, and produces sugar, coffee, cotton, and cacao, mandioc, maize, and rice in abundance.

The rivers in this tract are very numerous, but have a short course, seldom exceeding 100 miles. They are generally navigable to from 30 to 60 miles inland. The banks of nearly all of them are skirted by low ground, which are inundated after the rains have begun. The rivers begin to rise in November, and the inundation ceases in the middle or towards the end of January: in some it lasts two months, in others only a fortnight. As the mouths of these rivers are commonly formed by a soft soil they are subject to many changes, which are produced by the variable winds and by the current prevailing on this coast. The largest of these rivers are the Parnahyba, the Doce, and the Rio Belmonte. The waters brought down by the Doce preserve their freshness for a considerable distance into the ocean, and hence it has received the name of Doce (soft or fresh).

The Rio Belmonte, in traversing a mountainous range called Serra dos Aimorés, is contracted by two high steep rocks, and descends on a sudden from a height of more than 120 feet with tremendous noise into a whirlpool: 15 miles lower down it has a little fall, after which it flows through a flat and wooded country to the sea, describing various windings, with a current rapid and wide, but of little depth. It contains many flat islands, and receives no considerable stream after it descends the fall. About 20 miles from the sea the Rio Belmonte is united to the Rio Patype, its nearest neighbour to the north, by a natural channel called Salas.

This country though mostly within the tropics enjoys a moderate climate. In Porto Seguro the medium heat, according to Freyreiss, is only 70½° Fahrenheit, but at Rio Janeiro 74°, which he attributes to the neighbourhood of the Rocky Mountains. At the latter place however the thermometer occasionally rises to 100°, 110°, and even to 120°. In summer (December, January, and February) the average heat at noon is 86°, and in the morning 72°; and in the winter (June, July, and August) it is 72° at noon, and in the morning 59°. Another peculiarity is the great humidity, which arises probably partly from the country being almost entirely covered with high trees and exuberant vegetation, and partly from the regular change of the land and sea winds. The sea winds commonly begin at noon, rarely sooner, more frequently at two o'clock, and blow till nightfall. In the other parts of the day the winds from the west prevail. The effect of this great humidity of the atmosphere is that the coast of Brazil has not such a regular succession of dry and rainy seasons as other tropical countries. No part of the year is entirely exempt from rain, though the winter is often dry and the sky cloudless; and the rains in the summer are generally very abundant, especially in January. In summer thunder is very frequent, and always accompanied with violent storms, which however never cause damage to be compared with that of the hurricanes in the West Indies.

The Serra Espinhaço, which bounds on the west the countries on the shore, divides them from the highest part of the table-land of Brazil. This extensive country, which extends west to the north branch of the Serra Paricó, is an uneven plain, on which numerous hills, sometimes isolated, sometimes in groups, and sometimes in ranges, rise to a moderate height, commonly with a gentle ascent. Along the watercourses are depressions or valleys, but generally of small extent. The plain has an elevation of upwards of 2000 feet, and the hills rise above it only a few hundred, and perhaps never more than 1000 feet. The surface of the plain, as well as of the hills, is in some places covered with sand, and in others with bare sandstone rocks, but it is generally clothed with a coarse grass, bushes, and single standing trees. The valleys along the watercourse have a much more fertile soil, and here the high trees and thick foliage which cover the maritime districts occur again. These valleys are adapted to culture and for raising nearly all the products of the coast. The plains yield only pasture for cattle.

This plain is drained by four rivers of considerable extent, the San Francisco, the Tocantins, the Xingú, and the Tapajós. The upper branches of the S. Francisco rise on the north declivity of the Serra dos Vertentes about 3000 feet above the sea, and between 21° and 20° S. lat. They are principally two—the Paraopeba, and that more properly called the S. Francisco, which unite after a course of above 150 miles in about 19° 20' S. lat. The river then flows in a nearly due north direction to its junction with the Rio das Velhas (mouth of 17° S. lat.); but before reaching this point it forms the cataracts of Pirapora. The Rio das Velhas rises in the neighbour-

hood of Villa Rica, on the north declivities of the Serra Mantiqueira, and runs upwards of 250 miles. From this point the Francisco continues to flow north with a slight declination to the east, and its current is much less rapid. It has here numerous windings, and is navigable down to Vargem Redonda, 300 miles below Ioaneiro where the navigation is interrupted by several falls. In all this course it is not joined by any considerable tributary, and on its banks there extend for about 250 miles salt steppes, in which the mineral appears in the form of an efflorescence, and is collected by the inhabitants. Not far from this place the river is narrowed by high rocky cliffs on both sides, runs with great rapidity, and forms several falls, of which the Cachoeira de Affonso, the most considerable, is said to be 50 feet in perpendicular height. The cataracts and rapids occupy a space of nearly 70 miles, and terminate at the Aldea do Caninde, whence a road leads to Vargem Redonda for the transport of merchandise into the interior of Brazil. From the Aldea do Caninde to its mouth the river runs still about 200 miles, and its navigation is not interrupted, but the current is rapid. Though a deep river in the interior of the continent, the Rio de S. Francisco enters the sea by two comparatively shallow mouths of unequal size, of which the north and the larger is nearly two miles wide, but with so little depth that only vessels of 60 tons burden can enter it at high water, and must wait for the full tide to go out. The inundations are considerable, especially above the falls. They fertilise the country, and are particularly favourable to the cultivation of the sugar-cane.

The Rio Tocantins is divided from the Rio de S. Francisco by a table-land, which towards the upper branches of the river, and also towards its confluence with the Araguay, is overtopped by groups of hills of considerable height. The upper branches of the Tocantins rise in the Montes dos Pyreneos and in the Serra Dourada, both portions of the Serra dos Vertentes. In the Serra Dourada rises the Urubá, which is considered as the true source of the river, and after a course of 70 miles joins the Rio das Almas, which is not inferior to it, and descends from the Montes dos Pyreneos. The river preserves the name of Rio das Almas to its confluence with the Maranhão, which joins it 90 miles farther down. The Maranhão rises in Lake Formosa, which is 15 miles in length, and 2 miles in width, and flows to the west and then to the north. Hence the united river is called Maranhão to its junction with the Parauatinga, about 140 miles lower down (12° 20'). The Parauatinga is formed by the junction of two considerable rivers, the Parauam and the Palma, the former of which flows nearly 300 miles. Hence the river is called Tocantins, and becomes navigable at the Porto Real de Pontal, where it is 374 fathoms wide. The number of its affluents lower down is great, but none of them is very considerable except the Rio Araguay, which joins it at about 5° S. lat. Before the Tocantins arrives at this point its navigation is interrupted by some cataracts between 7° and 6°, among which the most considerable are the Cachoeira de S. Bartolomeo or das tres Barras, and the Cachoeira de S. Antonio. After its junction with the Rio Araguay the Tocantins flows between rocks and cliffs, forming many rapids and small cataracts, and this part of its course is called the channel of Taniri. Issuing from this channel it has near Itaboca (3° 30') more considerable cataracts, which rise above one another like terraces, and then the river enters the low country skirting the Amazonas. Its whole course is in a northern direction: at about 1° 30' S. lat. it unites with the south branch of the Rio das Amazonas, and takes the name of Rio da Pará. At the point of junction is an island about 15 miles long, and low and flat, called Uararaby, which divides the mouth of the Tocantins into two arms; of which the east is called Bahia de Marapatá, and the west Bahia de Limoeiro: the width of the river is here upwards of 15 miles. The Rio da Pará, which divides the island of Marajo or Ioanes from the continent, widens in its progress to the north still more, and may be above 60 miles where it falls into the sea (about 0° 20' S. lat.). The whole course of the Tocantins is at least 1500 miles.

The Araguay, the largest tributary of the Tocantins, rises on the north declivity of the Serra Seida, about 18° S. lat., where it is called Bonito, which name is changed into that of Rio Grande, after it has united with the Rio Barreiros and Rio Cajapo. Its waters are lower down increased by those of the Rio Claro, Rio Vermelho, Rio Tizoiras, and Rio Criza. All these rivers flowing from the south-east join the Araguay on the right, and neither of the last three runs less than 200 miles. About 30 miles from the mouth of the Criza, the river divides itself in 12° 30' into two branches nearly equal, which re-unite in 9° 36', inclosing the island of S. Anna, perhaps the largest river island in the world. It is more than 200 miles in length, and of considerable width. The west arm preserves the name of Araguay, and the east takes that of Furo: barges generally go through the latter; but both contain small falls and rapids. The branch called Araguay receives about 40 miles north of the south point of the island of S. Anna, the Rio das Mortes, which runs nearly 300 miles. At about 5° the Araguay joins the Tocantins after a course of above 1000 miles.

The Rio Xingú rises in the Serra dos Vertentes somewhere about 15° S. lat. Between 5° and 4° S. lat. its bed is narrowed and traversed by a chain of rocks, and thus the cataracts are produced which occur in this part of the river. These rocks make the river form a large bend to the south and east, though in general the direction of its

course is to the north, with numerous windings; it joins the Rio Amazonas at Porto de Moz, where it is about 4 miles wide.

The *Rio Tapajós* is formed by the confluence of two considerable rivers, the Iruena and the Rio dos Arinos. The Iruena rises near the parting of the Serra dos Paricis, and the Serra Agoapehy, near 14° S. lat. It runs for upwards of 200 miles due north, and then inclines to the east to meet the Rio dos Arinos. The number of its affluents is very great, and at the confluence the Iruena is the larger river. The Rio dos Arinos rises farther to the east, near the sources of the Paraguay, and runs first north-east and then north to the junction with the Rio Preto, which is the only branch of the river at present navigated. After this junction the Rio dos Arinos flows north-west, nearly to its confluence with the Iruena, about 90° S. lat. Hence the united river is called Tapajós, and flows north-east forming two cataracts, the Cachoeiras de S. João da Barra and de S. Carlos. At the latter the course of the river is changed, and flows hence to the north-north-east. The largest of its cataracts, called Salto Grande, occurs at about 7° 30', and is said to be 30 feet in perpendicular height. Between 5° and 6° is another fall called Cachoeira de Maranhão, which likewise interrupts the navigation. The remainder of its course is through the low country along the Rio Amazonas. This river is joined by numerous tributaries, especially from the right. It falls into the Amazonas near Santarém, where it is about 4 miles wide.

On the banks of the Iruena, and west to the north branch of the Serra Paricis, stretches a sandy desert called Campos dos Paricis, the extent of which has not been ascertained. The surface is formed by long-backed ridges of sandy hills, parallel to one another, and divided by longitudinal valleys. The soil consists of sand so loose that boats of burden can hardly proceed; and it is nearly destitute of vegetation, except where springs issue from the ground.

The table-land of Brazil is separated from the Andes of Bolivia by a large and extensive plain upwards of 1200 feet in height, and traversed by those streams which by their junction form the Rio Madeira. A small portion only of this plain belongs to Brazil—the country extending along the west declivity of the north branch of the Serra Paricis on both banks of the Rio Guaporé. A few scattered hills rise on the plain to a moderate elevation, and are separated by extensive level tracts, mostly covered with high forest-trees, and here and there intersected by a few barren districts without trees and with little vegetation.

The *Rio Guaporé*, called also Itenez, rises (14° 30' S. lat.) in the Serra dos Paricis, about 100 miles north-east of Matto Grosso, and at first runs south parallel to the Rio Jaurá, a tributary of the Paraguay. It then turns west and receives the waters of the Rio Alegre, a small but navigable tributary. In 1773 an unsuccessful attempt was made to unite this river by a canal with the Rio Agoapehy, which falls into the Jaurá. At the junction with this river the Guaporé turns to the north-north-west, and then to the west, where it is joined on the right by the large Rio Paraguay and the still larger Ubahy. At the confluence with the latter it turns north, and uniting itself to the Mamoré loses its name. The Guaporé runs more than 400 miles, and having only a few rapids and no cataracts is a navigable river.

The *Rio Madeira* is formed by the junction of the Rio Beni with the Mamoré (in 10° 22' S. lat.), which takes place about 100 miles below the confluence of the Mamoré with the Guaporé (in 11° 55' S. lat.). [BOLIVIA.] The Madeira runs in a north-east direction, with numerous windings, and falls into the Amazonas in 3° 24' S. lat., about 70 miles below Villa de Borba, after a course of upwards of 600 miles. After the junction of the Mamoré and Beni, it is 900 fathoms wide, and in its course in general preserves this width, with a considerable depth; its course however is interrupted by numerous cataracts. Below the union of the two principal rivers thirteen cataracts or rapids occur; and above it, in the Mamoré, five. They begin in 10° 37' with the Cachoeira da Bananeira, and terminate at 8° 48', with the Cachoeira de S. Antonio.

The north part of Brazil comprehends the greater portion of the plain of the Rio das Amazonas, one of the most extensive on the globe. This plain has been sufficiently described under AMAZONAS. It lies along both sides of that majestic river, from its wide mouth, near 50° W. long., to the confluence of the Ucayale, near 72° W. long., and consequently extends in this direction about 1500 miles. Elevations deserving the name of hills are rare, but the surface consists of a continual succession of extremely slight undulations, and to this peculiarity of its surface, joined to its tropical climate, it seems principally to owe the inconceivable luxuriance of its vegetation.

The tracts which skirt the banks of the river are generally low, and overflowed when the river rises. In many places the inundations are extended much farther inland by the channels which, in the dry season, bring down the water from the numerous lakes. But during the inundation these channels carry the water from the rivers to the lakes, and the low country in their vicinity is covered with water. All the tracts thus inundated are overgrown by an uninterrupted forest of trees of different size and species, with various bushes and underwood between them, and all these plants are tied together by numerous creepers, so that they form a vegetable wall, through which it is impossible to penetrate. The water-courses are the only roads which lead through this wilderness. That portion of the plain which is not

subject to inundations is likewise covered with interminable forest, but the trees are of more equal size, and without underwood, though here also the creepers are numerous. Occasionally some tracts of moderate extent occur, which are without trees, and covered with rich grass, intermingled with a few low bushes. Nothing however characterises this plain more strikingly than the incredible abundance of water. Brooks and ponds are of rare occurrence, for they enlarge immediately into rivers and lakes; and these rivers and lakes form along the banks of the larger rivers an interminable watery maze. This abundance of water, the softness of the soil, and the comparatively small inequalities of the surface, have made some phenomena common here which are rare in other countries. Such are the natural canals by which two rivers are united. Between the Madeira and the Rio Purus, its next western neighbour, two such natural water communications exist, at least 120 miles distant from one another. Others occur between other rivers. These natural canals unite also different river systems, as the Cassiquiare between the Orinoco and Rio Negro, and the canal of Cabuqueria farther west, which, according to the information of the natives, unites the Uaupé or Uaupes, the principal branch of the Rio Negro, to the Guaviaro, a tributary of the Orinoco. To the same peculiarities it is mainly to be attributed that many of the rivers, especially those running from the north to the Amazonas, send detached branches to the principal river, 100 miles and upwards before they entirely unite with it.

As to the rivers which drain this plain, we have already noticed the Tocantins, Xingú, Tapajós, and Madeira. To the west of the last, and nearly parallel to it, flow some considerable rivers: the Purus, the Coary, the Tefé, the Iruia, the Intahy, and the Hyabary or Yavary. These rivers, which run from 600 to 800 miles, have not been explored, and the country through which they flow is nearly unknown; but according to the information of the Indians it does not seem that they are interrupted by cataracts. The rivers which drain the plain on the north of the Rio Amazonas belong partly to the republic of Ecuador, as the Pastaza, the Tigre, the Nape, and Putumayo or Iça, and partly to Brazil, as the Yapurá or Yapura and the Rio Negro. About 100 miles from the mouth of the Yapurá begins the canal of Avatiparaná, which lies from north-east to south-west, and joins the Rio Amazonas nearly 200 miles above the mouth of the Yapurá. In this canal the water flows from December to June north-east from the Rio Amazonas to the Yapurá, and from June to August south-west from the Yapurá to the Rio Amazonas. The large island formed by this canal and the rivers is traversed by other canals, which are subject to a similar change of current. The *Rio Negro* originates in a swampy country about 2° 30' N. lat., and 70° 30' W. long., and runs first north-east and afterwards south-east about 200 miles, when it is joined by the canal of Cassiquiare, which comes with a rather rapid course from the Orinoco. Hence it runs with numerous windings nearly due south till it is joined from the west by the Rio Uaupé or Uaupes, which rises in one of the eastern branches of the Andes, and flows in a generally eastern direction for nearly 500 miles before its junction with the Rio Negro near the equator, between 67° and 68° W. long. From this junction the Rio Negro flows first east and then south-east, presenting in this part of its course rather the appearance of a succession of lakes united by comparatively narrow channels than that of a river. It sometimes enlarges to 12, 15, or even 20 miles in width, and sometimes narrows to a mile or a mile and a half; its current is generally very slow and not disturbed by rapids. Above 200 miles from its mouth it is joined by the Rio Branco, whose principal branch, called Uraricoera, originates in the Serra Parime, at no great distance from some of the branches of the Orinoco, and flows east till it joins another considerable branch, the Tacutú, which rises near the sources of the Rupunuri, a tributary of the Essequibo, and flows a considerable distance north parallel to the Rupunuri. The Tacutú afterwards turns south by a bold bend and joins the Uraricoera. Both branches have probably a course of more than 200 miles before their junction. The united river called Rio Branco, runs about 400 miles in a south direction, and has only a few rapids; cataracts however occur in the Tacutú. About 50 miles below the mouth of the Rio Branco, a canal branches off from the Rio Negro, called Carapuhuanu, which lies in a south-west and south direction, and passing through the Lake of Cudaya, sends its waters to the Rio Amazonas by the Cudaya canal, about 100 miles above the principal mouth of the Rio Negro. The whole course of this river may be from 1200 to 1400 miles.

No large rivers traverse the north plain east of the Rio Negro. The Oriximiná, or Rio das Trombetas, and Guruputuba are the most considerable. The great plain of the Rio das Amazonas, which even on its extreme borders hardly anywhere exceeds the elevation of 600 or 700 feet above the sea, and extends on both sides of the equator, differs in climate considerably from other tropical countries. The dry and rainy seasons are here not so distinctly marked as in Asia or Africa; nearly every day exhibits both. The nights are cloudless, but between nine and ten o'clock clouds begin to appear on the horizon, and in the afternoon rain falls, frequently in torrents accompanied by thunder and lightning and sometimes by fierce hurricanes. The rains however are less regular and abundant from August to October. They increase during the month of November and are accompanied with more violent thunder-storms; the rains generally

continue in equal abundance to the end of March. Frequently however they are interrupted by a drier season in January and February, which is called *veranico* (fore-summer), and then they continue more abundant to April and May. The east wind is by far the most prevalent. The trees are never without leaves; for while they are shedding the old ones, new ones are already forming. Most of the trees and plants, especially those which are peculiar to a tropical climate, blossom between November and March, and bear fruit between June and September.

All the rivers traversing the plain inundate the adjacent low tracts of marshy land, but the inundation does not take place in all of them at the same season. [AMAZONAS.]

On the north of the Rio das Amazonas, the plain extends to Macapá, opposite the island of Cavianna, which lies in the principal embouchure of the river; on the south it includes the lower course of the Rio Tocantins, and extends to the series of hills which run at a distance of about 50 miles from its banks on the east parallel to its course. To the east of these hills lies another and more uneven plain named after the Parnahyba, the largest of the numerous rivers by which it is watered. It measures from north to south upwards of 600 miles, and from west to east more than 400 miles. Its surface rises frequently to hills of some hundred feet elevation, which spread out into spacious table-lands. The south portion of the plain, which is more level, is covered with fine soft grass, interspersed here and there with bushes and a few high trees. This district is well adapted for the rearing of cattle. The north part has a much greater portion of high trees, but they form forests of only small extent, which are separated from one another by large plains destitute of trees, overgrown with grayish high grass and a few bushes. The lower districts of this part are favourable to the growth of cotton, the soil being rather dry and sandy. The climate of this plain is hot; the thermometer rises in summer above 100° and sometimes to 110°. The rains begin in October, and increase gradually to February, when they are most abundant; they terminate early in May.

The *Parnahyba* originates in the most southern angle of the plain, near 10° S. lat., and traverses it in a diagonal line from south-west to north-east and north. Having no falls and only a few rapids, it is navigated by vessels of from 15 to 40 tons to its junction with the Rio das Balsas, up to which place the European settlements on its banks are numerous. It empties itself into the sea by five mouths, the most remote of which are 30 miles apart. But as these mouths are not more than 2 to 4 fathoms deep, only vessels of moderate size can come up to the town of S. João de Parnahyba. Its whole course is nearly 600 miles; and, with the exception of the Francisco, it is the largest river that enters the sea between the Rio de la Plata and the Amazonas.

The eastern boundary of this plain is formed by the Serra Ibiapaba or Hybiappaba, from which extends east the mountainous country that forms the projection of Brazil and terminates with the capes of St. Roque and Augustinho. It resembles, in some respects, the table-land of Brazil; but the mountain plains are of less extent, and the valleys occupy proportionally a much greater part of the surface. Besides this, the tops of the mountains and their declivities are clothed with trees, while the low tracts are covered only with coarse grass and low bushes. Numerous rivers traverse this country, but their course is comparatively short; they have also very little water, and are, consequently, not well adapted for navigation. Though the weather is more changeable here than in other parts of Brazil, it rains less; the rainy season begins only in January and terminates in April. In this season vegetation is vigorous and rapid, but from August to December the country resembles a dusty desert. Sometimes, and as it appears in decennial periods, there is no rain at all, and then both men and animals die of hunger and thirst.

Cape Augustinho (Augustin) in 8° 20' 41" S. lat., and 34° 58' W. long., is one of the most eastern points of Brazil. About 300 miles from this cape, the great equatorial current, which traverses the Atlantic near the line, divides into two branches, of which the northern and by far the larger part runs along the north coast of Brazil to the mouth of the Rio das Amazonas, and hence along Guyana to the West Indies. This, called the Guyana current, combined with the trade-winds, which along these shores constantly blow from the east, renders the voyage from the northern parts of Brazil along this shore to the provinces south of Cape Augustinho so tedious, that it was, before the establishment of the mail steamers, more easy for the inhabitants of this part to communicate with Europe and North America than with the southern provinces of the empire. The south branch of the equatorial current is called the Brazil current; the character of these currents and of the monsoon connected with them is fully described under ATLANTIC OCEAN.

Agriculture, Productions, &c.—The climate and soil have been noticed in describing the several great natural divisions of this vast country. The cultivated lands in Brazil bear a very small proportion to the whole surface, but the proportion of cultivated land is steadily increasing. Except in the vicinity of the larger towns, the farms occur at great distances from one another, even in the neighbourhood of the sea, and still more so farther inland. They are nearer one another in the east district of the table-land of the Paraná, about S. Paulo in the mining district near Villa Rica, and along the river

Parnahyba in the provinces of Piahy and Maranhão. Agriculture is still generally carried on in a very rude manner.

The aborigines of Brazil were not entirely unacquainted with agriculture, but it was limited to a few articles. They planted maize, bananas, *apiis* (*Manihot apiis*, Pohl.), mandioc, and capsicum. Since the arrival of the Europeans and Africans the cultivated plants have largely multiplied, but still the cultivation of those which were grown by the aborigines is the most extended. The mandioc, of which different species are cultivated (*Jatropha manihot*, Linn.), is grown in every province except that of Rio Grande do Sul. Maize is grown all over the country. In low and hot places the milho cadete, a species with smaller grains, is commonly cultivated; it yields 20-fold. The milho de serra, with larger whitish grains, is grown in the valleys of the table-land, especially in Minas Geraes, and yields 150-fold. Two crops are annually got, one in September and the other in May: the first is the most abundant. Rice is extensively cultivated on the plains as well as on the mountains, but especially in the provinces of Maranhão and Pará. The cultivation of wheat has been attempted in different districts, but not with much success, except on the table-land of the Paraná and the plains of Rio Grande do Sul, whence considerable quantities are brought to Rio Janeiro. The banana is cultivated in the low plains and valleys along the coast and in the plain of the Amazonas. Potatoes succeed in Rio Grande do Sul and in Minas Geraes; and sweet potatoes succeed wherever there is a good sandy soil. The cara, a root similar to the sweet potato, and superior in flavour, is less productive. The inhame (*Phenix dactylifera*, Linn.) is likewise cultivated for its root, which, as well as its leaves, is eaten by men and pigs. Various kinds of beans are also cultivated.

The vegetables of Europe do not generally succeed well, being often destroyed by the ants and other vermin; leeks however are an exception. None of the trees or plants cultivated in Europe for oil are found in Brazil. The inhabitants cultivate the sesamum (*Sesamum orientale*), which was brought from the East Indies, and different kinds of the castor-oil plant. Lamp-oil is got from the fruit of a forest-tree called audiroba (*Carapa guianensis*, Aubl., *Xylocarpus*, Schreb.), which is common in some districts, especially in the plain of the Amazonas. A species of palm (*Enocarpus distichus*, Mart.), which gives an excellent oil for the kitchen, grows on the north coast. The coca-plant (*Eriothryum coca*), which is used by the aborigines as a narcotic, is cultivated on the banks of the Yapurá, as in Peru. The maté-plant, which produces the tea of Paraguay, is a shrub which is cultivated in the provinces of Rio Grande do Sul and of S. Paulo.

Coffee, which was introduced into Brazil about seventy years ago, is now grown in most of the maritime provinces, more especially in Rio Janeiro, the southern districts of Minas Geraes, and in Bahia, and its culture is extending every year. The sugar-cane is most extensively grown in Bahia and along the banks of the Rio S. Francisco; in other districts of Brazil the cultivation of the sugar-cane is less attended to, but from most of the maritime provinces a certain quantity is exported. The growth of cotton has increased very largely. It may be grown as far as 31° S. lat., but is only cultivated to any great extent from 15° S. lat. to the equator. In Pernambuco the cotton is gathered in July and August, in Maranhão in October, November, and December. On the banks of the Amazonas there are two trees, the mungaba and the sannauma (*Eriodendron sannauma*, Mart.), which produce a kind of cotton that is used to make felts and mattresses. Tobacco is less cultivated than formerly; but considerable quantities are still exported to Africa and to Europe. The best is grown in the Reconave of Bahia, especially at Cachoeira and S. Amaro. Indigo was formerly much grown, but the cultivation has almost entirely ceased; little is exported, and that is of inferior quality. Ginger and the eurenma were once cultivated and exported from the north coast, but both articles are now neglected. In modern times the pepper-tree, the cinnamon-tree, the clove-tree, and the muscat-tree have been planted near Rio Janeiro and Pará, and the three first seem to succeed at Pará. The first trial with the tea-tree failed at Rio, but the plant is now cultivated successfully in the Botanic Garden at Ouro Preto, where several acres are devoted to its growth. A considerable quantity of tea is manufactured, and sells in the market for about the same price as that imported from China. Tea-plantations have also been formed in several places in the province of San Paulo.

The immense forests which cover the plain of the Rio das Amazonas supply various articles of export. Cacao is gathered very extensively, as well as cloves, cinnamon, vanilla, sarsaparilla, caoutchouc, Brazil-nuts, and different balms, as copaiba and copal. What most strikes the attention of the naturalist in these vast forests is the great diversity of vegetation which they contain. In the words of the most recent traveller, Mr. Wallace, "The forests of the Amazonas are distinguished from those of most other countries by the great variety of species of trees composing them. Instead of extensive tracts covered with pines, or oaks, or beeches, we scarcely ever see two individuals of the same species together, except in certain cases, chiefly among the palms." ('Travels on the Amazon,' p. 436.) The forests on the coast produce different sorts of timber, and woods for the making of furniture and dyeing. The fruits of Europe which succeed best in Brazil are figs, oranges, pomegranates, quinces, and a small sort of lemons. Vines bear abundantly in the neighbourhood of Bahia as

well as in the plain of the Rio das Amazonas, and produce ripe grapes twice a year, in June and in December. Pine-apples are sometimes found wild in the forests near Pará, but they are cultivated in the districts north of 30°, and near Pará attain an extraordinary size, with an exquisite flavour.

About a hundred varieties of palms are found in Brazil. They abound in the northern provinces, and perhaps every one of the numerous species may be applied to some useful purpose. The most useful is the coco-palm (*Cocos nucifera*, Linn.), which is common along the coast between 10° and 20° S. lat., and principally valuable on account of the 'cairo' or outer part of the fruit, of which ropes of great strength are made. The Coco de Denté, or oil-palm (*Elæis guineensis*, Linn.), which has been brought from Africa, grows not only like the coco-tree on the coast, but also to a considerable distance from the shore, and yields an oil which is used for lamps and culinary purposes. The leaves of the piacaba-palm (*Attalea funifera*, Mart.), which grows wild between 10° and 20° S. lat., are an excellent substitute for hemp, which does not succeed in these parts of Brazil. Cables made of these leaves are much preferred to those made of cairo, being three times as strong.

A singular feature in the vegetation of Brazil is the leafless parasite plants. "They are all comprehended under the general name of 'timbo'; they serve for basket-work, and are beaten into tow. Their juice is used in tanning: being bruised and cast into the lakes and rivers, they stain the water with a dark colour, and intoxicate or poison the fish. These plants twist round the trees, climb up them, grow downwards to the ground, take root there, and springing up again cross from bough to bough and tree to tree, wherever the wind carries their limber shoots, till the whole woods are hung with their garlanding, and rendered almost impervious. The monkeys travel along this wild rigging, swing from it by the tail, and perform their antics. This vegetable cordage is sometimes so closely interwoven that it has the appearance of a net, and neither birds nor beasts can get through it. Some are as thick as a man's leg, their shape three-sided, or square or round; they grow in knots or screws and every possible form of contortion. Any way they may be bent; but to break them is impossible. Frequently they kill the tree which supports them; and sometimes they remain standing after the trunk which they have strangled has mouldered in their involutions." (Southey.)

Of the native vegetation of so extensive a country as Brazil it is impossible to give any exact idea without going into numerous details or which this is not the place. Those who are desirous of making themselves acquainted with this subject will find the most valuable though still very incomplete sources of information to be the following:—Auguste de St. Hilaire's 'Voyage dans l'intérieur du Brésil;' the 'Travels' of Martius and Spix, and of Prince Maximilian of Wied; the 'Pflanzen und Thiere des tropischen America, ein Naturgenüsse,' of Dr. C. F. Ph. von Martius; the 'Aperçu d'un voyage dans l'intérieur du Brésil, la Province cisplatine et les Missions ites du Paraguay,' by Auguste de St. Hilaire, published in the 'Mémoires du Muséum,' vol. ix.; Gardner's 'Travels in the Interior of Brazil;' and Wallace's 'Travels on the Amazon and Rio Negro,' 353.

As so small a proportion of Brazil is cultivated, and by far the greatest part consists of extensive plains, very thinly wooded and frequently without trees, the pastures are extensive, and one of the principal sources of wealth is in the domestic animals. The best pastures are to the south of 20° S. lat., in Rio Grande do Sul, San Paulo, and the northern districts of Minas Geraes. The herds of horned cattle are immense, and their produce, consisting, besides live stock, of deer, jerked beef, tallow, horns, and horn-tips, is exported in great quantities. As soon as the animals are skinned the hides are spread on the ground, slightly salted, and dried in the sun. The flesh is cut to thin slices, salted, and dried in the air. Thus prepared it is called 'Carne seca do Sertão,' 'Passoca,' or 'Carne charquada,' and is carried from the southern provinces to the northern, where it is consumed by the poorer classes, and especially by the negroes. Butter made in San Paulo, and cheese in Minas Geraes, but neither is good. By far the greatest part of the cattle live nearly in a wild state, and are not milked. Cattle-hair is exported from Rio Grande do Sul.

Horses are numerous in the southern provinces, but less so in San Paulo than in Rio do Sul. The number annually exported to the north is vaguely estimated at about 50,000 head. They are of a middling size, from 12 to 14 hands high, but strong, lively, and swift. Those reared in Espírito Santo, and called 'Campos' horses, are beautiful animals, and last longer. Even near the equator, in the province of Pará, good horses are reared. Mules are only reared in the southern provinces, but in great numbers. The sheep are in little vogue, the meat being ill-flavoured and the wool of indifferent quality. Goats are more numerous, and kept for their milk. Hogs are kept in great numbers. Monkeys are among the wild animals used for food by the Indians. A great number of monkeys live in the forests along the Amazonas, where Spix observed twenty-five different species, some of very small dimensions, and there are doubtless several other species.

Other wild animals, many of which are used for food, are different species of the anta or tapir, the porcupine, the nasica, deer, the Brazilian hare, armadillos, the great and small ant-eaters, several kinds

of sloths, didelphys, pacas, and agoutis, and the wild boar. Besides these there are hyenas, jaguars, ounces, tiger-cats, coatis, squirrels, rats, &c., and two or three kinds of bats, the vampires and the *quandirê*, which stick to domestic animals in the night-time, and suck their blood. Of birds Brazil possesses a wonderful variety. The largest bird is the American ostrich or emu, which is found in numerous flocks on the table-land, and is caught for its flesh and eggs as well as for its feathers, of which different articles are made, as fans, &c. Among birds of prey the king-vulture and the harpy-eagle, which are found in the whole district of the lower Amazonas, are the most remarkable; there are also many varieties of eagles, hawks, kites, and owls. The other birds are more remarkable for the beauty of their plumage than their voice. The most beautiful are the toucans, the tanagras, the numerous species of the parrots, chatterers, and ravens of different colours, as also the Balearic crane, different shrikes, kingfishers, wood-peckers, and humming-birds. Many varieties of birds are suitable for food, and especially the different kinds of pigeons, which are caught by steeping grain in the poisonous juice of the mandioc-root.

The numerous lakes at the southern extremity of Brazil in the province of Rio Grande do Sul are at certain seasons covered with water-fowl, especially geese and ducks; this is still more the case with the numerous lakes in the plain of the Amazonas, where the Indians kill great numbers of storks, cranes, ducks, &c.

Fish must be considered as one of the most important sources of wealth to Brazil. Whales, which in the southern hemisphere approach much nearer to the equator than in the northern, and come as far as 15° S. lat., formerly yielded considerable profit, but this branch of industry has much declined. Farther south, on the coast of Rio Grande do Sul, the *Physeter macrocephalus* (Linn.) is frequent, and yields spermaceti in abundance. Among the fish caught along the coast the guropa is the most important. It attains the length of from 12 to 20 feet, and is very well tasted. It is most abundant along the shores of the province of Bahia, where great quantities are annually caught and exported. But the quantity of fish in the Amazonas and its large tributaries as far up as the cataracts is truly astonishing. Mr. Wallace found 205 species of fish in the Rio Negro alone, and these he says he is sure "are but a portion of what exist there." It is to be observed, too, that most of the fishes of the Rio Negro are different from those found in the Amazonas; indeed "in every small river and in different parts of the same river distinct kinds are found." In many places the inhabitants, Indians as well as European settlers, gain a considerable portion of their subsistence by fishing, in which the Indians display much ingenuity. The larger fish are salted and dried, and in this state consumed by the lower classes; from the smaller fish oil is extracted. The largest species are the pirarucu (*Sardinia pirarucu*, Spix), which for size and quantity may be compared with the cod of our seas, and the pirarara (*Phractocephalus biolor*, Agass.). The dolphin (*Delphinus Amazonicus*, Spix) is not found towards the mouth of the Amazonas, but occurs farther up the river. It is from seven to eight feet long, and is caught by the natives for the oil which is extracted from its fat; the flesh is hard and has a disagreeable taste. The lamantin or manati (*Manatus Americanus*, Cuv.) was formerly found even in the smaller rivers along the coast between Rio Janeiro and Maranhão. It is now sometimes seen in the Rio de St. Francisco, but is common in the Amazonas and its northern larger affluents. From its resemblance to an ox it is called by the Portuguese peixe-boi (ox-fish), and by the Spaniards vaca marina (sea-cow). In the Rio Amazonas, according to D'Orbigny, it is sometimes 20 feet long, and weighs from 70 to 80 cwt. One fish often yields 450 or 500 gallons of oil, and its flesh, which resembles fresh pork, is excellent. Mr. Wallace, however, states that he saw none exceeding seven feet in length. Sausages are made of it, and sent to Portugal as a delicacy. It is a very peaceful animal, and rapidly decreasing in numbers. Its greatest enemy is the alligator, of which there are several species in the rivers and lakes of Brazil.

There are several species of turtles in the Rio Amazonas, but that called *Tartaruga grande* (*Emys Amazonica*, Spix) is most common. Its flesh generally weighs from 9 to 10 lbs. The farms in the neighbourhood of the river have places well fenced, in which they are kept and killed as they are wanted. On some sandy islands of the Rio Amazonas, as well as the Madeira, Rio Negro, and Yapurá, the turtles lay their eggs when the water is lowest: the eggs are gathered, broken, and by means of a slow fire reduced to a fat substance, called 'Manteiga de Tartaruga,' which is extensively used all over Brazil. About 20,000 pots of this fat, each containing 60 lbs., are annually made, and several thousand persons are occupied in its preparation.

Snakes are common in Brazil, and some are of great size, but the number which are poisonous, according to Freyreiss, is not very large. Lizards are very numerous.

The insects of Brazil are remarkable for the beauty of their colours, and their size, especially the butterflies, in respect to which Brazil is unrivalled both as regards numbers and beauty: Mr. Bates obtained 1200 species in the valley of the Amazonas. Some of the insects are very destructive to fruits or furniture, as the ants, of which one species is fried and eaten as a delicacy. The variety of *Coleoptera* is very great; but with the exception of the extraordinary harlequin-beetle and the gigantic *Prioni* and *Dynastes*, they are generally of small size and

little brilliancy of colour. Persons, more especially Europeans, who have just arrived in Brazil, suffer much from mosquitoes, sand-fleas (*Pulex penetrans*), and some kinds of *Conops*. The scorpion, which sometimes attains a length of six inches, the scorpion, and some kinds of caterpillars, especially those of the family of *Bombyces*, cause swellings and excessive pains.

The domesticated bee of Europe is not known in Brazil; but Martins has enumerated more than thirty species of wild bees, nearly all of which are without stings, and it is supposed that some of them could be domesticated. Gardner, however, during his four years' travels in Brazil, only saw one attempt made to do so, and that was by a Cornish miner in the Gold District. In the province of San Paulo the nopal-tree grows, and the inhabitants collect cochineal. Several attempts have been made to introduce the silk-worm, but hitherto we believe without success.

The mineral wealth of Brazil is considerable. Gold is found on both sides of the Serra dos Vertentes, from the Serra de Mantigueira to the north branch of the Serra dos Paricis, for a distance of about 200 miles, but farther on the north than on the south side. It is found, more or less, in almost all the rivers which form the upper branches of the Francisco, Tocantins, Araguay, and Guaporé, but by far the greatest quantity has been collected in the affluents of the Francisco. The greatest quantity has been obtained by washing the sand from the bed of certain rivers, or the alluvial deposit on their banks. It is only in comparatively recent times that attempts have been made to work the mines in the mountains. Before the beginning of the last century the quantity of gold obtained was inconsiderable, but it increased rapidly. The greatest quantity was found between 1753 and 1763, and from that time it continued to decrease, mainly owing to the better portion of the auriferous sand having been exhausted, and to the amount of capital required to work the veins in the mountains on a regular system. British capital has within the last few years been employed with considerable success, and the mines at Congo Soco, near the Villa de Sabará, on the banks of the Rio das Velhas, a tributary of the Rio de S. Francisco, at Cocoes, at Morro Velho, and elsewhere, are the result of British enterprise. Iron is very abundant: in some places, as at Minas Geraes, there are whole mountains of ore; according to St. Hilaire, it may be regarded as inexhaustible, but up to the present time it has been worked on an extensive scale only in two or three places. Copper was once worked to a considerable extent. No silver has been found, and only slight indications of tin and quicksilver. Platinum occurs on the banks of the Rio Abaeté, a tributary of the Francisco, and in some other places. Lead and cobalt are more common. Arsenic, bismuth, antimony, and manganese are found.

No country probably is richer in diamonds than Brazil, but hitherto they have only been found in the rivers. The most western stream in which diamonds have been discovered are some of the upper branches of the Paraguay. The diamond district, of which the Cidade Diamantina is the centre, or the district of Tejuco, where by far the greatest quantity of diamonds has been found, is situated under 15° S. lat., and comprehends both sides of the Serra de Espinhaço. It is traversed by the Rio Iaquetinhonha, an upper branch of the Rio Belmonte; the small rivers of the western part of the district fall into the Francisco. In this district about 10,000 persons are dependent upon the collection of diamonds. The searching for stones, formerly a monopoly of the government, is now free to all. To the south-west of this district, on the Abaeté and Indaia, both of which join the Francisco on the left bank, between 18° and 19°, there is another diamond district, in which some of the largest diamonds known have been found; but the search here has been long abandoned. In the plain of the Rio Paraná diamonds are found in the Tabagi, which falls into the Parapanema, a tributary of the Paraná. The value of the gold and diamonds of Brazil has however become inconsiderable compared with its other products. The yellow topaze found near Villa Rica are much esteemed. Amethysts and other precious stones are found in Minas Geraes.

Brazil could not maintain its immense stock of cattle if the people were obliged to buy salt, without a supply of which the animals will not thrive. The table-land does not contain rock-salt, but a great number of small patches occur on the surface covered with a salt efflorescence, which the cattle lick up. These patches, which generally do not exceed a few square yards, double the value of an estate. In other places salt-springs occur, and serve the same purpose. There are also salt steppes, which resemble those on the high land of Iran in Asia. Two of them are very extensive; one runs, on both sides of the Francisco, between 7° and 10° S. lat., from the Villa de Urubú to the Villa de Iazeiro, with an average breadth of from 80 to 100 miles; the other is situated near the western boundary of the empire, between the Paraguay and the Serra de Agapehy, beginning on the banks of the Jurua, and extending in a south-western direction for a great distance. In both districts the surface is slightly undulating, and the salt which appears on the surface after the rains is extracted by washing the earth, and leaving the water to evaporate. In some places, along the Francisco and in the province of Ceará, large caverns occur, the soil of which is impregnated with salt-petre. In other places, more especially on the Rio de Iaquetinhonha, alum is found in abundance.

Inhabitants.—The inhabitants of Brazil consist of aborigines and of foreigners, who have settled here in the last three centuries. The aborigines are divided into a great number of tribes, but they so far resemble one another in figure, complexion, and habits, as to appear to belong to the same race. They are of a middling size and of slender make. Their complexion is a shining light copper colour, which sometimes passes into a yellowish-brown; their hair is black, lank, and rough, their eyes are small, dark brown, and placed a little oblique; their cheek-bones are prominent. All these characters indicate a resemblance to the race which inhabits the eastern parts of Asia. They have little hair on the chin. It is remarkable, that though these tribes agree so well in their external characters, they have all a different language, even if a tribe consists of only a few families, which is sometimes the case. It is true that most of these languages contain some common roots, but the relationship is not so close that one can be easily understood or learned because another is known. These tribes are still in a very low state of civilization, but they are not unacquainted with agriculture, and with scarcely an exception cultivate the ground and plant the two kinds of manioc, bananas, and a species of palm-trees. They have likewise divided their hunting-grounds, and marked these divisions by boundaries. Still they derive the greater part of their subsistence from the chaco, the wild fruits of the forest, and from fishing. In some tribes the men and women go naked, in others the women have some clothing. The number of these savage tribes probably exceeds 200; many of them, however, consist of only one or two families. This is particularly the case with the tribes in the plain of the Amazonas to the north of the river, where the people live in a completely isolated state, and at great distances from one another. To the south of that river the tribes are much more numerous, and often consist of several thousand individuals.

All the aborigines, who lead an independent and roving life, are called in Brazil *Indianos Bravos*, or *Gentios*, in contradistinction to the *Indianos Mansos* (Domesticated Indians), who have settled among or in the neighbourhood of the Europeans. Of these domesticated Indians, there is a very considerable number, especially on the coast. They were brought together by the Jesuits, and induced to settle in villages, called in Portuguese *aldeas*, where they were accustomed to agricultural labour. But on the suppression of that order, the Indians left their abodes and returned to the woods, where they now cultivate a piece of ground, hardly sufficient to give them a bare subsistence, and employ their time chiefly in fishing and hunting. Their huts are better than those of the savage tribes, and they profess Christianity.

The foreign settlers are either Portuguese, or negroes from Africa who have been brought over as slaves, and for the most part are still in a state of slavery. The Portuguese and the negro have intermingled with one another, and with the aborigines. The descendants of Europeans and negroes are called *Mulattos*; those of Europeans and aborigines, *Mamelucos*; and those of the negroes and Indians, *Caribocos*. The offspring of the mulattos and negroes, who are called *Culbras*, are also very numerous. The descendants of the negroes are called in Brazil *Crooles*. The Mamelucos are valued for their quiet disposition and their honesty.

The whole population of Brazil is estimated at from four to five millions; but the different independent aboriginal tribes, which still possess more than half the surface of the country, are not included in this account. It is conjectured that the white number less than a million; the negroes about two millions, of which more than three-fourths are slaves; and the mixed races and Indians somewhat more; but, as we pointed out before, all the statements hitherto published respecting the population of Brazil, whether of the entire empire, of the several provinces, or of particular towns, are mere estimates, and generally founded on very insufficient data.

Political Divisions.—Brazil is divided into nineteen provinces, of which fifteen are situated along the coast, and four in the interior. Along the coast, beginning from the south, are the following provinces:—

1. S. Pedro do Rio Grande do Sul comprehends the sandy plain that stretches along the shore from the boundary of the republic of Uruguay to the Rio Mambituba, a small river which enters the south of the Morro de S. Marta, and also the whole country between this plain and the Rio Uruguay. This province is rich in cattle and horses, produces the grains of Europe, and rice, as well as most European fruits; vines also succeed very well. In the most northern districts along the Rio Uruguay there are a few feeble tribes of independent Indians. S. Pedro, the only harbour of this province, is situated near the mouth of the Rio S. Pedro, and is formed by a sandy tongue of land. As vessels cannot approach near the town of S. Pedro, which contains nearly 4000 inhabitants, and carries on an active trade with Rio Janeiro, they remain at a place called S. José. *Povo Aleyre*, the capital of the province, situated on a bay formerly the Rio Jacuhy, is well built, and contains an hospital and several schools. The population in 1845 was about 10,000.

2. S. Catharina comprehends the hilly country along the coast between the Rio Mambituba and the Rio Sulhy, which separates it from S. Paulo, and also the island of S. Catharina; it lies between 29° 20' and 25° 50'. Here the grains and fruits of *Europy* are cultivated together with those of a hotter climate. There are some good

harbours on the coast, but the most frequented is that formed by the island of S. Catharina. The island of S. Catharina is above 30 miles long from north to south, and from 4 to 8 miles wide; its surface presents a succession of hill and dale, and a great part of it is covered with fine trees; it abounds with water, and has some fine lakes; the climate is temperate, and the air salubrious, so that it is sometimes resorted to by invalids. It is separated from the mainland by a strait, which in its narrowest part, where it is formed by two projecting capes, is not more than 200 fathoms wide. These capes divide the strait into two large ports, almost equal in size, and both very safe. The north and larger port is 10 miles wide, and deep enough for ships of war; it is one of the best ports in South America. *Nossa Senhora do Desterro*, the capital of the province, is on the west side of the island upon a bay, a little to the east-south-east of the narrowest part of the strait. It has about 4500 inhabitants, and contains the residence of the president of the province, an hospital, an arsenal, &c. Some small manufactures of linen and cotton cloth, and of pottery are carried on. Many spermaceti whales are taken in the strait, and the oil is prepared in several places of the island and the adjacent mainland. *Laguna*, population about 1000, on the continent, has a harbour for coasting vessels, and exports grain, timber, and fish, which abound along this coast. *S. Francisco*, near the boundary of the province of S. Paulo and on an island, has also a harbour for smacks, and exports grain and a great quantity of timber and cordage.

3. S. Paulo extends over the greater part of the plain of the Paraná, namely, that part of it which lies on the east of the Rio Paraná, and over the Campos da Vacaria, and the sea-coast from the Rio Suly, to the bay called Angra dos Reis. On the table-lands cattle and horses are raised in great numbers, and grain, mandioc, and rice are cultivated and exported. On the coast, sugar, tobacco, cotton, and a little coffee are raised. The west districts, along the Rio Paraná, from the mouth of the Rio Tieté to that of the Iguaçu, are still in possession of independent tribes. This province has many harbours for coasting vessels, and some thriving towns along the coast. *Iguape*, population 7000, stands on a good harbour; it exports great quantities of rice and timber. *Santos*, the port of the town of S. Paulo, to which an excellent road leads over the mountains, is on the north side of an island called S. Vicente, in the Bay of Santos, and has a harbour capable of receiving men-of-war. It has 8000 inhabitants, and carries on a very considerable trade, especially in sugar. On the same island, but on the south shore, is the town of S. Vicente, population 600, the first establishment of the Portuguese in Brazil and long the capital; it is now only inhabited by fishermen. *S. Sebastião*, further to the east, is on the strait of Toque, which is more than 2 miles wide, and separates the island of S. Sebastião from the continent. The town has a harbour for coasting vessels, 3000 inhabitants, and exports timber and grain. Besides the capital, S. Paulo, which contains 12,000 inhabitants, there are four other considerable places in the interior, Itu, S. Carlos, Sorocaba, and Corytiba. *Itu*, or *Itua*, on the Tieté, is the centre of the most fertile and populous district in the province. The town contains two churches, two convents, several schools, an hospital, &c., and with the surrounding district about 10,000 inhabitants. *S. Carlos*, formerly *Campinas*, is a large town situated on the border of the plains, and is a principal station of the muleteers and others carrying on the intercourse between the coast and the interior: population about 5000. *Sorocaba*, situated on a hill to the west of S. Paulo, has 10,000 inhabitants, and considerable trade in cattle and grain. Coffee and tobacco are cultivated to some extent in the vicinity. In its neighbourhood is the Morro do Aracoyaba, which is several miles in circuit, and consists entirely of iron-ore. *Corytiba*, on the north skirts of the Campos da Vacaria, with the surrounding district, has a population of 12,000 mostly dependent on agriculture; some coarse woollens are manufactured: it sends the produce of that country to the coast.

4. Rio Janeiro, comprehending the coast between the western extremity of the bay, called Angra dos Reis, and the mouth of the Rio Catapuzina, extends from 50 to 60 miles inland. To it belongs the greatest portion of the Serra do Mar; and the Serra do Mantigueira stretches along its western boundary. It is mountainous, but contains also extensive valleys. The grains of Europe do not thrive in this province; but rice, mandioc, and maize are extensively cultivated. Coffee is raised to a greater amount than in any other province, and cotton is also largely raised. It has some excellent harbours, especially those of Rio Janeiro and of Angra dos Reis. The latter is formed by two islands, Ilha Grande and Murumbaya, lying in a parallel line with the coast, and contains some excellent roubustens. Two of its three entrances are from 5 to 8 miles wide, with a depth of about 30 fathoms. The port-town of *Angra dos Reis*, on the mainland opposite the Ilha Grande, was once a more important place than at present. It contains three churches with convents attached, and about 3500 inhabitants. *Paraty*, near the mouth of the harbour of Angra dos Reis, is a small town, but is a somewhat busy place, being the port of the singularly fertile plains of Paraty-Merim, Bananal, and Mamibuca, from which are exported the finest sugar, coffee, and fruits. The town is regularly built, and contains three churches. Distilling is carried on largely. The town and suburbs contain nearly 10,000 inhabitants. This province does not contain any other considerable town except Rio Janeiro, the capital of Brazil. [RIO JANEIRO.]

5. Espírito Santo extends from the Rio Catapuzina to the Rio Belmonte along the coast, and from 60 miles to above 100 miles inland. Some districts are hilly, but the greater part of the province consists of extensive low plains. A small portion of it is under cultivation, and produces sugar, cotton, rice, mandioc, and maize in abundance. Fish abound along the whole extent of the coast. The west districts are occupied by the independent aborigines, among whom the Botocudos are distinguished by their bravery and cannibalism. Along the coast are the islands called the Abrolhos. There are some harbours, but only fit for trading vessels. *Victoria*, or *Nossa Senhora de Victoria*, the capital of the province, is on the west side of an island 15 miles in circumference, in the large bay of Espírito Santo, which is deep enough for frigates, and has safe anchorage. The town contains 6000 inhabitants, who carry on an active commerce in the produce of the country. *Caravelhas*, the most commercial town of Espírito Santo, is opposite the Abrolhos, on the river Caravelhas, which is only an arm of the sea extending 10 miles inland, of considerable width and very deep; but the entrance is only accessible to small vessels. The town, which contains above 3500 inhabitants, exports chiefly mandioc-flour, rice, and fish, the garoupa being taken in great numbers near the Abrolhos and the reef extending east of them. *Porto Seguro*, near the mouth of the small river Buranhen, is a considerable place, with a good but not deep harbour. The town-house was once a Jesuits' college; its church is one of the oldest in Brazil. Its inhabitants are principally occupied in the garoupa fishery.

6. Bahia extends from the Rio Belmonte to the Rio S. Francisco about 480 miles, and on the average about 200 miles inland. By far the greater part of its surface is mountainous. With regard to its climate and productions it may be divided into three districts of very unequal extent. The first, comprehending the southern coast up to point Mutta, or the Bay of Canaanu, and extending inland about 90 miles, is called the Beira-Mar, and has an abundance of running water with a fertile soil, on which mandioc, rice, maize, sugar, cotton, and coffee flourish; but the climate is humid and unhealthy. In this part there are few European settlements. The inhabitants are mostly of the mixed races, but there are some native tribes. Rice is the chief article sent to Bahia. The Beira-Mar contains immense forests of valuable timber, as yet almost untouched by the woodman. The second district, known as the Recôncavo, lies north of the former; it extends round the Bahia de Todos os Santos, or All Saints' Bay, to Cape S. Antonia, and from 20 to 30 miles inland. The climate of the Recôncavo is healthy, the soil is fertile, and there is abundance of water; and these with its commercial advantages have rendered the Recôncavo the most populous district of Brazil. Villages and farm-houses are frequent, and there are between 20 and 30 small towns. The capital of the province, BAHIA, lies near the northern entrance of the bay around which the district is situated. Between the entrances to the bay lies the island of *Itaparica*, which is 23 miles long from north to south, and 10 miles across in the widest part. The soil of the island is fertile; and it is planted with coco-palms, mangoes, leas, vines, which bear three times a year, oranges, quinces, and other fruits of the south of Europe. It has also a whale fishery, cord manufactories, and distilleries; and about 16,000 inhabitants, of whom nearly half live in and around the port-town of S. Gonzalo. The surface of the Recôncavo is hilly or gently undulating, with wide open plains, watered by the Paraguaçu, the Itapicuru, the Iguaçu, and several smaller streams. Great quantities of sugar, tobacco, and cotton are raised for shipment from Bahia. Rice, mandioc, and numerous fruits and vegetables flourish; and along the coast are whale and other fisheries. The third district, which is very different from the other two, consists of the mountains, and the sertões, or dry open plains on the backs or between the ridges of the mountains. These plains afford in ordinary seasons rich pasturage, but they are subject to occasional droughts which cause much mortality among the cattle. In the narrow valleys mandioc, fruits, vegetables, and some cotton are raised, and a few villages have been built; but the larger part of the district is only inhabited by Indian tribes. As has been seen, the soil of this province is extremely fertile, and a good deal of care has been bestowed upon its cultivation. The principal products have been enumerated. In indigenous trees and plants it is very rich. Timber trees affording wood of great beauty and value are very abundant, as well as those whose wood is used in dyeing. There are numerous palms, some of which attain a prodigious size: the coco-palm and the passaliba, the bark of which supplies cordage and cables, are among the most valuable. The cashew-nut, and the mayla-tree, which yields a sweet nut, are very abundant. Among medicinal plants are ipé-cemacha, Jesuit's bark, jalap, tamarinds, Brazil-root, curcuma, and betony. Among trees producing gums are the copal, dragon's-blood, mastic, and copiba. The metals once formed a considerable portion of the wealth of this province, but they are now of very little importance. Mines of gold, silver, copper, iron, and antimony exist, but they are not worked. Saltpetre occurs, but it is not collected. The capital, BAHIA, is noticed under its title. *Cachoeira*, on the Paraguaçu, is a busy and flourishing town situated in the midst of the chief tobacco district of the Recôncavo; some coffee is also grown in the neighbourhood. The population of the town and district is about 5,000. Near this town copper mines

were once worked; in one of which a piece 1666 lbs. in weight was found, being the largest piece of native copper ever discovered. *Maragocyte*, in the valley of the Iguaçu, an affluent of the Paraguay, though but a small town is of some importance as the centre of the sugar district, which extends for five or six miles north of the town, and contains above 20 plantations. *Ilheus*, at the mouth of the river of the same name, was founded in 1535; it has a good deal of trade, and contains nearly 3000 inhabitants. *Oliveira*, a town some miles south of Ilheus, has also some local importance. *Camamu*, at the mouth of the Bay of Camamu, population 2000, is a busy port-town; the exports are chiefly of timber and rice. *Jacobina*, on the left bank of Itapicura, near its confluence with the Oura, is the centre of a busy agricultural district, celebrated for its tobacco: population together about 10,000.

7. *Sereipe del Rey* comprehends the country to the north of the river Rio Real, as far as the embouchure of the Francisco, and 140 miles inland. Its surface is a plain, with the exception of a few hills; but the west portion is considerably higher than the east, which is covered with forests, intermingled with patches of cultivated ground. The west country is generally stony, with few woods or fertile tracts, and is very deficient in water. It supplies only very indifferent pasture for cattle. In the east district the plantations of sugar, cotton, and tobacco are numerous. The harbours are formed by the mouths of the rivers, which are neither large nor deep. *São Christóvão*, or as it is commonly called *Sereipe*, population 3000, the capital of the province, is situated near the river Paramopania, an arm of the Rio Vazabarris, 18 miles from the sea: coasting vessels come up to the town. It has manufactories of sugar and tobacco, and some tan-pits. *Estancia*, population about 3000, 18 miles from the sea on the Rio Real, carries on an active commerce in the produce of the country.

8. *Alagoas*. This province has been already described. [ALAGUAS.] The present capital is *Marcé*, or *Mucayo*, the seat of government having been removed there from Alagoas. The town consists of a single street of white houses, ranged along the beach at the back of the harbour of the same name, which is formed by a coral reef, and affords good anchorage. The town contains four churches, a government house, a theatre, and about 6000 inhabitants. The chief exports are sugar, cotton, hides, and Brazil-wood, but the products of the province are chiefly sent to Bahia and Pernambuco for shipment. Some lace is made at *Maçêdo*.

9. *Pernambuco* consists of two parts, one on the coast, and the other on the table-land. The latter is distinguished by the name of *Sertão de Pernambuco*. The country along the shores extending between the river Una and Goyanna is in general flat, but further inland it presents a succession of hill and dale, intermixed with some level grounds of considerable extent. Where it approaches the *Sertão* the surface is stony and sterile. The *Sertão*, which extends along the left bank of the Rio S. Francisco, between the province of Bahia and Goyaz, as far as the Rio Carinhonha, an affluent of the Rio S. Francisco (near 15° S. lat.) is a portion of the table-land of Brazil, and comprehends the greater part of the salt steppes already described. Other portions however afford excellent pasture for cattle, and on the banks of the river the plantations of cotton are increasing. Sugar and cotton, and other common productions of tropical climates are cultivated, and dye-wood is got in the forests, nearly 100 miles from the sea. Close to the mainland and about 30 miles north from Pernambuco city is the island of *Itamaracá*, celebrated for the fertility of its soil, its salt-works, and its fisheries. The island is about 20 miles long and 2½ miles broad; it contains two or three villages, several churches, a theatre, and about 8000 inhabitants. Vast quantities of coco-nut palms grow on the island; sugar, rice, and mandioc are also raised. The numerous harbours along the coast of Pernambuco are only adapted for small craft, except those of Catuama, Recife, and Tamandara. The port of Catuama is at the north entrance of the strait, which divides the island of Itamaracá from the continent, and near the north part of the coast. Recife is the harbour of the town of Pernambuco; and the port of Tamandara lies about 30 miles south-west of Cape S. Augustinho. The last named is the best, and capable of holding large vessels, being four and five fathoms deep at the entrance, and six fathoms within. Besides the towns of Recife and Olinda, which compose the town of PERNAMBUCO, there is *Goyanna*, population 5000, at the junction of two rivers, 15 miles from the sea, which exports considerable quantities of cotton. It contains five churches, an hospital, and some other public buildings, and is the seat of civil and criminal courts. Some factories have been established here.

10. *Parnahyba do Norte* extends about 60 miles along the coast from the Rio Goyanna to the Bay of Marcos, and 210 miles at its greatest width from east to west. More than two-thirds of its surface have an arid soil and are not cultivated. The cultivated lands are in the vicinity of some rivers and on the mountain ridges, which are generally covered with trees and have a strong soil. The principal products are sugar, cotton, mandioc, maize, and tobacco, with excellent fruits. Its few ports can only receive small vessels; but from Cape Branco a reef extends nearly 18 miles north, between which and the beach there are nine and ten fathoms of water, in which vessels can ride in safety. *Parnahyba*, the capital of the province, popu-

lation 15,000, is on the right bank, 10 miles above the embouchure of the river of the same name, which, though about three miles wide at its mouth, allows ships to ascend only for three miles; nothing but smacks can come up to the town, the commerce of which in the produce of the province is considerable. In the town are government and other warehouses, the president's palace, the treasury, a handsome edifice, several churches and convents, an arsenal, and an electoral college.

11. *Rio Grande do Norte* extends along the coast from the Bay of Marcos to a range of hills called the Serra of Appody, by which it is separated from Ceará, and it runs 100 miles inland. Its surface is generally uneven and hilly; at a few places it rises into mountains; forests, however, are rare and of no great extent, but they produce very fine Brazil-wood. The climate is healthy; in general the soil is dry, and best adapted to the cultivation of cotton; but mandioc and maize are raised abundantly; the sugar-cane and rice are also cultivated. Along the Appody River near the boundary of Ceará and elsewhere, are several salt-lakes, from which great quantities of excellent salt are extracted. The few harbours of this extensive coast are not deep. *Natal*, population about 10,000, the capital of the province, is advantageously situated on the right bank of the Rio Grande, near two miles above its mouth. It has also an easy communication with the inland districts, the river being navigable for large barks near 40 miles. It carries on a considerable export trade in timber. The Island of Fernando de Noronha, 3° 30' S. lat., about 250 miles east-north-east of Cape S. Roque, belongs to this province. It is 10 miles long, generally hilly and stony, with a few small portions of land capable of cultivation. Convicts are transported here.

12. *Ceará* or *Serra* extends from the Serra Appody to the Serra Hibiapaba, which terminates between the rivers Camuacim and Parnahyba, in hills not far distant from the sea, and separates it from Piahy. It is computed to measure from north to south above 300 miles. The surface of this province is generally uneven, but the valleys are wide and not deep; the elevations are not great, except towards the south and west boundary-line. The soil is in general sandy and comparatively unfertile, except on the sides of the mountains, where it is rich and covered with forests. In the lower districts grain and mandioc are cultivated. Along the rivers cotton is grown. The district about the upper branches of the Rio Jaguaribe, the principal river of the province, is the most fertile and populous. Ceará is celebrated for its cattle, of which large numbers are reared. The chief exports of the province are hides, cotton, and dye-woods. The country often suffers much from long droughts. The descendants of the aborigines are numerous, especially in the less fertile districts. The shores, which in some parts are steep, in others flat and sandy, have no ports except for small coasting vessels. *Fortaleza*, formerly *Ceará*, population about 3000, the capital, is situated near the beach about 7 miles north-west of the mouth of the river Ceará. It has no harbour and very little commerce. There are few public buildings, but the town is said to be improving in appearance. *Aracaty*, on the Jaguaribe, 8 miles above its mouth, is the most commercial and populous town in the province. It contains four churches, and 5000 inhabitants, and exports cotton and hides in large quantities. The tide, which runs 30 miles up the river, facilitates the navigation. *Sobral*, not far from the bank of the Camuacim, the second town in commerce and population, is about 70 miles from the sea. Its port is Granja, on the left bank of the Camuacim, 20 miles from the sea. *Icó*, situated on the plain east of the Rio Jaguaribe, or *Salgada*, is the most important town in the interior. It consists of three principal streets, and several smaller ones, and contains four churches and nearly 5000 inhabitants. It is the chief mart for the interior of the province.

13. *Piahy* has only a coast of about 60 miles between the Serra Hibiapaba and the mouth of the Rio Parnahyba, which river divides it from Maranhão; but it extends 400 miles inland to the source of that river. This province is only hilly on the boundary-line of Ceará and Pernambuco; it is particularly adapted to the breeding of horses and cattle, the pastures in the southern portion of the plain of the Parnahyba being extensive and excellent. Besides cattle and horses, cotton is exported, and, in addition to other grains, rice and mandioc are particularly cultivated. Silver, lead, and iron exist, but are not worked to any extent. Salt is found and manufactured largely. Independent tribes still exist in the south district, between the rivers Parnahyba and Gorgua. It has no port, except that formed by the east mouth of the Rio Parnahyba, called *Higuarassu*. *Oeyras*, the capital, is situated in a circular valley on the small river Mochu, which, 3 miles lower down, falls into the Caninde, a tributary of the Parnahyba. It is a small town with 3000 inhabitants, and contains the provincial house of assembly, three churches (two of them unfinished), a jail, hospital, barracks, and the ruins of the Jesuits' college. *Parnahyba*, population 3000, lies on the Higuarassu, the east and most considerable branch of the Parnahyba, 15 miles from the sea, and carries on an active trade in hides and cotton.

14. *Maranhão* comprehends the western portion of the plain of the Parnahyba, extending along the coast 350 miles from the western mouth of the Rio Parnahyba to that of the Turvyassu, and nearly 400 miles inland. It is more hilly than Piahy, especially in the south districts, but towards the sea extremely productive in rice, and

cotton, which are exported in large quantities. A considerable part of the province is still covered with the primeval forests which abound in valuable timber. Iron, lead, and antimony exist, but have not been turned to much account. The southern and central districts and most of the western, forming together perhaps half the province, are still occupied by independent tribes. It has some good harbours, the best of which are the bays of S. José and of S. Marcos, formed by the island of Maranhão, which is 20 miles long from north-east to south-west, and 15 miles in its greatest width. To the west of the Bay of S. Marcos, the shores are skirted by a series of small and low islands up to the Bay of Turvassu, the limits of the province on the side of Pará. Besides the capital, S. Luiz de Maranhão [MARANHÃO], it contains two considerable places, Alcantara and Cachias. *Alcantara* stands on rising ground on the west of the Bay of S. Marcos; it has a port capable of receiving large coasting vessels, is a large well-built town, and carries on a considerable trade in the produce of the country. In the vicinity are several salt-works. *Cachias* is situated on the Itapicuru, where that river begins to be navigable for large barges, in a district which is productive in cotton. It was a thriving town before a rebellion which broke out in the province in 1839, during which it suffered severely, having been for some time in possession of the insurgents. Its population is now probably not above 6000.

15. Pará extends west from the Rio Turvassu, nearly to the island of Tupinambarana, along the south bank of the Amazonas; and further to the south to the east banks of the Rio Madeira; thus comprehending a large part of the plain of the Rio das Amazonas, and also considerable portions of the table-land; nearly the whole of it is still in the possession of independent tribes, the European settlements being very small and at great distances from one another. They occur almost exclusively on the banks of the Rio das Amazonas, and at or near the mouth of its larger affluents. Cultivation is in a very backward condition, and millions of acres of the most fertile land in the world are left in their natural state. Rice, cotton, sugar, and hides are exported. One of the most important articles of export is caoutchouc, which is sold as it is obtained from the trees and manufactured into shoes. Cacao, sumapirilla, cloves, Brazil-nuts, and various substances for dyes form considerable articles of export. The fisheries of the coast and the rivers afford employment to many persons. The capital PARÁ is situated on the Pará, a wide river formed by the confluence of the Tocantins with the Tagipuru or southern arm of the Amazonas. *Braganza*, population 5000, stands on the Cayté about 20 miles from the sea. It is an old town and a considerable place; the port is often resorted to by the coasting vessels which navigate between Maranhão and Pará. *Cameta*, or *Vizoa*, the most considerable town next to Pará, is situated on the left bank of the Tocantins, above 30 miles from its mouth. It has considerable trade with Pará and the province of Goyaz: with the surrounding district, which is remarkably fertile, it has nearly 20,000 inhabitants. *Santarem*, near the mouth of the Tapajos, is the depot of the numerous articles of commerce collected in the forests around it and further up the Amazonas; it is also visited by barges which navigate towards the country farther west: population of the town and suburbs 10,000. To this province belongs the island of Marajó, or Ilha dos Joannes, the largest island of Brazil, extending above 90 miles from north to south, and at least 120 from east to west. It contains about 10,000 square miles: the population is under 20,000. The north shores are washed by the sea, the west partly by the principal branch of the Rio Amazonas and partly by the canal of Tagipuru, which unites the great river to the Rio das Bocas, a fresh-water bay, at the eastern extremity of which the Tocantins has its embouchure. This bay and the Rio de Pará inclose the island on the south and east. Its surface is level, and its own numerous rivers, some of which have a course of 70 or 80 miles, inundate, in the rainy season, considerable tracts on the west and south side. About one-half of the island, consisting of that part which borders on the ocean and the Rio de Pará, is nearly without wood and pastured by great herds of cattle and horses or cultivated; the other half is covered with high trees and abundance of underwood.

16. Alto Amazonas is a new province formed out of those parts of the province of Pará and the former province of S. José do Rio Negro, which lie to the north of the Amazonas; it includes consequently the whole of Brazil north of that river, frequently called Brazilian Guyana. This wide tract is almost entirely occupied by independent tribes. The few European settlements only occur on the sea-coast and on the banks of the Amazonas and the Negro rivers. *Barra do Rio Negro*, the capital, is situated on the left bank of the Rio Negro, and contains with the suburbs about 6000 inhabitants. It has some trade in Brazil-nuts, sarsaparilla, coffee, cocoa, and tobacco, which are raised in the neighbourhood. *Macapa*, population 5000, is at the mouth of the canal of Braganza, the principal branch of the Rio Amazonas, opposite the archipelago of islands which that great river forms here. It is a considerable town with a fortress, and carries on an active commerce in the produce of the country. *Montalegre*, situated on a small island in the river Gurupatuba, 7 miles from its junction with the Amazonas, is a considerable place, and has some trade: the population of the island is about 4000. *Ohydos*, formerly *Panxis*, population of the district 6000, is near the east mouth of the

Rio Orizimina, which joins the Amazonas. In this place, at the distance of about 700 miles from the sea, the Amazonas runs in one channel, about 900 fathoms wide, and up to this point the tide ascends. It has some commerce chiefly in cotton and cocoa. *Tabatinga*, on the Amazonas, situated near the boundary-line of Ecuador, is a very small place. The island of Tupinambarana belongs to this province. It lies near the right bank of the Amazonas, east of the Rio Madeira, and is above 150 miles long. Between it and the mainland on the south is a large, deep, and navigable channel, called canal de Iraridá, into which many rivers empty themselves. When the Madeira is swollen, the current runs through this channel east; but in the dry seasons it runs partly in the Madeira, and partly to the Amazonas, by different mouths. The island is low and covered with impenetrable woods. Nearly in the middle it is divided by a narrow strait called the Furo dos Ramos, which unites the Iraridá with the Amazonas.

17. Matto Grosso (Great Forest) occupies the centre of South America. It comprehends the greater portion of the table-land between the Madeira and the Araguay, the tributary of the Tocantins, the portion of the plain of the Upper Madeira belonging to Brazil, the plain of the Paraguay, and the west portion of the table-land of the Paraná, up to the banks of that river. A great portion of the table-land north of the Serra dos Vertentes seems to be a desert of little value, of which the Campos dos Paricis are the worst part; and no Europeans are settled here. The table-land of the Paraná is better, and has extensive pastures; but it is still possessed by the independent Indians, more especially the Cajapos. But on the river falling into the Paraguay there are numerous European settlements, though they are generally small. Diamonds and gold are found in many places; which circumstance gave rise to the settlements, though the mines at present are poor or neglected. The low country on both sides of the Paraguay is mostly occupied by the Guaicurus. On the plain of the Upper Madeira, along the banks of the Guaporé, there are also many European settlements: gold abounds here; but the greater part of the country is possessed by independent tribes. *Cuyabá* was made the capital of the province in 1820 in place of Matto Grosso; it is situated near the banks of the Rio Cuyabá, an affluent of the Rio de S. Lourenço, which is a tributary of the Paraguay, and is noted for the quantity of gold which was found here in the beginning of the last century. *Cuyabá*, though the seat of the provincial government and an episcopal city, is in appearance merely a village of poor houses. It has about 3000 inhabitants. *Matto Grosso*, formerly *Villa Bella*, a considerable town, situated near the Guaporé, has 15,000 inhabitants; some important mines are in its neighbourhood. *Villa Maria*, on the east bank of the Paraguay, in a very fertile country, is a thriving town.

18. Goyaz occupies the centre of the Brazilian table-land, including the basin of the Tocantins to its confluence with the Araguay and the countries on the east bank of the Araguay, together with the hilly country on the Parnahyba, an affluent of the Paraná. European settlements are common only on some of the upper branches of the Tocantins and Araguay, where gold was found in abundance. There are a few small settlements along the Tocantins up to its confluence with the Araguay: but by far the greater portion of the country is in possession of independent tribes; among which the Chjupas on the Parnahyba and the Chevantes between the Tocantins and Araguay are the most numerous. *Goyaz*, formerly *Villa Boa*, the capital, situated on the Rio Vermelho, an affluent of the Araguay, in a country rich in gold, contains the governor's palace, seven churches, and some other public buildings, and about 7000 inhabitants. *Nossa Senhora do Pilar*, a considerable place near the ridge which divides the affluents of the Tocantins from those of the Araguay, is in the neighbourhood of some rich gold mines. *Natividade*, a town 35 miles from the east bank of the Tocantins, population about 2000, is the most commercial place of the province: it sends its produce to Bahia. It contains four churches, but, as is so common in the Brazilian towns, they are, though old, unfinished.

19. Minas Geraes comprehends the east end, as it appears, most elevated portion of the Brazilian table-land along the upper course of the Rio de S. Francisco, together with the most northern part of the table-land of the Paraná. Almost every kind of metal is found in this province. It is rich in gold, iron, copper, and diamonds: lead, manganese, quicksilver, chrome, arsenic, platinum, bismuth, and antimony are also found. In iron the province is perhaps richer than any other part of the world. Gold is found, particularly in the upper branches of the Francisco and its two affluents, the Parapeba and Rio das Velhas; the mines are chiefly worked by English companies. Diamonds are found in the Iquetingonha and Abasté. The countries about these rivers are well settled by Europeans, except the Abasté; but a large portion of the province is possessed by Indian tribes. Topazes, aquamarines, garnets, amethysts, tourmalines, and chrysoberyls are found chiefly in Minas Novas. Coffee, sugar, cotton, maize, and tobacco are raised in considerable quantities, but the agricultural resources of the province are but imperfectly developed. Vast herds of cattle are pastured on the uplands. *Ouro Preto*, formerly *Villa Rica*, the capital of the province, is situated near the Serra Itacolundi, in the midst of mountains rich in gold: it has 8000 inhabitants. *Ouro Preto* is one of the best looking cities in the

interior of Brazil. In form it is compact; it has six churches, one or two of which are very handsome; the palace of the provincial government, a spacious and well-built edifice; a college, and other public buildings; and some of the private houses are of a superior class. In the vicinity is a botanic garden, in which several acres are devoted to the successful cultivation of the tea plant. *Marianna*, at no great distance farther to the east, has also considerable mines in its neighbourhood, and 5000 inhabitants, but has little business. It contains the residence of the bishop and a theological college. *S. João del Rey*, on a small river which unites with the Rio Grande, the principal branch of the Paraná, has about 5000 inhabitants. In its vicinity are some mines, but it derives more importance from the road between S. Paulo and Villa Rica passing through it. *Sabará*, on the Rio das Velhas, is a long dull town of about 5000 inhabitants; it contains several churches, the streets are wide and well paved, and some of the houses are large and handsome, but it has little trade. In its neighbourhood are considerable gold mines, among which are the rich mines of Congo Soco, and Cuyabá; but by these there are commonly villages which supply the ordinary requirements of the miners. *Cidade Diamantina*, formerly *Tejura*, the capital of the diamond district, is situated on an acclivity of a lofty mountain, about 4000 feet above the level of the sea, and on the upper part of the small river S. Antonio which falls into the Iguetinhonha: it has about 6000 inhabitants. It is a well-built place, contains three or four handsome churches, and several public fountains. The shops are good and well stocked, and in the city and suburbs are many excellent and costly houses with rich gardens. In the same neighbourhood is *Cidade do Serrô*, formerly *Villa do Principe*, which is nearly as large as *Cidade Diamantina* and like it stands on the slope of a mountain; but it is a much poorer and less populous place.

Commerce, &c.—The manufactures of Brazil are quite in their infancy and of the rudest kind. The Brazilians are not merely unskilful in mechanical pursuits but averse to their practice, and comparatively few European mechanics have settled in the country. Cotton is spun, but only of coarse kinds. There are a few iron-works. The making of india-rubber goloshes is carried on to a considerable extent by native workmen in Pará, and the export is of some consequence to the province. The manufacture of various articles for home consumption is also carried on, but not to any great extent. In the towns various ordinary handicrafts are of course practised.

The scarcity of the means of inland communication prevents the provinces of Mato Grosso and Goyaz, which lie at a great distance from the sea, from bringing their agricultural produce to any market, and their export is consequently limited to gold and diamonds. Minas Geraes, which is connected by tolerable roads with Rio Janeiro, Bahia, and S. Paulo, and also enjoys the advantage of an easy navigation on the middle course of the S. Francisco, exports its gold and precious stones, and also coffee and cotton. The provinces along the coast generally possess good harbours, or can easily reach them. The maritime intercourse of the several provinces has been greatly facilitated by the introduction of powerful government mail steamers.

The foreign commerce of Brazil is more extensive than that of any other country of America except the United States. The vessels of all nations are admitted on the same conditions, and their cargoes pay the same duties. The most important articles of exportation are—coffee, of which the quantity annually exported is valued at nearly 3,000,000*l.*, about half of it being sent to the United States; sugar, which amounts to upwards of 1,500,000*l.*; and cotton, the value of which is at least 750,000*l.* The exportation of cocoa, tobacco, rice, tapioca, hides, tallow, horns and horn-tips, mahogany, cedar, rose-wood and other valuable timber, dye-wood, sarsaparilla, and india-rubber is also considerable. The smaller articles are—isinglass, indigo, castor-beans, castor-oil, ipecacuanha, and different drugs.

Nearly all the sugar of Brazil finds a market in England, the United States, Hamburg, Trieste, and Portugal; the rice is with a trifling exception sent to Portugal; the coffee is divided between Europe and the United States, the latter having increased their imports to one-half of the whole quantity in late years. Almost all the cotton, rosewood, india-rubber, and isinglass is brought to England. The hides are distributed between England, the continent of Europe, and the United States. The tobacco is sent to Portugal and to Gibraltar, previous to being smuggled into Spain, and to the coast of Africa. The rum which is exported finds a market chiefly on the African coast and in some ports of Portugal.

The annual exports from Brazil may be estimated at about 6,000,000*l.*, of which nearly one-fifth is exported to England; a fourth to the United States; the remainder goes chiefly to Austria, the Hanse Towns, France, Portugal, and Belgium.

The imports into Brazil may likewise be estimated at nearly 6,000,000*l.* Of these about half are brought from England and its colonies in English vessels. The most important articles are cotton fabrics, which amount to nearly 1,500,000*l.*; next to these are woollen articles, linen, brass and copper wire, iron and steel wrought and unwrought, hardware and cutlery, hats, arms and ammunition, provisions, soap and candles, and tin. Many cargoes of cod are sent from the British fisheries in North America; and from the British colonies potashes, India cotton piece goods, silks, and spices. Nearly

the whole of this commerce is carried on by vessels from London and Liverpool.

France sends to Brazil, chiefly from the ports of Havre and Brast, some articles of fashion, trinkets, furniture, wax candles, hats, dry fruits, some glass goods, and wine. From Holland and Belgium are sent beer, glass goods, linen, Geneva, and paper; from Germany, Bohemian glass, linen, and iron and brass utensils; from Russia and Sweden, iron, copper utensils, sail-cloth, cords, ropes, and tar; from Portugal, wine, brandy, fruits, hats, and European manufactures; from the United States, considerable quantities of wheat, flour, biscuits, soap, spermaceti candles, train-oil, tar, leather, boards, pitch, potashes, and some rough articles of furniture and coarse cotton cloth.

The maritime intercourse between Brazil and the neighbouring republics is not considerable. The most active is that carried on with Buenos Ayres, to which sugar, tapioca, and some other agricultural products are sent, and whence the Paraguay tea or maté is brought back.

Formerly an active trade was carried on with the coasts of Africa avowedly in silks, cottons, ivory, East India goods, &c.; but really in slaves, of whom in some years 40,000 were imported, chiefly from Benguela, Cabinda, and Mozambique. And though several years back the slave trade was by a treaty with England nominally abolished, the traffic was continued with much activity in spite of the utmost exertions of British cruisers. Recently however the Brazilian government has appeared to be really desirous of putting an end to the detestable traffic. The Emperor of Brazil in his address on closing the session of the Legislative Assembly, October 25th, 1853, said, "My government will continue the repression of the slave trade with energy and perseverance." If this be done it is but reasonable to anticipate that the traffic will soon be greatly lessened, if not wholly suppressed.

Government, &c.—In October, 1822, Brazil was declared an independent state, and the Prince Regent was proclaimed Emperor of Brazil under the title of Pedro I. The deputies of the several provinces met on the 3rd of May, 1823, the anniversary of the discovery of Brazil, and adopted the title of General Assembly of Brazil (*Assembleia Geral do Brasil*). They appointed a committee for drawing up a constitution, which was done by the 30th of August; but the constitution contained several provisions to which the emperor objected. The meetings of the assembly becoming more and more turbulent, the emperor finally dissolved it on the 12th of November, and called another assembly. In the meantime he caused a new constitution to be drawn up and published, which was afterwards accepted by the new assembly (1824). According to this instrument Brazil is an hereditary monarchy, limited by a popular assembly. The executive is in the hands of the emperor. The legislative body consists of two assemblies, the Senate and the Chamber of Deputies. The Catholic faith is the religion of the state; all other Christians are tolerated, but are not allowed to build churches, or to perform divine service in public. No important change has since been made in this constitution, but there have been some innovations and modifications. One of the most important innovations consisted in the appointment, in November, 1842, of a council of state consisting of eight members who hold the office for life. They are the immediate advisers of the emperor, and are responsible equally with the regular ministers to the General Assembly. The emperor is irresponsible. In case of failure of issue in the reigning dynasty a successor is to be chosen by the General Assembly, the initiative being in the Chamber of Deputies. The regular ministry consists of a president of the council, and ministers of the finances, the interior, of justice, foreign affairs, of war, and of marine. The emperor may create titles of nobility, but these titles are not hereditary. The members of both the houses of assembly are chosen by the provinces: the senators for life; the representatives for a temporary period. The Senate is composed of half as many members as the Chamber of Deputies: the Senate consists at present of 55 senators; the Chamber of Deputies of 112 representatives. The imposition of taxes and the regulation of all matters of finance belong to the Chamber of Deputies; the determining of the numbers, &c., of the army and the navy; as well as whatever respects the general government, &c. The judicature consists of a supreme court, a court of appeal, common law, municipal and orphan courts, the judges of which are appointed by the crown, and of justices of the peace who are elected by the people.

For ecclesiastical purposes Brazil is divided into an archbishopric, Bahia, and nine bishoprics, Cuyabá, Goyaz, Maranhão, Minas Geraes, Pará, Pernambuco, S. Paulo, Rio Grande do Sul, and Rio de Janeiro. In educational matters the country is very backward. Primary schools for gratuitous elementary instruction have been established by the general governments throughout every province, and grammar or Latin schools in most towns of any size; but they have hitherto been very inefficient, partly from the difficulty of obtaining duly qualified masters at the inadequate salaries provided for their support by the provincial governments, and partly from the general disinclination of the people to avail themselves of the schools.

The total revenue of Brazil for the year 1853-4 is estimated at about 3,594,700*l.* (32,853,000 milreis), the expenditure at 3,292,630*l.* (29,633,700 milreis). The revenue is chiefly derived from the heavy

ad valorem duty charged on all articles imported into Brazil (amounting in 1851-2 to 2,814,443*l.*), a low duty charged on the articles exported (amounting in 1851-2 to 508,070*l.*), and rents, royalties on mines, &c. The estimated expenditure for 1853-4 is thus distributed:—

Ministry of the Interior	£412,353
„ Justice	250,020
„ Foreign Affairs	80,000
„ Marine	452,158
„ War	813,935
„ Finances	1,304,162
	<hr/>
	£3,202,630

The total unredeemed public debt amounts to about 15,000,000*l.*

The Brazilian army numbers about 65,000 men. Of these the regular army consists of 22,540 officers and privates (including 3727 cavalry and 3582 artillery); the remainder are militia. The navy consists (1853) of 1 frigate of 50 guns, 5 corvettes, 5 brigs, and 9 schooners carrying together 188 guns, and 4 smaller vessels carrying together 27 guns; 10 steamers mounting 36 guns; with various unarmed ships and steamers, and a frigate and a corvette building.

The provinces have the management of their own local affairs. Each province has its president appointed by the crown, and its provincial house of assembly, the members of which are elected by the people.

History.—Brazil was discovered in the first year of the sixteenth century. The voyages of Columbus and Vasco de Gama, who first sailed across extensive seas, had taught navigators to adopt the practice of entering at once upon the open ocean. Accordingly Pedro Alvares de Cabral, who, after the return of Vasco de Gama, was sent by the king of Portugal with a large navy to the East Indies, directed his course from the Cape Verde Islands to the south-west, and was carried by the equatorial current so far to the west that he found himself very unexpectedly in sight of land in 16° S. lat. This country was Brazil, which he saw first on the 3rd of May, 1500. He sailed along the coast as far as Porto Seguro (16° S. lat.), where he landed and took possession. He sent an account of his discovery to Lisbon, and continued his voyage to India. The king afterwards sent Amerigo Vesputci, a Florentine, to examine the country, who took a rapid survey of nearly the whole of its shores, and upon his return published an account of it, with a map. To this publication this navigator is indebted for the honour of having given his Christian name to the new continent.

Vesputci, and others who were sent somewhat later, reported that the country was not cultivated, and did not offer any great commercial advantages, but that they had found extensive forests of Brazil-wood, of which they brought some cargoes to Portugal. This was not sufficient to induce the Portuguese to form a settlement, especially as they were then actively engaged in their conquests in the East Indies; but it was quite enough to induce mercantile speculators to send their vessels for the dye-wood. This trade continued for some years, and the merchants of other nations, especially the French, began to follow the example of the Portuguese. The Portuguese government considered this as a violation of their rights as discoverers of the country, and they accordingly began to think of forming a permanent establishment. King John III. however, on calculating the expenses necessary for such an undertaking, thought more advantageous to invest some of the richest noble families of Portugal with the property of extensive tracts of coast, for the purpose of colonising them with Portuguese subjects. Accordingly, about ten or twelve Portuguese noblemen obtained the property each of about 100 leagues of coast, and 40 or 50 leagues inland. These proprietors were called *donatarios*. Most of them made great sacrifices, and underwent much fatigue and danger in forming settlements in Brazil. The towns of S. Vincent, Espirito Santo, Porto Seguro, and Pernambuco were founded by them between 1531 and 1545. But soon became evident that the private fortune of these noblemen was not adequate to the establishment of such settlements in an uncultivated country, and in the neighbourhood of warlike savage tribes. The king therefore sent, in 1549, as governor to Brazil, Dom de Sousa, who founded the town of Bahia in the bay of Todos os Santos, and established a regular colonial administration. The government gradually found means to acquire the property of the dones then existing from the donatarios, either by purchase or by exchange.

Before the religious divisions in England began to people the coasts of North America, the Protestants of France made a similar attempt in Brazil. A colony of French Protestants was established in 1555, on an island in the bay of Rio Janeiro, by Nicolas Durand de Villegagnon, but it soon fell into anarchy. The Portuguese attacked it in 1565, and expelled the French, though not without encountering considerable resistance. On this occasion the town of Rio Janeiro was founded by the Portuguese.

On the death of King Sebastian, when Portugal was united to Spain (1580), the numerous enemies of the latter country began to annoy Brazil, among whom the English, under Thomas Cavendish, were the most active. They did not however form any settlement. The French made a second attempt in 1612 to settle on the island of Maranhão, where they founded the town of San Luiz de Maranhão, but in 1615 they were compelled to abandon it to the Portuguese. The Dutch were more formidable enemies to the Portuguese. Their East India Company had already taken from them many settlements in the Indian seas, and their West India Company was thus invited to similar attempts in America. In 1623 they sent a fleet to Brazil, which took Bahia, then the capital of the country; but it was lost again in 1625. In 1629 the Dutch made another attempt, and possessed themselves of Pernambuco, from which the Portuguese were unable to dislodge them. They afterwards extended their conquests till they held in 1643 the province of Serapipe and the whole of Brazil north of the Rio Francisco, with the exception of Pará. A few years later however the settlers of Portuguese origin rose upon them and drove them out of province after province, till at last the Dutch were confined to the town of Pernambuco, from which also they were expelled in 1654. By the peace of 1660 the Dutch renounced their claims on these countries.

At that time the mineral riches of Brazil were not known. The town of S. Paulo had been founded by some Portuguese in 1629, who had ascended to the table-land of the Parana from the town of St. Vincent, and been induced to settle there on account of its fine climate. The adventurers established a kind of democratic government, and made frequent incursions among the savage nations for the purpose of capturing them and using them as slaves. In the excursions, towards the end of the 17th century, they discovered the mines of S. Paulo; and near Sabará, on the Rio das Velhas, in 1700; the richer mines at Villa Rica; and in 1713 those of Mariana. The mines at Cuyabá and Goyaz were discovered between 1715 and 1720. The existence of diamonds in the Rio Iaquetinhonha was not known before 1728. These discoveries, and the riches which government derived from the mines, induced it to remove the administration of the colony from Bahia to Rio S. Janeiro in 1773.

The government of Brazil by the Portuguese was of the most exclusive character, and led to a constantly growing dissatisfaction on the part of the bulk of the inhabitants. Foreign vessels were not permitted to enter the ports of Brazil, nor the Brazilians to send their commodities to any other country than Portugal. This of course caused discontent among the merchants. Further, the natives of Portugal who had emigrated to the colony constituted a privileged class, being exclusively entitled to all posts of honour and all lucrative employments under government, which naturally excited dissatisfaction among the rich descendants of the Portuguese. This dissatisfaction began to generate a wish for change as soon as the United States of North America had obtained their independence; and events in Europe took such a turn that Brazil obtained its object almost without bloodshed or war. When Bonaparte had formed his scheme for taking possession of the Peninsula, he began by declaring war against Portugal, upon which the royal family left Europe for Brazil, where they arrived 22nd January, 1808. Considering Brazil as the principal part of his remaining dominions, King John VI. began to improve its condition by placing the administration on a more regular footing and throwing open its ports to all nations. On the 6th of Bonaparte, the king raised Brazil to the rank of a kingdom, and assumed the title of King of Portugal, Algarve, and Brazil. The royal family remained in Brazil until the king was obliged to return to Europe by the revolution which took place in Portugal in 1820, by which the constitution of Spain had been adopted in that kingdom also. The news of that event had hardly reached Brazil when the same constitution was proclaimed by the inhabitants in the town of Pernambuco, and soon afterwards in Bahia and Pará. It was feared that similar measures would be taken in Rio Janeiro, and accordingly the king found it expedient to proclaim the constitution himself on the 28th of February, 1821, soon after which he sailed for Lisbon, leaving at the head of the administration in Brazil, Pedro his eldest son and successor, as lieutenant and regent. The Cortes of Portugal did not conceal their design of restoring the old relations with Brazil, by which its commerce was restricted to the mother country; and they did not treat the deputies from Brazil quite as well as they should have done. This of course increased the discontent of the Brazilians, and prepared the way for the independence of that country.

The Cortes in Portugal continued their course of policy. They formed a scheme for a new organisation of the administration in Brazil, and recalled the Prince Regent. But the prince, induced by the representations of the Brazilians, refused to obey their orders, and sent the Portuguese troops stationed at Pernambuco and Rio Janeiro to Europe. The Portuguese commandant of Bahia however did not yield; he expelled the militia and remained master of the town. This step was decisive, and immediately followed by others. On the 13th of May the Prince Regent was proclaimed protector and perpetual defender of Brazil. The General Procurators (*Procuradores gerais*) of the provinces were assembled by the Prince Regent to consult on the new form of government, but they declared that they were not competent to such a task, and proposed the convocation of deputies chosen by the people, to which the prince acceded after a short delay. As the Cortes in Portugal still persisted in their design it was thought necessary to declare the independence of Brazil, and the Prince Regent did not venture to oppose the torrent of public opinion. Accordingly on the 12th of October, 1822, Brazil was declared an independent state, and

the prince adopted the title of Emperor of Brazil: on the 1st of December he was crowned.

As this step might be considered a declaration of war against Portugal, preparations for hostilities were immediately made. The Portuguese troops still occupied the towns of Bahia, Maranhão, and Pará. Bahia was besieged by the Brazilian forces, and after a few weeks the garrison was obliged to abandon it, upon the appearance of the admiral of Brazil, Lord Cochrane, before the harbour. The admiral also compelled the garrisons of Maranhão and Pará to sail for Europe. Thus the independence of Brazil was established, with no other loss of blood than what took place in the town of Bahia.

A General Assembly of deputies from the provinces was called to consider the draft of a constitution, but as they refused to frame one to which the emperor would agree, he dissolved them in November, 1823, and a few days after published a constitution, which as already stated, was accepted and confirmed by the new General Assembly convoked in the early part of 1824. The independence of Brazil was acknowledged by Portugal in 1825.

In 1826 two events took place which gave rise to great discontent, the death of King John VI., and the war with Buenos Ayres, for the retention of Monte Video as a part of the Brazilian empire. By the decease of the king, Portugal devolved on the emperor of Brazil, and the Brazilians again apprehended that they might be placed in a state of dependence on that country. To remove such fears, Pedro declared his daughter Maria queen of Portugal, intending to marry her to his brother Miguel. Peace was concluded with Buenos Ayres in 1828, and Monte Video became the independent republic of Uruguay. But the internal peace of the country was not re-established. Frequent disputes arose between the Chamber of Deputies and the emperor, and sometimes great disturbances occurred in Rio Janeiro. In the spring of 1831, one of these disputes assumed a form of more than common seriousness in consequence of the emperor refusing to dismiss some unpopular ministers. On the 6th of April a tumultuous populace having assembled before the palace, the emperor ordered the military to disperse them. This they refused to do, and the emperor issued a proclamation by which he abdicated the throne in favour of his son, Pedro II., the present emperor.

At this time the young emperor was only in his sixth year. The Chamber of Deputies at once took a more decided lead in the government. They appointed a regency of three persons; and fixed the termination of the emperor's minority on his reaching the age of 18 years. Disturbances and revolutionary movements broke out successively in various parts of the empire during several following years. Most of them however were directed against the power of the Chamber of Deputies which was regarded with general distrust. The regency was in 1831 limited to one person. In 1841 the desire for the termination of the regency, which had been long growing, found vent in a popular rising, which the government was unable to resist; and on the 23rd of July, the young emperor, then only in his fifteenth year, was declared by the assembly to have attained his majority and to the full exercise of his constitutional prerogatives. Since that time there have been various outbreaks in different parts of the empire, some directed against the provincial governments, some with a view to erect one or other of the provinces into a republic, and some directed against the measures or the ministers of the imperial government; but on the whole Brazil has during the last few years had more internal tranquillity and consequently been more prosperous than any other of the states of South America. The most important of the foreign differences in which Brazil has been engaged was the long protracted war with Buenos Ayres, which led in 1851 to the fall of Rosas, and eventually to the opening of the Rio Paraná.

BREADALBANE. [PERTSHIRE.]

BRECHIN, Forfarshire, Scotland, a royal burgh in the parish of Brechin, is situated on the left bank of the South Esk, $7\frac{1}{2}$ miles above its junction with the sea at Montrose, in $56^{\circ} 46' N.$ lat., $2^{\circ} 38' W.$ long., $12\frac{1}{2}$ miles N.E. from Forfar, $39\frac{1}{2}$ miles S.W. from Aberdeen by road, and $45\frac{1}{2}$ miles by the Aberdeen railway. The population of the royal burgh in 1851 was 4515, that of the parliamentary burgh was 6637. The burgh is governed by 2 bailies and 11 councillors, one of whom is provost; and in conjunction with Montrose, Arbroath, Forfar, and Inverberrie [Bervie], returns one member to the Imperial Parliament.

Brechin was formerly a walled town and an episcopal residence, giving its name to a diocese founded and endowed by David I. about 1150. In the upper part of the town are the ruins of the ancient chapel of Maison Dieu, now used as a stable. In the churchyard near the cathedral there is a round tower, similar to the round towers which are numerous in Ireland; only one other exists in Scotland. This tower is about 103 feet high, and is constructed of hewn stone: the workmanship is excellent. It is surmounted with a conical roof of gray slate; and there is no appearance of there ever having been a

staircase within it. The cathedral, the western end of which is now used as the parish church of Brechin, was built by David I. in the 12th century. Brechin Castle stands on the top of a precipice, and is separated from the town on the east and west by a deep ravine; its south base is washed by the South Esk, which here forms a fine sheet of water. In this castle Sir Thomas Maule defied the forces of Edward III. until he was killed by a stone thrown by an engine, when the garrison surrendered. It is now the residence of Lord Panmure. The town-house, near the cross or market-place in the middle of the town, contains a court-room and prison, two rooms for the meetings of council, and a guild-hall. Three schoolrooms, built by subscription, are in the west end of the town. Besides the parish church and a chapel-of-ease, there are chapels in connection with the Free Church, the United Presbyterian Synod, the Scottish Episcopal Church, and other Dissenters. The hospital of the 'Maison Dieu' gives a small weekly allowance to poor residents, widows, and children of burghers. There is a school connected with it. The rector of the academy and preceptor of Maison Dieu has 52*l.* 10*s.* a year, besides fees from scholars. The number of scholars learning Latin in 1851 was 38. Spinning, weaving, and bleaching afford occupation to some extent. Several hundred persons in the town are employed in the linen trade. Distilleries, lime-works, freestone-quarries, and nursery-grounds are in the vicinity. There are two bridges over the Esk at Brechin.

BRECKNOCK, or BRECON, called by the Welsh 'Aber Honddu,' or the Mouth of the Honddu, the capital town of Brecknockshire, a municipal borough, and the seat of a Poor-Law Union, is situated in an open valley at the confluence of the rivers Usk, Honddu, and Tarell, in $51^{\circ} 57' N.$ lat., $3^{\circ} 22' W.$ long., distant 171 miles W.N.W. from London. Brecknock is governed by 4 aldermen and 12 councillors, one of whom is mayor, and returns one member to the Imperial Parliament. The population of the municipal borough in 1851 was 5673; that of the parliamentary borough was 6070. The livings of the two parishes are vicarages in the archdeaconry of Brecon and diocese of St. David's. Brecknock Poor-Law Union contains 42 parishes and townships, with a population in 1851 of 18,160.

Brecknock is built on both sides of the Honddu, and extends along the left bank of the river Usk. The castle was built A.D. 1094, by Barnard Newmarch, a relative of William the Conqueror, who wrested the county from the Welsh princes, and here fortified himself, that he might the better maintain the rights which had been granted to him as Lord of Brecon. It was considerably increased and improved by the last Humphrey de Bohun, earl of Hereford, high constable of England and governor of Brecknock. Parts of several towers, including that called 'Ely Tower,' in which Morton was confined, still exist. The situation is commanding for the purposes of warfare: the main part of the fortifications may still be traced. Two priories, the one Benedictine and the other Dominican, were also founded by Bernard Newmarch in the reign of Henry I. The first is now the parish church of St. John's, called the Priory church; the second was converted into a college by Henry VIII. The Priory church stands in the northern part of the town, adjoining the precinct of the priory, where there is a beautiful promenade by the side of the river Honddu. The church is built in the form of a cross, from the centre of which rises an embattled tower. The Dominican convent, now the college, is situated near Llanfaes church, or St. David's church, on the right bank of the Usk. There are two places of worship for Independents, and three for Baptists: one of each denomination having the religious services conducted in the Welsh language. There are several schools, namely, the College school, founded in 1541, which has an income from endowment of 32*l.* a year, and had 25 scholars in 1851; Bough-road Charity school, recently enlarged; two British schools; and a Girls' and Infants' school, erected in 1849. There are in the town a mechanics' literary and scientific institute, a young men's mutual improvement society, a savings bank, and an infirmary. The town is lighted with gas.

Brecknock occupies a healthy and picturesque situation. There are three stone bridges over the Honddu, and one over the Usk. A new shire-hall has been built, and the old town-hall converted into an assembly-room. The Lent and summer assizes are held in Brecknock. The county jail is situated in the town. A county court is held at Brecknock. There are barracks, in which detachments of infantry and cavalry are quartered. Coal is brought along the canal at a moderate price. Flannel and coarse woollen cloths are manufactured to a small extent: hats of a middling quality are made. The town is chiefly dependent on the agricultural district around. The market-days are Wednesday and Friday: the fairs, which are held in March, May, July, September, and November, are well supplied with corn, cattle, eggs, and poultry, of which last an abundance is reared by the neighbouring farmers and cottagers. Opposite the town are three mountain-peaks, known as the Brecknock Beacons, the highest of which is 2862 feet above the level of the sea.

BRECKNOCKSHIRE, an inland county of South Wales, lying between $51^{\circ} 54'$ and $52^{\circ} 17' N.$ lat., and $3^{\circ} 0'$ and $3^{\circ} 48' W.$ long., is bounded N. by Cardiganshire and Radnorshire, from which latter county it is for the most part separated by the rivers Claerwen, Elan, and Wye; W. by Cardiganshire and Carmarthenshire; S. by Glamorganshire and Monmouthshire; and E. by Monmouthshire and Herefordshire. This county extends from north to south 35 miles,

and from east to west about 30 miles. Brecknock is the county town. The area of the county is near 754 square miles. The population in 1831 amounted to 47,763; in 1841 it was 55,603; in 1851 it was 61,474. Brecknockshire was anciently called Garthmadrin, or the 'fox-hold,' and derives its present name from Brychan, a Welsh prince, who lived in the 5th century.

Surface, Hydrography, and Communications.—The surface of this county is extremely irregular, the valleys are deep, and the mountains the highest in South Wales. It is intersected on the north and south by two long ranges of mountains: that on the north goes by the general name of 'Epynt,' an obsolete British word for a hill; the other range, beginning with the Caernarthen Beacons, runs nearly parallel to the Epynt Hills, and inclining more towards the south, terminates in Monmouthshire. Between these two chains a third, which is called the Black Mountains, rises abruptly near Talgarth. Another line branches across in a direction from north to south, about eight miles below Brecknock, dividing the hundred of Devynnock from the hundreds of Talgarth and Penkelly. The highest mountains in Brecknockshire are—the Brecknock Beacons, about three miles south-west of Brecknock, which are 2862 feet above the level of the sea; Capellante, which is 2394 feet above the level of the sea; Pen Cader, or the 'Cradle Mountain,' 2545 feet above the level of the sea; and Dwygwan, near Builth, which is 2071 feet above the sea. The principal rivers are the Wye, which flows along the north-eastern side of the county, separating it from the county of Radnor; the Usk, which rises in the Caernarthen Fun, about five miles from Treacastle; the Honddu, which rises in Druan-dhu, and falls into the Usk at Brecknock; the Yrfon, which rises in Bryn-garw, in the north-west boundary of the county, and falls into the Wye about a mile above Builth; the Elan, the Claerwen, and the Tawe. The Tarell also, a small river rising in Bryn-du, joins the Usk a little above Brecknock, and the Taf Fechan, a small, and Taf Fawr, a large river, which rise

different parts of the south declivity of the Brecknock Beacons, unite into a considerable stream—the Taf—at the south boundary of the county, near Cyfwrthfa Park. None of these streams are navigable. To facilitate the conveyance of goods from Brecknock to Newport, a canal capable of conveying boats of 24 tons was finished in 1811 at a cost of 170,000*l.*; a railroad was soon after made from Brecknock to Hay, and from thence to Kington and the lime-rocks near Old Radnor. The Swansea Canal enters for a short distance the south-west part of the county. The mountains Mynydd Llangyidr, and Mynydd Pen Cym, near the Clydach, at the south boundary of Brecknockshire and Monmouthshire, are intersected by many railroads, which communicate with the various collieries and iron-works. Two branches descend into the vale of Usk, so as to form a connection with the Crickhowell Canal; the one near Tal-y-bont, the other near Llangattock. A long line of railroad also begins near the ninth milestone on the Brecknock and Treacastle road, and passing up the valley of Forest Fawr to the east of the river Tawe, and nearly parallel to it, communicates with Drim Colliery, and finally with the Swansea Canal. About five miles E.S.E. from Brecknock is situated Llyn-Safuddu, or Llangorse Pool, a sheet of water two miles long and in some places a mile in breadth. It abounds in fish, and in winter is much frequented by wild fowl. In 1235 permission was granted to the monks of Brecknock to fish in this lake three days in the week, and every day in Lent, provided they only used one boat. The other lakes in this county are Llyn Vau Vawr, under the Brecknock Beacons, about four miles from Bivory; Llyn Carw, about six miles from Llanwrtyd; and Pwl Bivory, near Capel Calwen, south-east of Mount Capellante. The scenery in this county is extremely beautiful. The extensive views from the mountains, the abrupt outline of the Brecknock Beacons, the undulating surface, frequently clothed with woods and intersected by torrents, from their expanse, their variety, and their wildness, are very striking to the admirers of the picturesque.

The principal roads are from Treacastle, through Brecknock to Crickhowell, which is travelled by the Caernarthen and London mail; that from Brecknock to Hay; also the roads from Brecknock to Merthyr, and from Builth to Hay. These as well as the less important thoroughfares through the county have in late years been greatly improved. Lines of communication of great public utility have been opened between Hay, Talgarth, and Crickhowell; and between Brecknock and Builth.

Geology.—The geology of this district has occupied the attention of that able geologist, Sir R. I. Murchison. The oldest rocks which occupy the west of Brecknockshire consist of gneiss and slates; a remarkable line of trap and porphyry breaks through the rocks of this age, extending from Llanwrtyd for about four miles to the north-east. Between these old rocks and the escarpment of Mynydd Epynt and Mynydd Bwlch y Groes, the transition-rocks are displayed; the uppermost consisting of that which Sir R. I. Murchison has described as the Ludlow rock, which there passes up into the old red sandstone. These transition rocks, which in Shropshire and Radnorshire contain thick masses of lime, are throughout the whole of their range in Brecknockshire remarkably void of limestone. The great mass of the county, especially the central and south-east district, consists of the old red sandstone, which has been shown by Sir R. I. Murchison to be divisible into three sub-formations:—1. A lower

zone of tile-stones, remarkably exhibited along the rectilinear escarpment of Mynydd Bwlch y Groes, extending into Caernarthenshire. 2. A central portion of marl, concretionary limestones (locally called 'cornstones'), sandstones, &c. 3. The upper portion of sandstone and conglomerate; this upper portion, occupying the summits of the Funs (Beacons) of Brecknock, and other lofty mountains between Brecknock and Abergavenny, is by its inclination carried under the whole of the great productive South Welsh coal-field. The remainder belongs to the Silurian system of Murchison. We thus see that the whole of the district to the north-west of this tract of country lies beneath the carboniferous series.

The mineral springs at Builth and at Llanwrtyd rise in the silicified and hardened schists, at points where they are penetrated by trap-rocks. Their origin is considered to be due to the decomposition of the vast quantities of sulphuret of iron which are collected at such points. With the exception of the strata containing iron and coal, which, though for the most part in MONMOUTHSHIRE, in some places cross the boundary of Brecknockshire, there are no mines or minerals in this county worthy of notice. Some traces of copper-ore have been found in the old red sandstone, which upon trial have proved to be unprofitable. One of the most remarkable features in the geology of Brecknockshire is a peninsula of transition rocks, which is thrown up from north-east to south-west, ranging from Erwood on the Wye to the rocky promontory of Corn y Fan, five miles north from Brecon.

Climate, Soil, &c.—The climate varies considerably, according to the elevation and exposure. In the neighbourhood of the Brecknock Beacons, the Black Mountains, and the elevated districts between Treacastle and Builth, the wind, the snow, the cold, and continual rains, are often severely felt, by which the crops are injured, and the harvests retarded; the lower valleys are comparatively warm. The country is subject to much ruin, but the air is on the whole bracing, and the population healthy. The soil in the hundred of Talgarth and Crickhowell is more favourable to cultivation than in any other part of this county. Wheat is here grown in considerable quantities; and there are orchards, from which good cider is frequently manufactured. In the hundred of Devynnock, and perhaps more so in that of Builth, where there is much cold wet clay, barley and oats are the grain crops chiefly cultivated by the farmers. Agriculture throughout the county has considerably improved during the last fifty years; partly through the exertions of an agricultural society, one of the earliest in the island, which was established in 1755, by Mr. Powell of Castle Malud. In the highlands are bred small black and brindled cattle, horses, ponies, and good hill-sheep, whose wool though finer than that of the neighbouring county is not so suitable for the manufacture of flannel. In the lowlands the Herefordshire breed of cattle predominates. The ewes are brought down from the hills in winter, and are not taken back until the cold weather has ceased and the lambs are strong enough to bear exposure.

Divisions, Towns, &c. Brecknockshire, exclusive of the borough of Brecknock, is divided into six hundreds: Builth, Crickhowell, Devynnock, Merthyr, Penkelly, and Talgarth. It contains 66 parishes, with 73 churches and chapels. The market-towns are BRECKNOCK, the only corporate town within the county, CRICKHOWELL, which stands upon the rich banks of the Usk, and BUILTH and HAY, which occupy two picturesque situations on the Wye. These will be noticed under their several heads.

A few of the more important villages may be briefly noticed here. *Bronllys*, or *Bryn-llys*, 7 miles N.E. from Brecknock, is on the high-road, about midway between Brecknock and Hay. Here is a building of considerable antiquity, somewhat resembling in appearance one of the Irish round towers which has lost its upper part. *Crickadarn*, 10 miles N. by E. from Brecknock, stands on the right bank of the Wye: the population of the parish in 1851 was 414. The church is a small building of ancient date, and has a massive tower. The scenery about Crickadarn is very picturesque, especially along the Clettwr, which in its course through Crickadarn to the Wye flows through a deep and richly wooded dingle. *Devynnock*, on the right bank of the Usk, 9 miles W. from Brecknock: the population of the parish in 1851 was 1969. The village lies in the Vale of Senni. The church is spacious; it is of the perpendicular style and date, except the tower, which is older. The Calvinistic Methodists and Independents have places of worship. There are an endowed Free School and some almshouses. Fairs are held in April, May, August, October and November. On the Senni was anciently a strong fortress, known as Castell Dŷ, or the 'Black Castle.' Henry IV. stayed some time at Devynnock, whence was dated a proclamation of pardon to the Welshmen who were willing to submit. In the parish are several *carneddau*, or cairns, and other primeval remains. *Cerrig duon*, or the 'Black stones,' a stone circle, is a short distance from the village. *Llangammarch* by the Vale of Llanwrtyd, 14 miles S.N.W. from Brecknock: the population in 1851 was 1028. The village is chiefly noticeable for a large circular British camp, which is still traceable. The Irwen is much resorted to by anglers. Llangammarch was the birthplace of the Rev. Theophilus Jones, the historian of Brecknockshire. The Vale of Llanwrtyd affords scenery of uncommon beauty and grandeur. *Llangattock*, or the Church of St. Gattock, 12 miles S.E. from Brecknock, is situated on the right bank of the Usk,

opposite to the town of Crickhowell: population of the parish 5415 in 1851. It has a very neat ancient church of the decorated style, and an Independent chapel. In the parish are extensive iron-works, and also limestone quarries. The Brecknock and Abergavenny Canal passes through the village. Many cairns and other early antiquities are in the neighbourhood. There are some rather singular caves. The scenery is very striking. *Llanelly* is a parochial chapel of which *Llangattock* is the mother church. It lies on the south of *Llangattock*: the population in 1851 was 9644, showing an increase since 1841 of 2278, attributed to the flourishing state of the *Llydach* or *Clydach* iron-works. *Llanfhaugel-cwm-dû*, on the *Rhiangoll*, 10 miles E. by S. from Brecknock, population of the parish 1066 in 1851, is believed to have been a Roman station. The remains of a square Roman camp of large size, called *Cod-y-gaer*, are still tolerably perfect. Roman coins have been found here. The church of *Cwm-dû* is recent, with the exception of the tower. *Llangorse*, 6 miles E.S.E. from Brecknock: population 401 in 1851. The church is ancient, with a tower containing six musical bells, whose sound over the adjacent lake, *Llyn-Safuddu*, is greatly admired. The Calvinistic Methodists and Baptists have places of worship. There are some parochial charities. *Llyn-Safuddu* is often called *Llangorse Pool*, on account of its proximity to the village. *Llangynidr*, on the right bank of the *Usk*, 8 miles S.E. from Brecknock: population of the parish 3246 in 1851. Besides the parish church it contains places of worship belonging to the Methodists, Independents, and Baptists. There are some parochial charities. The inhabitants are largely occupied in iron-works, coal-mines, and limestone quarries. The Brecknock and Abergavenny Canal passes through the parish; fairs are held in April, October, and December. *Llywern*, on the right bank of the *Wye*, 8 miles N.N.E. from Brecknock: population of the parish 225 in 1851. The little church is picturesquely situated close by the *Wye*. The village itself is a poor place, although here was anciently one of the residences of the native princes of Wales. *Llangow Castle*, in this parish, was erected in the 17th century. The grounds of *Llangow Castle* lie along the *Wye* for about two miles, and both by the river and on the heights afford scenes of surpassing beauty. *Llywell*, on the upper part of the *Usk*, 11 miles W. fr. Brecknock, population of the parish 1627 in 1851, possesses an ancient and rather interesting church; there is an endowed chapel-of-ease at *Rhyd-y-briw*. The Calvinistic Methodists and Independents have chapels here. *Talygarth*, 8 miles N.E. from Brecknock, a considerable village, formerly a borough and market-town: population of the parish 1328 in 1851. The church is a much better one than Welsh churches usually are. There are some Dissenting chapels. *Trecastle*, a ward of *Llywell* parish, population 274 in 1851, is a good-sized village, with an inn much resorted to by tourists; the scenery here is remarkably picturesque, and there are some remains of *Carreg Cennen Castle*, which stood on a steep and lofty rock above the river *Cennen*. *Tretower* village is a parcel of the parish of *Llanfhaugel-cwm-dû*, 9 miles S.E. from Brecknock: population of the parish of *Tretower* 291 in 1851. The chief object of interest is the castle, which is of Norman date, but is now a mere ruin. It belongs to the Duke of Beaufort.

Divisions for Ecclesiastical and Legal Purposes.—This county is wholly in the archdeaconry of Brecon, diocese of St. David's, and province of Canterbury. In its 66 parishes there are 23 rectories, 16 vicarages, and the remainder perpetual curacies. The assizes are held at Brecknock by the judge attending the South Welsh circuit. County courts are held at Brecknock, Builth, Crickhowell, and Hay. Brecknockshire returns one member to the Imperial Parliament.

Brecknockshire is divided by the Poor-law Commissioners into four Unions—Brecknock, Builth, Crickhowell, and Hay; these Unions include 107 parishes and townships, with a population in 1851 of 59,137; but the boundaries of the Unions are not exactly coequal with those of the county. There was only one savings bank in the county in 1851. It was at Brecknock, and the total amount owing to depositors on November 20th 1851 was 23,671*l.* 12*s.* 2*d.*

Occupations of the People.—The manufactures of this county are few and unimportant, except that of iron, which employs many hands. Flannel and other woollen goods, such as baize, and coarse checks for trousers, are woven in several small factories. The knitting of stockings, which was formerly practised to a great extent by the women of the county, is now less frequent. Woven stockings, though less durable, are so much cheaper as to have greatly diminished this branch of industry.

Civil History and Antiquities. Brecknockshire remained in the power of the Welsh princes until 1092, when *Barnard Newmarch* made himself master of Brecknock. Notwithstanding the vigorous efforts of the Welsh to drive him from the country, he succeeded in his conquest, and at his death the lordship of Brecknock was inherited by his son-in-law, *Milo Fitz Walter*, earl of Hereford. This earl was succeeded by four of his sons, in turn, and afterwards by *Philip de Breos*, their brother-in-law, who died about 1160. He was followed by his son *William de Breos*, to whom the lordship was confirmed by King *John* in 1194. Upon the accession of *Henry III.*, *Reginald de Breos*, who had married *Gwladis*, daughter of *Llewellyn*, Prince of North Wales, was induced by the restoration of some escheated property to forsake his father-in-law and his adherents,

with whom he had engaged in a confederacy against the English king. *Llewellyn*, incensed at this breach of faith, laid siege to Brecknock, which was however spared at the earnest intercession of the burgesses. *Reginald* and *Llewellyn* were afterwards reconciled. *Reginald* died in 1228, and was buried in the Priory church at Brecknock. *Henry* carried on the war against *Llewellyn* and his Welsh followers. *Edward I.* continued the sanguinary contest till 1282, when his supplies having been intercepted, and his army harassed by the king's troops, *Llewellyn* quitted his stronghold in *Snowdon*, marched towards Brecknock, and, unaware of the desertion of his friends, was slain near *Builth* by one *Adam de Fraucton*, who plunged a spear into his body. *Llewellyn* was buried at a place now called *Cefn-y-bedd* (meaning the back, or ridge of the grave), near *Builth*. In 1286 the lauds of *De Bohun*, who had succeeded to the possessions of *De Breos* in Brecknockshire, were invaded and pillaged by the retainers of his late guardian, *Gilbert*, earl of Gloucester, who held the lordship of Glamorgan. *De Bohun* quickly retaliated upon the men of Glamorgan; and for this feud the king sentenced the two barons to forfeit for their respective lives the liberties of Brecknock and Glamorgan, and to be kept in custody during his pleasure. They afterwards compounded with the crown, *Hereford* for 1000, and *Gloucester* for 10,000 marks. *Humphrey* was a benefactor to the monks, and augmenter of the liberties and privileges of the burgesses of Brecknock; he died at *Plessey* in 1298. He was succeeded by his eldest son, who, as an atonement for his father's conduct, surrendered to the crown the earldoms of *Hereford* and *Essex*, together with the constablership of England; and shortly after married *Elizabeth*, seventh daughter of *Edward I.*, when the king, with certain reservations, restored to him his office and estates. After the disaffected barons had been defeated in the early part of the 14th century, the younger *Despencer* who was now constituted governor of Brecknock Castle, obtained the lordship and the property of the late Earl of *Hereford*, who had been killed at the battle fought at *Boroughbridge*, in 1321. Upon the death of the *Despencers*, the confiscations consequent on the rebellion were reversed, and the property restored to the family of the *Herefords*, in the person of *John de Bohun*. This earl, after having been created knight of the bath, died in 1335. The lordship of Brecknock remained in the family till the death of *William* the last of the male line of the noble family of *De Bohuns*. The lordship of Brecknock now reverted to *Henry IV.*, who had married *Mary*, the daughter of the last *De Bohun*. *Henry IV.* granted to the inhabitants of Brecknock an exemption from tolls and other payments, renewed the benefactions to the monks, and gave them their first royal charter. After passing through several hands Brecknock came as an inheritance to the young duke of *Buckingham*, who lived in retirement within the walls of Brecknock during the greater part of the reign of *Edward IV.* On the death of this king however he left his seclusion, and became a conspicuous supporter of the Duke of *Gloucester*, until he was seated on the throne. In reward for these services, *Richard* made him governor of all his castles in Wales, and lord high constable of England, with other lucrative and honourable offices; he also promised to restore to him all the lands forfeited by the *Bohuns*, which would have made him the richest and most powerful nobleman in England. These promises never were fulfilled; *Buckingham*, as is well known, conspired against the king, took arms with his followers, but was taken, and ultimately executed at *Salisbury* without a trial. The Duke of *Richmond* afterwards passed through Brecknockshire, where he greatly increased the number of his followers. As soon as he was established upon the throne, he restored to *Edward*, the son of the last Duke of *Buckingham*, the estates and titles of his father, and in 1504 made him high constable of England—the last person that ever held that office. He was afterwards accused of treason, and executed in 1521. The dukedom of *Buckingham* was now extinct, and the lordship of Brecknock with its dependencies merged in the crown. Upon the union of England and Wales, which took place in 1534, in the 26th year of the reign of *Henry VIII.*, Brecknockshire became subject to English laws and authorities, and its history from this time must be considered in conjunction with the general history of the kingdom.

Brecknockshire abounds in antiquities. The principal castles have been at Brecknock, Builth, Crickhowell, and Hay; at which last place, after the destruction of its first castle, of which nothing but an archway remains, a second was built in the reign of *Elizabeth* or *James I.*, which is at this time inhabited. Besides these must be mentioned remains or traces of castles at *Tretower*, near *Crickhowell*, at *Blinllyfni* and *Dinas*, in the parish of *Talygarth*, at *Trecastle*, and *Penkelly*, at *Bronllys*, where a well-preserved round tower is standing, and at *Caeberis*, in the parish of *Llanganton*. There are traces of Roman encampments and of British stations at various places in the county. Cromlechs, cairns, and tumuli, or mounds where the dead have been interred, are found in many parts of the county; which has also been intersected by several Roman roads. The Welsh language, which was formerly spoken throughout the whole of Brecknockshire, is now greatly disused in the south and west portions of the county. It is estimated that the English language is spoken ordinarily by nearly half the population.

BREDA, a town in the Dutch province of North Brabant, is situated at the confluence of the *Merk* and the *Aa*, 22 miles W. by

S. from Bois-le-Duc, in $51^{\circ} 35'$ N. lat., and $4^{\circ} 47'$ E. long., and has about 13,000 inhabitants. It is a well-built strongly fortified town, surrounded by marshes, which in case of attack can be laid under water. The ramparts are planted with trees and form handsome promenades. The streets are wide and well paved, and the houses well constructed. There are four squares. Several canals traverse the town. The quays are planted with trees. The castle, which is the principal building in the town, is surrounded by the Merk. It was originally built by the family of Schoten, who held it with the title of Baron, in 1190. Breda afterwards came into the possession of the dukes of Brabant; and in the beginning of the 16th century passed by marriage to the house of Nassau. In 1567 it was annexed by the Duke of Alba to the crown of Spain. In 1577 the Spanish garrison opened the gates to the confederates. Four years after, the town was treasonably delivered to the Duke of Parma; but it was retaken by stratagem in March 1590 by Prince Maurice of Nassau. In 1625 Breda yielded by capitulation to General Spinola, who commanded the troops of the Infanta Isabella. In 1637 the town again came into the possession of the States-General of the United Provinces, and was confirmed to them by the treaty of Westphalia. The French, under Dumourier, took Breda in 1793. Charles II. of England resided in Breda during part of his exile.

The castle already mentioned was rebuilt in 1680 by William, Prince of Orange, afterwards William III. of England. The arsenal and the great market-place are among the chief ornaments of the town. The principal Protestant church is an elegant building, with a spire 362 feet high: it contains a fine monument to Engelhort of Nassau, a general of Charles V. There are besides another Protestant church, and four Roman Catholic churches, as well as hospitals for orphans and for aged persons. The town-hall and military hospital deserve to be mentioned. Breda has a tribunal of commerce, a grammar school, and a magnetic observatory. Its industrial products comprise broadcloth, linen, leather, beer, and musical instruments. The railway now in course of construction to connect Antwerp and the Hague passes through Breda.

BREDON. [WOMBERSTERSHIRE.]

BREGENZ. [TYROL.]

BREISACH, ALT, a fortified town on the Rhine, about 12 miles W. from Freiburg, in the grand duchy of Baden. It was formerly considered the bulwark of Germany on the line of the Upper Rhine, and is still one of the strongest fortresses in Germany. The castle was built by Berthold, Duke of Zähringen. Of the numerous sieges which Breisach sustained the most memorable was that of 1638, when it was taken by the Duke of Saxe-Weimar. In 1648 Breisach was ceded to the French, but the peace of Ryswick in 1697 restored it to the Austrians. Six years afterwards it was invested and taken by Marshal Vauban. Austria regained possession of the place by virtue of the treaty of Rastadt in 1715, and its works were afterwards rendered much stronger by the erection of a citadel on Mount Eckhardt. The events of the campaign of 1743 and 1744 threw it once more into the power of the French, who demolished the fortifications. Part of the town was burnt by the French during the revolutionary campaign in 1793; three years afterwards, General Moreau, upon re-crossing the Rhine in his retreat out of Swabia, left a garrison in Breisach; and the French retained possession of it in spite of the efforts of the Austrians. In 1806 the French government transferred it, together with the Breisgau, to the house of Baden. Breisach is situated on a circular hill on the east bank of the Rhine, between Basel and Strasburg; and contains about 3200 inhabitants. The Minster of St. Stephen, which has survived every calamity that has befallen Breisach, and is built in the old style of German architecture, contains the monuments of several old warriors and individuals of note.

BREISGAU, or BRISGAU, a district in Germany lying between the Rhine and the Black Forest, is now included in the Baden circle of Ober-rhein. It was originally a landgraviate belonging to the dukes of Zähringen; it then passed into the possession of the dukes of Hochberg, and in 1367 was sold to the house of Habsburg. Rudolph of Habsburg, the founder of the reigning dynasty of Austria, was born in the castle of Linburg, in this territory. The Breisgau is traversed by numerous mountains, with the exception of the districts adjacent to the Rhine, where the surface is level and the soil highly productive: here large quantities of grain, flax, hemp, fruit, vegetables, wine, &c. are raised. In the other parts flocks and herds are reared to a considerable amount, much timber is cut, and the metals, particularly iron, copper, and lead are worked. The inhabitants of the forest-districts are celebrated for the manufacture of wooden clocks and other articles of wood. By the peace of Presburg in 1805 Breisgau became the property of the Elector of Baden, with the exception of a small tract assigned to Württemberg, which Baden subsequently acquired. It contained seventeen towns, including Freiburg the capital, Ohl Breisach, Waldkirch, Kensingen, Endingen, Stauffen, and St. Blasien, and a great number of villages and hamlets. [**BADEN.**]

BREMEN, DUCHY OF, in Hanover, is bounded N. by the German Ocean, N.E. by the Elbe, E. by Lüneburg, S. by Brunswick, S.W. by the Republic of Bremen, and W. by the Weser. Its area is 1957½ square miles, and its population about 190,000. The soil which borders upon the sea and the rivers is fertile marsh land. The

interior consists of heaths and moors, a considerable portion of which has been of late years brought into cultivation. Dykes are maintained to preserve the marsh land from inundation. The Este, Bremer, Lühe, and Schwinge flow into the Elbe. The Aller and the Lesum (which receives the Wunne and the Worpe) fall into the Weser. The Oste and the Lesser Medem have their whole course in the duchy, and enter the sea near the mouth of the Elbe. Flax, hemp, and fruit, corn and other agricultural produce in abundance, as well as vegetables, are raised. Peat is used for fuel. Considerable numbers of horses, horned cattle, sheep, and swine are reared. Geese are very numerous. The duchy is now merged in the Province of Stade, the whole area of which is 2626 square miles. The capital, both of the duchy and of the province, is **STADE**.

BREMEN, REPUBLIC OF, extends along both sides of the Weser, between $53^{\circ} 1'$ and $53^{\circ} 11'$ N. lat., $8^{\circ} 32'$ and $8^{\circ} 58'$ E. long. It is bounded N., E., and S. by Hanover, and W. by the duchy of Oldenburg. The whole area of the republic amounts to 74 square miles, and the population, including that of the town of Bremen, amounted in 1849 to 79,047. The surface is low, and consists chiefly of drained marsh land. The pastures are remarkably rich, and the breed of horned cattle is very fine: corn is grown only on the more elevated spots. Two separate districts, nearer the mouth of the Elbe, also belong to the republic; on these stand the towns of Vegesack, population 3538, and Bremerlehe, which is the port of Bremen and has a population of 3618. The legislative power of the republic is vested in a Senate, which consists of 4 burgomasters, 12 syndics, and 24 senators; and in the Burger-Assembly, which is composed of all citizens who pay any considerable amount of taxes. The senators are chosen for life out of a number of candidates proposed by the burgesses, and the mode of election is by ballot. The Republic of Bremen is a constituent member of the Germanic Confederation, to the army of which it is bound to furnish 485 men. Four battalions of militia are kept up by the republic, which meet at least once a year.

The population of the Republic of Bremen was thus distributed in 1849:

City of Bremen	53,478
Country Parts	18,413
Town of Vegesack	3,538
Port of Bremen	3,618
Total	79,047

In 1852 the revenue of the republic was estimated at 989,706 thalers; the expenditure at 978,277 thalers.

The commerce of 1851 is returned as follows:—

Arrivals.	Tonnage.	Departures.	Tonnage.
2518	171,603	2934	181,124
Value of Imports.		Value of Exports.	
By Land	19,671,696 thalers	By Land	15,988,359 thalers
By Sea	17,874,420 "	By Sea	16,880,588 "
Total	37,546,116 thalers	Total	32,868,947 thalers

BREMEN, one of the free Hanseatic towns and capital of the Republic of Bremen, stands upon the Weser, about 50 miles from its mouth, in $53^{\circ} 4' 45''$ N. lat., $8^{\circ} 13'$ E. long., and has a population of 53,478. The Altstadt, or old town, which is on the right bank of the river, contains some handsome streets and dwellings; but in general the streets are narrow, and, in consequence of the height of the houses, dark and gloomy. It has large suburbs, and these form by much the larger portion of the city. The Neustadt, or new town, which stands on the left bank of the Weser, is regularly built, and has broad straight streets. The two quarters are connected by the Weser bridge, which crosses the island of Werder, that lies between them and is covered with buildings. The quays extend along both sides of the river. The ramparts of the old town have been converted into promenades. Among the public buildings are the cathedral, erected in 1180, and 8 other churches. The old archiepiscopal palace, now the town-hall, is an imposing building in the gothic style. The old town-hall, built in 1405, and famous for its Rathswinkel, or 'council's wine cellar,' which, it is said, contains hock of the vintage of 1624, and various other wines of an advanced age, still exists. Besides these must be mentioned the exchange, the building in which the chief merchants hold their sittings, the great waterworks near the bridge, the arsenal, the granaries, the museum, the city library, the observatory from which Olbers discovered the planets Pallas and Vesta, and the theatre.

Bremen owes its prosperity to the navigable river on which it stands. It is the entrepôt for imports of all the countries bordering on the Weser, and especially for Hanover, Oldenburg, and Hesse-Cassel. A railroad from Bremen to Hanover was opened in December 1847. Large vessels go up the river only as far as Bremerhaven, 2½ miles below Bremen; there they discharge their cargoes in a new harbour. Ships of 200 to 250 tons unload at Vegesack, 13 miles below Bremen; and vessels of seven or eight feet draft go quite up to the town. Cargoes brought to Bremerhaven and Vegesack are forwarded to Bremen by lighters and boats. Bremen is a place of great resort for the warehousing and transit of foreign and German goods; it has a bank, discount office, and several insurance companies. The ships

of Bremen are largely engaged of late years in carrying out German emigrants to America. The chief imports are raw cotton, cotton yarn, sugar, coffee, tea, tobacco, dye-stuffs, and other colonial produce. The exports consist of these same items and of linens, grain, oak-bark, salt meat, hides, seeds, rags, wool, woollen goods, and wine. The town has several sugar-refineries, above 100 distilleries, tanyards, soaperies, cordage and canvass factories, cotton-mills, bleach-works, tobacco factories, &c.

Bremen first rose into notice about the year 788, when it became the seat of a bishop. In 1233 it gave title to an archbishop. The city prospered greatly under its ecclesiastical rulers, who promoted its union with the Hanseatic league. In 1810 it was incorporated with the French empire, but recovered its independence after the battle of Leipzig in 1813, and was admitted a member of the Germanic Confederation, as one of the Free Hanse Towns, by the Congress of Vienna.

A railway and electro-telegraphic wires run up the right bank of the Weser to Hanover, giving Bremen access to the Prussian and Rhine systems of railroads. The electro-telegraphic wire is continued northward to Bremerhaven and Stade.

(Streit, *Free Towns*; Hassel, *Free Hanse Towns of Bremen*; Macgregor, *Statistics*; *Official Returns*.)

BRENOD. [Aix.]

BRENTA (the Roman *Medoacus Major*), a river of North Italy, rises from two small lakes near Pergine, in the Tyrol a few miles E. from Trento, flows east through a long and narrow valley between high mountains, then turns south at Prinolano, where it enters the Venetian territory. At Bassano the Brenta issues from the mountains into the great Paduan plain. At Limona there proceeds from it a canal called La Brentella, which joins the Bacchiglione. The Brenta continues its course in a south-east direction, passing near Padua; it then assumes a course nearly due east towards the lagoons of Venice. Near Strà, it receives a canal from the Bacchiglione, which passes through Padua. At Dolo, below Strà, another canal, called Brenta Nuova, carries part of the waters of the Brenta in a southern direction for nearly 20 miles to Brondolo, at the south extremity of the Venetian lagoons. The main stream however continuing its course to Fusina, where it entered the lagoons opposite to Venice occasioned considerable mischief by the violence of its current and its frequent overflowing, to prevent which the Venetians made a second cut (Brenta Nuovissima) at La Mira, a little below Dolo, which cut runs nearly parallel to the other, until both streams join near Brondolo, where they enter the sea. The original bed of the Brenta, from La Mira to Fusina, was at the same time embanked and made into a canal with locks, and it took the name of Brenta Morta, 'the Dead Brenta.' The communication between Padua and Venice is carried on by means of this canal, by which the boats from the interior supply Venice with provisions. The whole course of the Brenta is about 100 miles. The banks of the river below Padua were formerly embellished for several miles with splendid palaces and pleasure-grounds of Venetian noblemen. Many of these palaces are now gone to decay.

BRENTFORD, Middlesex, a market-town, and the seat of a Poor-Law Union, is situated in 50° 29' N. lat., 0° 18' W. long.; 7 miles W. by S. from Hyde Park Corner. It is divided into Old and New Brentford by the river Brent, which here unites with the Thames. Old Brentford is in the parish of Ealing and hundred of Ossulston; New Brentford is in the parish of New Brentford and hundred of Elthorne. The population of the town of Brentford in 1851 was 8870, of which New Brentford contained one-fourth. The living of Old Brentford is a perpetual curacy, that of New Brentford a vicarage, in the archdeaconry of Middlesex and diocese of London. Brentford Poor-Law Union contains ten parishes and townships, with an area of 21,146 acres, and a population in 1851 of 41,305.

Brentford is situated on the left bank of the Thames, on the great western road from London. The town takes its name from a ford over the Brent, where that stream is now crossed by a bridge. There was a bridge here at a very early period. In 1280 Edward I. granted a toll for three years in aid of the bridge of 'Braynford.' The present bridge was built in 1824; it is a stone bridge of one arch. Brentford has little historical interest: what interest it has arisen chiefly from its two battles. In 1016 Edmund Ironsides having driven the Danes out of London followed them to this place and defeated them here with great slaughter. In 1642 Rupert gained a somewhat doubtful victory over the Parliamentarians under Colonel Holles. The result of this encounter, which is generally known as the battle of Brentford, was however of much service in raising the spirits of the Royalists.

From its situation Brentford is a great thoroughfare, and has a considerable trade. Several manufactures are carried on in the town and its vicinity. In Old Brentford is the extensive distillery of Booth and Co.; there are also an ale brewery, a soap factory on a very large scale, gas-works, brick and tile works, saw-mills, and the works of the West London Water-works Company, the chimney of which is about 150 feet high. The company has recently erected in connection with the works a stand-pipe constructed of iron flanches 9 feet in length, which is carried up a height of 214 feet. Many of the inhabitants are employed in market-gardens in the neighbourhood. The Grand

Junction Canal joins the Brent a little below Hanwell, and thus has communication with the Thames at Brentford. A loop-line connects Brentford with the South-Western railway. Edward I. granted to Brentford a weekly market on Tuesday. It is still held on the same day, and is chiefly for the sale of corn, pigs, and vegetables. Fairs are held on the 17th to the 19th of May, and on the 12th to the 14th of September.

Brentford consists principally of one long irregular and narrow street. The parish church of New Brentford is a plain brick building, erected, except the tower, at the close of the last century, on the site of an older church. The chapel in Old Brentford, dedicated to St. George, is also a plain modern erection. The Baptists have a place of worship in New Brentford. In Old Brentford there are chapels for Independents, Wesleyan Methodists and Baptists. There are National schools in New Brentford, and National, British, and Infant schools in Old Brentford.

For election purposes Brentford is the county-town of Middlesex. A joint-stock company has recently erected a town-hall and market-house, a neat and commodious structure of brick and stone. A county court is held here. There are a savings bank, a dispensary, and a literary and scientific institute. An inn at the corner of the market-place, the Three Pigeons, has acquired some celebrity from having been mentioned by some of the dramatists of the age of Elizabeth and James. It was kept by John Lowin, one of the original performers of Shakspeare's plays. The inn was purchased by the company which built the new town-hall, and was to have been pulled down: but it for the time escaped. Lion House, the splendid mansion of the Duke of Northumberland, is in the vicinity of Brentford; as is also Osterley Park, the seat of the Earl of Jersey; the grounds of both are extensive, well-wooded, and very beautiful. A substantial stone bridge, erected in the last century by Payne, crosses the Thames from Brentford to Kew.

BRENTWOOD, Essex, a village in the parish of South Weald, and hundred of Chafford, is situated on the road from London to Chelmsford and Colchester, in 51° 37' N. lat., 0° 18' E. long.; 11 miles S.W. from Chelmsford, 18 miles E.N.E. from London, both by road and by the Eastern Counties railway. The population of the town of Brentwood in 1851 was 2205. The living of Brentwood is a perpetual curacy in the archdeaconry of Essex and diocese of Rochester.

Previous to Domesday Survey, the manor of South Weald belonged to Waltham Abbey. The manors of South Weald and Brentwood are now in the possession of the Tower family. The church, erected within the last 20 years, is a plain neat edifice; the old chapel, dedicated to St. Thomas à Becket, built in 1221, is now used as a National school. In the interior is a rude image of à Becket, carved in wood. The Wesleyan Methodists, Independents, and Roman Catholics have places of worship. The Grammar school founded in 1557 provides a liberal education for the sons of persons residing within 3 miles of the school-house. The number of scholars in 1852 was 61. The endowment yields about 1200*l.* a year, out of which ten almshouses are supported. There is also a school connected with the Roman Catholic chapel. The county asylum, an elegant building just completed, is situated near the town. A school-house for the pauper children of Shoreditch parish is now being erected.

Brentwood consists chiefly of one main street along the high road. The houses are generally old, and irregularly built. The situation of the town is pleasant and healthy. Numerous good mansions have been built within the last few years in the neighbourhood. Excellent water is obtained from wells in the vicinity. Brick-making is carried on to some extent; there is also a brewery. Some remains of the old prison and of the town-hall, in which the assizes were formerly held, are still existing, and are in the hands of persons who are bound to put them in repair should the assizes be again held in Brentwood. A county court is held in the town. The market held on Thursday has been of little importance for many years. Fairs are held in July and October for cattle. At South Weald are traces of a circular camp. South Weald church is a structure of great beauty and interest. South Weald Park contains much excellent timber, and affords many pleasing views.

BRESCIA, a province of Austrian Italy, is bounded N. by the Tyrol, E. by the Lake of Garda and the province of Mantua, S. and S.W. by the province of Cremona, and W. by the province of Bergamo. The river Oglio and the Lake of Isco, through which the Oglio passes, mark the boundary between Brescia and Bergamo, and also between Brescia and Cremona. The province is 54 miles long from north to south, and its greatest breadth from the Lake of Garda to the river Oglio is about 33 miles. The area is 1305 square miles, and the population in 1851 was 356,225.

The territory, with regard to its surface and the nature of the soil, may be divided into three tracts:—1. The valleys and mountains north of the town of Brescia, which are rugged and cold in winter; during the rest of the year great numbers of sheep and cattle are fed here, and much cheese is made. 2. The west coast of the Lake of Garda, called Riviera di Salò, which has a mild climate, and produces excellent wine, oil, and fruit, in abundance. In this part the properties are small; the peasants are, properly speaking, gardeners. About 12,000,000 of lemons, and 40,000 lbs. of laurel-oil are annually produced here. 3. The south part of the province, which forms part

of the great plain of Lombardy, and produces corn, rice, Indian corn, flax, grass, and a great quantity of mulberry-trees. The land in this part of the province is very carefully and skilfully irrigated.

All through the province olive-oil is produced in less quantity than formerly, the olive being supplanted by the mulberry, the produce of which is constant, while that of the olive is abundant only in alternate years. Within the last forty years the silk annually produced in Brescia has increased from 1,900,000 lbs. to above 3,000,000 lbs., and the quantity of oil has diminished from 400,000 lbs. to 180,000 lbs.

Besides the Oglio, which skirts the province of Brescia to the west and south, two rivers, the Mella and the Chiese, cross it from north to south, and drain the two principal valleys of its northern division. The Mella enters the Oglio near Ostiano; the Chiese enters it below Canneto. A canal issues out of the Chiese at Gavardo, passes close to the town of Brescia, and enters the Oglio above Canneto, whence the boats proceed by the Oglio into the Po. A steam-boat plies between Riva and Desenzano, at the two opposite extremities of the Lake of Garda.

The province is ordinarily administered by a delegate, each district by a commissary, and each commune by a municipal officer called Podestà. For the military there is a commandant at Brescia. For judicial purposes there are civil, criminal, and mercantile courts, from which there is an appeal to the superior courts at Milan. The ecclesiastical jurisdiction is vested in the bishop of Brescia. Higher instruction is afforded by the Lyceum and the gymnasium at Brescia, the gymnasium of Desenzano and Salò, the diocesan gymnasium and seminary for clerical students, besides a college and several private establishments authorised by the government. Female education is given by the Ursuline nuns at Brescia, and by the nuns of St. Francis de Sales at Salò. For elementary education there are at least one boys' and one girls' school in each of the 235 communes into which the province is divided.

Silk, linen, paper, leather, woollen and cotton goods, fire-arms, and cutlery, are the most important manufactures of the province. The minerals include iron (which is found in the Val Trompia), copper, jasper, alabaster, touchstone; particles of gold are found in the Oglio.

The province is traversed by the railway and electro-telegraphic wires from Milan to Venice, but the section of the railroad that crosses Brescia is not yet (December 1853) completed. The telegraphic wires sweep round the head of the Adriatic from Venice to Udine and Trieste, and thence to Vienna.

The province of Brescia is divided into 17 districts and 235 communes. The chief town is Brescia, which is noticed in the next article. [BRESCIA.] Among the other towns the following are the most important: *Bagolino*, a small place, with 3500 inhabitants, iron-works, and tanneries, is 23 miles N.E. from Brescia. *Castenedolo*, 6 miles S.E. from Brescia, is a market-town, with a population of 4500. *Chiari*, a town of 9000 inhabitants, is situated on the high road and railway to Milan, 12 miles W. from Brescia. It is a well-built town, with several churches and several silk and silk-twist factories. There is a good trade in silk and cotton goods and in raw silk. The town was formerly important as a fortress; but its defences are now gone to decay. Some Roman remains have been found here. *Desenzano*, 17 miles E. by S. from Brescia, is situated at the south-western angle of the Lago di Garda, which here forms a small harbour for fishing craft and the small steamers that ply on the lake. The town is defended by an old castle built on a height above it. It has a considerable commerce in corn, fish, &c., and about 3600 inhabitants. Steamers ply to Riva at the northern end of the lake. To the east of the town lies the promontory of Sirmione, which, surmounted by the castle built by the Scaligers, and by the remains of an ancient Roman palace (sometimes called the Villa of Catullus), forms a very beautiful object from the lake. The western shore between Desenzano and Salò abounds in beautiful and picturesque scenery. *Iseo*, a small town with 2000 inhabitants and extensive silk-works, is situated on the southern shore of the beautiful lake of Iseo (which is named from it), at a distance of 10 miles N.W. from Brescia. *Levo*, a market-town to the south of Brescia, near the Mella, has 4000 inhabitants, who manufacture silk, cotton, and linen. *Lonato*, 16 miles E. by S. from Brescia, and a few miles west from Desenzano, is a walled town, defended also by a citadel. It is situated in a fine silk district and has 6000 inhabitants. The principal church of Lonato is surmounted by a noble dome. *Mantecari*, 12 miles S.E. from Brescia, on the left bank of the Chiese, has several silk-throwing establishments and 6000 inhabitants. In the environs is the plain of Monte Chiari, in which military reviews are held annually. *Orzinuovi*, 20 miles S.W. from Brescia, on the left bank of the Oglio, is a place of some trade, with 4700 inhabitants. This town was formerly fortified. *Pontevico*, also on the left bank of the Oglio, is 20 miles S. from Brescia, having a population of above 5000. The town is defended by a citadel, and has some trade in corn and wine. The Oglio becomes navigable for large barges at Pontevico. *Rovato*, between Brescia and Chiari, has 5000 inhabitants and an old ruined castle. Timber, wrought-silk, tiles, and ironmongery, are the chief articles of trade in the town. *Salò*, beautifully situated at the head of the Bay of Salò, an inlet of the Lago di Garda, is 18 miles E.N.E. from Brescia, and has about 5000 inhabitants. The town is well built, part of it on piles. The town-hall, the church of Dôme, and the hospital are the chief buildings.

Mount San Bartolomeo rises above the town, and the neighbourhood is all covered with plantations of olives, oranges, citrons, mulberries, and vines. The chief articles of trade are wine, raw-silk, fruits, and bleached linen thread, which is famous all over Italy. There are many smaller towns of between 2000 and 3000 inhabitants each.

BRESCIA (the Roman *Brizica*), the capital of the province of Brescia, is situated on the Garza, in a plain between the river Mella, or Mella, and the canal which joins the Chiese and the Oglio, in 45° 32' N. lat., 10° 13' E. long., and has, including the suburbs, 40,000 inhabitants. The city (which is described as it existed before its late capture by the Austrians) is nearly square, surrounded by walls, about four miles in circuit, and has a castle on a hill which is inclosed within the walls in the north-east of the town. It is a well-built town, has many fine churches embellished with numerous pictures and frescoes by masters of the Venetian school, and by Moretto and other native artists. The rotunda of the old cathedral was erected by the Longobards in the 7th century. The new cathedral is a splendid building; it was commenced in 1604, but the cupola was finished only in 1825. The dome of this church is the third in size in Italy. The Broletto, or ancient Palace of the Republic, a vast brick structure, surmounted by a deeply battlemented tower, and dating from the latter end of the 12th century, forms with the two cathedrals one side of the Piazza del Broletto. In the centre of the square is a statue of an armed female, the allegorical representation of the city. The town-house, the episcopal palace, and the palaces and picture galleries of the nobility deserve mention. The public library, founded by Cardinal Querini, a former bishop of Brescia, contains 90,000 volumes and some rare manuscripts, including a copy of the Gospels written in the 8th century. There are seventy-two public fountains in the streets and squares, which are supplied with water from the hills in the neighbourhood. Many ancient inscriptions and the remains of a handsome temple have been found at Brescia.

Brescia is the seat of a bishop, and of the governor of the province. There are a lyceum, two gymnasiums, a college, a valuable library, and several other educational establishments in the town, besides the Ateneo, a literary and scientific society which publishes its transactions yearly, and has done much to illustrate the antiquities and artistic monuments with which this city abounds. There is also a handsome theatre, and outside of the town a large building for the annual fair which begins on the 6th of August, and a cemetery (*campo santo*), in which the tombs are placed in rows one above the other against the walls. Brescia is an important mart for raw silk; it has considerable iron-works, and its manufacture of arms and cutlery are considered the best in Italy. It has also silk, linen, and paper factories, tanneries, paper and oil-mills, and a Monte-di-Pietà.

Brixia was founded by the Cenomani Gauls, whose capital it was (Liv. v. 25, xxxii. 30). With the rest of Transpadane Gaul it was subject to Rome, and under the empire it became an opulent and flourishing town. Augustus, it appears from inscriptions, settled a colony of citizens, not soldiers, in Brixia, which was hence styled 'Colonia Civica Augusta.' Attila and his Huns plundered Brixia in A.D. 452, but it soon recovered from this disaster, and subsequently became the capital of one of the duchies of the Lombard kingdom.

The ancient remains at Brescia are numerous, and the architectural fragments are remarkable for beauty of design and skill of execution. The most remarkable remains of buildings are those of a basilica, or court-house, which is called however a 'Temple of Hercules'; portions of the theatre; and some Corinthian columns, supposed to have formed part of the forum. The cella of the so-called Temple of Hercules has been converted into a museum, rich in ancient remains, and particularly valuable for its collection of inscriptions, which are either originals or fac-similes let into the walls. Among the ancient works in bronze discovered in Brescia is a celebrated statue of Victory.

Brescia was taken by Charlemagne. In the middle ages it suffered much from the feuds between the Guelphs and Ghibellines. It subsequently in 1426 attached itself to the Republic of Venice, to which it adhered with steadfast fidelity in all its fortunes till 1796. It was stormed by Gaston de Fuix, after an obstinate resistance by the Venetian garrison, in 1512, when it is said 46,000 inhabitants of the city perished in the indiscriminate slaughter that followed upon its capture by the French, to whose lawless rapacity, unrestrained lust, and ferocious cruelty upon this occasion, even the disinterested conduct of Bayard formed but a feeble counterpoise. The French again took Brescia in 1796, when they turned the Broletto into a barrack, having first plundered it of its works of art. At the peace of 1815 Brescia, with the rest of North Italy, came under Austria. Brescia hardly ever recovered from its sack by Gaston de Fuix. It revolted against the Austrians in the late insurrectionary movements in Italy, and its ruin has been all but completed by the Lombardian and storming which it suffered from the Austrians under Marshal Haynau, March 30, 1849.

BRESLAU, a large city at the confluence of the Ohre and the Oder, the capital of the Prussian province of Silesia, stands in 51° 7' N. lat., 17° 4' E. long., 220 miles S.E. from Berlin by the Berlin and Vienna railroad, and has a population of 110,000. It has the form

of an oblong. The central part of the town contains the great market-place, from which the four main streets branch off to the four principal gates. The suburbs, separated by the Ohlan, but connected with the city by six large and several smaller bridges, are denominated the 'Outer Town,' in contradistinction to the central part, which is called the 'New Town.' The regularity and width of the streets, the broad fronts and handsome elevation of the houses, give the town a cheerful appearance, which is in contrast with the massive and more sombre aspect of the churches and public buildings. There are three suburbs on the same side of the Oder as the new town; a broad ditch crossed by a cast-iron bridge is interposed between them. On the north side of Breslau lie four other suburbs, built on two islands formed by arms of the Oder, and connected with the New Town by several bridges. The greater part of the town is encircled by an agreeable promenade, which is ornamented with trees and shrubs. In Blücher Square, which used to be called the Salzring, the Exchange-buildings are erected. A bronze statue of Blücher, resting upon a pedestal of granite, stands in this square. The fortifications of Breslau, which caused it to be besieged in 1741, 1757, 1760, and 1806, were demolished in 1813 and 1814.

Breslau contains thirty-two churches and one synagogue. The cathedral church, erected in the 12th century, is highly decorated in the interior, and contains seventeen side chapels. The church of the Holy Cross, erected by Duke Henry IV., duke of Silesia, in 1288, is in the shape of a cross, and stands upon a subterranean church of the same shape and dimensions. It contains the monument of Henry and a bronze relief of John of Breslau, by Vischer. Among the other remarkable churches are the church of St. Mary on Sand Island; St. Dorothea's, the loftiest church in Breslau; and the chief Protestant church, called St. Elizabeth's, the steeple of which is 364 feet high. The public buildings of the town are numerous. The Guildhall, erected in the 14th century, contains the hall, where the national diets formerly held their sittings. It is situated on the Parade, the finest square in Breslau. Among the other public buildings are—the government house; the courts of justice; the public library in the Sand suburb; the Roman Catholic gymnasium; the episcopal palace near the cathedral; the arsenal; the burg, once an imperial palace; and the university buildings. The university was founded by Leopold I. in 1702 for the two faculties of divinity and philosophy. Two more faculties, for law and medicine, were added in 1811, when the university of Frankfurt-on-the-Oder was incorporated with it. The library contains upwards of 100,000 volumes. The Protestants have three gymnasia here; the Catholics have a royal gymnasium and a theological college. The Jews have a good school, founded in 1790, and another of an inferior kind. Breslau likewise possesses a school of arts; a school of architecture; and a vast number of other schools and charitable institutions, among which must be mentioned the asylums for the blind and for deaf-mutes, the Silesian literary and scientific society; several public libraries; various collections of coins and works of art; and several hospitals and infirmaries. The town is the seat of a royal mint and bank, and has a head department of mines, and other establishments incidental to its character as the centre of provincial government. There is a theatre and opera-house, and several musical societies.

The central position of Breslau among the manufacturing districts of Silesia, its facilities for trade by means of internal navigation, and by railroads which connect it with Vienna, Prague, Dresden, Cracow, Warsaw, Leipzig, Hanover, Hamburg, Berlin, and Stettin, render it one of the most thriving manufacturing and commercial cities of Germany. We believe that a railway is projected to connect Breslau with Posen, and thus give it readier communication with the harbours of Stettin, Danzig, and Königsberg. Breslau is an entrepôt for the fine and coarse woollens, cottons, linens, silks, hardware, glass, wools, hemp and flax of Silesia; for the wines of Hungary, and all kinds of colonial produce. The oxen of the Ukraine and Moldavia, the corn and cattle of Silesia, and the produce of its own distilleries, tanyards, type-foundries, and all those manufactures which it has in common with other large towns, find a regular sale at Breslau. Four fairs are held in the year, those for wool are held in the early part of June and October. The average quantity of wool sold at the June fairs amounts to 7,000,000 lbs. [SILESIA.]

BRESSE, a district in the former province of Bourgogne in France. It was bounded N. by the duchy of Bourgogne and Franche-Comté, E. by Bugey, S. by the Rhône which divided it from Dauphiné, and W. by Lyonnais and the Saône. Bresse now forms part of the département of AIN. Bourg was its chief town.

BREST, a town in the département of Finistère in France, and one of the great naval stations of that empire, stands on the Penfeld, in 48° 23' N. lat., 4° 29½' W. long., at a distance of 370 miles W. from Paris, and has a population of 48,225. It lies on the north side of a deep bay called the Road of Brest, land-locked, and entered by a narrow channel called Le Goulet.

The town is of triangular form. The Penfeld enters the town near the northern angle of the walls, and passes through it into the roadstead with a winding course, dividing the town into two parts—that on the left bank being called Brest, that on the right bank Recouvrance. In Brest, just at the point where the river falls into the road-

stead, and placed so as to command the entrance to the port, is the castle, the strength of which is very much owing to its situation. The whole town is strongly fortified. The site of Brest is very uneven. So steep is the declivity in some parts that the communication is made by means of steps, and the gardens of some of the houses are on a level with the fifth story of others. The streets in the higher parts of the town are winding and steep. In Recouvrance modern houses are rapidly superseding the edifices of former times.

Brest is a fortress and naval station of the first class. Previous to the time of Louis XIV. it was a land-fortress merely; but Cardinal Richelieu, perceiving its importance as a naval station, caused magazines to be built and fortifications to be erected to defend the harbour. Louis XIV. afterwards established the great arsenal. All the principal buildings of the town, except the churches of St. Louis and St. Sauveur, are connected with the defence of the place, or are constructed for the purposes of the French navy. There are handsome quays, ship-building yards, extensive store-houses, rope-walks, and barracks; also a building called Le Bagne, for the reception of the convicts who are sentenced to the galleys. This last-mentioned building is on the summit of a hill, and large enough for 4000 convicts. The various establishments for the navy occupy nearly the whole of the port. Brest has a botanic garden, a marine library, an observatory, and a museum of natural history. It is the seat of a maritime prefect, has schools of medicine, navigation, and marine engineering, tribunals of first instance and of commerce. A naval school is established on board a vessel in the harbour. Schools of naval artillery, engineering, hydrography, and drawing, and a school for the instruction of midshipmen, are attached to the port.

The bay or road of Brest is the ancient *Brivates Portus*. It is perhaps one of the finest natural harbours in the world. The passage Le Goulet by which it is entered is less than a mile in width, but within there is room for 500 vessels of the line. The harbour is difficult of access in foul weather; the coast of Bretagne on either side of the entrance is rock-bound, and frequently fogs render the lights of Penmaret and Ouessant, by which the harbour is made, to disappear. Steamers have to slacken pace on approaching the entrance. The passage is defended by formidable fortifications on both sides. At its entrance, on the Point St-Mathieu, there is a lighthouse with a revolving light which is eclipsed every half minute. Its height is 177 feet above the sea, and it stands in 48° 20' N. lat., 4° 47' W. long. The road may be considered as the estuary of several small streams which flow into it, none of which however are of any importance except the Aulne or river of Châteaulin, which forms part of the system of inland navigation connecting Brest with Nantes. The commerce of Brest is almost entirely confined to the victualling of the navy. A project has been long entertained of forming a commercial port here, there being no harbour of that kind between Nantes and Havre. As a port of construction, and as a school for the navy, Brest ranks before both Toulon and Cherbourg; but in importance of situation and in accessibility it is very far surpassed by either. A railway is about to be constructed from Rennes through Lorient to Brest which will connect the town and harbour with Paris and the general railway system of France.

(*Dictionnaire de la France*, Paris, 1845; Balbi's *Géographie*.)

BRETAGNE, or *Brittany*, one of the provinces into which France was divided before the revolution, was bounded N. by the English Channel, W. and S.W. by the Ocean and the Bay of Biscay, S. and E. by the provinces of Poitou, Anjou, Maine, and Normandie. Its coast-line, which was above 500 miles in length, and indented with numerous bays and harbours, extended from the mouth of the Conesnon on the confines of Normandie to the mouth of the river Boulogne, which flowing through the Lake of Grandlien falls into the Bay of Biscay opposite the Isle of Noirmontier, dividing Bretagne from Poitou. The greatest length of the province from south-east to north-west was 205 miles; its greatest breadth at right angles to its length 105 miles; and its area amounted to 13,085 square miles.

A long range of mountains, called Ménez, runs parallel to the northern coast, and terminates in the western part of the peninsula. The principal rivers of the province rise in this chain. Those which run north into the English Channel have a short course: the chief of these are the Conesnon, before mentioned; the Rance, which falls in at St-Malo; and the Trieux, which enters the sea at Paimpol. To the south of the chain are the Aulne, called in the lower part of its course the river of Châteaulin, which falls into the harbour of Brest; the Blavet, which forms the harbour of Lorient and enters the Bay of Biscay at Port-Louis; the Vilaine, which joined by the Ille and several smaller streams enters the sea opposite Belle-Île a little below Roche-Bernard. The south of the province is traversed by the Loire. All these are tide rivers and navigable.

The soil of the province is fertile along the coast; but a great part of the interior is covered with mountains, heaths, and forests. Corn sufficient for the home consumption is grown. Very little wine is produced, the common beverage being cider. Flax and hemp are extensively cultivated. Lead, iron, antimony, coal, and marble are found. Among the manufactures of Bretagne linen and sailcloth are the most important. The number of harbours along the seaboard afford great facilities for carrying on an important coasting trade, which consists principally of wine, brandy, fish, salt, cattle, butter

and the other industrial, mineral, and agricultural products of the province. The language of the inhabitants is a dialect of the ancient Celtic, corrupted of course by a mixture of French words. The province now forms the départements of CÔTES DU NORD, FINISTÈRE, ILLE-ET-VILAINE, LOIRE INFÉRIEURE, and MORBIHAN, under which heads its present state will be more fully described.

Bretagne was divided into Haute-Bretagne and Basse-Bretagne, the capitals of which were respectively Rennes and Vannes. Before the first revolution it had a local parliament or assembly of states. The states consisted—1st, of the barons, who were ten in number, and the gentry; 2nd, of the clergy, who were represented by the heads of the several orders; and 3rd, of the *tiers état*, or third estate, which was composed of the deputies returned by 41 towns. The states met every second year at Rennes, Nantes, and St-Brieuc, alternately.

Bretagne was an early seat of the Druidical superstition, and contains some vast monuments at Carnac and elsewhere, which tradition represents as consecrated to the purposes of this ancient religion. Invasions of Bretagne from the British Islands or of the islands from Bretagne, figure in the accounts of the early historians, or the traditions of ancient times; but little or nothing certain seems to have been known before the time of Cæsar's invasion of Gaul.

At that time the states along the coast from the Sequana (Seine) to the Garunna (Garonne) had the general epithet of Armorica, from the Celtic words *Ar mor*, 'on the sea.' The chief tribes who inhabited Armorica were the Veneti, a powerful maritime people, who made a gallant though ineffectual stand against the Romans under Julius Cæsar ('*Bell. Gall.*' iii. 7-16), and whose name is retained in Vannes; the Osismii, who dwelt in the western part of the peninsula; the Redones, whose name appears in Redon and Rennes; the Curiosolites, who occupied the present diocese of St-Brieuc, and the Nannetes in the south, whose name remains in Nantes. Under the Roman empire Armorica formed part of Gallia Lugdunensis, but one or two revolts served to show that their love of freedom was unsubdued, though their want of success only riveted their chains the faster.

In 284 an emigration is said to have taken place from the island of Britain, then harassed by the Saxons, and that the emperor Constantius Chlorus gave them lands in Armorica. M. Daru however ('*Hist. de Bretagne*,' Paris, 1826) places the emigration in 383, when Maximus, chosen emperor by the legions in Britain, passed over into Gaul to dethrone Gratian. It is said that he then took with him a considerable force of native Britons, who, under their leader, Conan, were able after the defeat of Maximus to retain possession of Armorica which he had bestowed on them. When the further decay of the empire left the remoter provinces in the possession of independence, the Armoricans were released from the subjection in which they had been held; and in the year 419 the Romans recognised as their allies those who had lately been their subjects. Conan appears to have ruled his states in peace and with considerable ability till the year 421, when he died. He is usually designated *Conan Meriadec*, the latter name signifying, according to some, 'great king.' His successors are said to have borne the title of king till the time of Alain II., in the 7th century. In opposition to this history there are writers who deny that any immigration of the insular Britons into Armorica took place until the commencement of the 6th century, when the pressure of the Saxons forced the unhappy islanders to abandon their native seats and retire, some to the western side of the island, Cornwall, Wales, &c., and others beyond sea into Armorica.

If amidst these conflicting statements we may venture to give our own conjecture, we should say that the account given by Daru, though perhaps a distorted representation of facts, is not without foundation. A colony of this kind was much more likely to influence the language and customs of the district in which they settled, than a number of miserable exiles escaping from the pressure of barbarian invaders, and finding their way as they could to a place of refuge in a foreign land. This infusion of a military population serves also to account for the rise of a free state in Armorica, upon the decay of the Roman power, while the rest of Gaul tamely bowed to the yoke either of their Roman masters or their barbarian invaders. The reality of Conan's existence we see no just reason to doubt; and without placing implicit credence in the lists which the Breton writers furnish, we are led by the language of Gregory of Tours, and by other testimony brought forward by Daru, to admit that several succeeding chieftains, and perhaps Conan himself, took the title of king.

With Alain II., 690, as noticed above, the title of king ceased; and Bretagne, divided into a number of principalities, became again subject to the Franks, about 800, during the reign of Charlemagne. In the troubles of the following period, the kingdom of Bretagne was once more revived by Nomenoe (824-851), who had been nominated governor of Vannes, by Louis le Debonnaire, son and successor of Charlemagne, and had revolted from Charles le Chauve. Erispoe, the son of Nomenoe (851-857) acknowledged the supremacy of Charles, but maintained his kingly title. Civil dissensions among the Bretons themselves led to the extinction of this kingdom in 874. The country was divided into the counties of Rennes, Vannes, Cornouaille (Cornwall), and other portions; and civil discord between the rulers of the petty states thus formed conspired with the invasion of the Northmen or Normans to afflict the country. This

right of sovereignty, claimed by the kings of France, was conveyed to the Northmen by Charles the Simple, when he ceded to them the country afterwards known as Normandie, in 912. The dukes of Normandie thus became the feudal superiors of the rulers of Bretagne, and themselves did homage for this province as well as for Normandie to the kings of France. This cession was the cause of long and bloody wars between the people of the two provinces, for the Bretons struggled fiercely against the barbarians, to whose supremacy they were thus arbitrarily consigned. They seem however at last to have acknowledged the dukes of Normandie as suzerains.

In 992, Geoffroi, count of Rennes, assumed the title of Duke of Bretagne. Alain, his son, second duke of Bretagne, was, from the year 1035 to his death in 1040, the faithful guardian of the childhood of William the Bastard (afterwards the Conqueror), duke of Normandie, and several Breton lords accompanied William into England in 1066. In 1148 a disputed succession led to the dismemberment of Bretagne, and to a civil war, in which the kings of England (Henry II.) and France (Louis VII. 'le Jeune') took part. The marriage of Constance, daughter of one of the claimants, with Geoffroi, son of Henry II., added the duchy of Bretagne to the already vast possessions of the house of Plantagenet. On the death or murder of Prince Arthur, in 1203, Normandie was declared to be confiscated, and was seized by Philippe Auguste, the French king, and Bretagne thus became immediately a fief of the French crown. The duchy came to Alix, daughter of Constance, by her third husband, Gui de Thouars; and in her right to Pierre de Dreux, a younger branch of the royal family of France, to whom she was married in 1212.

Pierre de Dreux, a restless and ambitious prince, reigned from 1213 to 1237; first as duke in right of his wife, and then, upon her death (in or near 1219), as guardian to his son, a minor. In 1237 he abdicated his power as guardian of his son, and was intrusted by the pope with the conduct of an expedition against the infidels beyond sea: in 1248 he accompanied St. Louis in his crusade against Egypt, and was wounded and taken prisoner at the battle of Mansoura. He died on his passage back to Europe in 1250.

The history of the dukes, Jean I. (1237-1286), Jean II. (1286-1305), Arthur II. (1305-1312), and Jean III. (1312-1341), presents few incidents of moment; but the death of the last-named prince brought on the dispute for the succession to the duchy between Jean de Montfort and Charles de Blois, and led to the war which forms so important an episode in the wars of England and France under Edward III. of England and the kings of France of the house of Valois. Jean III. left no children: he had two brothers—or rather one brother, Gui, count of Penthievre, who died before him, and one half-brother, the above-mentioned Jean de Montfort, who immediately upon the death of Jean III. took possession of the duchy. Charles de Blois claimed in right of his wife, who was daughter and heiress of Gui, and the decision was referred to the king of France as suzerain. The case was argued before a court of the peers and grandees of the kingdom. Montfort, who had reason to fear an unfavourable decision, fled secretly from Paris; and a decree of the king declared Charles de Blois duke of Bretagne. Montfort immediately sought the protection of the king of England, who willingly gave him his support: and by a singular concurrence Edward III., who claimed the crown of France through a female, supported Montfort against a female claim; while Philippe VI., the actual possessor of the crown of France, whose right rested upon the exclusion of females from the succession, supported a female in her claim to the ducal coronet of Bretagne. But interest and ambition little regard such inconsistencies.

The war had nearly been concluded at its very commencement. The army of Charles de Blois invested Nantes in 1341, in which Jean de Montfort was, and throwing into the city the heads of thirty Breton prisoners of the Montfort party, so frightened the townsmen that they opened their gates, and Jean was taken, carried to Paris, and shut up in the tower of the Louvre. Jeanne of Flanders, countess of Montfort, was at Rennes when she heard of her husband's captivity: with matchless courage she re-animated her husband's partisans, raised troops, acquired numerous other partisans by fair speeches, promises, and gifts, and throwing herself into Hennebont, a town on the river Blavet not far from the coast, awaited the succours which she expected from England.

Upon the departure of the countess from Rennes that place was invested by the troops of Charles de Blois and surrendered by the townsmen, and the victorious army advanced to Hennebont, hoping by the capture of the countess and her son (a child of three years of age) to settle the matter. But they found this no easy task; Jeanne attacked vigorously by the besieging army, and having to counteract within the town the intrigues of the bishop of Léon, who wished to persuade the townsmen to surrender, defended herself with undaunted courage. In a sally during a fierce assault she entered the hostile camp, set the tents on fire, and, being unable to re-enter Hennebont, took refuge in the neighbouring town of Auray, recruited her forces, and again made her way into Hennebont. The siege continued, the bishop of Léon exhorted to surrender, and the heroic countess could only obtain of her now dispirited soldiers a promise to hold out for three days longer. Two days passed away: on the third the besiegers were seen preparing for a last assault when the English fleet hove in

night, the valiant Sir Walter Manny landed at the head of the relieving force, and having burned the machines of the besiegers, entered the town. "Whoever then saw the countess," says Froissart, "come down from the castle and kiss Sir Walter Manny and his companions, one after the other two or three times, might well say that she was a valiant lady." The siege was forthwith raised.

A second attack upon Honnclon marked the year 1312. Before the end of the year the countess of Montfort crossed the sea into England to beg further succours, and was returning with a fleet of 40 vessels, when near Guernsey she fell in with a French fleet of 22 great ships manned with Genoese seamen, and having on board 1000 men at arms under the orders of Charles de Blois himself. The battle was terminated by a tempest which separated the fleets, but four English ships were taken. The countess landed with her reinforcements, and the kings of England and France arrived in Bretagne with hostile forces; but early in the year 1343 a suspension of arms between the two potentates was agreed on, and the Bretons alone, with some mercenaries, were left to carry on the war. In 1344 the Montfort party was strengthened by the severity of the king of France, who, without form of trial, put to death a Breton lord, Olivier de Clisson, on a charge of traitorously forming an alliance with England. The widow of Clisson, on hearing of this, gathered some troops, surprised a castle held by the friends of Charles de Blois, and distinguished herself by her exploits in a war in which, more than in any other, women emulated the warlike fame and courage of men.

In 1315 Jean de Montfort managed to escape from the Louvre, after a confinement of three years. He landed in England, did homage to Edward as his suzerain, obtained aid and returned to Bretagne. He died however shortly after, and the rights of his son, a mere child, were bravely sustained by the Countess Jeanne.

In 1347 Charles de Blois, who had besieged Roche Derrien near Treguier, was surprised and taken prisoner by an inferior body of English troops. His wife, Jeanne de Penthievre, sustained his cause with a valour equal to that of the Countess of Montfort, and the hatred of the Bretons for the English induced many of them to embrace her party. In 1356 Charles recovered his liberty by ransom, and renewed the war, which was carried on for seven years longer, during which no decisive action took place. In 1363 the young comte de Montfort attained his majority, and did homage for the duchy of Bretagne to his powerful protector the king of England. In 1363 Charles de Blois and Jean de Montfort signed a treaty by which Bretagne was to be divided into two parts, having Rennes and Nantes for their respective capitals; but the reproaches of his wife, Jeanne of Penthievre, who told him that she had married him to defend her inheritance, not to yield up half of it, determined Charles to break it. The following year witnessed the decisive battle of Aurai, in which Montfort, Chandos, and Olivier de Clisson overthrew the army of Charles de Blois, though he was aided by the bravery and skill of the celebrated Bertrand du Guesclin. Charles de Blois himself fell in the action, and the treaty of Guerande in 1365 secured the duchy of Bretagne to the house of Montfort.

Although Jean de Montfort (Jean IV.) had no competitor for the duchy, his possession of it was neither quiet nor uninterrupted. His own violent disposition precluded repose. The course pointed out to him by the gratitude due to England for past services and his present duty of fidelity to France was neutrality; but the duke went beyond this; he formed an alliance with the English, which necessarily drew down upon him the hostility of France, while his liberality to the English individually disgusted the barons, and the admission of English garrisons alienated the towns of his duchy. He quarrelled with Clisson, who soon after left his service for that of the French king. A French army under Du Guesclin, now constable of France, himself a Breton, entered Bretagne in 1370, and the duke abandoned by his subjects was obliged to take refuge in England. In 1373 he returned, but not finding any support again retired to England. The duchy was declared to be confiscated; but a violation of the independence of the Bretons, and an attempt to establish the 'gabelle,' or salt-tax, caused the recall of the duke in 1380, and after a disturbed reign, in which his quarrel with Olivier de Clisson forms a prominent feature, Jean de Montfort died in 1399.

Jean V., son of the late duke, came to the duchy a minor. He had been married while yet a child to a daughter of the French king, Charles VI., and upon attaining his majority was involved in that perplexed scene of disturbance which marked the reign of the unhappy maniac. Though frequently changing sides in the unhappy contests which followed, he preserved Bretagne from war until the year 1425-26, when it was partly ravaged by the Duke of Bedford, regent of France for the English party, who was enraged at Jean for having deserted the English interest for that of the Dauphin. In 1430 he was ensnared and taken prisoner by the Count of Penthievre and his brothers, princes of the house of Blois, grandsons of that Clisson who had himself been entrapped in a similar manner by the late duke. Jean obtained however his release, and the event led in its consequences to the ruin of the house of Blois. In the year 1442 Jean V. died.

Jean V. was succeeded by his son, François I., and he by Pierre II. and Artur III., whose histories present few points of interest. Pierre II. held the duchy from 1450 to 1457; Artur III. from 1457 to 1458.

The first part of the long ducal reign of François II. (1458-1488) coincided with the reign of the astute Louis XI., whose desire of repressing the enormous power of the great feudal nobles led him into frequent disputes and contests. In 1465 François entered into the confederacy of the nobles against the king, known by the title of 'The League of the Public Good.' The Bretons were too slow in their movements to take part in the battle of Montlhéry, but they assisted in the blockade of Paris and took Pontoise and Evreux. In 1486 François allied himself with Maximilian, king of the Romans, who had married the heiress (since dead) of the late Duke of Burgogne; with the king and queen of Navarre; the dukes of Lorraine, Orléans (heir presumptive to the throne of France, and afterwards Louis XII.), Foix, and others, for mutual protection and support against the court of France, which was now directed by Anne, lady of Beaujeu, daughter of Louis XI., and guardian of her young brother the king Charles VIII. This led in 1487 to the invasion of Bretagne by the French. Henry VII. of England, who had in his adversity resided for some time in Bretagne, did not interfere in time: the occasion seemed favourable for annexing Bretagne to France, the king of which country laid claim to the duchy by virtue of the rights of the house of Blois, which Louis XI. had long since purchased. Nantes was attacked; but the invaders were repulsed. In 1488 a battle was fought at St-Aubin de Cornier between the French army under La Tremouille and the Bretons and their allies, English, Germans, Gascons, and Spaniards: the latter were defeated with loss, and the Duke of Orléans was taken prisoner on the field. A treaty was however agreed upon, and François died just after its conclusion, the 7th or 9th of September, 1488.

Anne, daughter of the late duke, succeeded to the duchy. Her situation was embarrassing and painful. The Maréchal de Rienx, her guardian, and other powerful persons at the court wished her to marry the Sire d'Albret, a Gascon noble to whom she was exceedinglyaverse. Some English and Spanish auxiliaries arrived to defend her against the hostile designs of France, but she feared that the English would make themselves masters of her person and compel her to marry the Sire d'Albret. To put an end to these intrigues and annoyances, she gave her hand to the Archduke Maximilian, to whom she was married by proxy in 1489. The French wished to dissolve the marriage, which indeed was never consummated; and in the year 1490 hostilities recommenced between France and Bretagne. The duchess was besieged in Rennes, and reduced to the necessity of negotiating. During the negotiations a proposal was made on the part of the French, listened to by the Breton leaders, and finally carried into effect, that the duchess and the young king of France, Charles VIII., should reconcile their discordant claims by marrying. This marriage took place in 1491; and by the terms of it the rights of whichever party died first were to go to the survivor in default of lawful issue. The duchess was bound also, if she survived, to marry only the future king of France or the heir presumptive, so that the final union of the duchy with the crown was apparently secured.

In 1498 Charles VIII. died without children; and in 1499, nine months after his decease, Anne married his successor, Louis XII. The articles of marriage between Anne and the new king were designed to separate the crown of France from the ducal coronet of Bretagne, by providing that the latter should descend to the second son, or in default of a second son to a daughter, so as to give to the province a sovereign of its own. The duchess Anne died in 1514, aged 51 years. Her daughter Claude was married a few months after to the Duke d'Angoulême, heir presumptive to the French throne, which he ascended upon the death of Louis XII. in 1515 under the title of François I.; and shortly afterwards Claude ceded to her husband her rights over Bretagne during her lifetime. It was not however till several years after her death, which was in 1524, that Bretagne was formally united to France: this union took place in 1532.

From this time the history of Bretagne ceases to possess any importance. It became completely a province of France, and the traces of its separate existence (except always the prevalence of the Breton language), which diminished during the monarchy, have been quite obliterated in the new arrangements induced by the French revolution.

(Daru, *Histoire de Bretagne*.)

BRETON, CAPE. [CAPE BRETON.]

BREWOD. [STAFFORDSHIRE.]

BRIANÇON, the capital of an arrondissement in the department of Hautes-Alpes, in France, the seat of a tribunal of first instance and of a college, is situated on a round-topped eminence at a little distance west of the Col de Genève, and at the junction of the Guisanne and the Clarée (which here unite and form the Durance), 37 miles N.E. from Gap, and has a population of 3433, including the whole commune. The town which stands 4384 feet above the level of the sea, consists chiefly of one steep street tolerably well built and traversed by a brook; in the centre is a square space in which the market is held. The rest of the town is ill built and dismal looking. One of the most remarkable houses is one of three stories, which is still called the Temple from its having been a Protestant chapel; it bears the date 1574. As a town Briançon is a poor place, but as a fortress it ranks very high, commanding as it does one of the great passes over the Alps. The

fortifications include a triple line of ramparts and seven forts, built on rocky heights of different elevations above the town and the fires of which cross each other. The summit of the eminence on which the town stands is crowned by fort Vieux. Several redoubts and lunettes command the road to Italy; but on the opposite bank of the Clarée is the most important part of the fortifications which communicate with the town by a bridge of a single arch 127 feet in span and 179 feet above the surface of the river. A zigzag road leads from the bridge to the several forts which command all the approaches to the town and communicate with each other also by subterranean galleries cut in the solid rock; all the forts and defences of the town are commanded by the lunette called Point-du-Jour, which occupies the highest ground between the two rivers. Briancón is the principal arsenal, magazine, and dépôt for the French Alps. The erections connected with the fortifications give the town a very imposing and picturesque appearance from the valley of the Durance. Besides these, vast barracks and a handsome church built on a terrace on the outskirts of the town and surmounted by two handsome towers are conspicuous objects. There are many pretty country houses in the neighbourhood of Briancón, one of which situated at the foot of the inclined plane that leads up to the town is surrounded by finely improved grounds, adorned with waterfalls and streams derived from the river Cèrvières which joins the Durance below Briancón. Nails, scythes, hosiery, hemp-hackles, cotton-yarn, crayons, leather, copper wire, &c., are made in the town, which trades in these articles, and in lead-ore, mules, sheep, turpentine, manna (gathered from the larch), lavender-water, and simples collected on the Alps.

Briancón occupies the site of the ancient *Brigantium*, which was 6 Roman miles from Alpis Cottia (Mont Genève), and was connected by a road through Grenoble with Vienne on the Rhône, and by another road through Embrun with Gap.

BRIANSK. [OUEL.]

BRIARE. [LOMET.]

BRIAVELLES, ST. [GLOUCESTERSHIRE.]

BRIDGE, Kent, a village, and the seat of a Poor-Law Union, in the parish of Bridge, hundred of Bridge and Petham, and lath of St. Augustine, is situated on the right bank of the Lesser Stour, near an old bridge over that river, in 51° 15' N. lat., 1° 7' E. long.; 3 miles S.E. from Canterbury, and 58 miles E.S.E. from London by rail. The population of the parish of Bridge, including 234 persons in the Bridge Union workhouse, in 1851 was 864. The living is a vicarage in the archdeaconry and diocese of Canterbury. Bridge Poor-Law Union contains 22 parishes and townships, with an area of 39,771 acres, and a population in 1851 of 11,151. This place, which is of some antiquity, is termed in old deeds Brigge. Besides the parish church there is a chapel for Wesleyan Methodists. There are two schools in the parish. The South-Eastern railway brings this district of country within easy reach of the metropolis. In the neighbourhood are many gentlemen's seats.

BRIDGEND, Glamorganshire, a market town, and, in conjunction with Cowbridge, the seat of a Poor-Law Union, in the parishes of Coyty and Newcastle and hundred of Newcastle, is situated on both banks of the river Ogmore, in 51° 30' N. lat., 3° 34' W. long.; distant 7 miles W. by N. from Cowbridge, 18 miles W. by N. from Cardiff, 181 miles W. from London by road, and 100½ miles by the Great Western and South Wales railways. The population of the parish of Coyty in 1851 was 2301; that of the parish of Newcastle was 1536; the population of the town of Bridgend is not given separately but probably amounted to about 3000. The living of Coyty is a rectory, held with the curacy of Nolton, in which the greater part of the town stands, in the archdeaconry and diocese of Llandaff. Bridgend and Cowbridge Poor-Law Union contains 52 parishes and townships, with a population in 1851 of 23,369.

Bridgend is called in Welsh Pen-y-Bont-ar-Ogwr. The town is divided by the river Ogmore, or Ogwr, into two unequal parts: the lesser portion, which is on the right bank, is in the parish of Newcastle; the other part, on the left bank, which is called Oldenale, is in the parish of Coyty. Two bridges cross the Ogmore here, the more modern one being that over which the turnpike-road passes. The parish church of Newcastle, St. Illtyd's, stands in an elevated position surmounting the steep bank of the Ogmore at a height of about 100 feet. The church has been recently rebuilt in the gothic style. There is a chapel-of-ease to Coyty parish in Bridgend, and another called Nolton Chapel. Three Dissenting chapels are in the town. There are a National and a Wesleyan school.

The sanitary condition of the district is attended to by a Local Board of Health. The general appearance of the town is picturesque. In the main street are several new buildings and handsome shops. The market-place, built by the Earl of Dunraven, is well planned and executed, neatly paved, and kept in excellent order. Behind the market are well-built public slaughter-houses. A county hall has been recently built. The town is lighted with gas. Bridgend possesses a mechanics institute and a savings bank. A county court is held in the town. The chief support of Bridgend arises from its position as a market-town, placed between a mineral and an agricultural population. The market day is Saturday. A fair is held on Holy Thursday for

cattle, sheep, and hogs, and another on November 17th. The South Wales railway now open to Swansea passes near Bridgend. A railway for coals, 4½ miles in length, connects Bridgend with the Llynir Valley mineral line. About three miles from the town is a quarry of mountain limestone. The river Ogmore is much resorted to for salmon fishing; also for the Sewin trout and the gwyniad, a fish which abounds in this river. About two miles from Bridgend stands Coyty Castle, an extensive ruin.

BRIDGENORTH, Shropshire, a municipal and parliamentary borough and market-town, and the seat of a Poor-Law Union, is situated on the river Severn, in 52° 33' N. lat., 2° 26' W. long., 20 miles S.E. by E. from Shrewsbury, and 138 miles N.W. by W. from London. The town lies on both sides of the Severn, which are connected by a bridge of six arches. The larger portion of the town is on the right bank, built on a red-sandstone rock, which rises 60 feet from the bed of the river. The borough is governed by 4 aldermen and 12 councillors, one of whom is mayor; and returns two members to the Imperial Parliament. The population of the municipal borough in 1851 was 6172; that of the parliamentary borough was 7610. The livings of St. Mary and St. Leonard are perpetual curacies in the archdeaconry of Salop and diocese of Hereford. Bridgenorth Poor-Law Union contains 29 parishes and townships, with an area of 67,882 acres, and a population in 1851 of 15,608.

Bridgenorth, anciently Briges or Brug, is stated to be of Saxon origin. The first known charter is one of the 16th year of King John. The borough has sent members to Parliament since the 23rd year of Edward I. Bridgenorth Castle is historically interesting. When by whom it was built is uncertain; but in 1102 Robert de Belesme, earl of Shrewsbury, rebuilt the castle and strengthened the town, and defended it unsuccessfully against Henry I. on behalf of his elder brother Robert, duke of Normandy. In 1157 Henry II. besieged Bridgenorth, when, it is said, his life was saved by a knight who stepped forward and received in his own person an arrow aimed at the king. In the civil wars the inhabitants espoused the Royalist cause, and held out for three weeks against the Parliamentary force. A large part of the town, including the church of St. Leonard, was on that occasion burned to the ground.

Besides the parish churches, the National school in the lower town is licensed for divine service. There are also places of worship for Baptists, Independents, and Irvingites. Bridgenorth has a Free Grammar school founded in 1503. It has an income from endowment of about 500*l.* a year, and had 36 scholars in 1852. Connected with the school are three exhibitions to Christ's College, Oxford. The school is free to sons of resident burgesses. There are also a Blue-Coat school for educating, clothing, and apprenticing 30 boys; a National and an Infant school, common to both parishes; and a National school in the lower town, erected in 1847. A society for the diffusion of religious and useful knowledge; a mechanics institute; a savings bank; a dispensary; and a combined infirmary and dispensary, erected in 1836, are the chief public institutions in the town. A library, bequeathed for the use of the clergy in the town and neighbourhood by the Rev. Hugh Stackhouse, contains many old and valuable books. There is also a public subscription library. Bridgenorth possesses a considerable number of charities; amongst others an almshouse for 12 of the widows or unmarried daughters of burgesses, and an hospital for 10 widows belonging to the upper town.

The situation of Bridgenorth renders it airy and salubrious. The prospect from the top of the hill is delightful. There is a curious walk made from the high part of the town to the bridge, being hewn to the depth of twenty feet through the rock; the descent is great, but it is made easy by steps and rails. A public walk on the grove above the lower town forms a beautiful walk, although now little frequented. The town is lighted with gas. There are three carpet manufactories and two large mills for the spinning of worsted. A large portion of the labouring class find employment in the navigation of the Severn, but the principal sources of profit to the inhabitants are the market, held weekly on Saturday, and the retail trade with the neighbourhood. There are five annual fairs—on the Thursday before Shrove Tuesday, May 1st, June 20th, August 2nd, and October 29th (the last continuing for three days), for cattle, sheep, butter, cheese, bacon, &c. There is a jail at Bridgenorth, built in 1825. The inhabitants to the east of Bridgenorth are less connected with the town than those on the west. They are separated from it by a tract of hilly but fertile country, and their chief market is Wolverhampton.

BRIDGETOWN. [BARBADOS.]

BRIDGEWATER, Somerset, a market-town, municipal and parliamentary borough, and the seat of a Poor-Law Union, in the parish of Bridgewater and hundred of North Petherton, is situated on the banks of the river Parret, in 51° 7' N. lat., 3° 11' W. long., 33 miles S.W. by S. from Bristol, 139 miles W. by S. from London by road, and 15½ miles by the Great Western railway. The borough is governed by 4 aldermen and 18 councillors, one of whom is mayor and returns two members to the Imperial Parliament. The population of the municipal and parliamentary boroughs, which are co-extensive, was 10,317 in 1851. The living is a vicarage in the archdeaconry of Taunton and diocese of Exeter. Bridgewater Poor-Law Union

contains 40 parishes and townships, with an area of 85,539 acres, and a population in 1851 of 33,477.

Bridgewater is mentioned in Domesday Book under the name of Brugie. William de Briwere, to whom Henry II. had granted the manor, built a castle of considerable strength at Bridgewater, and obtained from King John for the town a market and a fair; he also founded the hospital of St. John, consisting of a master, brethren, and 13 poor persons of the order of St. Augustine. This hospital had very large possessions. In the west part of the town was a priory of Minorites, or Gray Friars, dedicated to St. Francis. There was also in Leland's time an hospital for lepers. The founder of St. John's hospital commenced a stone bridge of three arches over the river Parret; this was completed in the reign of Edward I. by Sir Thomas Trivet.

Bridgewater was one of the towns that were taken by the barons during their revolt against King Henry III. In the civil wars it stood out a long time for the king. In July, 1645, Colonel Wyndham, the governor, was compelled to surrender, when the castle was dismantled: the only remains of it now existing are the sally-port and some small detached portions of the walls. The inhabitants of Bridgewater supported the claims to the throne of the Duke of Monmouth, who was proclaimed king by the mayor and corporation.

The parish church, dedicated to St. Mary, is a handsome structure, consisting of a nave, chancel, transepts, two side aisles and a tower, surmounted with a lofty spire. It has recently been restored. There is also a chapel-of-ease in the parish dedicated to the Holy Trinity. There are places of worship in Bridgewater for Independents, Baptists, Methodists, Quakers, and Unitarians. King James's Free Grammar school, founded in 1561, has an income from endowment of about 13*l.* a year. It is free to none: 6 boys of the borough pay 2*s.* a quarter. The number of scholars in 1852 was about 30. In 1723 Dr. John Morgan founded and largely endowed a school for the education of the sons of decayed tradesmen resident within the borough. A spacious school-room and a house for the master were erected in 1816. The number of scholars is about 150, of whom 30 are clothed on the foundation. A school was founded and endowed by Mr. Edward Tuckwell for the clothing, educating, and apprenticing the children and grandchildren of certain of his relatives. The management is in the hands of trustees. Various other sums have been left for the instruction of poor children. There are almshouses and an infirmary.

The elective franchise was conferred on Bridgewater by Edward I. in the 23rd year of his reign, since which time it has returned two members to Parliament. Its first charter was granted by King John, June 26th, 1200, and twelve other charters were granted to it between that time and 1683. The town is pleasantly situated, about nine miles from the sea, in a level but well-wooded country; to the north-east are the Polden and Mendip hills, and on the west the Quantock hills. The river Parret, over which there is a handsome iron bridge, divides the town into two parts. The principal part of the town is on the left bank of the river. The streets, although rather irregular, are of good width and paved; the houses are generally well built: the town is lighted with gas. The town-hall is a good building. The jail is convenient in its internal arrangements. The market-house is a rather handsome structure, surmounted with a dome and lantern. Eastover, that part of the town which is on the right bank of the river Parret, has greatly increased since the formation of the Bristol and Exeter railway, the station of which is in Eastover. It possesses a very handsome church dedicated to St. John the Evangelist.

The river Parret is navigable as far as Bridgewater for vessels of 700 tons, but it is subject, like some other rivers in the Bristol channel, to a rise of nearly six fathoms at spring-tides. The flow of the tide is preceded by a head-water commonly termed the 'bore,' which often produces much inconvenience among the shipping. The principal imports to Bridgewater are grain, coals, tallow, and timber. Coals are imported from Wales, and conveyed into the interior of the county by means of the river Parret and a canal. The Parret is navigable as far as Langport; the canal runs to Taunton, and thence into Devonshire. The foreign trade is principally with Russia, the United States, Canada, Newfoundland, and the West Indies. The number of vessels belonging to the port as registered on December 31st, 1852, was under 50 tons burden, 54 vessels, tonnage, 2021; above 50 tons, 68 vessels, tonnage, 10,148; with 2 steam-vessels, 31 tons. The number and tonnage of vessels entered and cleared at the port of Bridgewater during the year 1852 were as follows:—Const-wise, inwards, 2682 vessels, 126,958 tons; outwards, 1170 vessels, 47,722 tons. In the colonial and foreign trade there entered 58 vessels of 9365 tons, and cleared 15 vessels of 3046 tons.

A manufacture peculiar to and constituting the staple trade of Bridgewater, is the fabrication of that kind of white brick known as Bath brick: this branch of industry gives employment to many of the inhabitants. There are markets on Tuesday, Thursday, and Saturday; that on Thursday being the principal market for provisions, and especially for cheese, for which the neighbourhood is celebrated. Fairs are held on the first Monday in Lent, July 24th, October 2nd, and December 27th. The fair on October 2nd, called St. Matthew's Fair, which is held by royal charter, was formerly the mart of Somersetshire and the adjoining counties, and is still of considerable importance. Bridgewater possesses a savings bank. A

county court is held in the town. Petty sessions are held weekly for the borough, and monthly for the county. The July quarter sessions are held in Bridgewater, and the summer assizes are held here alternately with Wells. Bridgewater was the birthplace of Admiral Blake, who received his education at the Grammar school in the town.

BRIDGEWATER. [VAN DIEMEN'S LAND.]

BRIDLINGTON, formerly written BRILLINGTON, but now commonly pronounced 'Burlington,' East Riding of Yorkshire, a port and market-town in the parish of Bridlington and wapentake of Dickering, is situated in 54° 5' N. lat., 0° 12' W. long., distant 40 miles E. by N. from York, 206 miles N. from London by road, and 204 miles by the Great Northern (via Boston and Hull) and North Midland railways. The population of the town of Bridlington with Bridlington Quay was 2482 in 1851. The living is a perpetual curacy in the archdeaconry of the East Riding and diocese of York. Bridlington Poor-Law Union contains 32 parishes and townships, with an area of 63,410 acres, and a population in 1851 of 14,201.

The town is about a mile from the east coast. At this place the surface which farther north is hilly, subsides into a flat, which extends along the coast to Spurn and thence to Hull, and comprises the whole of the fertile alluvial tract called Holderness.

Bridlington is considered by some authorities to have been the site of a Roman station—Gabrautovicorum. Flamborough Head is thought by some good antiquaries to be the Oculum Promontorium; though the received opinion is that Spurn Head better agrees with its position. The road to York called the York road, appears to have been a British road, perhaps improved by the Romans. The remains which determine the exact sites of inland towns inhabited by the Romans, have here been long swept away by the encroachments of the sea. After the invasions of the Danes, and after the Saxons had established themselves in Britain, the north portion of the country was the last subdued; nor was this effected until the landing at Flamborough of Ida, in 547. A series of parallel intrenchments intersect the Wolds from east to west, and near the extremity of the Wolds shorter lines occur in different directions. Tradition attributes them to the Danes; and this locality was undoubtedly their stronghold for nearly three centuries. Several engagements were fought here between the Danes and the Saxons and Normans. The Dunes-tower, near Flamborough, is plainly of Norman architecture. Great numbers of tumuli are spread over the Wolds, some in groups, others detached. The group called 'Danes'-graves' comprises at present about 200 burrows. The detached tumuli extend down to Flamborough Head. Some of them have been found to contain merely skeletons, others bronze and iron weapons, and a few British urns. Specimens of these urns, now in the possession of a gentleman at Bridlington, were evidently formed by hand, and baked. In July 1834 a tumulus was opened at Cris Thorpe, near Filey, a description of which was published by Mr. Williamson. The coffin was of oak, and of the rudest shape and structure, the interior having been hollowed out apparently with chisels and hatchets of flint. The body within the coffin was enveloped in a strong skin. No pottery was found. Flint heads of arrows, and of a javelin, pins of horn, bone, and wood, and the fragments of a horn-ring, were among the contents of the coffin; in addition to which was a spear-head of brass or some other composition of metal. The body is considered to have been about 6 feet 3 inches in height, and its muscular attachments are very strong. The coffin and its contents are placed in the Scarborough Museum. At the foot of the Wolds large Saxon burrows occur. In 1824 a party of gentlemen caused some ground in a field called Tuff-Hill, at Kilham, to be opened, when half-burned bones, pieces of urns, &c. were found intermingled with the light sandy earth. In a sand-pit

below the surface; many ornaments of brass, clasps, hooks, rings, and buckles were found in different parts, as well as a large number of amber and glass-beads which lay about the neck. The legs of the skeleton were crossed. Near Rudston, five miles from Bridlington, about six years back, a large tessellated pavement was discovered by a ploughman. The design is said to have differed from those of Roman pavements. The tesserae were formed of the chalk-stones of the neighbourhood, and were put together with considerable skill. An account of the Beacons will be found in Poulson's 'History of Holderness'; the sites of nearly all those referred to in Queen Elizabeth's 'Letter to the Justices,' may be traced to this day: they are supposed to be coeval with the Danish invasion. The derivation of the names of many of the villages, as well as the common dialect of the inhabitants, is evidently from the Saxon.

After the Norman Conquest the manor of Bridlington formed part of the extensive possessions of Earl Morcar. To Walter de Gant, son of a nephew of the Conqueror, to whom the manor had been granted, Bridlington owes its priory, the most distinguishing feature in its early history. When completed, probably in 1114, it was peopled with canons regular of the order of St. Augustine. The estates of the priory were of immense extent, and included not only lands in its vicinity but also in many other parts of Yorkshire and in Lincolnshire; and they were largely added to by subsequent benefactors. Henry I. granted to the prior civil jurisdiction over the manor and town. John granted them an annual fair and a weekly market.

The monastery existed four centuries: when it was dissolved its revenues amounted to 650*l.* per annum, a very large income at that day. In 1539 it was demolished, and the manor and rectory became the property of the king, by whom they were granted on lease to various individuals. In 1643, during the contest between Charles and his parliament, Bridlington became the scene of temporary hostilities on occasion of the queen landing here with a supply of arms, under the convoy of Admiral Van Tromp. Admiral Batten, whose squadron had been stationed to intercept the queen, cannonaded the town for some hours, but was warned off by the ebbing tide, which would have left him in shoal water. The celebrated Paul Jones with four ships engaged and captured two ships, the convoy of the Baltic fleet, in Bridlington Bay, on September 21st, 1779. Jones reached the Texel in safety with his prizes.

The priory church is the chief feature in Bridlington. The nave and an arched gateway leading to it are the only parts now left of the once spacious monastery. The west front has had two towers, of which the lower stories only remain. This front still retains a great degree of architectural magnificence, and is in the style of the beautiful collegiate church of Beverley. "The grand western entrance is an exquisite specimen of the architecture of Henry VII.'s time; excepting however the north-western tower, which belongs to a much earlier period. The style of the north-western tower is early English, as is also the whole of the north side of the church. The west window is 55 feet in height from its base to the crown of the arch, and 27 feet in breadth. The head is filled with good perpendicular tracery. . . . The north porch is also a truly splendid specimen of architecture. . . . The length of the present church in the interior is 185 feet; and the distance of the farthest pillar from the east wall of the church, whose foundation has been taken up, 152 feet; so that the ancient church seems to have been nearly of the same length as Beverley minster, about 333 feet; its breadth is 68 feet, and height about 60 feet." ('An Historical and Architectural Description of the Priory Church of Bridlington,' by the Rev. Marmaduke Prickett.) Attention has recently been directed to the restoration of this church. The work has been carried on under the superintendence of the archdeacon of the East Riding and a committee of clergymen and laymen connected with the district. The great west window has been elaborately restored by Mr. Wallis of Newcastle. The Wesleyan and Primitive Methodists, Baptists, and Independents have places of worship in Bridlington. A building which was formerly a Quakers' meeting-house, is now used as a temperance-hall. There are in Bridlington an Endowed school, founded in 1636 for the instruction of 20 boys, the children of poor parishioners; another school, founded and endowed in 1781, "for maintaining and educating the poorer children of Bridlington and Key in the art of carding, knitting, and spinning of wooll," in which 12 children are instructed; National and Infant schools; also about 20 day and boarding-schools. The town possesses two public subscription libraries, a small museum, and a mechanics institute.

The streets of Bridlington are narrow and irregularly built, and the appearance is that of an old town; but the town has been much improved within the last twenty years. The streets are lighted with gas. The town-hall is over the priory gateway; the corn-exchange is in the market-place. The trade of Bridlington is chiefly in corn. Soap-boiling and bone-grinding for the purpose of manure, give employment to some of the inhabitants. The retail business with the surrounding agricultural districts, and the resort of visitors to Bridlington Quay during the bathing season, are now the principal sources of the prosperity of the town. The imports are chiefly coals from Sunderland and Newcastle, timber from America and the Baltic, and general merchandise from London and Hull. Two fairs are held annually in a large open area between the priory-gate, called also the 'Bayle Gate,' and the church. This area, which is called 'the Green,' was the close of the priory.

BRIDLINGTON QUAY, East Riding of Yorkshire, a small modern town in the parish of Bridlington and wapentake of Pickering, is situated on the sea-coast, in the recess of Bridlington Bay, in 54° 4' N. lat., 0° 10' W. long., and about one mile from the town of BRIDLINGTON. The population of the town of Bridlington Quay in 1841 was 1852; in the Census returns of 1851 the population is included with that of Bridlington town. The living is a perpetual curacy in the archdeaconry of the East Riding and diocese of York.

This place is much frequented during the bathing season; it has increased rapidly within the last ten years. The principal street, which runs directly to the harbour, is very wide. The town is lighted with gas. Two substantial stone piers inclose the harbour. There is good anchorage in the bay, particularly when the wind is unfavourable for coasting-vessels proceeding northward round Flamborough Head. A new church in the early English style was erected about 1842. The Wesleyan and Primitive Methodists have places of worship. There are National schools for boys and girls, a commodious Infant school, and a day-school conducted by Wesleyan Methodists.

A fine view of Flamborough Head and Bridlington Bay is obtained from the piers. The beach has a fine hard sand, which affords a good walk at low water. There are warm and cold sea-water baths. At a short distance there is a chalybeate spring of reputed efficacy, resembling

the waters of Scarborough and Cheltenham, but not so purgative. An ebbing and flowing spring, which was discovered in 1811, furnishes an abundant supply of water of remarkable purity. This spring, being below high water mark, is covered by the sea every tide. The fossils of the chalk-cliffs near Bridlington are numerous and well known. A few years ago a head of the great extinct elk with branching horns measuring 11 feet from tip to tip, was found in the lacustrine deposit in this vicinity.

BRIDPORT, Dorsetshire, a port, borough, and market-town, and the seat of a Poor-Law Union, in the Bridport division of the county, is situated in a vale above the confluence of two branches of the river Brit, or Bride, in 50° 44' N. lat., 2° 4' W. long.; 15 miles W. by N. from Dorchester, 134 miles W.S.W. from London by road. Dorchester, the nearest railway station, is 141 miles from London by the South-Western railway. The population of the municipal borough, which is co-extensive with the parliamentary borough of Bridport, was 7566 in 1851. The town is governed by 6 aldermen and 18 councillors, one of whom is mayor; and returns two members to the Imperial Parliament. The living is a rectory in the archdeaconry of Dorset and diocese of Salisbury. Bridport Poor-Law Union contains 19 parishes and townships, with an area of 31,731 acres, and a population in 1851 of 16,860.

At the period of the Domesday Survey, Bridport contained 120 houses, and possessed a mint for the coining of silver. The first charter was granted to the town in the 37th of Henry III. The town has sent members to Parliament since the 23rd of Edward VI. A market and three fairs were granted in the 36th of Queen Elizabeth. The prosperity of the town of Bridport is dependent upon the harbour, which is at the mouth of the river Brit, at the distance of a mile and a half from the town. The sand accumulates so rapidly in the harbour that much trouble and expense have been required to fit it to receive vessels of any considerable burden. From the commencement of the 14th century down to the present time much has been done to improve the harbour. It is now safe and commodious, and can accommodate vessels of 250 tons burden; the trade of the port has in consequence rapidly increased. The number and tonnage of vessels registered as belonging to Bridport on 31st December, 1852, were—under 50 tons, 2 vessels, 73 tons; above 50 tons, 14 vessels, 1774 tons. The number and tonnage of vessels that entered and cleared at the port of Bridport during the year 1852 were as follows:—Coastwise, inwards, 198 vessels, 13,723 tons; outwards, 87 vessels, 3717 tons; colonial and foreign, inwards, 37 vessels, 3143 tons; outwards, 34 vessels, 1751 tons.

Bridport had a considerable coasting trade in coal and grain, but it has been almost entirely lost in consequence of the superior facilities for transmission of goods afforded by railways. Hemp, flax, tallow, timber, and wheat are imported from Russia and the Baltic; and timber from Norway and America. Wines, spirits, skins, coals, oil, and slates are also imported. The exports consist chiefly of the manufactures of the town, and of cheese and butter for which the neighbourhood is celebrated. The manufactures of Bridport are principally of twine, shoe-thread, cordage, sailcloth, and fishing nets. The antiquity of the hemp trade in Bridport long since dignified a halter with the name of a 'Bridport dagger.' Ship-building is carried on to some extent.

The parish church is an ancient cruciform edifice, chiefly of the perpendicular style. The Independents, Baptists, Unitarians, Wesleyan Methodists, Quakers, and Roman Catholics have places of worship. There are National and Infant schools; a savings bank; a mechanics institution with reading room and lecture room; almshouses for 27 persons; besides several charities. The town consists chiefly of three spacious and airy streets; the main street forming a portion of the old mail road from London to Exeter. The streets are well paved and lighted with gas. The sewerage is good. The town-hall, erected in 1786, in the centre of the town, is built of brick, faced with Portland stone. The markets are held on Wednesday and Saturday. Fairs for cattle, sheep, cheese, and pedlery, are held on April 6th, Holy Thursday, and October 11th. A county court, a court of sessions, court of record, and court leet are held in the town.

BRIE, a district in France comprehended partly in Champagne, and partly in the Ile-de-France, extended from the banks of the Seine toward the north-east nearly 70 miles; and its greatest breadth at right angles to the length was about 65 miles. It was formerly divided into Brie Françoise, chief towns Brie-Compte-Robert, and Montereau; Brie Champenoise divided into Upper Brie, capital Meaux, and Lower Brie, chief town Provins; and Brie Pouilleuse, chief towns Château-Thierry and La-Fère-en-Tardenois. Brie Pouilleuse was afterwards incorporated with Brie Champenoise.

Brie had anciently its own feudal lords, who bore the title of counts of Meaux; but Herbert of Vermandois, count of Meaux or of Brie, having become count of Troyes or Champagne in the 10th century, united the two countries. Brie ever afterwards followed the fate of Champagne. The territory is now divided between the departments of Aisne, Aube, Marne, Seine-et-Marne, and Seine-et-Oise.

BRIEG. [SILEZIA, PRUSSIAN.]

BRIEL (sometimes called *Brille* and *the Brill*), a seaport town on the northern side of the Island of Voom in the Dutch province of South Holland, is situated near the mouth of the Maas, in 51° 54' N. lat.,

4° 9' E. long. The confederates, having been driven from the Nether lands by the Duke of Alba, equipped a fleet in England in 1572, and entered the harbour of Briel, which surrendered to them, and thus became the earliest seat of Dutch independence. In 1585 the town was given up to Elizabeth, queen of England, as security for advances made by her to the States of Holland, and it continued garrisoned by English soldiers until 1616, when it was restored. Briel is well built and strongly fortified. The harbour is commodious, and capable of containing 300 vessels. The inhabitants number about 5000; the men are principally occupied as fishermen and pilots. Briel was the birth-place of the admirals Van Tromp and De Witt. The town is 12 miles W. from Rotterdam.

BRIENNE-LE-CHÂTEAU. [AUBE.]

BRIENZ, LAKE. [BERN.]

BRIEUC, ST.- (or St.-Brieux), an episcopal city in France, capital of the department of Côtes-du-Nord, the seat of tribunals of first instance and of commerce, of a chamber of commerce, an agricultural society, a school of hydrography, communal college, and a diocesan seminary, is situated on the Gouet near its mouth, in the Bay of St.-Brieuc, a part of the English Channel, 278 miles W. from Paris, in 48° 30' 53" N. lat., 2° 45' 41" W. long.; and has about 13,000 inhabitants.

This city owes its origin to a monastery built in the 5th century by St. Brieuc, an Irishman: it has given title to a bishop since A.D. 844. It is built near the little river Gouet, over which is a handsome granite bridge, and in a bottom surrounded by hills sufficiently high to intercept the view of the sea, although so near. The Gouet is navigable, and at its mouth is the village of Legué, with a tide-harbour which forms the port of the town, and is almost joined to it by buildings. St.-Brieuc is a neat town, tolerably well laid out and built for an old town, with streets sufficiently wide, and neat squares. The ramparts were demolished in 1788 and their site converted into a promenade, which is planted with lime-trees, and terminates in a terrace, whence there is a view of the Channel on one side and the Bay of St.-Brieux on the other.

The entrance of the Gouet was formerly defended by the tower or fort of Cesson, which was demolished in 1598 by order of Henri IV.: from its ruins, which crown a high cliff nearly 300 feet above the sea, there are fine views of the coast. At the foot of the cliffs there is a strand of considerable extent, covered with firm level sand at low-water, which serves (in the beginning of July) as a race-course for horses from the five departments formed out of the Armorica peninsula. The cathedral of St.-Brieuc is a structure of various dates: part of it is as old as the 11th century; the nave was rebuilt in the 18th century. It has two fine rose-windows. In the south transept is the chapel of St.-Sacrament, which is adorned with several wooden statues of good workmanship, representing the Annunciation. There are several specimens of good wood-carving in the interior. The building is surmounted by two low and ugly towers, one of which supports a high wooden spire. The church of St.-Michel has a hideous exterior, resembling a large barn; but the interior is handsome and has an imposing effect. The town has seven public fountains and two bridges.

Among the manufactures of St.-Brieuc may be enumerated linen, serge, woollen stuffs, cotton and linen yarn, leather, paper, gilt buttons and beer. It is engaged also by means of the port of Legué in the coasting trade, in the Newfoundland cod-fishery, and in ship-building. Corn, flax, hemp, pulse, butter, honey, and cattle are the principal exports. St.-Brieuc has a public library containing 24,000 volumes, a theatre and a fine hospital. The see of St.-Brieuc includes the department of the Côtes-du-Nord. The bishop is a suffragan of the archbishop of Tours.

For a long time after its foundation St.-Brieuc was an open town, often taken and plundered by the Northmen, who however were conquered under its walls, in 937, by the Bretons under Alain Barbe-Torte. The town was taken and pillaged by the Constable de Clisson during the war against Duke Jean. On this occasion the duke had fortified the cathedral, which the constable took and made his headquarters. The Chouans entered St.-Brieuc in 1799, but were driven out by the inhabitants.

BRIGHTON, or as it was formerly ordinarily written, and is still written in most legal documents, BRIGHTHELMSTONE, Sussex, a parliamentary borough, market-town, and watering-place, and forming of itself a Poor-Law Union, in the hundred of Whalesbone and rape of Lewes, is situated in 50° 49' N. lat., 0° 8' W. long., distant 52 miles S. from London by road, and 50½ miles by the Brighton and South Coast railway. The town occupies the entire breadth from east to west of the parish of Brighton, and extends west into the parish of Hove. The barracks and a few detached houses north of the town are in the parish of Preston. The population of the parliamentary borough of Brighton, which includes the parishes of Brighton and Hove, was 69,673 in 1851. The town of Brighton comprises an area of 1980 acres. The government is vested in a constable and a body of commissioners, 112 in number, elected by the 20/ householders under an Act of Parliament for regulating, paving, improving, and managing the town. The parliamentary borough was constituted by the Reform Act; it returns two members to the Imperial Parliament. The living of St. Nicholas, the parish church of Brighton, is a vicarage

held with the rectory of West Blachington, in the archdeaconry of Lewes and diocese of Chichester.

Brighton stands near the centre of the curved line of coast of which the east and west points are respectively Beachy Head and Selsea Bill. The town is built on a slope, and is defended from the north winds by the high land of the South Downs, which from Beachy Head as far as the central part of Brighton press close on the sea and form high chalk cliffs. From the central part of Brighton westward the hills recede farther from the sea, leaving a level coast. Thus the town of Brighton in the eastern part presents a high cliff to the sea, and in the western part a low sloping beach. The town has not increased towards the north so much as along the coast; but it has run up the depressions in the chalk, along which the London and Lewes roads respectively are formed. The entire sea frontage of the parish of Brighton, a space of nearly three miles in length, is occupied with a range of superior houses. The population of the town has increased with astonishing rapidity during the present century: in 1801 it was 7339; in 1811, 12,012; in 1821, 24,429; in 1831, 40,634; in 1841 it was 46,661; and in 1851 it was 65,509. The number of residents during the summer occasionally amounts to 80,000. The place is rapidly increasing.

The origin of Brighton is uncertain. Roman coins have been dug up in the vicinity. At the Conquest the lordship of the manor was included in the possessions of Harold, and was given by the Conqueror to his son-in-law, William de Warren. About this time some Flemings are supposed to have established themselves here for the purpose of fishing. From the exposed nature of the coast the town has occasionally suffered from hostile invasion. It was plundered and burned by the French in the early part of the 16th century. During the reigns of Henry VIII. and Elizabeth fortifications were erected to protect the town. Brighton has frequently suffered from storms and the encroachments of the sea, by which the cliffs have been undermined, and at different times many houses have been destroyed. Wooden groins have been formed which run from the cliff to low water mark, within which the loose shingle is deposited; the shingle in this part of the channel is always driven eastward. A sea wall has been built along the eastern cliff, extending from the pier to Kemp Town. This wall is 60 feet high, 23 feet thick at the base, tapering to the top to a thickness of 3 feet: its construction cost the town upwards of 100,000/. Two centuries ago the town was situated 'under the cliff,' or on the tract of beach now covered by the sea, on which stands the chain pier. Twenty-two houses were destroyed in 1665, leaving still under the cliffs 113 tenements: the whole were swept away in hurricanes which occurred in 1703 and 1705, and by irruptions of the sea. In the year 1818, while some labourers were making excavations in Ship Street and Middle Street, the walls of one of the engulfed streets, named South Street, were discovered 15 feet below the surface of the beach. About the middle of the 18th century attention was directed to Brighton as a suitable watering-place, chiefly by Dr. Richard Russell, an intelligent medical man, whose work on the use of sea-water excited considerable interest. The place was rendered a fashionable resort by George IV., then Prince of Wales, who first visited Brighton in 1782, and for many years in succession made it his residence during the summer and autumn. In 1784 the foundation of the Marino Pavilion was laid. This royal palace may be regarded as the nucleus of modern Brighton. Its exterior appearance is rather fantastic than graceful, presenting an assemblage of domes, minarets, and pinnacles. The Pavilion has been purchased and fitted up by the corporation of Brighton as a place of recreation for the inhabitants and visitors. The grounds attached, which occupy upwards of 7 acres, are appropriated as pleasure-grounds for the use of the public.

Adjoining the Pavilion is a large open space termed the Steyne. Prior to 1793 this was a piece of common land used by the fishermen for repairing their boats and drying their nets. It is now inclosed with railings, planted with trees, intersected with roads, and rendered an ornament to the town. It is surrounded by excellent houses. On the north side is a bronze statue of George IV. by Chantrey; and on the south side is the Victoria Fountain, 32 feet high, erected by subscription in 1846. The rapid increase of Brighton caused the want of a suitable landing-place to be strongly felt. A company was accordingly formed for the erection of a suspension or chain pier, which was begun in October, 1822, under the direction of Captain Brown, and opened in November of the following year. The cost of erection was 30,000/. It is composed of four spans or chain bridges, each 255 feet in length, and at the end on a framework of strong oaken piles is a platform paved with blocks of granite. The main chains, which are eight in number, are carried over pyramidal cast-iron towers 25 feet high, which rest on clusters of piles. The entire length of the pier is 1136 feet, the breadth of the platform being 13 feet. This structure was seriously damaged in heavy gales in October, 1833, and November, 1836. The pier has since been considerably strengthened, and is now in a state of thorough repair.

On the east side of the parish of Brighton is Kemp Town, a magnificent assemblage of private houses erected on the estate of Mr. Kemp. When first built some years ago it was quite detached from the town, but is now united with it. On the west side of the town, in the parish of Hove, are several handsome squares and terraces. The

Marine Parade extends about a mile along the cliff from the Steyne to Kemp Town, and along the whole distance is a broad terrace on the margin of the cliff, which at this place attains a considerable height. Many fine houses are situated on this range, which forms an agreeable and convenient promenade. In clear weather the prospect from the cliff is very extensive; the Isle of Wight, 40 miles distant, may occasionally be discerned from it. The battery in the western quarter of the town consists of six pieces of heavy ordnance, 42-pounders. It was erected in 1793, and rebuilt in 1830. On the eastern side of the town is the Queen's Park, which is planted with trees, and affords opportunities of healthful exercise and recreation to the inhabitants of Brighton. A chalybeate spring in the parish of Hove has considerable celebrity.

The parish church, an ancient edifice dedicated to St. Nicholas, stands on Church Hill. At the west end is a square tower surmounted with a small spire, and containing a peal of eight bells. St. Peter's church, on the north level, near the entrance to the town by the London road, is a handsome structure of the perpendicular style, erected in 1827 by Barry. In addition to these there are 11 churches and chapels belonging to the Established Church in Brighton, besides the parish church and St. Andrew's chapel in the parish of Hove. The Dissenters have upwards of 20 chapels, including 5 Independent, 5 Baptist, 1 English Presbyterian, 3 Wesleyan and Primitive Methodists, 1 Roman Catholic, 1 Unitarian, and various other chapels. Some of the Dissenting chapels are handsome edifices. There is also a Jews' synagogue.

The Central National school was erected in 1830, and was subsequently enlarged to accommodate 650 pupils. The cost of the erection was 4500*l*. Besides this school there are numerous National, British, and Infant schools, of which a British and Infant school and a School of Industry are supported by the Society of Friends. The Union Charity schools, founded in 1805 by Edward Goff, Esq., are under the management of Dissenters. There are also two Rugged schools, and a School for educating and clothing the indigent Blind. Brighton is a favourite place of education for the children of the more opulent classes. There are upwards of 100 boarding-schools in the town, besides a large number of day-schools. St. Mary's Hall, Kemp Town, is an institution founded for educating the daughters of poor clergymen, and preparing them for governesses; it has been established about 20 years: each pupil pays 20*l*. per annum. There is also a Training school for school-mistresses, in which there were 17 pupils in 1851.

The Brighton College, a proprietary school, founded in 1847, is intended to provide on moderate terms a sound religious, classical, and general education of the highest order. The college, a handsome building in the Tudor-collegiate style, was erected in 1849. The literary societies include the Royal Brighton Scientific and Literary Institution, the Brighton Athenæum, and the Brighton Working Men's Institute.

The benevolent institutions of Brighton are numerous. Among these may be named the Sussex County Hospital, established in 1828; the Victoria wing was added to the building in 1839 and the Adelaide wing in 1841; it is on a large scale, and 'open to the sick and lame poor of every county and nation'; the Brighton Dispensary, founded in 1809, for administering advice and medicine gratuitously to the sick poor, and for promoting vaccination; the Provident and Self-supporting Dispensary, for the labouring classes; a Doreas Society; a Lying-in Institution; the Dollar Society, for the benefit of persons especially the aged, who have experienced great reverses in their circumstances; a Society for the relief of distressed Widows; an Asylum for Female Orphans; an Infirmary for Diseases of the Eye; an Asylum for the Blind; an Institution for the Deaf and Dumb; a Homoeopathic Dispensary; several Loan and Provident societies for the benefit of persons of limited incomes, and a savings bank.

The town-hall of Brighton is a large but inelegant building of a so-called classic character, with three double porticoes. It contains rooms for public meetings, for the meetings of magistrates, town commissioners, police officers, &c.; it has also a spacious market room. In the Justice room the Sussex county court sits two days in each month. The building was commenced in 1830, on the site of the old market, nearly in the centre of the town, and cost upwards of 50,000*l*. Its dimensions are 144 feet by 113 feet. The new market-place, which is commodious, is in the same locality. The market is well supplied with poultry, meat, fish, and vegetables, and is open daily, an Act for a daily market having been obtained in 1773. A corn-market is held in the town on Thursday. A fish-market is held by the fishermen on the open beach. Fairs are held north of the town on Holy Thursday and September 4th. Brighton is well lighted with gas. The supply of water is good. Among the places of amusement are a theatre, an assembly room, and two club-houses. At some of the public rooms as well as on the promenade music is provided during the bathing season. About a mile east of the town, on a beautiful part of the Downs, races take place annually, about the beginning of August. Regattas and other aquatic sports are occasionally given. In addition to the bathing-machines on the beach, baths, shampooing establishments, and other places for the accommodation of invalids and other visitors are abundantly provided. The hotels are numerous, and some of them on a scale of great magnitude and splendour.

The trade of Brighton is confined almost wholly to the supply of the wants of a wealthy population. Almost the only manufacture of the place is that of Tunbridge ware. Shoreham, about 7 miles west from Brighton, and Newhaven, about 9 miles to the eastward, are the ports through which the foreign and coast trade of Brighton is conducted. The coast off Brighton is too dangerous to allow of much direct trade with the town. Fishing is carried on somewhat extensively: the fisheries giving employment to upwards of 100 boats and about 500 men. Mackerel, herrings, soles, brill, and turbot are taken in large numbers; mullet, whitinga, and other fish are also caught. The principal feature of the traffic of Brighton in more recent years has been the construction and operations of the three branches of the Brighton and South Coast railway, which have their common centre in the town, namely, the main line northward to London, the branch westward to Portsmouth, and that eastward to Hastings. The central station in Brighton in the north-west part of the town is a handsome and convenient building. Previous to the opening of the railway there were 32 coaches passing daily in each direction between London and Brighton. There is now not one. The greatly increased facility of communication by railway between Brighton and the metropolis has caused a considerable demand for house accommodation, to meet which building is extensively carried on. The Downs and the country generally in the vicinity of Brighton afford a great number of fine drives and walks.

Upon the erection of the chain pier, Brighton became a packet-station, and was much used by those who preferred going and returning from Paris by way of Dieppe and Rouen, instead of the old route of Dover and Calais. The opening of the South-Eastern line of railway introduced a rival and more ready communication with Paris by way of Folkestone and Boulogne; and more recently Newhaven, since the construction of a branch railway to it, has obtained a share of the Brighton and Paris traffic.

BRIGHTON. [VAN DIEMEN'S LAND.]

BRIGNOLES. [VAR.]

BRINDISI, the Roman *Brundisium* or *Deuxulonium*, and the Greek *Brentesio*, a town in the province of Terra d'Otranto in the kingdom of the Two Sicilies, well known in Roman history for its spacious and safe harbour, which was the chief port of embarkation from Italy to Greece, is situated on the Adriatic Sea, 200 miles E. by S. from Naples, 44 miles E. by N. from Taranto, in 40° 38' N. lat., 15° E. long. and has 6500 inhabitants. The origin of Brundisium is lost in the obscurity of the ante-Roman times. Tradition spoke of a Cretan colony having early settled here; and it certainly existed as a *Micropium* or Sallentine city before the settlement of Greek colonies in this part of Italy. It appears to have retained its independence after that event, and it never received a Greek colony. It was one of the chief towns of the Messapian peninsula, and of that part of it called Calabria by several ancient geographers. The Brundisians and the other Messapians were often at variance with the Greek colony of Tarentum before the Romans extended their conquests into Apulia. After the war of Pyrrhus and the subjugation of Tarentum, the Romans, under the consuls M. Attilius Regulus and Lucius Jun. Libo, turned their arms against the other towns of Messapia, and seized Brundisium among the rest, about B.C. 267. It was made a Roman colony in B.C. 244, and from this time it rose rapidly to wealth and prosperity, partly owing to the fertility of its territory but still more to its excellent commercial situation. Its double harbour, the inner part of which forms two horns half encircling the town, was the chief naval station of the Romans in the Adriatic. Hannibal failed in his attempt to seize Brundisium, and it was one of the eighteen colonies which voted men and money to assist Rome in continuing the war. The Roman generals and the armies during the wars with Macedonia, Greece, and Asia, almost invariably sailed from Brundisium, and here likewise they landed on returning home. When the provinces east of the Adriatic were thoroughly subjugated by the Romans, Brundisium became a great commercial thoroughfare, and soon rose to be one of the most flourishing towns of South Italy.

Brundisium in consequence of its position witnessed many remarkable historical events. Sulla, on his return from the Mithridatic War in B.C. 83, landed at Brundisium, which he exempted from all taxation in reward for his friendly reception in the port and town at this critical period of his life. In B.C. 57, Cicero landed at Brundisium on his return from exile. Pompey having left Rome at the beginning of the civil war, repaired to Brundisium, where he was besieged by Caesar, who endeavoured to prevent his escape by blocking up the inner harbour by means of two piers which he raised, one on each side of the entrance. Before however he could accomplish his object, Pompey embarked his troops in secrecy and sailed away for Greece. To these two piers raised by Caesar the beginning of the deterioration of the inner port has been attributed. It was at Brundisium that Octavius assumed the name of Caesar. In B.C. 40 it was besieged by Antony and Allenobarbus, but its fall was averted by a reconciliation between Antony and Octavius. Soon after Antony again threatened it with a fleet of 300 sail, when Mæcenus and Cocceius succeeded in once more making an arrangement between the two triumvirs. The representatives of Octavius were accompanied by the poet Horace, who has immortalised his journey to Brundisium (*Sat.* i. v.). Virgil died at Brundisium B.C. 19, on his return from Greece; and

here at a later period Agrippina landed with the ashes of her husband Germanicus.

The port of Brundisium consisted of an outer and an inner harbour united by a very narrow channel. The outer harbour was in a great degree sheltered by some *ialeta*, one of which, Barra (now Isola di St. Andrea), was occupied by a Pharosot lighthouse. At the south-western end of the roadstead a narrow channel led to the inner harbour, which was completely landlocked, deep enough for the largest ships, and formed by two arms of the sea which as mentioned above extended in the shape of two horns round three sides of the town.

The calamities which befell Brindisi after the fall of the Roman empire, when it was taken and retaken by the northern barbarians, the Greeks, and the Saracens, contributed to the deterioration of the bar by preventing the inhabitants from attending to its repair.

The Normans finally wrested Brundisium from the Greek empire, and the city witnessed the marriage of Tancred's son Roger with the Princess Irene. Under the Normans the city was the chief port of embarkation for the Crusaders: when these expeditions ceased it sunk into insignificance as a naval port. The town was sacked by Louis of Hungary in 1348, and soon after by Louis, duke of Anjou. In 1456 an earthquake destroyed the greatest part of the town: from this disaster the town never recovered.

Frederick II. built a castle for the defence of the town, which was repaired and extended by Charles V. Under the Angevins the inner harbour was already become a stagnant pool separated from the sea by an isthmus or bar (the slow work of centuries) which blocked up the channel between the inner and outer harbours. Other marshes formed themselves in the neighbourhood; and the air of the town, which had in ancient times been unwholesome in autumn, became seriously affected. A cut was made across the isthmus, and the seawater being thus let in, and the other marshes at the same time partially dried up, the air of Brindisi evidently improved. The depth of the channel however is not more than about eight feet, and vessels are obliged to remain in the roads, in which there is good anchorage partly protected by an island having a castle upon it called Forte di Maro. New works have been undertaken since 1830 to keep the channel of communication clear and to cleanse the inner harbour of the mass of sea-weeds which accumulate very fast, and by their decay corrupt the atmosphere. These recent works have brought to light many of the piles driven by Cæsar.

Coin of Brundisium. Copper. Brit. Mus.

The present town of Brindisi occupies but a small part of the site of the ancient city. It is surrounded on the land side by walls and ditches, and has a castle flanked by enormous round towers, and called Forte di Terra, which commands the northern arm of the inner harbour. Outside the town and not far from the castle is a fountain said to be of Roman construction, with a niche on each side, from which flow two rills of very good water, probably the fountain mentioned by Pliny, from which the ships were supplied. The water in the town is brackish. The town is ill built and looks miserable, and the air is still unwholesome in summer. The inhabitants carry on some trade by sea: part of the oil of Puglia is shipped off at Brindisi. The principal object of antiquity is a pillar about 50 feet high, which forms a conspicuous object. Another, which stood near it, has been removed to Lecce, and the pedestal alone remains; they were probably designed for fire-beacons. The cathedral is a large but not handsome building of the Norman times, with a mosaic pavement: it bears many marks of the effects of earthquakes. Frederick II. was married to his second wife, Yolanda, in the cathedral in 1225.

Brindisi gives title to an archbishop. The harbour has been considerably improved since 1843, when a lighthouse was erected, which stands in 40° 39' 17" N. lat., 17° 58' 21" E. long. The town contains a public library, the gift of Monsignore de Leo, a native of Brindisi. The territory of Brindisi is distinguished now as in ancient times by its great fertility. The olive especially flourishes, and vast quantities of oil are made. Steamers to the Ionian Islands and Malta touch at Brindisi, which has been recently constituted an entrepôt for foreign goods, with bonding warehouses.

BRINTON, Norfolk, a village, and the seat of a Gilbert's Poor-Law Incorporation, in the parish of Brinton and hundred of Holt, is situated in 52° 53' N. lat., 1° 2' E. long., 28 miles N.N.W. from Norwich, and 118 miles N.N.E. from London. The population of the parish in 1851 was 190. The living is a rectory held with the rectory of Thynage in the archdeaconry and diocese of Norwich. Brinton, Melton-Constable, and Burgh Parva, form together a Davies Gilbert's Incorporation, which contained in 1851 a population of 296. Brinton is a small but pretty village. In the neighbourhood are two or three good mansions.

BRIONIC ISLES. These three islands lie on the north-east coast of the Adriatic, near the port of Tassano, and north of Pola, in the Austrian Circle of Trieste. They contain the quarries from which the Venetians obtained the ash-gray-coloured and highly durable marble of which their palaces are constructed. The largest of the islands is called Brioni; the names of the other two are Coseda and San Girolamo. They are situated in 45° 3' N. lat., 13° 53' E. long.

BRIOUDE. [LOIRE, HAUTE.]

BRISBANE. [WALES, NEW SOUTH.]

BRISTOL, a port, parliamentary and municipal borough, cathedral city, the seat of a Poor-Law Union, and a county in itself, is situated between the counties of Gloucester and Somerset. For many purposes it is considered to be in the county of Gloucester. It stands at the junction of the rivers Avon and Frome, in 51° 27' N. lat., 2° 38' W. long.; 88 miles S. by W. from Gloucester by railway, 108 miles W. from London by road, and 118 miles by the Great Western railway: the population of the municipal and parliamentary boroughs, which are co-extensive, was 137,328 in 1851. The borough is governed by a corporation consisting of 16 aldermen and 48 councillors, one of whom is mayor; and returns two members to the Imperial Parliament. For sanitary purposes the city is governed by a Local Board of Health. The livings of the city parishes are in the archdeaconry of Bristol and diocese of Gloucester and Bristol. Bristol Poor-Law Union, which is co-extensive with the city, contains 20 parishes, with an area of 1840 acres, and a population in 1851 of 65,716. Bedminster, which forms part of the borough, is also the seat of a Poor-Law Union comprising 23 parishes and townships, with an area of 52,939 acres, and a population in 1851 of 38,171.

Name and History.—The most ancient name of Bristol on record is *Cæsar Oder* (the City of the Gap, or chasm through which the Avon finds a passage to the sea), though the site of *Cæsar Oder* was probably the present Clifton. The name of Bristol has been spelled in nearly fifty different ways, chiefly variations however of the form *Bricestow*. Much diversity of opinion prevails as to the origin of the name, but it appears to be formed of two Saxon words, *Brieg*, a bridge, or *Brice*, a rupture, and *Stow*, a place; the form *Bricestow* would thus have a similar meaning to the *cæsar oder* of the Britons.

The Romans obtained early possession of Bristol; and in the time of Constantine, the time assumed by Mr. Seyer in his 'Memoirs of Bristol' for its foundation, they invested it with a wall and gates, which inclosed the area now occupied by the most central portions of the town. At the epoch of the invasion of Cerdic the Saxon, (A.D. 495), Bristol formed part of the dominions of the princes of Cornwall, whose jurisdiction extended over all Somersetshire and part of Gloucestershire. In 584 it was made a frontier city of the Saxon kingdom of Mercia. In 596 Jordan, the companion of Augustine, preached on the spot now called College Green, which subsequently became the site of the monastery built in honour of the chief missionary, and now of the cathedral church of Bristol. In the 11th century, Briceton, as it was called, was, from its convenience as a port, especially for embarkation to Ireland, used commonly for the purpose of exporting slaves; a practice which Wolstan, bishop of Worcester, denounced to the Conqueror, who by a royal edict forbade, though he failed utterly to extinguish, the inhuman traffic. To the early part of the Norman period the addition of the second wall around the town is ascribed.

The first historical notice of the castle occurs on the death of William I., when it was fortified and held by Godfrey on behalf of Robert, the Conqueror's eldest son, and appears to have been a place of considerable strength. At the time of preparing Domesday Book, Bristol was a walled town and a royal burgh. The local government of the city was vested in a prepositor or chief magistrate, who acted under the custos of the castle, the *caput honoris*. It does not appear that the prepositor was a salaried officer, although, as he was *de virtute officii* answerable to the king, his reasonable charges on that head were defrayed; but the town was charged with the maintenance of the castle. The prepositor at the accession of William I. was Hardyng, a wealthy merchant of the town, and the founder of the Berkeley family. He was continued in his office by the Conqueror, and was succeeded on his death in 1115 by Robert, commonly called Fitzharding, and first lord of Berkeley. The honour of Bristol was transferred from one possessor to another, according to the course of royal favour, till the reign of Stephen, in whose reign the castle was made one of the strongest fortresses in the kingdom; it covered six acres of ground, and had walls twenty-five feet thick. During this stormy period the prepositor of the town, Robert Fitzharding, was employing a portion of his wealth in erecting the abbey of St. Augustine, now the cathedral church, and in founding the priory of St. James, subsequently the parochial church of that name; and William of Malmesbury writes that the port was at that time "the resort of ships coming from Ireland, Norway, and other countries beyond sea." Henry II. on his accession (1154) resumed the royal jurisdiction over the towns, castles, &c., which belonged to the crown, by taking them into his own hands; but twenty years elapsed before he obtained possession of the castle of Bristol, when (1175) the earl surrendered it to the king. Bristol had thus evidently become a port of some note in the 11th century; and in the 12th century (1164 and 1190) charters were granted by Henry II. which placed Bristol in a most

favoured position among commercial towns. In the reign of Henry III., on occasion of a visit by that monarch to Bristol, the privilege of choosing a mayor and two prepositors was granted to the burgesses. The functions of the prepositors from henceforth were similar to those of bailiffs or sheriffs, into which offices their own subsequently lapsed; and upon the mayor devolved the duty of escheator to the king. The king frequently farmed out the revenues of the town to individuals at a yearly rent for a short lease. The trade of the port having outgrown the extent of the quay, which stretched along the then bank of the river, the burgesses resolved to cut a new course for the Avon. The ground necessary for the purpose was ceded to the mayor and commonalty by the abbot of St. Augustine's for the sum of 10 marks. In 1239 the work was commenced; it was completed about 1247. An extent of quay of about 2400 feet was thus obtained, and the channel of the river was dug 18 feet deep and 40 yards wide at a very heavy expense. About the same time Redcliff or Redcliffe, on the Somersetshire side of the Avon, was united to Bristol; a wall was made to embrace the united town; a stone bridge was built from one to the other, and both shared in forming the new harbour. Redcliff shortly became the seat of those manufactories which from the 13th to the 16th century almost entirely supplied England with cloth, glass, and soap. In the year 1213 it is recorded that Bristol-made soap was first sold in London.

During the unsettled state of the kingdom in the reign of Edward II., the town was for some time held by the citizens against the sovereign. The rebellion began in 1311; and the town held out for the space of four years, during which time it continued to exist, a little republic in the heart of a monarchy. The local government was carried on according to its ancient form, except that the burgesses held the authority of the castle at defiance, and, for their better security, built against it a strong wall with forts, traces of which of an immense thickness have been discovered in making excavations on its site in Dolphin Street, anciently, from this fact, termed Defence Lane. In 1332 the traffic of the port on which customs were levied comprised live stock, agricultural produce and fish, wine, wool, skins, linen cloths, and cloth of silk, 'Irish Galway cloths,' salt, ashes, honey, iron, lead, alum, brass, tallow, millstones, copper, leather, oil, and wood. Various charters and protections were from time to time awarded to Bristol; these sometimes referred to the woollen manufacture. In the 27th of Edward III. a wool staple was fixed at Bristol, and the 'cloth of Bristol' acquired a high reputation. In the 47th of the same reign Bristol was made a county in itself; the jurisdiction of the castle was confined to its own precincts, and the independence of the town from any feudal rights was established. The successive charters granted to Bristol were very numerous; three were granted during the reign of Richard II. By one granted in 1377 the townsmen are empowered to levy new duties on timber, coal, bark, flax, hemp, pitch, tar, wax, pepper, fruit, almonds, and chalk. As early as 1437 Bristol had extended its commerce along the whole west coast of England, to South Wales and Ireland, and to France and Russia. At that date it appears that the commercial shipping of Bristol comprised 66 'ships' and 64 'boats.' The exports comprised cloth, iron, glass, cutlery, honey, meath (mead), alum, pitch, wine, salt, fish, and cardus (corduroys). The imports were very much more numerous; among the most material were iron, Irish cloth, tin, skins of lambs, goats, calves, sheep, &c., hides in barrels, fish, salt, wine, oil, and fruit. These were the articles charged with customs or port dues; but the townsmen traded in numerous articles exempt from imposts, and not included in this list. In 1442 the commons ordered eight ships, having each 150 men, to keep the sea continually, of which number Bristol was directed to furnish two; and twelve years after, when a fleet was ordered for the protection of trade, London lent towards its fitting-out 300*l.* and Bristol 150*l.*

On the accession of Edward IV. to the crown, 1461, he came, in his progress through the western counties, to Bristol; and after some concession on the part of the townsmen, he confirmed to them all their former privileges. In their negotiations the townsmen were much aided by a wealthy merchant, William Canynges, of whom it is recorded by William of Worcester that he employed for the space of eight years 800 men, and every day 100 artificers. Among three persons, to whom the honour of founding Redcliff church has been ascribed, Canynges is one: the other two being his grandfather and Simon de Bourton. From a charter granted by Henry VII., we learn that the town then possessed a recorder, which officer and five others, to be chosen by the mayor and common council, were appointed aldermen, with powers equal to those exercised by the aldermen of London. The merchants of Bristol entered with spirit into the exploratory voyages of Sebastian Cabot, who was a native of the town. In the reign of Henry VIII., among the suppressed religious houses of the greatest note, were the monastery of St. Augustine, now the cathedral church, and the hospital of the Gaunts, now the mayor's chapel. Henry VIII. founded upon the ruins of the abbey lands a bishopric, the town having previously formed part of the diocese of Salisbury. In the year following, 1546, a mint and a printing-press were set up in the castle. Bristol contributed towards the fleet intended to oppose the Spanish Armada. In 1609 Newfoundland was colonised from Bristol. Bristol became early involved in the contest between Charles and the merchants respecting ship money. The city was held by the Parlia-

mentarians. The castle was demolished by order of the Parliament in 1656. In 1663 Charles II. visited Bristol. By an Act obtained in 1699 the corporation, for the better preservation of the river, extended their jurisdiction 4 miles along the course of the Avon inward above Bristol bridge. In 1793 Bristol was disturbed by riots having their origin in a circumstance of local interest: they are spoken of as the 'bridge riots.' A disturbance of a much more disastrous nature occurred in 1831, on the occasion of the visit of Sir Charles Wetherell to Bristol. He was recorder of the city; and his opinions, which were adverse to the Reform Bill gave origin to a commotion which ended in a serious riot. On October 29th a lawless mob set fire to the city prison, the Gloucester county prison, the mansion-house, and the bishop's palace; and during the ensuing night 45 more public buildings, and almost as many private houses were destroyed. On the following morning the military dispersed the mob after killing 12 persons, and wounding 96. The property destroyed was estimated at 200,000*l.*; and Bristol has ever since paid a rate of about 10,000*l.* a year, in liquidation of the losses.

Site, Aspect, Streets, &c.—The rivers Avon and Frome have their course through Bristol—the former being the larger river. The city is built at about eight miles' distance from the mouth of the Avon; its site is for the most part a thick bed of sand, which generally yields water at the depth of a few fathoms. Some portions of the city are built on ground so steep as to render the formation of carriage-roads almost impracticable. Kingsdown, St. Michael's Hill, and Brandon Hill, rise nearly 250 feet above the level of the river. There are seven eminences within the limits of Bristol, taking it in its greatest extent; and the streets are built on these eminences and in the hollows between them. Bristol is nearly ten miles in circumference. Several Acts of Parliament have been obtained during the last thirteen years, conferring the necessary powers for carrying out various public improvements in the city, by the formation of new streets, providing a sufficient supply of water, &c.

Public Buildings and Institutions.—There are about forty churches and chapels belonging to the Establishment in Bristol, Westminster, and Clifton; and about an equal number of places of worship belonging to Roman Catholics, Independents, Baptists, Wesleyan Methodists, Calvinistic Methodists, Quakers, Unitarians, and Jews. The church of St. Mary Redcliff has been long admired as a grand example of gothic architecture. It is supposed that this church was built at four different periods, ranging between 1200 and 1400. It is considered by many to be the finest parish church in England. The tower reaches to a height of about 200 feet. The north porch is a rich specimen of the decorated style, but had fallen considerably to decay, when in 1848 a subscription was commenced which led to the adoption of a plan for the entire restoration of the church. A society has since been established, under the name of the Canynges Society, to carry out the restorations as fast as funds can be provided, and to issue annual reports relating to the progress of the works.

The cathedral church, anciently part of the Abbey of St. Augustine, possesses one of the finest Norman gateways in the kingdom. The church contains fine monuments by Chantrey and Baily. St. Stephen's church was rebuilt about 1465, on the site of a much older edifice. Its chief ornament is the tower, 133 feet high, which is a fine example of the perpendicular style. The Temple church was founded in the reign of Stephen by the Knights Templars; but the date of the present structure is not known. The Temple Meads, being part of the lands belonging to the house of the Knights Templars, were exempt from tithes, and remain so to this day. All Saints, or All Hallows, was one of the most ancient churches in Bristol, but the present structure was erected about 1470. St. Augustine the Less was founded by the abbots of St. Augustine's Monastery as a chapel for the accommodation of the inhabitants who had erected houses within the precincts of the monastery: the present structure was built in 1480; it was improved in its interior arrangements in 1843. St. James's church was built and consecrated as early as 1130; the tower was added and the church made parochial in 1374. The nave and north aisles are parts of the original Norman structure. This church has recently undergone extensive restorations. The church of St. John the Baptist consists of but one aisle, and is the smallest in Bristol: it was built about the middle of the 14th century; considerable alterations have been recently made in this building. The Mayor's Chapel, formerly the collegiate church and hospital of the Virgin Mary and St. Mark, is a small but highly-embellished structure, with numerous effigies and monuments. The church of St. Philip and St. Jacob is supposed to have been erected some time before 1200; the venerable structure being much dilapidated was recently repaired. St. Thomas's church has a tower which was built in the 12th century. Bristol is thus particularly rich in old churches, nearly all of which have been more or less restored within the last few years, chiefly by means of private subscriptions. Several new churches have been built 1836. Of the three Roman Catholic chapels in the city, one opened in 1813 is a beautiful structure. Many of the chapels of Protestant Dissenters have been erected within the last few years. The Jews' synagogue was, previous to 1842, a Quakers' meeting-house.

The Free Grammar school was founded in 1532 by Robert Thorne. The endowment has recently undergone a Chancery investigation, the result of which was that in 1848 the school was reopened on a very

enlarged and superior system: it now contains nearly 300 boys. The College Grammar school was founded by King Henry VII., for educating the singing boys of the cathedral. Queen Elizabeth's Free Grammar school is a small endowed establishment under the control of the corporation. Queen Elizabeth's Hospital was founded in 1586 by John Carr, for boarding, clothing, and educating poor children and orphans of the city and of the manor of Congresbury. The estate has so greatly improved in value that the trustees have been enabled to increase the number of boys from 38 to 132, to enlarge the range of instruction, and to build a beautiful structure in lieu of the old one in Christmas Street. The new hospital was opened in 1847. It is situated on the western slope of Brandon Hill, on a site of four acres; and as there is an ascent of 48 steps up the slope of the hill to the building, the building itself is shown to great advantage. The hospital is nearly 400 feet in length, and is amply supplied with school-rooms, dormitories, lavatories, baths, wardrobe room, dining-hall, class-rooms, sick-rooms, kitchens, playgrounds, &c. Colston's Free school (at which Chatterton was educated), Temple Street school, the Red Maids' school, Elbridge's Charity school, St. Augustine's Clacity school, and the Pile Street school, are among the older public schools of Bristol. In the Red Maids' school 80 girls (clothed in red) were to be boarded and educated till the age of 18; the improved value of the estate has enabled the trustees to increase the number to 120, and to build a fine new school-house in the Elizabethan style, which has recently been opened.

Among the more modern schools of the city is the Bristol College, founded in 1830 by a proprietary body, on the plan of King's College, London: the college is in Park Street. The number of scholars in 1852 was 60. The Bristol Education school, the Clerical Education school, the Bristol Diocesan and Cathedral Middle Day school, the Merchants Hall school, the Marine school, the Blue-Coat Girls school, the Bristol Adult school, the Hammali More schools, and the Counterslip schools are among the numerous public schools of Bristol; to which must be added the National, British, Infant, and Ragged schools. The Baptist denomination has a college for the education of young men intended for the ministry. The college, which was founded in 1770, and has an endowment of 94*l.* a year, had 19 students in 1852.

The hospitals and miscellaneous charities of Bristol are very numerous. St. Peter's Hospital, a very old building, is appropriated for the relief of the sick poor. The Bristol Infirmary, in Marlborough Street, is a large structure, with sufficient space and funds to receive 200 in-patients. The Bristol Dispensary and the Clifton Dispensary, the Bristol General Hospital, the Lying-In Institution, the Eye Infirmary, and several Dorcas societies, assist in various ways the sick poor. The Asylum for the Blind, in Park Street; the Bristol Deaf and Dumb Institution, in Park Row; the Asylum for Orphan Girls; the Clergy Society and the Gloucestershire Society are among the numerous charitable institutions; to which may be added about 20 almshouses and minor charities.

The Bristol Institution, a handsome building erected in Park-street, opened in 1823, has a reading-room, a small library, and a museum, containing a very fine collection of ancient and modern works of art; among which are Baily's statue of Eve at the Fountain, and a complete set of casts from the *Egina* marbles. The museum also contains rich collections in natural history and mineralogy. The Bristol Library, the Bristol Law Library, and the Medical Library are the principal public libraries in the city; the first named, besides a large library, has a valuable museum of natural history. The Bristol Athenæum is a literary and scientific institution for the middle classes; its lectures are delivered at the Royal Albert Rooms. The Victoria Rooms form one of the best modern buildings in Bristol; the large hall is 117 feet long, 55 feet wide, and 47 feet high. The building is used for concerts, exhibitions, and meetings. There are in Bristol an assembly room, and a theatre.

Of the municipal buildings the Council-house was built in 1824 in the Italian style; over the principal entrance is a fine figure of Justice, by Baily. Annexed to the Council-house is a common hall for the daily administration of justice. The Bridewell Prison, in Bridewell Lane, was rebuilt after the riot in 1831. The jail, near Bathurst Basin, is a large and strong structure, finished in 1820. The Custom House and the Excise Office were both rebuilt after the riots. The Exchange, built about 1740, is a quadrangular edifice, 110 feet long by 148 feet in depth. The interior is now occupied chiefly as a corn-market, the merchants preferring to assemble in the Commercial Rooms. These rooms, opened in 1811, are situated in Carr Street, and form well arranged commercial and news-rooms. The Merchant Venturers' Hall, in King Street, belongs to a society, or company, incorporated by letters patent in the reign of Edward VI.; the society, which consists of the principal merchants, possesses large landed property. This is the only trading company remaining out of twenty-three which were in existence in Bristol a century ago; the halls belonging to those companies are now occupied as exhibition-rooms, warehouses, &c. The new Guildhall, in Broad Street, opened in 1846, is a very enriched specimen of the Tudor style, having a central tower and two wings. The central tower is loftier than the wings. The principal apartments of the building are; Law Court, 54 feet by 30 feet, and 24 feet high; Court of Bequests, 30 feet by 24 feet, and 13

feet high; two Courts of Bankruptcy, each 30 feet by 24 feet, and 14 feet high; and a Grand Jury Room, 33 feet by 15 feet, and 14 feet high. The architect was Mr. R. S. Pope, of Bristol.

Behind the exchange are the principal markets, designated the High Street and the Nicholas Street markets. In the former are three arcades for the sale of butter, cheese, poultry, eggs, and lard; there is also a handsome new market-house for meat and vegetables. The Nicholas Street market is for meat and poultry. Other markets are located in different parts of the city. At the markets held in the Leather Hall in March and September, more leather is said to be sold than at any other fair or market in the kingdom.

Docks, Commerce, Manufactures.—The docks were commenced in 1804, by a proprietary body, and were first opened in 1809. The old channel of the Avon was converted into one floating harbour, about three miles in length. The quays were made to extend from Bristol bridge to the small stone bridge across the Frome, where that river ceases to be navigable, and form three sides of a parallelogram, the eastern and southern being washed by the Avon, the western by the Frome. The total extent of quay is 2000 yards; but these limits admit of any extension along the banks of the harbour below the town which the increase of trade may require. There are two basins for the temporary accommodation of vessels entering or quitting the harbour. Cumberland Basin, at Rowham, principally used by large vessels, extends in length between the locks 275 yards, in extreme width 147 yards; it becomes smaller towards the mouth, and empties itself through two locks into the Avon. Bathurst Basin, east of Cumberland Basin, about 300 yards below the iron bridge at Red-minster, communicates with the Avon branch of the harbour, above its junction with the Frome, and empties itself into the river Avon through a single lock: it is used by the coasting-vessels, and is about 170 yards long, and of an average width of 80 yards. By the construction of the harbour, important facilities were afforded to the trade of the port. The actual cost of the docks exceeded 600,000*l.*; and the dividend has seldom exceeded 2 per cent. An Act was obtained in 1842 for improving the floating dock.

About 60 years ago Liverpool began to overtake Bristol in shipping and commerce. In 1786 the tonnage belonging to the port of Liverpool amounted to 49,541 tons, comprised in 465 vessels; the number of vessels belonging to the port of Bristol in 1787 was 360, with a burden of 56,909 tons. In the same year the entire trade of Bristol stood thus:—Foreign trade—British vessels in, 255, tonnage 38,502; out vessels 243, tonnage 37,542; foreign bottoms in, 69, tonnage 11,112; out 66, tonnage 37,542. Coasting trade—in vessels 1862, tonnage 66,200; out vessels 1632, tonnage 62,139: Irish vessels in, 161, tonnage 9623; out 139, tonnage 9187. The port charges of Bristol having been considerably in excess of the charges at the ports of London, Liverpool, Hull, and Gloucester, this circumstance tended to draw shipping away from Bristol to the other ports; and with a view to check the decline which had been gradually taking place in the commerce of Bristol, a new arrangement of the dock charges on a lower scale was adopted under the powers of an Act of Parliament obtained in 1848. By this Act the docks were transferred from the company to the corporation. Additional grounds belonging to the company were declared to be within the city of Bristol, in order to the better exercise of corporate privileges. The dock dues which formerly varied from 6*d.* to 3*s.* per ton, were reduced so as to range from 4*d.* to 1*s.* A borough assessment of 4*d.* in the pound is to make up the loss accruing from the change. On November 13th, 1848, a grand procession paraded through Bristol to commemorate this important alteration. It has been found that the arrivals and departures of shipping have considerably increased since the new system was adopted. The number and tonnage of vessels registered as belonging to the port of Bristol on December 31st, 1852, were:—Sailing vessels under 50 tons, 153, tonnage 4577; above 50 tons, 191, tonnage 46,407: Steam vessels, under 50 tons, 12, tonnage 304; above 50 tons, 19, tonnage 3743. During 1852 there entered and cleared at the port—in the coasting trade, sailing vessels, inwards, 550, tonnage 312,286; outwards, 3765, tonnage 238,377: steam vessels, inwards, 208, tonnage 65,471; outwards, 207, tonnage 65,486. In the colonial trade there were, inwards, 180 vessels, of 66,171 tons; and outwards, 107 vessels, of 37,131 tons. In the foreign trade the numbers were:—Sailing vessels, inwards, 450, tonnage 68,457; outwards, 155, tonnage 42,756: steam vessels, one inwards, 111 tons; and one outwards, 590 tons.

The foreign trade of Bristol principally consists in imports of sugar, rum, wine, brandy, colonial and Baltic timber, tallow, hemp, turpentine, barilla, dye-woods, fruits, wheat, and tea. The principal articles of export are iron, tin, bricks, refined sugar, glass bottles, Irish linen, and manufactured goods. Bristol derives a considerable portion of her supply of foreign produce coastwise under bond principally from London and Liverpool, but also from the minor ports of Gloucester, Newport, Bridgewater, Exeter, Barnstaple, and Bideford. The coasting trade of Bristol is very considerable, particularly with Ireland. The imports principally consist of iron, tin, coal, salt, Irish linens, and agricultural produce: the exports, of articles of foreign and colonial produce, particularly groceries, tea, wines, and spirits, and of the manufactures of the place. The existing manufactures of Bristol are glass bottles, crown and flint glass, brass-wire, pins, sheet-lead, zinc, spelter, chain-cables, anchors, machinery, drugs, colours, dyes, painted

floor-cloth, earthenware, refined sugar, starch, soap, British spirits, tin, copper and brass wares, bricks, beer, porter, pipes, tobacco, and hats. Most of these manufactures are carried on within the city or in its immediate neighbourhood. The principal factories are those for glass, sugar, iron, brass, floor-cloth, and earthenware. There was established about fifteen years back a very large joint-stock cotton factory, under the title of the Great Western Cotton-Works. It consists of an immense range of spinning, weaving, bleaching, and repaying shops.

The principal bridge is that connecting the centre of the town with the Redcliff side of the Avon; it is built of stone, and has three arches; the central arch is elliptical, with a span of 55 feet, the side arches are semicircular, each 40 feet in span. A swivel-bridge of iron, opened in 1827, in the place of the old drawbridge, crosses the harbour, connecting the parishes of Clifton and St. Augustine with the city; and two iron bridges, each with one arch of 100 feet span, cross the new course of the Avon, severally connecting the city with the Bath and Wells and Exeter roads. In 1838 an Act was obtained for constructing St. Philip's Bridge; and in 1842 a second Act empowered the widening of the bridge. For the suspension-bridge over the Avon, the original Act was obtained in 1831; several subsequent Acts have been obtained, permitting the postponement of the works, about 30,000*l.* more than the amount collected and expended being required to complete the undertaking. The Portbury Pier and Railway Company have a clause in their Act, enabling them to complete the bridge in conjunction with their railway; but the proceedings of the company are wholly suspended.

The connection of Bristol with other parts of England by means of the broad-gauge railways is efficient. The Great Western line extends through Bath and Reading to London; the Midland line to London and Birmingham to the north; and the Bristol and Exeter line to the south and west. The communication with Wales is partly by steamers, which pass down the Avon and cross the Bristol Channel at Newport, Cardiff, &c.; and partly by means of the Great Western Railway, to which a road of about eight miles leads from the city. The joint-station at Bristol is a large structure in the Tudor style. A small branch, about four miles long, leaves the Bristol and Exeter railway at Yatton, about twelve miles from Bristol, and runs to the east, on the bank of the Severn opposite Cardiff.

Hotwells, &c. The rocks in the immediate neighbourhood of the city are composed of carboniferous limestone, coal-measures, and the lower red-sandstone formation, with the dolomitic conglomerate. In the last formation there have been discovered some saurian remains, which form three new genera. The ranges of mountain limestone at St. Vincent's Rocks are remarkably fine; the coal-fields extend north and south of the city about twenty-eight miles, but the beds are thin as compared with those of the other coal districts of England. The rocks at Clifton supply a scarce spring; the temperature of which from the top is 74° Fahrenheit, and it then evolves free carbonic acid gas. It is principally celebrated for its beneficial influence in consumptive cases. The Hotwell House is situated beneath the rocks, looking on the river, along the banks of which a carriage road leads from the well round the rocks to Clifton Down; but a readier means of access to Clifton is furnished by an easy serpentine path, leading up the rocks from behind the Hotwell House. The scenery around Bristol, particularly the Clifton Hotwells, is very beautiful, and the botanical features of the country are highly interesting. Clifton has long been a favourite residence for wealthy persons. The hotels, restaurants, parks, assembly-rooms, libraries, &c., are such as are met with at most watering places. The portion of the Hotwells district nearest the city is becoming surrounded by commercial and shipping establishments; but higher up towards Clifton and St. Vincent's Rocks there are still left some fine walks and rides. There are not many open spots within the limits of Bristol; but the heights around the city afford numerous pleasant walks, such as more level towns are deficient in. The College Green, Brandon Hill, Tynall's Park, Cotham, and Clifton, are all open to the inhabitants. On Clifton Down are the Zoological Gardens, opened in 1836, to which a botanic garden is attached.

BRISTOL CHANNEL. [SEVERN.]

BRISTOL, U.S. [RHODE ISLAND.]

BRITAIN, GREAT. [GREAT BRITAIN.]

BRITAIN, NEW. [NEW BRITAIN.]

BRITANNIA, the name by which the Island of Great Britain is mentioned by the Latin writers. We propose in the present article to give a notice of its ancient inhabitants, with a very brief narrative of the Roman conquest and occupation of the country.

The earliest inhabitants of Britain, so far as we know, were probably of that great family the main branches of which, distinguished by the designation of Celts, spread themselves so widely over middle and western Europe. The Welsh and Danish traditions indicate a migration from Jutland; and the name of Cynry, given to the immigrant people, has been supposed to indicate their probable identity with the Cimmerians (the *Κιμῆριοι* of Herodotus, and the Cimbræ of the Roman historians), who, being expelled by the Scythians from their more ancient seats north of the Euxine, traversed Europe in a north-westerly direction, and founded new settlements near the Baltic

and the mouth of the Elbe. These barbarians then reached Britain by the same route which was afterwards traversed by the Saxons and Angles. The Celts crossed over from the neighbouring country of Gaul; and Welsh traditions speak of two colonies, one from the country since known as Gascony, and another from Armorica. At a later period the Belgæ, actuated by martial restlessness or the love of plunder, assailed the south and east coasts of the island and settled there, driving the Celts into the inland country. These Belgæ were a branch of the great Teutonic family.

Before the arrival of Julius Cæsar in Britain the island was but imperfectly known to the more civilised nations of the ancient world. The people of Carthage and Massilia (called Massalia by the Greeks) or Marseille, traded for tin with certain islands called by Herodotus *Κασσιτερίδες* (Cassiterides), the 'Tin Islands,' which are supposed by some to have been the British Isles, or at least Cornwall and the Scilly Isles.

The etymology of the word Britain has been much disputed. One of the most plausible is that which derives it from a Celtic word 'brith,' or 'brit,' (painted, daubed); in which name it is supposed there is a reference to the custom of the inhabitants of staining their bodies with a blue colour extracted from wood. Carte says that the name in the most ancient British poets is 'Iulis' (island) 'pyrlhain.' Whether this form or that of the Roman writers furnishes the best clue to the original form of the native designation is perhaps questionable. The meaning of 'pyrlhain,' if it be anything more than a corrupt form derived from the root 'brit,' does not seem to be known. It would be to little purpose to give other etymologies, or to enter further into a matter in which certainty is so little attainable.

Cæsar is the first writer by whom any authentic particulars respecting the island are given. Stimulated probably by the desire of military renown, and of the glory of first carrying the Roman arms into Britain—provoked also, as he tells us, by the aid which had been furnished to his enemies in Gaul, especially to the Veneti (the people of Vannes in Bretagne), and other maritime people of Western Gaul—he determined upon the invasion of the island. As a preliminary step he summoned to his camp a number of the merchants who traded to the island (who alone of the Gauls had any acquaintance with it), and to them he addressed his inquiries. Their caution, however, or their ignorance, prevented his learning much from them. Failing in this quarter, one of his officers, C. Volusenus, was sent to reconnoitre; but he did not venture to leave his ship, and trust himself on shore among the natives. Cæsar, no way deterred by this want of information, collected a fleet, and disposed his forces with a view to the descent.

The description which Cæsar gives of Britain in his 'Commentaries' is as follows:—

"The inland part of Britain is inhabited by those who, according to the existing tradition, were the aborigines of the island; the sea-coast by those who, for the sake of plunder or in order to make war, had crossed over from among the Belgæ, and in almost every case retain the names of their native states from which they emigrated to this island, in which they made war and settled, and began to till the land. The population is very great, and the buildings very numerous, closely resembling those of the Gauls: the quantity of cattle is considerable. For money they use copper, or rings of iron of a certain weight.* Tin (*plumbum album*) is produced there in the midland districts; and iron near the sea-coast, but the quantity of this is small; the copper which they use is imported. There is timber of every kind which is found in Gaul except beech and fir. They deem it unlawful to eat the hare, and the hen, and the goose; these animals however they breed for amusement. The country has a more temperate climate than Gaul, the cold being less intense.

"The island is of a triangular form, one side of the triangle being opposite Gaul. One of the angles of this side, which is in Cantium (Kent), to which nearly all vessels from Gaul come, looks towards the rising sun; the lower angle looks towards the south. This side extends about 500 miles. The next side looks towards Spain and the setting sun. On this side is Hibernia (Ireland), considered to be about half the size of Britain; but the passage across is of the same length as from Gaul into Britain. Midway in this passage is an island which is called Mona (Man); many smaller islands also are thought to lie in the passage, concerning which islands some have written that about the winter solstice they have night for thirty days together. We could not ascertain anything upon this point by inquiry; but we found, by using certain measure of water, that the nights were shorter than on the continent. The length of this side, according to the opinion of the natives, is about 700 miles. The third side fronts the north; there is no land opposite to this, but one angle of it extends very much in the direction of Germany: this side is thought to be 800 miles in length. So that the whole island is 2000 miles in circuit.†

* The copies here vary very much. We have followed the text of Gudendorp, as edited by Oberlin. Lipsiæ, 1805.

† This is a literal rendering of Cæsar's expression *inferior*, the meaning of which it is rather difficult to fix. He elsewhere states that the lower part of the island was the more westerly (Lib. iv. c. 28)—*inferiorem partem insule quæ est propius solis occasum*.

‡ The Roman mile was about twelve-thirteenths of the English mile. It is scarcely necessary to observe that Cæsar's description of the island is erroneous in several respects.

"Of all the natives, those who inhabit Cantium (Kent), a district the whole of which is near the coast, are by far the most civilised; and do not differ much in their customs from the Gauls. The inland people for the most part do not sow corn, but live on milk and flesh, and have their clothing of skins. All the Britons however stain themselves with woad (*se citro inficiunt*), which makes them of a blue tinge, and gives them a more fearful appearance in battle: they also wear their hair long, and shave every part of the body except the head and the upper lip. Every ten or twelve of them have their wives in common, especially brothers with brothers and parents with children; but if any children are born they are accounted the children of those by whom first each virgin was espoused." (lib. v. c. 12, 14.)

As to the religion of the Britons, Druidism flourished among them in all its vigour. Indeed this singular superstition was considered by the Gauls to have originated in Britain. The following is Cæsar's account of the Druids:—

"They are ministers of sacred things; they have the charge of sacrifices both public and private; they give directions for the ordinances of religious worship (*religionis interpretantur*). A great number of young men resort to them for the purpose of instruction in their system, and they are held in the highest reverence. For it is they who determine most disputes, whether of the affairs of the state or of individuals; and if any crime has been committed, if a man has been slain, if there is a contest concerning an inheritance or the boundaries of their lands, it is the Druids who settle the matter; they fix rewards and punishments. If any one, whether in an individual or public capacity, refuses to abide by their sentence, they forbid him to come to the sacrifices: this punishment is among them very severe; those on whom this interdict is laid are accounted among the unholy and accursed; all fly from them, and shun their approach and their conversation, lest they should be injured by their very touch; they are placed out of the pale of the law; and excluded from all offices of honour.

"Over all these Druids one presides, to whom they pay the highest regard of any among them. Upon his death, if there is any of the other Druids of superior worth, he succeeds; if there are more than one who have equal claims, a successor is appointed by the votes of the Druids; and the contest is sometimes decided by force of arms. These Druids hold a meeting at a certain time of the year in a consecrated spot in the country of the Carnutes (people in the neighbourhood of Chartres), which country is considered to be in the centre of all Gaul. Hither assemble all from every part who have a litigation, and submit themselves to their determination and sentence. The system of Druidism is thought to have been formed in Britain, and from thence carried over into Gaul; and now those who wish to be more accurately versed in it, for the most part go thither (that is, to Britain) in order to become acquainted with it.

"The Druids do not commonly engage in war, neither do they pay taxes like the rest of the community; they enjoy an exemption from military service and freedom from all other public burdens. Induced by these advantages, many come of their own accord to be trained up among them, and others are sent by their parents and connections. They are said in this course of instruction to learn by heart a number of verses, and some accordingly remain twenty years under tuition. Nor do the Druids think it right to commit their instructions to writing, although in most other things, in the accounts of the state and of individuals, the Greek characters are used. They appear to me to have adopted this course for two reasons—because they do not wish either that the knowledge of their system should be diffused among the people at large, or that their pupils, trusting to written characters, should become less careful about cultivating the memory; because in most cases it happens that men, from the security which written characters afford, become careless in acquiring and retaining knowledge. It is especially the object of the Druids to inculcate this—that souls do not perish, but after death pass into other bodies; and they consider that by this belief more than anything else men may be led to cast away the fear of death, and to become courageous. They discuss moreover many points concerning the heavenly bodies and their motion, the extent of the universe and the world, the nature of things, the influence and ability of the immortal gods; and they instruct the youth in these things.

"The whole nation of the Gauls is much addicted to religious observances, and on that account those who are attacked by any of the more serious diseases, and those who are involved in the dangers of warfare, either offer human sacrifices or make a vow that they will offer them, and they employ the Druids to officiate at these sacrifices; for they consider that the favour of the immortal gods cannot be conciliated unless the life of one man be offered up for that of another; they have also sacrifices of the same kind appointed on behalf of the state. Some have images of enormous size, the limbs of which they make of wicker-work and fill with living men, and setting them on fire, the men are destroyed by the flames. They consider that the torture of those who have been taken in the commission of theft or open robbery, or in any crime, is more agreeable to the immortal gods; but when there is not a sufficient number of criminals they scruple not to inflict this torture on the innocent.

"The chief deity whom they worship is Mercury; of him they have many images, and they consider him to be the inventor of all

arts, their guide in all their journeys, and that he has the greatest influence in the pursuit of wealth and the affairs of commerce. Next to him they worship Apollo and Mars, and Jupiter and Minerva; and nearly resemble other nations in their views respecting these—as that Apollo wards off diseases, that Minerva communicates the rudiments of manufactures and manual arts, that Jupiter is the ruler of the celestials, that Mars is the god of war. To Mars, when they have determined to engage in a pitched battle, they commonly devote whatever spoil they may take in the war. After the contest they slay all living creatures that are found among the spoil; the other things they gather into one spot. In many states, heaps raised of these things in consecrated places may be seen; nor does it often happen that any one is so unscrupulous as to conceal at home any part of the spoil, or to take it away when deposited: a very heavy punishment with torture is denounced against that crime.

"All the Gauls declare that they are descended from Father Dis (or Pluto), and this they say has been handed down by the Druids; for this reason they distinguish all spaces of time not by the number of days, but of nights; they so regulate their birth-days, and the beginning of the months and years, that the day shall come after the night." (Cæsar 'De Bell. Gall.' lib. vi. 13, 14, 16, 17, 18.)

Although in what relates to or is closely connected with the system of the Druids we have quoted that part of Cæsar's 'Commentaries' which has relation to Gaul, we have thought ourselves authorised in applying his description to Britain by his declaration that the system existed in its greatest vigour in that island. Of the account which he gives of the civil institutions of the Gauls we do not feel ourselves completely justified in making a similar application, although it is likely that in their political and social arrangements a considerable similarity existed between the two countries.

In the autumn of the year B.C. 55, Cæsar, embarking with the infantry of two legions (about 8000 to 10,000 men) at the Portus Itius (probably Witsand, between Calais and Boulogne), arrived with part of his fleet, after a passage of about ten hours, on the coast of Britain, and beheld the steep cliffs which skirted the shore covered with armed natives ready to dispute his landing. Proceeding about seven miles farther, he disembarked on the open and level beach which presented itself to him (26th of August). The place at which Cæsar first touched was near the South Foreland, and he landed somewhere on the flat shore which extends from Walmer Castle towards Sandwich. He did not make good his landing without a severe struggle. But the season was late, and Cæsar made apparently no progress in the island. Being anxious to return, he contented himself with requiring an increased number of hostages, whom he commanded to be brought to him on the continent, for which he immediately embarked.

In the next year (B.C. 54), Cæsar, embarking again at the Portus Itius, invaded the island with a much larger force. His fleet consisted of 800 vessels of all classes. He landed in the same place as on the former occasion, and, setting out about midnight in pursuit of the natives, found them drawn up on the bank of a river, the Stour, to oppose his further progress. His cavalry drove them into the woods in the rear of their position, and one of his legions (the 7th) stormed a stronghold, formed of timber, which had been formerly constructed probably in some domestic war. Intelligence that his fleet had been damaged by a storm obliged Cæsar to recall his troops from the pursuit of the enemy; and his return to the coast, to ascertain the extent of the damage and take measures for repairing it, delayed his operations for some days. Upon his return to his former post he found that the natives had augmented their forces from all parts, and had intrusted the command-in-chief to Cassivellaunus, a prince whose territories were divided from the maritime states by the river Thames or Thames, at a part which was 80 Roman miles, or about 74 English miles, from the Kentish coast. This prince had been engaged previously in incessant wars with his neighbours; but the common danger compelled them to forego their disputes, and it is likely that his talents for war pointed him out as the most suitable person for general. After some severe but unsuccessful struggles Cassivellaunus dismissed the greater part of his forces, detaining about 4000 charioteers, whose skill in the management of their chariots rendered them very formidable, and retired, as it appears, into his own dominions across the Thames. That river was fordable only in one place in the line of Cæsar's advance, and the natives had planted stakes sharpened at the point on the bank and in the bed of the river. Cæsar, crossing the river, put the enemy to flight; received the submission of several tribes, and took by storm the town of Cassivellaunus. These disasters, combined with the entire defeat of the princes of Cantium (Kent) in an attack upon the maritime camp which the Romans had formed to protect their fleet, induced Cassivellaunus to submit. The conqueror demanded hostages, fixed a tribute to be paid by the subject Britons, and returned to Gaul with his forces and a number of captives.

The line of Cæsar's march from the Stour to the Thames cannot be determined, nor is it clear at what place he crossed the Thames. He probably spent about two months in Britain in his second expedition. ('The British expeditions of C. Julius Cæsar,' by G. Long, in 'Classical Museum,' No. 13.)

The tribes with whom the Romans in Cæsar's expedition became acquainted were as follows: we give also their names as written by Ptolemæus, where they have been identified or where identity is

conjectured by antiquaries. The positions are those laid down or suggested in the map published by the Society for the Diffusion of Useful Knowledge, 'Ancient Britain,' part 1, with the exception of the Cassi, as to which tribe we give Camden's conjecture :—

Cæsar.	Ptolemæus.	Inhabitants of
People of Cantium	Καντιοι	Kent.
Trinobantes . . .	Τρινοβαντες	Essex.
Coninmagi	Σικενοι (?)	Iceni of Tacitus (?)
		Norfolk, Suffolk, Cambridge.
Segontiaci	not mentioned	parts of Hants and Berks.
Ancalites	Ανκαλιται (?)	parts of Berks and Wilts.
Bibroci	not mentioned	parts of Berks and adjacent counties.
Cassi		Cassio Hundred, Herts (!)

The Romans did not return to the island until the reign of Claudius, leaving the Britons alone for about a century. In the interval the Britons who dwelt in the parts nearest to Gaul appear to have made some progress in civilisation. They coined money, and many British coins have been discovered, of which about forty (note to (tough's 'Camden') belong to a prince, Cunobelin, whose residence was at Camalodunum (either Colchester or Maldon), and whom we should therefore take to be a king of the Trinobantes, the people of that part of the country. The money of Cunobelin is supposed to have been the work of a Roman artist, or of some Gaul familiar with Roman customs. The subjoined engraving is from a coin, one of several of Cunobelin, in the British Museum :—

Coin of Cunobelin. Gold. Actual size.

The Trinobantes took the lead in opposition to the invading force sent by the emperor Claudius. Aulus Plautius, a senator of praetorian rank, commanded the forces which were designed for the attack on the island (A.D. 43). The Britons were defeated in two battles, in the first of which they were commanded by Catarractes, in the second by Togodumnus, the sons of the now deceased Cunobelin. After various encounters with the natives, Plautius awaited the arrival of the emperor Claudius. Claudius embarked with reinforcements, including some elephants, and, landing at Massilia, proceeded through Gaul to Britain. Upon his arrival he crossed the Thames with his army, defeated the natives who had assembled to oppose him, took Camalodunum or Camulodunum, the capital of Cunobelin, and forced numbers of the Britons to submit. After this success Claudius disarmed the vanquished tribes and returned to Rome, leaving Plautius to secure the Roman conquest. The senate decreed triumphal honours to the emperor, and the memory of his victory has been perpetuated in his coinage.

During the command of Plautius, his lieutenant Vespasian conquered the Isle of Wight. Upon the departure of Plautius, those Britons who were struggling for independence overran the lands of such as had allied themselves with or submitted to the Romans; and P. Ostorius Scapula, who succeeded Plautius (A.D. 50) as proprætor, on his arrival found affairs in great confusion. He immediately collected forces, routed and pursued the invaders, and prepared to restrain their incursions by stations or camps at the rivers Sabrina (Severn) and Antona or Aufona (Nene). The line which Ostorius proposed to defend comprehended within it all the southern and south-eastern parts of the island, including nations who for the most part were of Belgic origin, and who had either submitted without a struggle to the Roman sway, or had been subdued by Plautius and Vespasian, or had willingly embraced the Roman alliance. This part of the island was inhabited by the tribes mentioned by Cæsar, by the Iceni, or inhabitants of Norfolk, Suffolk, and Cambridgeshire, and the Atræbatii; by the Cantuallani or Catyenchani, probably the native tribe of Cassivellaunus; by the Dobuni; and by the following people not yet noticed: the Damnonii or Dumnonii, people of Devonshire and Cornwall; the Durotriges, in and about Dorsetshire; the Belgæ, people of Somersetshire, Wilts, and Hants (the name of whose capital, Venta, is preserved in Winchester); and the Regni, people of Surrey and Sussex.

The Iceni had never been subdued: they had allied themselves with the Romans, but they saw that, if Ostorius severed the island into two parts by a line of military posts, the independence of all within that line would be sacrificed. They consequently opposed his plan, but they were defeated by Ostorius. He next subjected the Canti and the Brigantes. He then prepared to march against the Silures or Silyres, a people of South Wales, whose resistance to

the Romans was more obstinate than that of any other people of South Britain. That no apprehension of a rising in his rear might impede his progress, he settled a colony of veterans at Camalodunum.

Although the name of Cataractes, or, according to the orthography of Tacitus, Caractacus, has not been mentioned since the notice of Plautius's first campaign, that valiant prince appears to have kept the field; and in some manner, with which we are not acquainted, he became commander of the Silures. (Tacit. 'Ann.' xii. 33, 36.) The seat of war was transferred into the country of the Ordovices, people of North Wales and Shropshire, by Caractacus. He posted his forces upon a steep ascent, and fortified the approaches by a rampart of loose stones; a river ran in front of his strong position, and his best troops took their station before the ramparts. But this strong position was stormed by the Roman troops; the wife and daughter of Caractacus were taken; his brothers surrendered themselves; and the gallant prince himself was put in chains by Cartimandua, queen of the Brigantes, with whom he had taken refuge, and delivered up to the Romans. His noble demeanour when at Rome before Claudius commanded the admiration of that prince, and the emperor pardoned him. His defeat and capture took place probably A.D. 51.

The insignia of a triumph were decreed to Ostorius; but his successes ended with the defeat of Caractacus. The Romans were harassed with repeated skirmishes, and by the obstinate resistance of the Silures, and Ostorius died worn out with care (perhaps A.D. 53).

Didius, the successor of Ostorius, found the Roman affairs in a depressed condition; and he does not appear to have gained any signal advantage. His command lasted into the reign of Nero, the successor of Claudius, probably till A.D. 57. Veranius, the successor of Didius, lived only a year after undertaking the command, and did little. His successor, Paulinus Suetonius, attacked the island of Mona (Anglesey), transporting his infantry over the straits which divide that island from the mainland (the Menai) in flat-bottomed boats, the cavalry fording the passage, or in the deeper parts swimming. The description of this attack, which is highly characteristic of the people of the island, is given in the annals of Tacitus. ('Annals,' xiv. 30.)

From the shores of the extreme west Suetonius was recalled by the news of a great rising of the natives under Boadicea in that part of the island which had been already subdued by the Romans. [BOADICEA, HIST. AND BIOG. DIV.]

The revolt of Boadicea had nearly extinguished the Roman dominion in Britain, but at last the natives were completely defeated in a battle, the scene of which is supposed to have been just to the north of London. Battle Bridge, St. Pancras, is thought to have preserved in its name a memorial of this dreadful day. (Nelson, 'History of Islington.') The Roman general ravaged the territories of all those native tribes which had wavered in their attachment to the Romans, as well as those who had joined in the revolt. Suetonius was at last recalled without finishing the war (A.D. 62) and Petronius Turpilianus appointed his successor.

Several generals were successively sent to the island; but the Romans made little progress until the time of Vespasian, A.D. 70-78, in whose reign Petilius Cerealis subdued the Brigantes, who under Venutius had renewed hostilities; and Julius Frontinus subdued the Silures. But the glory of completing the conquest of South Britain was reserved for Cæsar Julius Agricola. [AGRICOLA.]

From the time of Agricola we read little about Britain in the Roman historians until the reign of Hadrian (A.D. 117 to 138), who visited the island. The emperor fenced in the Roman territory by a rampart of turf 80 Roman, or about 74 English, miles long. This rampart extended from the estuary Ituna, Solway Frith, to the German Ocean, a little south of the more solid wall afterwards built by the emperor Severus. In the subsequent reign of Antoninus Pius (A.D. 138 to 161) Lollius Urbicus, his lieutenant in Britain, drove back the barbarians, and recovered the country as far as Agricola's line of stations between the Forth and Clyde. [ANTONINUS WALL OF.]

Reverse.

In the following reign of M. Aurelius Antoninus (A.D. 161 to 180) we have some notice of wars in Britain, which Calpurnius Agricola was sent to quell. Commodus, the successor of Aurelius, sent against the Caledonians his lieutenant, Ulpian Marcellus, who defeated the Caledonians with heavy loss.

Septimius Severus, near the close of his reign, though growing old

and infirm, crossed over into the island A.D. 206 or 207. The natives who had been in a state of insurrection offered to submit; but Severus dismissed their ambassadors and continued his military preparations. Two people, the Meatae, who dwelt nearest to the Roman wall, and the Caledonians, who were more remote, were the great objects of the emperor's hostility. These tribes wore little clothing, and painted or otherwise marked upon their bodies the figures of divers animals; a small target or shield, a spear, a poniard, and as we learn from Tacitus a cumbersome unpointed sword, composed their offensive and defensive arms. They had neither walls nor towns, but lived in tents: a pastoral race, feeding upon milk and wild fruits, and the flesh of such animals as they took by hunting.

It was during this war that Severus ordered the erection of the wall which stretches across the island from the Solway to near the mouth of the Tyne. The length of this wall, owing to the corruption of the text of ancient authors, is given with great diversity. It is probable that the true reading in each of them was LXXXII. or LXXXV. miles, which is rather more than the length assigned to Hadrian's rampart of turf, which was near this wall, and extended in the same direction. Remains of both these great works exist.

The rampart of Severus, which is of stone, is for the most part, but not invariably, parallel to that of Hadrian; it lies to the north of it, and extends rather further at each end. It is accompanied throughout by a military road, or indeed by several military roads. Perhaps the most complete account of the wall of Severus is by Hutton ('History of the Roman Wall,' pp. 136-140).

Severus died probably at Eboracum (York), A.D. 210 or 211. He appears to have carried his arms far into Scotland, and probably fixed the boundary of the empire at the rampart of Antoninus, though his erection of a wall so near to the rampart of Hadrian indicates that he thought the intermediate territory either of little value or of uncertain tenure. His son Caracalla soon after his death surrendered a great part of this territory when he made peace with the Caledonians. In the reign of Diocletian and Maximian, Carausius, a Menapius (the Menapians were a people of the Netherlands), who commanded the Roman fleet in the North Sea against the Frankish and Saxon pirates, seized Britain and assumed the purple (about A.D. 288); and such was his activity and power that the emperors consented to recognise him as their partner in the empire. He was however after some years killed by Allectus, one of his friends (A.D. 297), and three years afterwards (A.D. 300) Britain was recovered for the emperors by Aesclepiodotus, captain of the guards. Upon the resignation of Diocletian and Maximian (A.D. 304) Britain was included in the dominions of Constantius Chlorus, one of their successors. This prince died at Eboracum A.D. 307, after an expedition against the Caledonians. His son Constantine the Great also carried on some hostilities with the same people and the Meatae. The northern tribes now began to be known by the names of Picts and Scots.

The Roman power was now decaying, and the provinces were no longer secure against the irruptions of the savage tribes that pressed upon the long line of their frontier. Britain, situated at one extremity of the empire, suffered dreadfully. The northern tribes, Picts, Scots, and Attacotti, burst in from the north, and the Saxons infested the coast. In the reign of Valentinian, Theodosius (father of the emperor of that name), being sent over as governor, found the northern people plundering Augusta (London). He drove them out, recovered the provincial towns and forts, re-established the Roman power, and gave the name of Valentia either to the district between the walls of Antoninus and Severus (Richard of Cirencester, Roy), or as Horsley thinks, to a part of the province south of the wall of Severus.

When Gratian and Valentinian II. associated Theodosius (son of the above) with them in the empire, Maximus, a Spaniard, who had served with great distinction in Britain, took umbrage at the preference shown to another, and raised in the island the standard of revolt, A.D. 381. Levying a considerable force he proceeded over to the continent, defeated Gratian, whom he ordered to be put to death, and maintained himself for some time in the possession of his usurped authority. He was however at last overcome by Theodosius, and the province returned to its subjection to the empire. The Britons who had followed Maximus into the continent received from him possessions in Armorica, where they laid the foundation of a state which still retains their name. [BRETAGNE.]

Stilicho, whose name is one of the most eminent in the degenerate age in which he lived, served in Britain with success, probably about A.D. 408; but the time and particulars of his service are not known. The unhappy province after his departure was again attacked by barbarians, and agitated by the licentiousness of the Roman soldiery, who successively set up three claimants to the imperial throne, Marcus, Gratian, and Constantine. The first and second were soon dethroned and destroyed by the very power which had raised them. Constantine was for a time more fortunate. Raising a force among the youth of the island he passed over into Gaul (A.D. 409), acquired possession of that province and of Spain, and fixed the seat of his government at Arles, where he was soon after besieged, taken, and killed. His expedition served to exhaust Britain of its natural defenders: the distresses of the empire rendered the withdrawal of the Roman troops necessary, and near the middle of the 5th century,

or according to some about A.D. 420, nearly 500 years after the first invasion by Julius Cæsar, the island was abandoned by them.

We proceed to give an account of the subdivision, government, and general state of Britain while a province of the Roman empire.

The first Roman governors were the proprietors, officers chiefly or entirely military; nor are there, so far as we know, any records or traces of a subdivision of Britain till a comparatively later period of the Roman dominion. The extensive and important changes introduced into the Roman government by Diocletian affected Britain. The whole empire was divided into four great prefectures, and Britain was included in the prefecture of Gaul.

Our authority for the administration of Britain is the 'Notitia Imperii,' a record of late date, probably as late as the time of the Romans quitting the island. From the 'Notitia' we learn that the government of the island was intrusted to an officer called 'Vicarius,' which Horsley, not imaptly, translates 'vice-gérant.' Under him there were five governors (for civil purposes, we presume), two 'Consulares' (men of consular rank) for the two provinces of Maxima Cæsariensis and Valentia, and three 'Praesides' (presidents) for the provinces of Britannia Prima, Britannia Secunda (First and Second Britain), and Flavia Cæsariensis. Three other principal officers are mentioned,—the 'Comes litoris Saxonici per Britanniam' (Count of the Saxon shore in Britain), the 'Comes Britanniarum' (Count of Britain), and the 'Dux Britanniarum' (Duke of Britain). We have translated the words 'Comes' and 'Dux' by 'Count' and 'Duke,' after Horsley: the modern titles are obviously derived from the more ancient; but there is this difference, that while the modern names now indicate only rank and title, the ancient names were attached to offices.

The situation of the five provinces of Britain, according to Richard of Cirencester (a monk of the 14th century, whose work was discovered and published at Copenhagen about the middle of the last century, and whose authority, though disputed by some, is apparently trustworthy), was as follows. We give them in a tabular form, with the nations which occupied each:—

BRITANNIA PRIMA, the country south of the Thames and the Bristol Channel, including the territories of the

<i>Cantii</i>	{	These nations are mentioned by Richard of Cirencester: the Cantii were the inhabitants of Kent; the Belgæ, of Somersetshire, Wilts, and Hants; the Damnonii, of Devonshire and Cornwall; the Bibroci, of parts of Berks and adjacent counties; the Segontiaci, of parts of Hants and Berks; the Hedni, of Somersetshire and part of Gloucestershire; the Atrebatii, of parts of Berks and Wilts; the Durotriges, of Dorsetshire and neighbourhood. Richard places the Bibroci, whom he seems to confound with the Regni (or, as he terms them, the Rheimi) in Surrey and East Sussex. He says the Durotriges were sometimes called Morini.
<i>Belgæ</i>		
<i>Damnonii</i>		
<i>Bibroci</i>		
<i>Segontiaci</i>		
<i>Hedni</i>		
<i>Atrebatii</i>		
<i>Durotriges</i>		
<i>Regni</i>	{	Not mentioned by Richard, unless the first are the same as the Rheimi or Bibroci, and the second as the Atrebatii. The Regni, according to other authorities, were people of Surrey and Sussex. The Ancalites of Cæsar are held to be the Atrebatii of Ptolemæus.
<i>Ancalites</i>		
<i>Cimbri</i>	{	People, as it seems, of Devonshire and Cornwall, mentioned by Richard, not by Ptolemæus.
<i>Cornubii</i>		

BRITANNIA SECUNDA, the country separated from the rest of Britain by the Sabrina or Severn, and Deva or Dee; that is, Wales, Herefordshire, Monmouthshire, and parts of Shropshire, of the counties of Gloucester and Worcester; including the territories of the

Silures, people of that part of South Wales bordering on England and of those parts of England between South Wales and the Severn.

Ordovices, people of that part of North Wales bordering on England.

Dimecie, or { People of the west part of South Wales, counties of Angharai { Pembroke, Caernarthen, Cardigan.

Cangiani, { People of Caernarvonshire, supposed by some to be or Kaykavoi { the Cangii, attacked by Ostorius. (See above.)

FLAVIA CÆSARIENSIS, the territory north of the Thames, east of the Severn, and probably south of the Mersey, the Don which joins the Yorkshire Ouse, and the Humber; comprehending the territory of the

Carnabii { People of Cheshire, part of Shropshire, and some Kopvavoi { adjacent districts.

Cassii { Richard of Cirencester considers the Cassii and the Catyeuchlani to be the same people. The same writer considers that the Cassii and Dobuni made up the kingdom or rather the republic of the Cassii. The situation of the Cassii is supposed to be in Cassio Hundred, Herts; the Dobuni, in Gloucestershire; the Iceni (supposed to be the Cenomagni of Cæsar), in Norfolk, Suffolk, and Cambridge; the Trinobantes, in Essex.

Coitani
Κοιτανοί } People of the counties of Lincoln, Nottingham, Leicester, and the adjacent parts. These people seem to be regarded by Richard as a subdivision of the Iceni. The Iceni, properly so called, he gives as the other subdivision, calling them *Cenomanni*.

MAXIMA CAESARIENSIS, the country from the Mersey and the Humber to the wall of Severus, comprehending the territory of the

Brigantes.

Parisi
Παρισοί } People of the East Riding of Yorkshire.

Volantii
and
Sialuntii } Two nations confederate together, according to Richard, not mentioned by Ptolemaeus; they inhabited Lancashire, or part of it.

VALENTIA or VALENTIANA, the country between the wall of Severus and the rampart of Antoninus, including the south part of Scotland, the county of Northumberland, and part of Cumberland, comprehending the territories of the

Ottadini
Οτταδηννοί } The inhabitants of the east coast of Northumberland and the adjacent coast of Scotland.

Gudeni
Γαδηννοί } These people dwell to the west of the Ottadini, in Northumberland, in Roxburgh, Selkirk, Peebles, and Lanark-shires.

Selgovae
Σελγουαί } The inhabitants of Dumfries and part of Kireud-bright-shires.

Novantae
Νοβανταί } The inhabitants of Wigtonshire.

Damarii
Δαμάριοι } The inhabitants of that part of Scotland south of the wall of Antoninus not occupied by the above-mentioned nations. They seem to have occupied a considerable tract north of the wall, which, being cut off from the rest of their territories, was wasted by the Caledonians.

The remaining part of the island was never long in the power of the Romans. Agricola overran part of it and established some stations; and probably other commanders after him brought it into temporary subjection. The part which Agricola thus subdued is termed by Richard

VESTASIANA, including the country between the rampart of Antoninus and a line drawn from the Moray Frith (Varar estuary,* Ptolemaeus) to the mouth of the Clyde, and comprehending the territories of the

Hovetii, mentioned by Tacitus but not by Ptolemaeus; it is likely they occupied the portion of the territory of the Damarii which lay beyond the wall: they were south-west of the Tay.

Iecturones
or
Ienricones
Ουενικουρτες } The difference between Richard and Ptolemaeus with respect to this people makes it uncertain whether we are to assign them to Fifeshire or Angus.

Taiacali
Τεταλοι } Inhabitants of the coast of Aberdeenshire. Their chief town, *Devana* (*Δηουανα*), was probably Old Aberdeen.

Vaccaei
Ουακαμαγγοί } The range of the Grampians towards the north-east; Banff, Moray or Murray, Nairn, and part of Inverness-shires.

Damnii Albani (not mentioned by Ptolemaeus), parts of Perth, Argyle, Stirling, and Dunbarton-shires. General Roy considers Albani to mean mountaineers. Perhaps they are comprehended by Ptolemaeus among the *Damnii* (*Δαμνιοί*) of Valentia.

Atacotti, not mentioned by Ptolemaeus but by Ammianus Marcellinus. They inhabited, according to Richard, the country on the bank of the Clyde and of the great lake Lyncalidor, supposed to be Loch Lomond.

Richard supposes that this province of VALENTIA was, in the time of the later emperors called THULE: to the rest of Scotland he gives the name of

CALEDONIA, comprehending the territories of the following people:—

Caledonii, properly so called, *Καληδονιοί* } North-west of the Moray Frith and Loch Ness. The immense Caledonian Forest covered their territory or rather skirted it to the north-west. Ptolemaeus seems to make them extend in a south-west direction as far as Loch Fyne; thus assigning to them parts of Inverness, Perth, and Argyle-shires.

Cannie
Καννί } Inhabitants of parts of Ross and Cromarty-shires.

* Varar, as it is correctly written in the Latin edition of Ptolemaeus by Pirekheimer. The name Varar still exists in Strath Farar, the upper end of the Moray Frith.

Logi
Λογοί } These two nations seem to have inhabited the east coast of Sutherland and Caithness-shires. The name of the Logi is preserved in that of the modern parish of Loch. Richard intimates that the Carnabii were a colony of the people so called in South Britain, who abandoned their country in conjunction with the Cantii, upon the Roman conquest, and settled here. If there be any truth in this account we may perhaps identify the Cantii with these wandering Cantii.*

Catini
Καττινοί } Part of Caithness and Sutherland-shires west of the Carnabii. If we follow Richard's orthography, perhaps a relic of the name Catini may be preserved in Caithness.

Mertae
Μερταί } West of the Logi in Sutherlandshire.

Carnocae
Καρνοκαί } The west coast of Sutherland and Cromarty-shires.

Cerones
Κερωνες
Οκωνες
Κρεωνες } These two people (if two there were, for we are inclined to think some confusion of transcribers had led one name to be variously written, and hence it has been supposed there were two people where really was only one) dwelt along the west coast of Scotland, between Loch Broom and the Linthe Loch.

Epidii
Επιδιοί } The peninsula of Cantire and the adjacent part of Argyllshire between the Linthe Loch and Loch Fyne. Richard, in his map, gives the names of Epidia Superior and Inferior to Jura and Islay respectively.

Horsley gives an arrangement of the provinces entirely different from the above, except so far as regards *Britannia Secunda*. He makes *Britannia Prima* to extend from the coast of Sussex to the banks of the Neve, and assigns the western counties to *Flavia Caesariensis*. He places Valentia within the wall of Severus, and *Maxima Caesariensis* beyond it.

Our chief authorities in the above table have been Richard of Cirencester and Ptolemaeus; in the Latin names we have commonly followed the spelling of the former; the Greek names we have subjoined from Ptolemaeus, as far as he furnishes them, except where they have been given before in the course of the history. The locality of the several nations may be seen in the maps of Ancient Britain (north and south), published by the Society for the Diffusion of Useful Knowledge.

There were, according to Richard of Cirencester, two municipia or towns whose inhabitants enjoyed most of the privileges of Roman citizens.

Verolacium (*Ουρολακιον*) near St. Albans.

Eboracum (*Εβορακον*), now York, quarters of the sixth legion and apparently the residence of the Roman emperors when in Britain.

The Coloniae were settlements of Roman citizens, and served to diffuse the language, religion, and arts, and to secure the supremacy of Rome. According to Richard there were in Britain nine colonies, namely:—

Londinium (*Λονδινιον*) or *Augusta*, now London, mentioned by Tacitus as a place of great trade, though not spoken of in his time as a colony.

Camulodunum (*Καμουλοδουνον*), *Geminae Martiae*, now Colchester or Malden (†).

Rutupis (or *Rutupie*, 'Itin. Anton.' *Ρουτουπια*), now Richborough, near Sandwich.

Therouae or *Aquae Solis* (*Τεθρα Οεπια*), now Bath.

Iaca or *Secunda*, now Caerleon.

Deva or *Antica* (*Δηουανα*), now Chester, quarters of the 20th legion.

Eborac or *Claudia*, now Gloucester.

Lindum (*Λινδον*), now Lincoln.

Eboracica, now Cambridge (or Icklingham, in Suffolk. Horsley).

There were ten cities *Latii Jure donati*; the inhabitants of these possessed privileges, but not equal to the foregoing.

Durnomagus (*Δυκονβρινα*, 'Itin. Ant.'?), now Castor on Nene or Water Newton.

Catarracton (*Catarracto* or *Catarractonum*, 'Itin. Ant.' *Καταρρακτωνον*), now Catterick in Yorkshire.

Cambodunum (*Καμουλοδουνον* †), now Slack in Yorkshire near the border of Lancashire.

Coccium (supposed by some to be the *Πρυδοουνον* of Ptol.), now Ribchester, Lancashire.

* A comparison of the situation of the Carnabii at the extremities of the island in Cornwall and Caithness will perhaps incline us to account for the similarity of their designation by a reference to its etymology rather than to such a connexion of the people as Richard supposes. The Celtic root *corn* or *harn* (see *Caudeu*) appears in many other languages with the signification of an extremity or a horn: compare the Hebrew *keru*, the Latin *cornu*, our own words *corn-cr*, *corn-wall*, &c. By a reference to the presumed etymology of the names *Cant-ae* and *Cant-ii*, we can account for their similarity also; the root *cant* (compare *Cant-ii* and *Cant-ae* above with the ancient *Cant-abri* and the modern *Cant-ire*, see *Camden*) is supposed to mean in Celtic, a corner.

Jugubalia (*Jugurallium*, 'Itin. Ant'), now Carlisle.
Pterolon (*Πτερον στρατοεδον*, the flying camp), now Burgh-head,
 Morayshire, Scotland.
Victoria (*Ουνκτοπια*), now Dealgin Ross, Porthshire.
Theodonia, now Dumbarton.
Corium (*Δυροκορνουμ*, 'Itin. Anton.' *Κορινιον*), now Cirencester.
Sorbiodunum, now Old Sarum.

There were twelve towns called Stipendiarie, with whose municipal constitution and privileges we are not acquainted.

Venta Silurum, now Caerwent or Caer-gwent, Monmouthshire.

Venta Belgarum (*Overra*), now Winchester, Hants.

Venta Icenorum (*Overra*), now Caistor, near Norwich.

Segontium, now Caer-Segont, near Caernarvon.

Muridunum, now Seaton, near Colyton, Devon.

Ragæ (*Ratæ*, 'Itin. Anton.' *Ραγε*), now Leicester.

Cantiopolis or *Durocorum* (*Δαπορορον*), now Canterbury.

Durinum (*Durnotaria*? 'Itin. Anton.' *Δουρινον*?), Dorchester.

Iaca (*Iaka*), now Exeter.

Bremenium (*Βρεμενιον*), now Rochester, Northumberland.

Vindonum (*Βινδοντι*, 'Itin. Anton.'), near Andover, Hants, a very doubtful position.

Durobrivæ, now Rochester.

In the above list we have given the orthography of Richard, nothing any variation between him and the 'Itinerary of Antoninus.' The Greek names as usual are from Ptolemaeus. The list of Municipia and Coloniae, it should be added, is by no means complete.

BRITISH AMERICA. The territory comprehended under this name extends from 41° to 78° N. lat., and from 52° to 141° W. long. The south boundary of British America is formed by the territory of the United States. The frontier line between New Brunswick, Canada, and the United States, was settled by the Conventions of 1839 and 1846. It strikes the St. Lawrence in lat. 45°, at the village of St. Regis, which stands at the western extremity of Lake St. Francis. The line then proceeds in a south-western direction through the middle of the St. Lawrence into Lake Ontario, which it divides into two nearly equal portions; leaves Ontario by the river Niagara and bisects Lake Erie; passes north through the river Detroit into and through the lake and river St. Clair; enters Lake Huron at its southern point and quits it at its north-western extremity; runs through 'the Narrows' and to the west of the island of St. Joseph into Lake Superior, which it crosses with a winding course leaving Isle Royale within the limits of the United States. Quitting Lake Superior by Pigeon River the boundary-line runs north-west to the north-western angle of the Lake of the Woods in 49° 0' N. lat., 94° 25' W. long.; proceeds thence due west to the Pacific: the island of Vancouver, opposite this maritime boundary-point, being allotted to Great Britain. A very large proportion of the territory to the north of the line just described has been little explored, and is of value only as hunting-ground. The eastern portion of the territory is in possession of the Hudson's Bay Company, while the western is known as the North-Western or Indian territory. A portion of the north-west coast of America bordering on the North Pacific Ocean is claimed by Russia. This portion extends from 57° N. lat. to the shores of the Arctic Sea, and from 140° W. long. to the North Pacific Ocean.

The settled provinces of North America belonging to Great Britain are Lower Canada, or Canada East, lying between 44° and 50° N. lat., and between 64° and 76° W. long.; Upper Canada, or Canada West, 41° to 49° N. lat., 74° to 85° W. long.; New Brunswick, 45° to 48° N. lat., 64° to 68° W. long.; Nova Scotia and Cape Breton, 43° to 47° N. lat., 60° to 67° W. long.; Prince Edward's Island, 46° to 47° N. lat., 62° to 65° W. long.; Newfoundland, 46° to 52° N. lat., 52° to 60° W. long. [ATLANTICA; BEAR LAKE; CANADA; CAPE BRETON; COPPER-MINE RIVER; HUDSON'S BAY TERRITORIES; NEW BRUNSWICK; NEWFOUNDLAND; NOVA SCOTIA; VANCOUVER ISLAND.]

BRITISH CHANNEL. [ENGLISH CHANNEL.]

BRITISH GUYANA. [GUYANA, BRITISH.]

BRITISH HONDURAS. [HONDURAS, BRITISH.]

BRITISH INDIA. [HINDUSTAN.]

BRITISH KAFFRARIA. This name is applied to a dependency or military possession, recently annexed to Cape Colony in South Africa. The annexation arose out of the Kaffir war of 1847. For twenty years before that date the settlers in the Albany district of Cape Colony, being near the eastern frontier, were often exposed to irruptions from the Kaffirs. Successive governors of the colony—Sir B. D'Urban, Sir P. Maitland, and Sir H. Pottinger—had endeavoured in vain to suppress these incursions. In 1847 Sir H. Smith subdued for a time the Kaffirs, but their deep-seated resentment against the white settlers broke out again with great force in 1850. On the last day of that year Sir H. Smith issued a proclamation from King William's Town establishing martial law in the colony, and ordering all colonists between the ages of 15 and 20 to rise en masse to defend the frontier against the Kaffirs. The British troops suffered much annoyance and loss in the harassing bush-warfare which ensued. On the 8th November, 1851, in an encounter with the Kaffirs in the Waterkloof, Lieutenant-Colonel Fordyce and several officers and men of the 74th regiment were killed, and a considerable number wounded, the Kaffirs escaping unhurt. In January 1852 Major-General Cathcart replaced Sir H. Smith. On the 20th December General Cathcart defeated the *Bakwena*, a Kaffir tribe,

on Boreas Mountain in the Orange Sovereignty, shortly after which three chiefs named Macomo, Sandilli, and Krelli submitted to the British, and the war was virtually at an end. A treaty of peace was ratified at a conference between the General and the Kaffir chiefs held near King William's Town on the 9th of March, 1853. This 'little war' cost England about a million and a half sterling. The country called British Kaffraria is a large district eastward of Cape Colony, over which the British government hold a kind of sovereignty or protectorship, the precise character of which has not been very clearly defined. British military posts are maintained at various points over the area. The district is divided into counties: Buffalo River is considered the harbour; a town called London is to be established at the mouth of Buffalo River.

BRITISH WEST INDIES. [WEST INDIES, BRITISH.]

BRITTANY. [BRETAGNE.]

BRIVES. [CORREZE.]

BRIXEN. [TYROL.]

BRIXHAM, Devonshire, a seaport and market-town in the parish of Brixham and hundred of Haytor, is situated on the south side of Torbay, in 50° 23' N. lat., 3° 31' W. long.; distant 25 miles S. from Exeter, and 203 miles S.W. by W. from London. The population of the town of Brixham in 1851 was 5627. The livings are in the archdeaconry of Totnes and diocese of Exeter.

The manor of Brixham formerly belonged to the Novants, from whom it passed to the Vullotort family, who sold the manor. It was afterwards divided into quarters, one of which was purchased by 12 fishermen of Brixham Quay, divided into 12 shares, and again subdivided into smaller portions, the possessors of these divided shares, however small, calling themselves quay lords. Many of these quay lords are to be found among the fishermen of the place. Brixham is situated about a mile and a half south-west from Berryhead, the most westerly point of Torbay, and directly opposite to Torquay; being distant from that celebrated watering-place about 7 miles by water. The town is long and straggling, extending, from the upper extremity beyond the church to the lower on the quay, upwards of a mile and a half. Most of the business of the place is transacted in the lower town. In both sections of the town there has been of late years a considerable increase of new and well-built houses, and the two are now almost united. The lower town is lighted with gas. The fish-market has been enlarged and greatly improved. The prosperity of Brixham is chiefly dependent on its fishery. More than 200 sail of vessels, comprising 20,000 tons of shipping, and employing 1500 seamen, belong to this town, which as a port is subordinate to Dartmouth; most of these vessels are engaged in the fishing trade. The average amount received for fish is said to be 600*l.* per week. The best of the fish are sent to Exeter, Bath, Bristol, and London. Turbot, sole, whiting, plaice, mullet, mackerel, and other fish are taken in considerable numbers. During the London season about 50 of the decked trawl boats are usually absent from Brixham, being employed in supplying the London market with soles, turbot, &c., from Hull and Ramsgate, fishing over the intermediate space between those places. Several of the vessels belonging to Brixham are employed in the Mediterranean, Spanish, and coasting trade. The harbour consists of two basins, the outer one having been formed at an expense of nearly 5300*l.*, raised solely amongst the inhabitants.

The parish church, situated in the upper town, was built by the Prior of Totnes in 1373; the accommodation has been increased by the addition of galleries. In the church is a cenotaph of Sir Francis Buller, the judge. Lower Brixham has been constituted a district parish; its church, which was built in 1820 has since been enlarged. The Wesleyan Methodists, Baptists, and Independents have places of worship. There is a National school, with which has been incorporated an Endowed school founded in 1634.

The Public Rooms, erected in 1835, are situated near the centre of the town. The market-house is by the water-side. A market was granted to Brixham by Act of Parliament in 1799. Markets are held on Tuesday and Saturday. A fair is held on Whit-Tuesday and the following day. There are two iron mines in the neighbourhood of Brixham, one of which is worked during the winter. The ore is shipped at Brixham to be smelted in Wales. Brixham was the landing-place of William Prince of Orange, afterwards William III., when he arrived in England, November 4th, 1688. A monument with an inscription commemorates the event. At the end of the pier is a tablet recording the visit of the Duke of Clarence, afterwards William IV., July 21st, 1823. The inhabitants on that occasion presented to the duke an address, with a piece of the stone on which the Prince of Orange had first set foot, both being inclosed in a box made of heart of oak said to be 800 years old.

BRIXTON. [SURREY.]

BRIXWORTH, Northamptonshire, a small village, and the seat of a Poor-Law Union, in the parish of Brixworth and hundred of Oringbury, is situated in 52° 21' N. lat., 0° 54' W. long.; 6½ miles N. from Northampton, and 72½ miles N.W. by N. from London. The living is a vicarage in the archdeaconry of Northampton and diocese of Peterborough. The population of the parish of Brixworth in 1841 was 1258, including 137 inmates of the Union workhouse. Brixworth Poor Law Union contains 34 parishes and townships, with an area of 61,370 acres, and a population in 1851 of 14,629. Besides the parish

church, there is a place of worship for Baptists. There is a National school. A fair is held on the Monday after Ascension Day.

BROACH. [BAROACH.]

BROADSTAIRS. [KENT.]

BROCK. [CANADA.]

BROCKVILLE. [CANADA.]

BROD. [BOSNIA.]

BRODY, a town in the Austrian Crownland of Galicia, is situated in a swampy plain bounded by forests, and on the rivulet Suchnielka, which flows north into the Styr; in 50° 7' N. lat., 25° 18' E. long., and has 24,000 inhabitants. Brody is large, but ill built and dirty; the houses are mostly constructed of wood. Above 8000 of the inhabitants are Jews, on which account the town has been nicknamed 'The German Jerusalem.' There are several squares and open spaces; several Greek and Roman Catholic churches, three synagogues, a convent, a large palace belonging to the Potocki family, and other handsome buildings. It has two Jewish schools, a Roman Catholic grammar school, a seminary for female education annexed to the convent, a Jewish hospital, a theatre, and public baths. Brody was made a free town in 1779. In a commercial point of view, it is the most important town in Galicia. The trade is almost exclusively in the hands of the Jews, and consists principally in the export of cattle, horses, honey, wax, tallow, isinglass, hides and skins, leather, aniseed, dried fruit, &c.; jewels, pearls, colonial produce, and manufactured goods are imported by way of Odessa; there is also a transit trade in merchandise to Russia, Turkey, &c. The chief industrial products of Brody are leather and linen; its fairs are well attended.

BROEK. [HOLLAND, SOUTH.]

BROMBERG. [POLEN.]

BROMLEY, Kent, a market-town and the seat of a Poor-Law Union, in the parish of Bromley, hundred of Bromley and Beckenham, and lath of Sutton-at-Hone, is situated on elevated ground on the right side of the small river Ravensbourne, in 51° 24' N. lat., 0° 1' E. long.; 10 miles S.E. from London. The population of the parish of Bromley in 1851 was 4127. The living is a perpetual curacy in the archdeaconry of Maidstone and diocese of Canterbury. Bromley Poor-Law Union contains 16 parishes and townships with an area of 41,333 acres, and a population in 1851 of 17,640.

The origin of the name of this place is doubtful. The manor was given by Ethelbert, king of Kent, in the 8th century to the bishop and church of Rochester. After the conquest it was seized by Odo, bishop of Bayeux, the brother-in-law of the conqueror, but was restored in 1076 to the see of Rochester through the exertions of Archbishop Lanfranc. The dean and chapter of Rochester are the patrons and proprietors of the great tithes. The present mansion, a plain brick building, was erected in 1777. In the grounds is a spring of mineral water, known as St. Blaise's Well, which was at one time in great repute for its healing properties. Bromley church is a spacious gothic structure, with an embattled tower. It is partly of perpendicular architecture, but has been much disfigured by repairs and alterations. The interior contains some monuments of several bishops of Rochester. A chapel of ease, dedicated to the Holy Trinity, was erected in 1841. There are places of worship for Wesleyan Methodists and Independents, National and Infant schools, a literary institution, and a savings bank. Bromley College, founded in 1666 by John Warner, bishop of Rochester, for 20 poor widows of clergymen, has been enlarged by subsequent benefactions so as to accommodate 40 widows, each receiving 38s. a year, with an allowance for coal and candles. The college is a handsome pile of buildings, standing at the entrance of the town from the London road. Other charities are in the parish. Bromley consists chiefly of one long street, in which are some well-built houses. The town is paved, and is lighted with gas. Petty sessions and a county court are held here. Bromley being on the main road to Tunbridge Wells and Hastings, formerly possessed a considerable posting trade; since the construction of the South-Eastern railway this trade has greatly declined. It is now mainly dependent on the trade of the agricultural district in which it stands and of the families of the gentry in the vicinity of the town. The market day is Thursday. Fairs are held on February 14th, and August 5th, for cattle, horses, sheep, and hogs.

BROMLEY ABBOTTS. [STAFFORDSHIRE.]

BROMLEY ST. LEONARD'S. [MIDDLESEX.]

BROMPTON. [KENT.]

BROMPTON. [MIDDLESEX.]

BROMPTON. [YORKSHIRE.]

BROMSGROVE, Worcestershire, a market-town and the seat of a Poor-Law Union in the parish of Bromsgrove and upper division of the hundred of Halfshire, stands near the small river Salwarp, in 52° 20' N. lat., 2° 3' W. long., 13 miles N.N.E. from Worcester, 116 miles N.W. from London by road, and 127 miles by the North-Western and Bristol and Birmingham railways. The population of the town in 1851 was 4426. In the reign of Edward I. Bromsgrove returned two members to Parliament; but when the trade of the town declined the inhabitants petitioned to be freed from the franchise. The living is a vicarage in the archdeaconry and diocese of Worcester. Bromsgrove Poor-Law Union contains 15 parishes and townships, with an area of 47,206 acres and a population in 1851 of 24,824.

GEOG. DIV. VOL. II.

The town consists principally of one good street about a mile in length, lighted by gas, and paved. Commissioners were appointed under the powers of an Act of Parliament obtained in 1846 for the purpose of effecting various improvements in the town. This measure has been highly beneficial.

The church of Bromsgrove, dedicated to St. John the Baptist, is situated on a gentle eminence; it has a beautiful tower and spire, together 189 feet in height. There was a church at Bromsgrove at the time of the Conquest. A chapel of ease at Cats Hill in this parish has been made a district church. There are three or four Dissenting chapels, a literary and scientific institute, National and Infant schools, and a savings bank. A Grammar school founded by Edward VI. in 1553, and further endowed by Sir Thomas Cookes, Bart., in 1693, has an income from endowment of about 35*l.*, and had 58 scholars in 1852, of whom 12 were free scholars. The 12 boys on the foundation are educated, clothed, and apprenticed; and in Worcester College, Oxford, are six scholarships and six fellowships, the vacancies in which are filled up by boys selected from this school.

The linen manufacture was formerly carried on at Bromsgrove, but has been abandoned. Nail-making is now the principal trade; there is also an extensive manufactory for patent buttons. In the parish of Stoke Prior, and closely adjoining that of Bromsgrove, are situated the extensive salt and alkali works of the British Alkali Company. The manufacture of salt has been carried on for centuries in the adjoining borough of Droitwich, where it is prepared from rich springs of native brine. Rock-salt was discovered in 1829 at Stoke Prior in the course of sinking a pit in search of brine. The beds of salt were of great thickness, and were excavated to a considerable extent; but at present the supplies for making refined salt are derived from a natural brine spring, which has communicated with the excavations. Immediately after making this discovery, the proprietors erected extensive works for the manufacture of salt, and for the preparation of British alkali by the decomposition of this substance, which very speedily changed the green fields and retired lanes into an active manufactory and a populous village. The Birmingham and Worcester Canal passes near Bromsgrove and Stoke Prior. Bromsgrove is situated in a highly-cultivated and richly-wooded valley. On the Lickey Hill, which forms one of its acclivities, are the sources of the river Rea, which flows through Birmingham; of the Salwarp, which passes through Droitwich; of the Arrow, and of several small streams, some of which fall into the basin of the Severn and ultimately into the Irish channel, while others descend in the opposite direction to the basin of the Trent and the German Ocean. The strata belong to the new red-sandstone formation. The Lickey Hill is composed of quartz, and is regarded by geologists as the source from whence have been derived the vast beds of gravel which extend through Oxfordshire, in the valley of the Evenlode, and even along the Thames.

BROMWICH, WEST, Staffordshire, a mining and manufacturing town, and the seat of a Poor-Law Union in the parish of West Bromwich and hundred of South Offley, is situated in the heart of a mining district, near the river Tame, in 52° 31' N. lat., 1° 59' W. long., four miles from Birmingham, 113 miles N.W. from London by road, and 115 miles by the North-Western railway. The population, which in 1831 was 15,327, increased by the year 1841 to 26,121; in 1851 it was 34,591. The parish is divided into two districts, namely, north-east (16,706 inhabitants) and south-west (17,885 inhabitants). It is governed by the county magistrates, who hold petty sessions. The living is a perpetual curacy in the archdeaconry of Stafford and diocese of Lichfield. West Bromwich Poor-Law Union contains six parishes and townships, with an area of 20,165 acres, and a population in 1851 of 69,718.

The circumference of the parish of West Bromwich is about 13 miles, nine of which are marked by the course of the river Tame as it flows from Oldbury to the Trent. In the 12th century Birmingham, Castle Bromwich, Little Bromwich, and West Bromwich all belonged to one feudal lord; and Bromwich is said to have been distinguished from Bromwicham (Birmingham) by the prefix West, which indicates its relative position. West Bromwich affords a remarkable instance of the growth of population and wealth through mining and manufacturing industry. Within the space of a few years it has grown up from being little else than a barren heath to a town nearly three miles in length. The iron and coal beneath the surface of the whole parish have caused the growth of the town. The manufacture of iron goods is carried on very extensively at Bromwich: guns, gunlocks, swords, bayonets, saddlers' ironmongery, fire-irons, coach ironmongery, chains, bolts, nails, and agricultural implements are among the iron goods made here.

The Earl of Dartmouth, who is the chief landowner, has a seat at Sandwell Park, near West Bromwich; it occupies the site of a small Benedictine priory. The earl has appropriated about four acres of ground, inclosed by a wall, for the use of the inhabitants. The Birmingham and Wolverhampton Canal supplies West Bromwich with water-carriage for heavy goods.

All Saints parish church belonged to the priory of Sandwell, and the original structure is supposed to have been built about seven centuries ago; but the body of the church was nearly all rebuilt in 1735, and the upper part of the steeple was rebuilt in 1824. Christ church was built in 1828. Trinity church and St. James's have been erected

within a recent period. There are six chapels for Wesleyan Methodists, three for Independents, two for Baptists, three for Primitive Methodists, and one for Roman Catholics. There are four National schools, and schools are connected with most of the chapels. A literary institute and two mechanics institutions are in the parish.

There are gas-works at Bromwich on so extensive a scale as to have 150 miles of pipes in connection with them. The gas company has two stations, one at Birmingham, which supplies a great part of that town, and one on the Dudley Road. The two stations together produce 200,000,000 cubic feet of gas in a year.

BROMYARD, Herefordshire, a market-town and the seat of a Poor-Law Union, in the parish of Bromyard and hundred of Broxash, is situated in 52° 11' N. lat., 2° 29' W. long., 14 miles N.E. from Hereford, 125 miles W.N.W. from London. Worcester, which is about 14 miles from Bromyard, is 120½ miles from London by the Great Western, and Oxford, Worcester, and Wolverhampton railways. The population of the parish of Bromyard was 3000 in 1851. The living is a rectory and vicarage in the archdeaconry and diocese of Hereford. Bromyard Poor-Law Union contains 33 parishes and townships, with an area of 59,290 acres and a population in 1851 of 11,652.

The parish of Bromyard is almost encircled by the river Frome; the town lies a short distance from its right bank. The church is a spacious structure, partly in the Norman and partly in the decorated styles; with nave, side aisles, and chancel; it is 136 feet long by 65 feet wide. In the town are places of worship for Independents, Wesleyan and Primitive Methodists, and Quakers. The Free Grammar school, founded by Queen Elizabeth, A.D. 1565, and augmented in 1665 by John Peryn, Esq., a native of Bromyard and afterwards adderiman of London, is under the patronage of the Goldsmiths' Company and the principal inhabitants. Its income is about 120*l.* a year: the number of scholars in 1852 was 40. Mr. Peryn also left funds to establish in the church of Bromyard a divinity lecture to be delivered every week, by six neighbouring clergymen; who are still appointed to officiate, as vacancies occur, by the principal inhabitants of the parish. There are National schools, an almshouse for widows, a dispensary, and a savings bank. An agricultural society was formed in 1844. A county court is held in Bromyard.

The magistrates of the district hold their petty sessions every Monday in premises called 'Dumbleton Hall,' formerly an old mansion-house left to the parish, but recently rebuilt by subscription, and now affording accommodation for parochial meetings, the savings bank, fire-engine house, &c. A new police station house with a residence for a superintendent was built in 1844. There is a covered market place with commodious stalls and benches; but poultry and dairy produce are still sold in the public streets. The market is held on Monday. There are fairs for live stock and agricultural produce during the year. The town is wholly dependent on agriculture. Bromyard returned burgesses to Parliament up to the reign of Edward I., when this privilege was withdrawn at the request of the inhabitants, who pleaded their inability to defray the expense of their representatives. During the civil wars between Charles I. and the Parliament, the royal army with the king in person marched from Worcester towards Hereford to relieve that city then besieged by the parliamentary forces. On this occasion the king and the court lay at Bromyard on the 3rd of September 1645; and on the following day proceeded to Hereford.

BRO'NTE, a town in the province of Catania in Sicily, situated at the western base of Mount Ætna, 22 miles N.N.W. from the city of Catania. The territory of Bronte is healthy and fertile, and produces corn, almonds, wine, pistachio nuts, and silk. Bronte has manufactures of paper and coarse woollens, and has a population of about 9000. It is a modern town, and has grown out of several scattered habitations since the time of Charles V. Admiral Lord Nelson was made Duke of Bronte in 1799 by King Ferdinand, with an income of 6000 *onze*, about 3000*l.* sterling.

BROOKLYN, a city, the capital of King's County, State of New York, is situated at the west end of Long Island, and on the shore of East River, opposite New York city, in 40° 42' N. lat., 74° 1' W. long., distant 145 miles S. by W. from Albany, and 227 miles N.E. by E. from Washington. The population of Brooklyn city, which in many respects may be regarded as a suburb to New York, has very rapidly increased since the commencement of the present century. In 1800 the population was 3278; in 1830 it was 15,396; in 1840 it was 36,233; in 1850 it had risen to 96,838.

Brooklyn is regularly laid out, and has many wide streets, with a profusion of well-built churches and public buildings. The city is lighted with gas, and has a good supply of water. Of its churches, which are upwards of 60 in number, 11 belong to Episcopalians, 11 to Methodist Episcopalians, 7 to Roman Catholics, 7 to Presbyterians, 6 to Baptists, &c. For educational purposes the town is divided into 13 districts, each of which possesses schools and a good library, the schools and library being free to the inhabitants of the district. There are also numerous advanced schools and academies for youth of both sexes. Among the public buildings are the City Hall, a handsome marble edifice, the City Hospital, the Dispensary, &c. In the eastern part of the town is the United States Navy Yard, on the Wallabout, covering about 40 acres. Connected with the Navy Yard are large ship houses, timber sheds, store-houses, workshops, &c., and

an immense dry dock, the most extensive work of its kind in the United States. Eastward from the Navy Yard stands the Naval Hospital on an eminence commanding an extensive prospect of interesting scenery; the hospital stands in a well laid out park of about 33 acres. The Greenwood Cemetery, covering about 300 acres of ground, in the south part of the city, is pleasantly laid out with walks, trees, shrubbery, and small ponds or lakes, and contains numerous good monuments, many of which are of white marble. Brooklyn has communication with New York by five ferries across East River, which is here about half a mile broad, and across which first-class steamers constantly ply, the usual charge being one cent for each passenger. Carriages and waggons are also conveyed across. A considerable amount of trade is carried on in Brooklyn. It is a favourite place of residence for the merchants of New York. Four daily newspapers are published in the city. Some remains are still visible of fortifications erected by the Americans during the revolutionary war. The site of Fort Green has been converted into a public park called Washington Park. Near the Navy Yard is a tomb in which were placed the remains of 11,000 Americans who perished in the prison ships which were moored in the bay during the period of the revolutionary struggle.

BROSELEY, Shropshire, a market-town in the parish of Broseley and district of Wenlock borough, is situated on the river Severn, in 52° 34' N. lat., 2° 30' W. long., 13 miles E.S.E. from Shrewsbury, and 144 miles N.W. by W. from London. The population of the parish in 1851 was 4739. The living is a rectory held with the rectory of Linley in the archdeaconry of Salop and diocese of Hereford. Extensive iron and coal mines and brick and tile works afford the chief means of employment to the population. The parish church, an edifice in the perpendicular style, rebuilt in 1845, will accommodate about 1200 persons. There are places of worship for Baptists, Independents, and Wesleyan and Primitive Methodists. Within the parish are two National schools. The town is lighted with gas. A market is held on Wednesday, and an annual fair on Easter Monday. A spring of petroleum or fossil tar was discovered here in 1711. After some years the supply of petroleum failed, but the spring broke out again in 1747, and yielded about three or four barrels a day; about 1752 the spring was cut into in searching for coals, and the quantity of petroleum yielded has since been small. At Pitchford, a few miles from Broseley, is a coarse-grained sandstone, highly impregnated with petroleum.

BROUGH, or **BURGH-UNDER-STAINMOOR**, Westmorland, a small market-town in the parish of Brough, in the East Ward, is situated on the mail-coach road to Carlisle and Glasgow, in 54° 28' N. lat., 2° 20' W. long., 8 miles S.E. from Appleby, and 262 miles N.N.W. from London by road; Tebay station of the Lancaster and Carlisle railway, which is 16 miles from Brough, is 263 miles from London. The population of the township of Brough in 1851 was 773; that of the entire parish was 1533. The living is a vicarage in the archdeaconry and diocese of Carlisle.

The town of Brough is little more than a village, the railway having destroyed the coaching trade which from its position on the North Mail Road it formerly possessed. A small weekly market is held on Thursday: there are two cattle markets and two annual fairs, one of which, called Brough-Hill fair, is held on a common two miles from the town, and is a great fair for cattle, horses, wearing apparel, and hardware. The town is divided into two parts, called Market Brough and Church Brough, by the Hilbeck, a small feeder of the Eden. Lead and coal mines in the parish give employment to a considerable number of the inhabitants. The church is a neat structure of the 14th century, with a handsome embattled tower of somewhat later date, and a peal of four bells. There is a chapel at Stainmoor in the parish; and there are places of worship for Baptists and Wesleyan and Primitive Methodists. The Endowed Grammar school has recently been incorporated with a National school.

Brough Castle is a very ancient edifice: the ruins stand on an eminence, in the midst of what is supposed to have been the Roman station of *Vertere*. Both castle and town were taken and sacked by King William of Scotland in 1174. The chief parts now standing are portions of the keep and some other towers; the keep is in its general appearance similar to those of the Tower of London, Rochester Castle, &c. Many Roman coins have been dug up in the parish.

BROUGHSHANE. [ANTRIM.]

BROUGHTON ARCHIPELAGO. Vancouver gave this name to the group of islands discovered by him in company with Captain Broughton, in 1793, off the west coast of North America, to the north of Vancouver Island.

The Chatham Islands, discovered in 1791 by Captain Broughton, are also sometimes called the Broughton Archipelago. [CHATHAM ISLANDS.]

BROUGHTON-IN-FURNESS. [LANCASHIRE.]

BROUGHTY FERRY. [FORFARSHIRE.]

BRUCHSAL, an old town on the *Salzach*, in the circle of Mittel-Rhein, in the grand duchy of Baden, is mentioned in ancient records between the years 937 and 996, when it was called *Bruxole*. It was the residence of the bishops of Spire from the year 1024, and came into the possession of the grand dukes of Baden in 1803. It is situated 15 miles N.E. from Karlsruhe by the railway to Mannheim,

and has a population of about 8000. The town, which is surrounded by a wall, is well built, and consists of the Old Town, the New Town (founded in the last century), and the suburbs of St. Peter and St. Paul, which the Salzach separates. The buildings most deserving of notice are the former episcopal palace, a handsome structure in the Italian style; spacious barracks and stables; three parochial and three auxiliary churches, the finest of which is that of St. Peter, where the last four bishops of Spire lie interred; an ecclesiastical seminary; a gymnasium; a military hospital, another well-arranged hospital for 70 patients, conducted by the confraternity of Pious Brothers, and provided with an anatomical theatre and a lecture room; and a general house of correction for the circle of the Mittel-Rhein. There are some salt-works outside of the town; but they are in a state of decline. The principal occupation is making and selling wine.

BRUFF. [LIMERICK.]

BRUGES, a city in Belgium, capital of the province of West Flanders, is situated in a level country, in 51° 12' N. lat., 3° 13' E. long., about 6 miles from the sea, and has a population of 49,457. Its Flemish name Brugge is derived from the number of bridges which cross the canals. The city is connected with all the principal towns in Belgium by railway. It is distant 14 miles E. by S. from Ostend, 50 miles W. by S. from Antwerp, and 75 miles W.N.W. from Brussels. Its distance from Brussels in a straight line however is only 60 miles.

In the 7th century Bruges held the rank of a city. In 837 it was fortified by Baldwin, count of Flanders, in order to form a barrier to the progress of the Northmen. The city was surrounded by walls in 1053, and enlarged in 1270. It was almost entirely destroyed by fire on three several occasions—in 1184, 1215, and 1280. It was further enlarged in 1331 by Count Lewis de Crey. In order to commemorate the high degree of perfection to which the woollen manufacture had then been carried in Bruges, Philip the Good in 1430 instituted the order of the Golden Fleece. While under the dominion of the dukes of Burgundy Bruges became a principal emporium of the commerce of Europe, the great centre of the English wool trade, and the connecting link between the Hanseatic league, and the great trading republics of Italy. The merchants of Venice and of Genoa conveyed thither the produce of Italy and the Levant, which they exchanged for the manufactures of the north of Europe. The tapestry of Bruges was at that time the most esteemed of any in Europe, and this reputation it long enjoyed. In addition to the woollen manufacture Philip the Good gave encouragement to many other branches of industry, and particularly to the production of silk and linen fabrics. His enlightened patronage attracted the Van Eycks to Bruges, in whose time the painters' guild, enrolled in 1358, numbered above 300 painters. At the time of its greatest prosperity Bruges is said to have had a population of 200,000.

In 1488 the citizens rose against the archduke Maximilian, and placed him in confinement. Having vainly solicited the king of France to support them in this act of violence they were reduced to submission by the emperor of Germany, who marched to the deliverance of his son. On this occasion 56 citizens were condemned to death, and a great number were banished; the city was deprived of its privileges and was subjected to a heavy fine. From this time the city lost its commercial importance, which was in great part transferred to Antwerp. In 1560 Pope Paul IV. erected Bruges into a bishopric, which was united to that of Ghent by the concordat of 1801 but since the fall of Napoleon has recovered its independence. Bruges was bombarded by the Dutch in 1704. Two years thereafter it surrendered to the allies; and it was twice taken by the French—in 1708 and 1745, but reverted to the house of Austria. In 1794 the troops of the French republic took possession of the city, which was soon after incorporated with France, and so continued until the close of the war in 1814, when it became part of the kingdom of the United Netherlands. Bruges, during its annexation to France, was the capital of the department of Lys.

Bruges stands on the little river Roge, which was formerly navigable, and crowded with richly freighted cargoes up to the quays of the town, but is now almost absorbed by canals. Ramparts extending all round the town form an agreeable public walk. The streets of the town are narrow, but neat and clean, and the houses are mostly large and well built; many of them have an appearance of grandeur which attests the opulence of their former inhabitants. The public buildings are numerous and interesting for their antiquity, their architecture, and the works of art which they contain. We can here only enumerate the principal.

The cathedral of St. Sauvour, in Stoen Street, is externally an ugly brick building; but the interior is the finest in Bruges. It dates from 1358, and contains several curious paintings by Hemling and others, and a series of monumental brasses. At a short distance from the cathedral is the church of Onze-Vrouw (Notre-Dame), surmounted by a tall brick tower: the interior is celebrated for its elaborately carved pulpit, and for the statue of the Virgin and Child by Michel Angelo. In a chapel on the south side of the choir are the tombs of Charles the Rash and his daughter Mary, wife of the emperor Maximilian. Mary's monument was erected in 1495; that of Charles was erected at the cost of his great-grandson, Philip II., about 1558. These monuments, so dear to the Flemish, were concealed from the rapacity of the French by the beadle of the church; they were cleaned

and re-gilt in 1848. Close to Notre-Dame is the hospital of St. John, where the sick are tended by nuns, and in which are the celebrated pictures executed by Hans Hemling in 1479 and presented to the hospital in gratitude for the attention he received in it after the battle of Nancy, in which he was wounded. The subjects of these admirable paintings are the 'Virgin and Child with St. Catherine,' the 'Decollation of St. John the Baptist,' and 'St. John at Patmos;' the two latter are painted on the shutters. On a Reliquary are painted by the same artist the Life and Martyrdom of St. Ursula, a series of small pictures which rank, says Kugler, among the very best productions of the Flemish school. In the chapel is an altar-piece by Hemling, representing the Adoration of the Magi; and at the sides the Nativity and the Purification. The large gothic hall of the hospital, divided by piers and pointed arches into aisles and partitioned off into wards and dormitories, remains the same as when Hemling was tended in it. The town-hall, an elegant gothic structure, dates from 1377. The long series of statues of the counts of Flanders which filled the niches on the façade was pulled down, smashed, and burnt in the great square by the French in 1792. In the grand hall of this building, remarkable for its open roof of wood-work, the public library is placed. Adjoining the town-hall is the court-house, the council chamber of which is decorated with a finely-carved wooden chimney-piece, representing life-size statues of Charles V., Mary of Burgundy, Charles the Bold, and Margaret of York. At the other end of the town-hall is the curious chapel of the Saint Sang, under which is a crypt dating from the 9th century, and said to be the oldest building in Bruges. The former cathedral of St. Donatus, which was demolished by the French, stood opposite the town-hall, and contained the remains of John Van Eyck, who died here in 1441. Its site is now planted with trees, among which is a painted plaster-cast statue of Van Eyck. The Academy of Painting in the Het Poorters Huis, which was formerly the factory of the Biscayners, is rich in old paintings by Van Eyck, Hemling, and others. On one side of the Grande Place is the Halle, which dates from 1364, and is surmounted by an elegant gothic tower of great height, and commanding fine views of the town and surrounding country. This tower contains the carillons, or chimes, which are the finest in Europe; they are played by machinery every quarter of an hour. Bruges was famous for its chimes as early as the year 1300. On the south side of the Grande Place is a house (Au Lion Belge) which was inhabited by Charles II. during his exile from England. Of the many other remarkable structures in Bruges we can only name the Beguinage, or convent of Beguine nuns, at the west end of the town, and the English nunnery, founded about a century ago, and admired for its beautiful chapel, in which part of the offices are exquisitely chanted by the nuns.

Six canals diverge from Bruges to Ghent, Sluis, Nieupoort, Furnes, Ypres, and Ostend. The high embankments along the canal to Ghent are immortalised by Dante in the 15th canto of his 'Inferno.' The canal from Ostend allows the passage from the sea to Bruges of vessels of from 200 to 300 tons burden. There are besides a wet dock and a dock for the building and repair of vessels, and warehouses for receiving goods in entrepôt. In the 12th and 13th centuries the port of Bruges is said to have been at *Dunne*, now a small village 3 miles N.E. from the town. Here were docks and basins capable of holding 1000 sail, where now is a fertile plain.

Bruges has an academy of the fine arts, an atheneum or college, in which lectures on every branch of education are given gratuitously, a museum, a botanic garden, a public library, a cabinet of natural history, and a school of navigation. The principal trade is in linen and cotton manufactures, corn, flax, hemp, and colza. The manufactures of Bruges consist of linens, lace, woollen and cotton goods, salt, refined sugar, earthenware, paper, and other minor branches of industry. Its trade, which had greatly decayed, is said to be partially reviving under the influence of that general prosperity which Belgium has enjoyed since her separation from Holland. The city however still has a desolate air; it is too large for its population, and the passers-by in its streets seem few.

(Murray's *Belgium and the Rhine*, London, 1852.)

BRÜNN, the capital of Moravia, since 1641, when the seat of government was transferred hither from Olmütz, is situated in the fork between the Zwittern and Schwartzava, at a distance of 92 miles by railway N.N.E. from Vienna, 102 miles S.W. from Prague, and has about 40,000 inhabitants. It stands in the middle of a fine open country, and partly on an eminence which commands some beautiful and extensive prospects. The town is surrounded by a deep ditch and high walls, and was formerly protected by the citadel of Spielberg, constructed on the summit of a hill 816 feet in height; but since the partial demolition of its defences by the French, in 1809, the Spielberg has been converted into a state-prison and a house of correction. The fortifications of Brünn have been greatly strengthened since 1850. East of the Spielberg is another eminence, the Franzensberg, about 600 feet in height, along one side of which the residences of the chapter and the new parts of Brünn have been erected. Independently of the Spielberg, the town is about a mile and a half in circuit, and has four gates facing the cardinal points; the streets are irregular, narrow, and crooked, but well paved, provided with flag-stones for foot passengers, and well lighted at night. There are seven squares ornamented with fountains. The Largo Square is of

spacious dimensions, surrounded by good dwelling-houses, and embellished with a handsome column. Brunn is divided into six parishes, and has as many parochial churches, besides those in the suburbs. The cathedral stands on the Petersberg, a rocky height in the west part of the town. St. Jacob's is a fine specimen of the gothic style of the beginning of the 14th century: the roof, which is very lofty, is supported by two rows of columns, and is covered entirely with copper: the steeple is 276 feet high. The church of the Minorites, with the adjoining sacred staircase and house of Loretto, is of peculiarly handsome construction; and the church of the Capuchins (celebrated for Sandrart's fine altar-piece, the Raising of the Cross), as well as the gothic church of the Augustinian monastery, in the Althbrunn suburb, with Kranach's Madonna and a large library are well deserving of notice. Among other public buildings are the Dicasterial House, which contains the governor's residence and the government-offices; the palace for the military department; the town-hall which is embellished in the gothic style; the theatre, and its assembly-room; the Jesuits' college, the northern front of which occupies one side of a whole street; the archiepiscopal palace built on the Petersberg, one of the most commanding sites in the town; the handsome mansions of the nobility; the military hospital; and the Maria-school, an endowment for females of noble birth. There are several delightful promenades in and near Brunn, the most attractive of which are the gardens on the Franzensberg, which are ornamented with an obelisk, 60 feet high, erected in 1818 in honour of the emperor Francis I.; and the Augarten, a park laid out in the English and French style. Brunn is the seat of government for the Margraviate; and also of the high courts of judicature. It gives title to the metropolitan of Moravia, and the Protestant consistory is established here. Among the educational establishments of Brunn are an episcopal seminary, a gymnasium, a museum, a training school, an academy for girls attached to the Ursuline convent, and several other schools. The principal benevolent institutions of the town are a general infirmary, a lying-in hospital and lunatic asylum; an orphan asylum; asylums for the blind, and the deaf and dumb; and a national loan-bank. Independently of the house of correction on the Spielberg, there is another here for the province in general.

Brinn is one of the most important manufacturing towns in the empire of Austria. It is particularly noted for the manufacture of fine woollen cloths and kerseymeres, silks, ribbons, yarns, leather, gloves, carpets, cotton prints, and vinegar. No town in Moravia has so extensive a domestic trade, in which it is much favoured by its central position and by the railways which connect it with all the leading towns of Austria, Prussia, and Central Germany. It has four wholesale markets in the year, which are each of fourteen days' duration. The trade of Brunn in colonial and other foreign productions is also extensive.

BRUNSWICK (Braunschweig). Two distinct sovereignties have sprung from the house of Brunswick. The possessions of the elder or ducal line are confined to the grand duchy of Brunswick-Wolfenbüttel; the younger or electoral line, by whom the kingly title was assumed in 1814, possesses the kingdom of Hanover, and is also designated the Brunswick-Lüneburg, or Hanoverian line. The latter line has given kings to Great Britain since the commencement of the 18th century. This article relates wholly to the duchy of Brunswick.

The duchy is at present divided into six circles, which, with their respective area and population, are as follows:—

Circles.	Area in Square Miles.	Pop. in Dec. 1852.
Brunswick . . .	224	69,702
Wolfenbüttel . . .	230	52,662
Helmstedt . . .	305	44,312
Holzminde . . .	316	30,400
Gandersheim . . .	276	42,257
Blankenburg . . .	173	22,492
Total . . .	1524	270,825

The lands of which the duchy of Brunswick is composed principally consist of three large unconnected districts, lying on the banks of the Aller, Ocker, Leine, and Weser, in the north-west of Germany. The most southern of these districts lies wholly upon or next the Lower Harz; the eastern district extends from the northern foot of the Harz to the plains of Lüneburg, and is traversed by several ranges of hills, but declines in the north to an uninterrupted plain; and the third or western district is all highland, and embraces portions of the Solling, Ilt, and Hills ranges. These territories are bounded N. and S. by Hanover, E. and S.E. by Prussian Saxony and Anhalt, and W. by the Weser which divides them from the Prussian dominions. Brunswick possesses also three isolated demesnes—the bailiwick of Ottenstein, on the right bank of the Weser, which is quite detached from the rest, and has the principality of Wuldeck for its neighbour; the bailiwick of Thedinghausen, which is surrounded by the Hanoverian earldom of Hoya; and the bailiwick of Calvörde, which is situated within the borders of Prussian Saxony. These several possessions were formerly constituent parts of the German empire, con-

sisting of the principalities of Wolfenbüttel and Blankenburg, the ecclesiastical bailiwick of Walkenried, the bailiwick of Thedinghausen, and other isolated parcels of land, together with four-fifths of the sovereignty of the Lower Harz.

The northern districts of Brunswick, particularly the principality of Wolfenbüttel, have an undulating surface, intersected by several ranges of hills, and there are also some forests: at their northern extremity heaths and moors occur. The southern districts, including the Blankenburg territory, which lie within the limits of the Harz, are a succession of highlands and mountains, in part well wooded, and furrowed by wide and highly-cultivated valleys. The Harz is the principal mountain range in the Brunswick dominions; it amounts to 104,000 acres, independently of its offsets. The loftiest summits within the duchy are the Wormberg, which is 2880 feet, the Radauerberg 2317 feet, the Förstertrünke 2298 feet, and the Rammelberg 1914 feet high. Throughout the duchy the surface gradually declines from this range towards the north, the larger portion sloping to the banks of the Weser, and the remainder eastward in the direction of the Elbe.

The soil in the north is highly productive, with the exception of the extreme borders, which belong to the great Lüneburg plain, though even here it does not degenerate into mere drift-sand or barren heath. In the south the country is mountainous and of a stony character, which is particularly observable of the Blankenburg districts; but in Wolfenbüttel and Scheppenstädt, and next the Weser and Leine, it admits of profitable cultivation. Thedinghausen consists partly of marsh and partly of high land. The most unproductive tract in Brunswick occurs in the bailiwick of Ottenstein, in the Holzminde circle.

The whole of that part of the Harz which is comprised within the Brunswick territory belongs to the region of the Lower Harz; the highest point is on the north-east edge of the most southerly districts, whence it spreads not only over the entire principality of Blankenburg, but sends out its branches, though not always in an unbroken line, over most parts of the duchy. These mountains contain the bulk of the woods and forests of Brunswick; the higher regions of the Harz are exclusively the regions of the fir and pine; the less elevated have these species of wood intermixed with underwood; and the lowest acclivities abound in oaks, beeches, birches, alders, &c.

The most considerable river in the duchy, the Weser, flows for about twenty miles through its western territory (where it is navigable), and again through the district of Thedinghausen, which lies about 14 miles S.E. from the city of Bremen. Among its tributaries, the Aller traverses a small portion of the northern district of Vorsfelde only, but in its course receives the Ocker, the principal river of the northern half of Brunswick, and is very useful to the duchy as a means of transporting timber. Other tributaries of the Aller are the Leine, which divides the Harz from the Weser districts; the Kune, which traverses the western extremity of Wolfenbüttel; and the Innerste, which rises in the Harz, and passes into the Hildesheim territory. The chief streams which discharge their waters into the Elbe or its tributaries are the Ohre and Bode. The Bode is the principal river of Blankenburg.

Brunswick contains a great number of ponds. The Wipperteich, near Vorsfelde, is still the largest of them, although a considerable portion of it has been reclaimed. There are mineral springs of some note at Helmstedt and near Seesen on the Harz, and sulphuretted waters near Bisperode and Bessingen. The great morass which formerly extended from the Ocker to the Bode has been drained by the navigable canal which now unites those rivers.

The valleys between the mountain ranges of the southern and western parts of Brunswick are by no means so favourable to the growth of grain as the rich lands in the vicinity of the Weser and Leine. The eastern highlands also, being too cold and stony for agricultural purposes, are used for grazing and supplying timber; but the northern part of Brunswick, where the sand usually acquires consistency from the presence of loam or mould, yields good crops of most kinds of grain. The country is seldom parched by excessive heat, and winter is usually limited to three months' duration in the northern districts; and even in the southern the atmosphere is cold and exposed to storms only among the mountain regions of the Harz. In the northern, harvest begins in the third week of July; and in the southern it is not above fourteen days later.

The agricultural products comprise wheat, rye, barley, oats, hay, common fruits, beans and peas, potatoes, tobacco, hops, rape-seed, chicory, and flax.

Horses and horned cattle are numerous, but of rather inferior breed. Great attention is paid to the rearing of sheep, and wool is an important article of the commerce of the duchy. Of goats and poultry the supply is scanty. Great numbers of bee-hives are kept in the sandy districts where heath grows. Fresh-water fish, such as carp, pike, and trout, are plentiful.

The woods and forests are placed under the control of a public board. Their most extensive sites are the districts of the Harz, Blankenburg, and the Weser, where the felling and preparing of timber, and the working it into utensils and for other domestic purposes, employ a vast number of hands. The most common kinds of wood are beech, fir, pine, and oak.

The mines of Brunswick are of two classes; one class comprising such as are worked in conjunction with Hanover (Communion-Harz), and the other independently of it. The mines of the Upper Harz yield small quantities of gold and silver, and are rich in iron, copper, lead, litharge, zinc, vitriol, sulphur, and salt. These mines are under the direction of a joint board at Goslar. The independent mines lie on the Lower Harz, in the principality of Blankenburg, near Seesen, and the district of the Weser; their principal produce is iron. Other mineral products are marble (near Blankenburg), alabaster, limestone and gypsum, potter's-clay, asbestos, serpentine, agate, jasper, chalcedony, garnets, porphyry, sandstone, freestone, coal, and alum. There are several saltworks. Cobalt and ochre are obtained from the Rammelsberge mines in the Upper Harz.

The peasantry use the Low German, and the townspeople and persons of education the High German dialect. For higher education the youth of Brunswick frequent the neighbouring university of Göttingen, into which 40 Brunswick students are admitted gratuitously, the duchy contributing a small portion of the professors' stipends. At the head of her own educational establishments in Brunswick, are a lyceum, conducted by 19 professors, and frequented by pupils from the higher classes of society; an anatomical and surgical institute; a gymnasium; and other schools. There are gymnasia also in Wolfenbüttel, Helmstedt, Blankenburg, and Holzminden. For the poorer classes there are schools of industry, civic schools, and above 400 parochial schools in the duchy. There is a public library at Wolfenbüttel, containing upwards of 200,000 volumes and 10,000 manuscripts, &c., besides libraries and cabinets in the capital and in other towns.

The constitution of Brunswick is a limited monarchy, the form of which is determined by the national compact of the 12th of October, 1832. The sovereignty passes to the female upon the failure of the male line, and the heir-apparent comes of legal age on attaining his eighteenth year. The legislature is composed of the duke, an upper chamber consisting of 6 prelates and 78 holders of equestrian estates; and a lower chamber, composed of 6 prelates, 19 deputies from towns (6 from Brunswick and one from every other town), and as many representatives of the landholders, who do not possess equestrian rights. During the prorogation of the chambers, a permanent committee of representatives acts as a legislative organ. The legislature must be assembled once at least every three years in the month of November. The taxes are voted for periods of three years; and every point connected with the finances, and indeed with the administration of national affairs, is more or less under the cognisance and control of the legislature. All Christian persuasions enjoy an equality of civil rights. The property of the church, schools, and charitable endowments cannot be diverted from its original destination, nor can it be incorporated with the property of the state.

There are provincial boards in each circle for its local government and police.

The revenue is derived from the ducal demesnes, monopolies, &c., and the direct and indirect taxes. The income of Brunswick for the financial period 1852-54 is estimated at 4,052,500 thalers, and the expenditure at the same amount. For public instruction, church aids, and benevolent institutions, the sum of 421,000 thalers, derived from property belonging to religious communities and schools, is allotted during the same period. The public debt amounted in September 1845 to 9,469,457 thalers, 3,725,000 of which were borrowed for the construction of railroads. Brunswick is a member of the German Zollverein, or Customs Union, the receipts from which on its frontiers in 1851 amounted to 393,618 thalers, in 1852 to 404,501 thalers.

The military establishment consists of an infantry corps, numbering 4857 men in time of war and 2476 in time of peace, with an artillery force of 502 in time of war and 244 in time of peace. By a military convention made with Prussia in December 1849, the Brunswick brigade is joined to the Prussian division in garrison at Magdeburg.

The mineral resources of Brunswick afford extensive employment for the labouring classes; but they are also extensively employed in the spinning of yarn and weaving of linen. About 5000 tons of flax are annually grown. The linen manufacture however has greatly declined of late years. In the districts nearest the Weser the people knit considerable quantities of stockings; and in the northern parts the peasantry make for their own use a species of linsey-woolsey called 'beiderwand.' Seed-oil is an important product of the lowlands, averaging 1200 tons a year. Other industrial products are paper, plaster-of-Paris, lime, tiles, pottery, pipes, china, glass, soap, ribbons, beer, and tobacco. The manufacture of woollens is small, and principally carried on at Brunswick. The number of water-mills is 234, wind-mills 63, and mills worked by horses 6: besides these, Brunswick possesses 51 saw and other mills.

The duchy having no coast or navigable streams, its trade with foreign parts is naturally cramped; but the introduction of railroads connecting Brunswick and Wolfenbüttel with the principal towns and ports of Germany has given a great impulse to commerce. The chief articles of home manufacture which are exported consist of yarn, linen, grain, oil, chicory, madder, leather, timber, hops, and ironware. The importations are principally composed of colonial produce, raw materials, fish, butter, cheese, cattle, &c.

The chief towns in Brunswick are those which give name to the several circles. BRUNSWICK the capital and WOLFENBÜTTEL are described in separate articles. *Helmstedt*, a walled town with suburbs, is situated near the Prussian frontier, 22 miles E. by S. from Brunswick, and has about 6000 inhabitants. It was formerly strongly fortified, but the outworks have been levelled, the ditches filled, and their sites converted into walks planted with trees. The girding wall still remains, through which four gates lead into the town, an old looking place. It contains however several small squares, two Lutheran churches, of which that of St. Stephen is the finest, an orphan asylum, a town-hall, and the former university building now used as a court-house. The university founded in 1575 was suppressed in 1809 by Jérôme Bonaparte, and a part of the library transferred to Göttingen. It has still a college and training school. The town is a place of some manufacturing and commercial activity: flannel, soap, hats, grain spirits, vinegar, leather, pipes, &c. are made: coal mines are worked in the neighbourhood. *Holzminden*, 56 miles S.W. from Brunswick, on the right bank of the Weser at the foot of the Solling mountains, is a small but well-built town, with a comparatively large suburb called Altendorf, and about 4000 inhabitants. The town is a busy industrious hive, turning out a great variety of products: iron and steel wares, hosiery, flannel, linen, linen-thread, paper, leather, &c. There are saw-mills, paper-mills, oil-mills, a hydraulic engine for cutting and polishing the flags brought from quarries of the Solling, and iron works. The Brunswick tolls for the passage of the Weser are paid at Holzminden, which is also a port of entry for colonial and other produce required for Brunswick and the neighbouring parts of Germany. *Gandersheim*, near the Hanoverian frontier, 37 miles S.W. from Brunswick, is a small place with about 2000 inhabitants. It has a ducal residence, but the most remarkable building is the former abbey of Gandersheim, of which the abbess was always a member of the house of Brunswick. The town and former principality of *Blankenburg* are noticed in a separate article. [BLANKENBURG.]

BRUNSWICK, the capital of the Duchy of Brunswick, is situated on the Ocker, 37 miles by railway E.S.E. from Hanover, 85 miles W. by N. from Magdeburg, in 52° 16' N. lat., 10° 32' E. long., and has about 42,000 inhabitants. It was founded by Henry the Lion. It became one of the Hanse towns in the 13th century, and until the middle of the 15th was accounted the chief town in Lower Saxony; but its prosperity declined with that of the Hanse towns. It is at present the residence of the Dukes of Brunswick. The fortifications were levelled in 1794, and converted into promenades. The area of the town, which includes Richmond, the duke's country seat, Eiscbüttel, and the Münzberg, occupies about eight square miles. The town contains some new streets, but the greater part of it is old looking. The streets are well lighted and paved. Among its 12 churches are the cathedral, in which are monuments to Henry the Lion and Matilda his consort, and the vault of the ducal family; and St. Andrew's, the steeple of which is 310 feet high. The chief public buildings are the new palace, house of legislative assembly, mint, arsenal, opera-house, town-hall, Collegium-Carolinum, and general and lying-in hospital. Between the Augustus and Steinthore gates an obelisk 60 feet high is erected to the memory of the two dukes of Brunswick who fell in the campaigns of 1806 and 1815. The establishments for education consist of the college, a gymnasium, and seminary for teachers, a college of anatomy and surgery, two orphan asylums, and a deaf and dumb asylum. There is a good museum in the arsenal. Brunswick has 7 gates and 12 squares or open spaces. A fine avenue of lime-trees leads from the town to the duke's seat, Richmond, the grounds of which are laid out in imitation of Richmond Park near London. The principal manufactures are woollens, linen, lickered and hard ware, tobacco, chicory, mineral colours, sealingwax, china, papier maché, leather, coloured papers, brandy, and liqueurs. Brunswick has an important wool-market; its once celebrated annual fairs are now of little account.

BRUNSWICK. [MAINE.]

BRUNSWICK, NEW. [NEW BRUNSWICK.]

BRUNTSISLAND. [BRUNTSISLAND.]

BRUSA, PRUSA, BURSA, or BROUSSA, a celebrated town in the ancient province of Bithynia, in Asia Minor, stands in 40° 11' N. lat., 29° 26' E. long., at the northern base of the Bithynian Olympus, in a most picturesque and fertile country. Prusa is mentioned by Strabo (p. 564, Cus.) as a well-governed town, situated near the Mysian Olympus, which is the same as the Bithynian. Strabo (p. 564) says that Prusa was founded by Prusias, who carried on war against Croesus. Pliny ('Hist. Nat.' v. 32) says that it was built by Hannibal, alluding to the time when he was staying at the court of Prusias, king of Bithynia. The town rose to importance only after its capture by Orkhan, the son and successor of Osman, the first sultan of the Osmanlis, who took it by capitulation a few weeks before the death of his father, in A.D. 1326. Prusa surrendered after a blockade of ten years, effected by means of two castles which Osman built in the immediate neighbourhood of the town, one of which, the castle of Balabanjik, is still standing.

Brusa became the residence of Orkhan, and this sultan, as well as Murad I., Bayazid I., and Mohammed I., and several Turkish princes were buried in the new capital. It continued to be the capital of the Turkish empire to the capture of Constantinople in 1453, though

during twenty years previous to this event the sultans used to reside at Adrianople. During several centuries it was the principal seat of Turkish learning, and its divines were notorious for their prejudices and fanaticism; but its inhabitants are now distinguished for their toleration and hospitality towards Europeans. The population is about 60,000, including about 9000 Armenians, 3000 Greeks, and 2000 Jews of Spanish descent. A rapid torrent flows along a deep gap through the town, and divides the Turkish quarter from the Armenian. The streets are narrow and tolerably clean for a Turkish town: the houses are mostly built of wood and clay. Brúsa is well supplied with fountains, and contains several very fine buildings, among which the great mosque is the most remarkable: in the mosque of Dáúd Monasteri, rather a small building, is the tomb of Sultan Orkhán. The total number of mosques exceeds 200. There are also large bazars, several khans, colleges, Christian churches and schools, and more than one synagogue. In the centre of the town is the citadel, built on a rock. Brúsa is one of the most important commercial centres in Turkey; it has an important trade in raw silk, and its industrial products comprise satin, carpets, longcloths, cotton and cotton-twist, tapestry, &c. The trade in corn, opium, and incense, which is quarried in the neighbourhood, is important. The bazars are well stocked with all kinds of British and other European manufactures, which are imported through Mudaniyeh, the port of Brúsa, six leagues distant on the Sea of Marmara. The trade with Constantinople, Smyrna, and the interior of Asia Minor is carried on by caravans. There are several permanent European residents in Brúsa. The beauty of the environs of Brúsa is celebrated, but the principal features of the town as well as the environs are the hot springs. The chief source is about a mile and a half west of the town; it rises out of a calcareous tuff or travertine, the formation of which is still going on in some places. Hamilton found the heat of the water to be 184° Fahrenheit; about a hundred yards farther west there is another spring, the temperature of which is 180° Fahrenheit, and there are several more in the neighbourhood. Abd-el-Khadir, the Arab chief, so long confined in France by the policy of Louis Philippe, and at last restored to liberty by the emperor Napoleon III., retired to Brúsa on his departure from France in 1852.

(Von Hammer, *Umblick auf einer Reise nach Brúsa und dem Olympus*; Hamilton, *Researches in Asia Minor*, &c.)

BRUSSELS (in Flemish *Brussel*, in Latin *Brucellæ*, and in French *Bruxelles*), the capital of the kingdom of Belgium and of the province of South Brabant, is situated in 50° 50' N. lat., 4° 22' E. long., on the river Senne, a small feeder of the Dyle, at a distance of 76 miles in a straight line, 89 miles by railway through Malines and Ghent E. by S. from Ostend, 30 miles S. from Antwerp, and has a population of 124,461, or including the suburbs about 160,000.

The Senne enters the city of Brussels by two branches, one of which passes by the old market-place, and the other crosses the garden of the Chartreux. It forms four islands in the interior of the city, the two principal of which are called Saint Géry and Bon Secours. The river is not navigable in any part of its course, but a broad navigable canal runs parallel to the Senne northward to Vilvorde, whence it is carried to Willebroeck on the Rupel. Another canal running southward for a considerable way also parallel to the Senne connects Brussels with the Sambre above Charleroi. The city has railway communication with all the principal towns of Belgium, and with France, Germany, and the Dutch frontier.

The greatest length of Brussels from north-north-east to south-south-west is about one mile and a half, and its greatest breadth about a mile and a quarter. In form it resembles a rectangle combined with a triangle, the base of the rectangle subtending the north-north-east, and the vertex of the triangle, which is much rounded, lying towards the south-south-west. The town is partly built on the side of a hill, and when seen from the west has the appearance of a fine amphitheatre. It is inclosed by a brick wall, which has eight gates, bearing respectively the names of the Antwerp, Solmerbeck, Louvain, Namur, Hal, Anderlecht, Flanders, and the Canal gates. These gates communicate with high roads, leading to different parts of the kingdom, which centre in Brussels as the capital, and outside the gates are several large suburbs. Inside the wall a wide boulevard planted with fine trees runs all round the town, and is above five miles in length.

Brussels is divided into an upper and a lower town. The upper town is on the eastern side of the city; it is also the newest and most fashionable quarter as well as the healthiest owing to its more elevated site. Here are the king's palace, the legislative chambers, and public offices in the Rue de la Loi, separated from the palace by the park, in the north-eastern angle of which is a theatre. In the upper town also are all the principal hotels and the residences of foreign ambassadors and ministers. The leading features of the lower town are its numerous well-built streets, which contain many fine old buildings formerly the residences of the Brabant nobility, now occupied by merchants and tradespeople. It has splendid churches and other public buildings; and several handsome squares surrounded by noble buildings, some of them unrivalled specimens of gothic civil architecture. An entirely new quarter, called the Quartier Leopold, has recently sprung up between the Louvain and Namur gates to the east of the upper town. This quarter contains many modern mansions, and is becoming the fashionable part of the town. French is the prevailing

language of Brussels, which is similar to Paris in many respects - in its operas, cafés, hotels, palace garden resembling that of the Tuileries, and boulevards. English is very generally spoken, Brussels having been for a long time resorted to by English families as a cheap place of residence. Flemish also is commonly spoken.

Brussels contains above 300 streets, besides numerous lanes and courts. Several of the streets are wide and airy; the houses are lofty and well built, and great care is taken to preserve their external cleanliness and neatness. The square of the great market-place (*La Grande Place*), situated in the centre of the city, is a parallelogram, surrounded on all sides by handsome buildings; the *Hôtel-de-Ville*, or town-hall of Brussels, and the halls of many trading companies occupy two of its sides. Of the other squares the principal are the *Place Royale* in front of the church of St. Jacques at the end of the *Rue Royale*; in the centre of this square is a fine bronze equestrian statue of Godfrey de Bouillon: the *Place du Grand Sablon*, at the end of which is the court-house, or *Palais de Justice*, a large structure formerly belonging to the Jesuits: the *Petit Sablon*, on the south-east side of which is the *Prison des Petites Carmes*, built on the site of the *Hôtel Cuylenbourg*, the place of meeting of the confederates in the reign of Philip II.: the *Place des Martyrs*, in which is a statue of Liberty, supported by four kneeling Genii, erected over the tomb of the Belgians slain in the revolution of September 1830: the *Place de la Mounaie*, on one side of which is the Mint, and opposite it the theatre royal, a handsome structure. Among the ornaments of the town are the public fountains, 29 in number, erected in different parts, which supply the inhabitants with water. One of these fountains, that in the *Place du Grand Sablon*, consisting of a beautiful group in statuary marble, was erected in 1751, under the will of the Earl of Aylesbury, "as an acknowledgment of the enjoyments he had experienced at Brussels during a residence of forty years."

Brussels contains twelve large churches, only a few of which are very remarkable for their exterior; but the interiors are for the most part decorated with rich sculptures, wood carvings, and paintings. The finest of these structures are the collegiate church of Sainte-Gudule, which stands at a short distance from the *Rue Royale* and the chamber of deputies; the church of Notre Dame de Bon Secours; and the church of Notre Dame de la Chapelle, situated in the *Rue Haute*, and containing some fine oil paintings and frescoes, a pulpit representing Elijah under a canopy of the palm-tree and comforted by an angel, and the tombs of Broughel the painter and the Spinola family. Sainte-Gudule is a handsome gothic structure, of which the choir and transepts were finished in 1273, the nave in the 14th century, and the square towers in 1518. Chapters of the order of the Golden Fleece were held in this church by Philip the Good in 1435 and by Charles V. in 1516. The exterior was cleaned and restored in 1843. The interior of Sainte-Gudule is lighted through beautiful painted glass windows, of which the four that adorn the chapel of the Saint-Sacrement des Miracles are said to be unrivalled. In the choir are monumental sculptures of some of the dukes of Brabant, and a finely sculptured monument has been recently erected in memory of the late Canon Triest. Against the pillars of the nave are statues of the Twelve Apostles by Du Quesnoy. But perhaps the greatest artistic wonder of the church is Verbruggen's carved pulpit, which represents Adam and Eve driven out of Paradise by an angel, who is seen wielding the fiery sword on one side of the globe while death appears with his dart on the other: the trees of life and of knowledge and various animals are beautifully represented. The pulpit, which is formed by the hallow of the globe, is surmounted by a canopy on which stands the Blessed Virgin and the infant Jesus, who crushes the serpent's head with the foot of the cross. This pulpit was executed for the Jesuits of Louvain; on the suppression of the order it was presented to Sainte-Gudule by Maria Theresa. The marriage of the Duke of Brabant, crown prince of Belgium, with the archduchess Marie of Austria, was celebrated in the church of Sainte-Gudule August 22, 1853. There are two Protestant chapels in Brussels, one near the museum, and the other on the Boulevard de l'Observatoire.

The *Hôtel-de-Ville*, or town-hall, the finest municipal palace in Belgium or elsewhere, was begun in 1401 and finished in 1442. The beautiful tower of gothic open work is 364 feet high, and surmounted by a gilded statue in copper of St. Michael, 17 feet high, which serves as a weathercock. The interior was greatly injured during the first French revolution, and it contains little worth notice now except some tapestries representing the abdication of Charles V. in 1555, which event however took place in the old ducal palace that stood on the site of the *Place Royale* and was burnt down in 1733. In the market-place in front of the town-hall the Counts Egmont and Horn were beheaded in 1568.

The *Hotel-de-Bellevue*, which stands between the *Place Royale* and the park, was occupied by the Belgians during the revolution of 1830, and was riddled with shot. At the opposite angle of the *Place Royale* stand the stables of the Prince of Orange, and a little farther along, towards the *Rue de la Madeleine*, is the Palace of the Fine Arts. This building was formerly the palace of the dukes of Brabant, and subsequently of the Spanish and Austrian governors of the Netherlands. It is now converted into a museum, containing a picture gallery, in which are several paintings by Rubens and other great Flemish painters; the public library, in which are 200,000 volumes

of printed books and above 18,000 manuscripts; and natural history collections very rich in zoological and mineralogical specimens. Public lectures are delivered in the building to the public gratuitously by professors appointed by the government; and in a part of it an exhibition of Belgian products and manufactures takes place every four years.

The most admired quarter of Brussels is that which immediately surrounds the Park. The Park is a large inclosure in the upper town containing an area of about seventeen acres, which is laid out in plots of greenward separated by shady walks under carefully-trimmed trees, and ornamented with statues. It was occupied by the Dutch troops at the revolution of 1830. On the south side of the Park are the king's palace and gardens. On the east side of it, in the Rue Ducale, are the palace and grounds presented by the city of Brussels to the late King of Holland when Prince of Orange, and the residences of the foreign ambassadors at the court of Brussels. On the north side of the Park is the Rue de la Loi, containing the government offices and the Palais de la Nation, or legislative chamber, which was built by Maria Theresa for the Council of Brabant, and resembles the French Chamber of Deputies before 1848. On the west side of the Park is the Rue Royale, a fine wide street, which extends nearly a mile from the Place Royale to the Schaebeek Gate and the botanic garden. Near this gate, in the Rue de Ragule, is the house in which the Duchess of Richmond gave the grand ball to the Duke of Wellington and his officers on the eve of the battle of Waterloo, June 15th, 1815.

Of the gates of the city, the only one remaining of those that formed part of the fortifications erected in 1381 is the Porte de Hal—a large gothic structure formerly used as a prison, now as a museum for old armour and other antiquities. Of the other buildings in Brussels we can only mention the Palais d'Arenberg in the Place du Petit Sablon, famous for its choice paintings, its objects of vertu, and its gardens; the university building in the Rue des Sals, which was originally Cardinal Grandvelh's palace; the astronomical and magnetic observatory in the angle between the Louvain and Schaebeek gates; the railway terminus for the northern lines at the end of the Longue Rue Neuve; the terminus of the southern lines near the church of Notre Dame de Bon Secours; the Broodhuis, a fine old gothic structure in the Grande Place, which was built in 1525, and once was the town-hall of Brussels; the Grand Béguinage, where above a thousand females, young and old, live in religious societies, observing certain rules, but not inclosed as nuns are—each society occupies a separate house, and is governed by a matron; and the Abattoir, which is built outside the walls between the Petit Senne and the Charleroi Canal.

The city supports several large hospitals and charitable institutions. One of these, the Hôpital de St.-Pierre, near the Hal Gate in the south of the town, was originally founded for the reception of Crusaders returning wounded from the Holy Land. Attached to it are very spacious and well kept gardens and commodious baths. Of the other hospitals the principal are—the Grand Hospice, between the Béguinage and the docks, in the north-west of the city; the Hôpital de St.-Jem, near the Rue de la Madeleine; the Maternité, to the south of the Church of Notre Dame de Bon Secours; the Hospice de l'Enferme, near the botanic garden; the military hospital, in the Rue des Minims; and the asylums for orphans, the blind, and deaf-mutes. Most of these hospitals are well endowed, and the sick in them are tended by Sisters of Charity or nuns of other orders.

Brussels has several barracks, one or two prisons, a military magazine, a court-hall in the Park, and numerous hotels, cafés, and baths. The city is well supplied with water, and lighted at night with gas. The best shops are in the Rue Montagne de la Cour, in the Rue de la Madeleine, and in the Galerie St.-Hubert, an extremely handsome street, glazed overhead. Besides the boulevards and the botanic garden there is a noble promenade along the broad canal that leads to Malines, formed by a triple avenue shaded by magnificent lime-trees, which were spared by Marshal Saxe in the siege of 1746 at the entreaty of the ladies of Brussels. The favourite excursions in the environs are to the royal palace of Laeken, which is about nine miles to the north of Brussels, and commands fine views of the city and neighbourhood; and to the battle-field of Waterloo.

In the year 1784 an order was given by the emperor Joseph II. prohibiting burials within the city, and directing the formation of burial-grounds outside the walls. Three cemeteries were accordingly established—one near the Hal Gate, another near the Flanders Gate, and the third, which is the largest, near the Louvain Gate. In addition to these the English inhabitants of Brussels have established two cemeteries—one on the road leading to the village of Veelo, and the other on the Louvain road.

Among its numerous educational establishments Brussels numbers a free university founded in 1834, a primary normal school, a polytechnic school, an academy of the fine arts, a royal academy of music, and several industrial schools. The public library before mentioned was formed by the union of the Burgundian library with the Royal library; it is open every week-day: the reading-room is everything that can be desired by the student. Among the private libraries must be mentioned the library of the Bollandists; and the great geographical establishment of Vandermeylen, near the Petit Senne, outside the Flanders Gate. It was established in 1830; it contains 20,000

volumes, a large collection of maps, in connection with a school of geography and a museum of natural history. One English newspaper and several journals in French and Flemish are published in Brussels.

Brussels, besides being one of the best-built cities in Europe, is considered a very pleasant place of residence. It is also healthy, although the climate is subject to considerable variations. The mean temperature, as ascertained by observation at the Royal Observatory for a complete year, was 52° Fahr. The greatest heat occurred in June, when the thermometer stood at 76½° Fahr.; the greatest cold in January was 37·8° Fahr. The number of days on which it rained was 180; there occurred 39 days of frost and 25 days of fog; it hailed on 5 days and snowed on 11 days, and there were 7 thunderstorms during the year; 3 of these occurred in June and the same number in July. The prevailing winds were from the west and south-west, and occupied 182 days. From the east, north-east, and south-east, it blew 104 days; from the north 30 days; from the south 25 days; and from the north-west 24 days.

Brussels is the seat of the Cour de Cassation, or supreme court of justice for Belgium, of a high court of appeal, of a court of exchequer (des comptes), and of a military court. The assizes for the province of South Brabant are held in the city four times in each year. Brussels is also the head-quarters of the fourth Military Division of the Belgian army. Ambassadors, ministers, or consuls from almost all the governments in the world reside in Brussels.

Brussels is one of the great centres of Belgian industry. It has several banks of issue and deposit, a national mint, savings bank, &c. It is particularly celebrated for the manufacture of lace, considered the finest in the world. The flax from which it is made is grown in the neighbourhood of Hal, the finest sorts bringing from 300 to 400 francs a pound; and the finest kind of lace costs 150 francs an ell (¾ of a yard), but good and inferior sorts may be bought at 50 francs and 10 francs the ell respectively. Many other manufactures are also prosecuted, among which are those of cambric, fine linen, damask, silk and cotton ribbons, machinery, cabinet-work, jewellery, mathematical and musical instruments, hats, stockings, calicoes, gold and silver lace, paper and paper-hangings, porcelain, hardware, and various chemical preparations used in the arts. Brussels has also many coach factories, soaperies, sugar-refineries, breweries, distilleries, and extensive printing and lithographic establishments. The commerce of the city is facilitated by a canal which connects it with the Schelde, and admits vessels of 300 tons; by good high roads and railroads which radiate from the city in all directions. Electro-telegraphic wires connect Brussels with Paris, Amsterdam, London, Berlin, and Vienna.

The population of the city was 84,004 in 1825, and 98,279 in 1830. The revolution in the latter year caused many mercantile men and persons attached to the former government to remove their establishments from Brussels to the Dutch provinces, so that the population of the city was temporarily diminished. Other causes have since brought a considerable influx of inhabitants; so that in 1835, when a census was taken, the numbers were found to be augmented to 102,702, and the population has since continued to increase: in 1849 there were 124,461 persons residing within the walls. The 'Almanac de Gotha' of 1854 gives the population of Brussels at 210,400; but this probably includes the suburbs and all the outlying dependences of the city.

The origin of Brussels reaches back to the 7th century. The first buildings were erected in the island of St.-Géry, so named after St. Gery, bishop of Cambrai, who built a chapel on the spot. In the 10th century Otto II. inhabited a castle in the island of St.-Géry. The city was inclosed with walls in 1044 by Lambert Baldric, count of Louvain; but the walls were removed and the city enlarged in 1369. Two dreadful fires occurred in 1326 and 1405; on the first occasion 2400 houses, and on the second 1400 houses were destroyed. The prosperity of Brussels was greatly increased in the 12th century by the establishment of the manufactures of cloth and fire-arms.

The city was taken by the English in 1213. In 1314, in consequence of long-continued rains, a contagious disorder carried off so many of the citizens that sixty were buried in the same grave. In 1370 the Jews were banished from the city and province, and their property was confiscated.

Brussels was taken by surprise in 1488 by Philip of Clèves. On regaining possession the Emperor Maximilian, suspecting the inhabitants of having been in league with Philip, deprived the city of various privileges, which were bestowed upon Malines. In 1489 and 1578 Brussels was ravaged by the plague. The tyranny of the Duke of Alba occasioned about 10,000 artisans to leave Brussels in 1567, many of whom settled in England.

In 1695 this city was bombarded by Marshal Villeroi, who demolished upwards of 4000 buildings. In 1708 it was again besieged by the Elector of Bavaria, but was relieved by the army under the Duke of Marlborough. In 1746 Brussels was taken by Marshal Saxe, but it was restored to Austria at the peace of Aix-la-Chapelle. The Austrian Netherlands having been conquered by the French in the early part of the war of the French revolution, Brussels was declared by the directory to be the chief place in the department of the Dyle. On the 1st of February, 1814, the Prussian army took possession of this city, which under the provisions of the treaty of the same year

became one of the capitals of the newly-formed kingdom of the Netherlands. On the separation of Belgium from Holland at the revolution of 1830, the movements leading to which began in Brussels, this city became the capital of the new kingdom and the seat of government. Brussels has been recently distinguished for the interest taken by her inhabitants in questions of high social and scientific interest. Here the first Peace Congress was held in 1848, and a general European Statistical Congress held a session in 1853.

BRUTON, Somerset, a market-town in the parish and hundred of Bruton, is situated on the right bank of the river Brue, which gives name to the town, in $51^{\circ} 6' N. \text{ lat.}, 2^{\circ} 26' W. \text{ long.}$; distant 22 miles S. by W. from Bath, and 109 miles W. by S. from London. The population of the town in 1851 was 1885; that of the entire parish was 2109. The living is a perpetual curacy in the archdeaconry of Wells and diocese of Bath and Wells.

The manor of Bruton, or Brunetone, as it is named in the Domesday Survey, was possessed by Edward the Confessor and subsequently by William the Conqueror. A Benedictine monastery was founded here at an early date; afterwards a priory of Black Canons was established. At Bruton the river Brue, here a narrow stream, is crossed by a stone bridge. The town has one main street clean, and well paved, with neatly built houses; and several smaller streets. The town is lighted with gas. Bruton parish church, which stands on the left bank of the river, is a handsome structure in the decorated style, with a tower which has richly ornamented battlements. The Independents and Wesleyan Methodists have places of worship in the town. The endowed Free Grammar school founded by Edward VI. educates 11 boys on the foundation; other pupils also attend the school. The income from endowment is about 300*l.* a year, from which several exhibitions are given to meritorious scholars. The number of scholars in 1852 was 40. There is a National school. An hospital for 14 old men, 14 old women, and 16 boys, founded by Hugh Saxey or Sexey, auditor to Queen Elizabeth, is a very valuable institution. The buildings form a spacious quadrangle. A statue of the founder is placed in a niche on the south side. The petty sessions are held in the upper part of the town-hall; the lower part is used as a market-house. The market day is Saturday. Two fairs are held yearly. The principal manufactures are of stockings and silk. A silk factory employs a considerable number of females.

BRZESE-LIVEWSKY. [GRODNO.]

BRZEZANY. [GALICIA.]

BUCH, a district of the Bordelois, in France, extending along the coast of the Bay of Biscay. Its capital was La Teste, or Tête de Buch, at the head of the Basin d'Arcachon. This district is now included in the department of Gironde. Its lords bore the title of Capta, and their lordship gave to them several rights and privileges in the city of Bordeaux.

BUCHAN, BULLERS OF. [PETERHEAD.]

BUCHAN, DISTRICT OF. [ABERDEENSHIRE.]

BUCHARIA. [BOKHARA.]

BUCHARIA, LITTLE, or Eastern Turkistan, is a name sometimes employed to indicate the most western portion of the countries dependent on the Chinese empire. It is described under **THIAN-SHAN-NANLU**, its Chinese name.

BUCHAREST, or **BUKAREST**, the capital of Wallachia, is situated in the eastern part of that principality, in a rich and spacious plain, diversified by hills, and on the Dumbovitzza, a feeder of the Arghish and about 40 miles N.W. from its mouth, in the Danube below Oltenitzza. In extent it is about four miles from north to south, and nearly three miles from east to west. It is ordinarily the residence of the prince and divan or council of Wallachia, the seat of government, as well as of a Greek archbishop, and the headquarters of the foreign envoys or consuls; but at the time we write (January, 1854) the city and the whole principality is in the occupation of a Russian army, and the prince has withdrawn from his territories. Independently of its agreeable situation, Bucharest has no claim to its designation, which means 'city of enjoyment;' for it is, with few exceptions, a heap of wretched brick or mud cabins, ranged along lines of streets either unpaved or faced with trunks of oaks. It is composed of the prince's palace, a vast pile, and of 67 quarters: these quarters being the separate property of the Boyars, on whose land colonies of their followers have gradually accumulated. The boyars' residences are spacious, and built of stone. The handsomest building, next to the prince's palace, is the adjacent metropolitan church; both of them situated on the largest square and in the centre of the town. There are nearly 100 churches, many of which are built in an uncouth style, none have fewer than three steeples or towers, and many no less than six; some have even nine. Seven of them, as well as the twenty-six monasteries and convents, are protected by walls. The other edifices of note are a large bazaar, a Roman Catholic and a Lutheran church, a synagogue, several hospitals and infirmaries, and the consular residences, particularly that of the Austrian consul, which is a handsome structure and built in good taste. In the middle of Bucharest there is a tower, called the Fire Tower, 66 feet high, which commands a full view of every part of it. Bucharest has a college conducted by twelve professors, and attended in ordinary times by between 400 and 500 students, a museum, a public library, and a great number of schools. The

whole number of dwellings is about 10,000. The town is full of coffee-houses, almost every one of which has a gambling or billiard table, and of shops where sherbet and wine are drunk. Bucharest is the great commercial mart for the principality, and an entrepôt for the commerce between Austria and Turkey. Its inhabitants carry on an extensive trade in grain, wool, honey, salt, timber, wax, tallow and cattle. There are no large manufactures; but woollen cloths, carpets, brandy, &c., are made. There is a Corso, or public mall, to which the fashionables resort in great numbers, in the main street and along the bridge which crosses the Dumbovitzza. Bucharest was taken by the Russians in 1769, and by the Austrians in 1780. By the treaty of Bucharest signed May 28, 1812, Turkey ceded Bessarabia and part of Moldavia to Russia. $44^{\circ} 26' N. \text{ lat.}, 26^{\circ} 8' E. \text{ long.}$

BUCKENHAM, NEW. [NORFOLK.]

BUCKHAVEN. [FIFESHIRE.]

BUCKIE. [BANFFSHIRE.]

BUCKINGHAM, the chief town of the county of Buckingham, a municipal and parliamentary borough and market-town, and the seat of a Poor-Law Union, in the parish and hundred of Buckingham, is situated on the left bank of the river Ouse, in $52^{\circ} 0' N. \text{ lat.}, 0^{\circ} 59' W. \text{ long.}$; 53 miles N.W. from London by road, and 61 miles by the Buckinghamshire branch of the London and North-Western railway. The borough of Buckingham is governed by 4 aldermen and 12 councillors, one of whom is mayor, and returns two members to the Imperial Parliament. The population of the municipal borough, which coincides in extent with the parish, was 4020 in 1851; that of the parliamentary borough, which comprises eight parishes, was 8089. The living is a vicarage in the archdeaconry of Buckingham and diocese of Oxford. Buckingham Poor-Law Union contains 29 parishes and townships, with an area of 44,770 acres, and a population in 1851 of 14,395.

Buckingham is described in the Domesday Survey as an ancient borough. It does not appear, however, that the town sent members to Parliament before 1544. Edward III. fixed one of the staples for wool at Buckingham. A charter was granted in the first year of the reign of Mary (1554), which was surrendered in 1684, when another was granted, but the charter of Mary was resumed a few years later under the proclamation for restoring surrendered charters. In 1644, Buckingham was for a few days the head-quarters of Charles I.; the neighbouring towns of Aylesbury and Newport Pagnell being garrisoned for the Parliament.

The church, dedicated to St. Peter and St. Paul, is erected on the summit of a mound, formerly the site of a castle. The erection was completed in 1780 at an expense of about 7000*l.* The former church had a lofty spire, which fell in 1699; the tower which supported it remained till 1776, when it also fell. There are two places of worship for Independents, and one for Baptists in the town. The Free school, endowed by Gabriel Newton for 25 boys, who were clothed in green, is now incorporated with the National school. A Grammar school was founded by Edward VI. for six boys. The income from endowment is 10*l.* 8*s.* a year: the number of scholars in 1850 was about 30.

The present town-hall was erected about the end of the last century by the first Marquis of Buckingham. The jail was built by Lord Cobham about 1758, at his own expense, for the use of the town and county. The town is lighted with gas. There are in the town a public bath, a mechanics' institute, and a savings bank. No trade of any consequence is carried on. Lace-making with bobbins is the only manufacture, and at this work the best hands earn a very small sum weekly. The market day is Saturday. There are ten annual fairs which are well attended. A county court is held in the town.

There were three stone bridges over the Ouse at Buckingham. One of the bridges was taken down by the Buckinghamshire Railway Company, who replaced it by a brick bridge of three arches. The Buckinghamshire railway passes through the southern end of the town. Some good public walks are in the neighbourhood of Buckingham.

(Browne Willis, *History of Buckingham*; Lipscomb, *Buckinghamshire: Communication from Buckingham*.)

BUCKINGHAMSHIRE, an inland county of England, of very irregular form, lies between $51^{\circ} 28'$ and $52^{\circ} 12' N. \text{ lat.}, 0^{\circ} 28'$ and $1^{\circ} 10' W. \text{ long.}$ It is bounded N. and N.W. by Northamptonshire; W. by Oxfordshire; S. by Berkshire; and E. by Bedfordshire, Hertfordshire, and Middlesex. Its greatest length, measured nearly north and south, from the neighbourhood of Olney to the river Thames above Staines is 53 miles. Its breadth varies much; the greatest breadth is about 27 miles. The area of the county is 464,930 acres; it is one of the smaller English counties, being the thirty-third in the scale of relative magnitude.

Aylesbury, which, though it does not give name to the county, has the best title to be considered the county town, is about 37 miles in a direct line N.W. from London; or by the road 38 miles.

Surface, Hydrography, and Communications.—The principal hills in Bucks are the Chilterns, a chalk range, which entering the county from Oxfordshire runs across it in a north-east direction, and enters Bedfordshire near Dunstable, separating the basin of the lower Thames from the basin of its tributary the Thame, and from the basin of the Ouse. Near Ivinghoe the elevation of these hills is 904 feet above the level of the sea; and another eminence south-west of Wendover is 905 feet; Muzzle Hill, near Brill, is 744 feet, and Bow Brickhill, between

Fenny Stratford and Woburn, 688 feet. Under the northern slopes of these hills is the rich Vale of Aylesbury, watered by the Thame. In that part of the county, south-east of the Chilterns, there is a good deal of woodland, though it has much diminished within the last 100 years. Beech is the prevailing timber in the south part of the county. There is some wood on Whaddon Chase, a tract of high land in the northern part of the county. The whole of the Chiltern district is said to have been a forest; and according to ancient historians the Chilterns and the south-east part of the county were once so covered with woods, chiefly of beech, as to be almost impassable, till an abbot of St. Albans had several of them cut down because they afforded harbour to thieves.

The chief rivers of Buckinghamshire are—the Thames, which skirts the county on the south-west, separating it from Berkshire, and for a short distance from Surrey; the Colne, which separates Berkshire from Middlesex until its junction with the Thames at Staines; the Thame, also a feeder of the Thames; the Ouse, and its tributary the Ousel. The Thames becomes the boundary of the county a little below Henley, and has a winding course first to the east and then to the south-east, past Great Marlow, Tuplow (opposite Maidenhead), and Eton, to its junction with the Colne, being navigable throughout this part of its course. The Wick, which passes High Wycombe, joins the Thames below Marlow. The Colne becomes the boundary of the county a few miles below Rickmansworth, and continues, by one or other of its arms, to be the boundary until it meets the Thames. Its general course is south; it passes Uxbridge in Middlesex, and Colnbrook, and receives a considerable stream, the Mishbourn, from Amersham. It is not navigable; but works several mills. It produces trout and other fish. The Thame is formed by the junction of several small streams; the principal, to which the name of Thame is assigned, rises near the village of Stowley, between Fenny Stratford and Aylesbury; and flowing in a south-west direction, unites near the village of Quarrendon with another stream which rises near Tring (Herts), and flows partly through Hertfordshire and partly through Buckinghamshire, and for a part of its course forms the boundary of the two counties. The united stream flows to the south-west until it reaches the border of Oxfordshire, near the town of Thame. Near Thame the navigation commences. After separating Bucks from Oxon for a few miles the river enters Oxfordshire, through which it flows till its junction with the Thames at Dorchester. The whole length of the Thame in that part of its course which belongs to Buckinghamshire is about 28 miles. This river abounds with eels, and produces pike, perch, chub, roach, and gudgeon. The length of the Ouse, and the extent of surface which it drains, give it a high place among the English rivers; but it is only in the upper part of its course that it is connected with Buckinghamshire. It touches the boundary of the county at Turweston near Brackley (Northamptonshire, in which county the Ouse rises) and after dividing it for a few miles, first from Northamptonshire and then from Oxfordshire, quits the border, and flowing east and then north-east through the county past the town of Buckingham again becomes a border stream, and separates Northampton from Buckinghamshire. Again quitting the border it flows to the north-east, past Newport Pagnell (where it receives the Ousel), Weston Underwood, and Olney. After dividing Buckinghamshire from Bedfordshire for a short distance, it finally quits the county a few miles below Olney. Its course within the county is very winding, being in all about 43 miles, although the direct distance from the point where it first touches to the point where it finally leaves the county is only 23 miles. The Ousel is formed by the junction of several small streams, which rise on the north slope of the Chilterns or their continuation the Dunstable Downs, and unite on the border of Buckinghamshire and Bedfordshire, above Leighton Buzzard. After dividing for several miles the two counties it quits the border, and flows through Buckinghamshire north to Newport Pagnell, where it falls into the Ouse. Its whole length may be estimated at from 25 miles to 30 miles. It is remarkable for fine perch, pike, and bream.

Buckinghamshire is tolerably well furnished with canals. The Grand Junction Canal enters the county from Hertfordshire not far from Ivinghoe, and runs north to Newport Pagnell, following the valley of the Ousel. From thence it follows the valley of the Ouse till it enters Northamptonshire near Stony Stratford. There are several cuts from this canal in Buckinghamshire; one to the town of Buckingham, another to Wendover, and a third to Aylesbury, besides a shorter cut to Stony Stratford. Several important roads cross the county. The parliamentary and mail road through Chester to Holyhead, before the construction of the railways the main channel of communication between the metropolis and Ireland, crosses the north part in a north-west direction, between Hockliffe and Stony Stratford; another road to Chester, nearly parallel to this, and more to the north, passes through Newport Pagnell. In the south part of the county there are the Oxford road through Beaconsfield and High Wycombe; and the great western or Bath and Bristol road between Colnbrook and Maidenhead. There is also a road to Birmingham through Aylesbury, Winslow, and Buckingham. The North-Western railway enters the county near Marsworth, 9 miles east from Aylesbury, and passes through the eastern part of the county in a nearly north-western direction. A branch from it to Aylesbury, about $4\frac{1}{2}$ miles long, quits the main line at Cheddington. Another branch quits the main line

at Bletchley and passes through the north-western part of the county to Winslow and Buckingham, and thence to Banbury in Oxfordshire. It is connected by various branches with the Great Western railway at Oxford, with Winslow and with Rugby. Acts for the several branches were obtained by a distinct company, entitled the Buckinghamshire Railway Company; but the works have been leased in perpetuity to the London and North-Western Company. The Great Western railway passes through the southern extremity of the county, entering it a few miles north of Colnbrook, and quitting it at Maidenhead. A short branch to Windsor quits the Great Western line at Slough. The Windsor and Staines branch of the South-Western railway also passes along the southern extremity of the county for a few miles; entering it near Staines, and quitting it just above Datchet.

Geological Character.—The general direction of the out-crops of the different geological formations which cross this county is north-east and south-west; and the formations present themselves successively to the observer as he travels north-west. The south-east part of the county, included between the Thames and the Colne, is occupied by the plastic clay which skirts the London clay. Only a very small portion of the London clay is found in Buckinghamshire, in the neighbourhood of Staines. The chalk underlies the plastic clay, and rises from beneath it, forming the range of the Chiltern hills. The chalk marl which is generally found skirting the chalk, rises from beneath it, and is in turn succeeded by what is termed Tetworth clay. Sandstone, more or less ferruginous, crops out from beneath this clay, and is succeeded by the limestone which is known by the name of Aylesbury stone. The chalk marl and the Tetworth clay form the soil of the fertile Vale of Aylesbury: the sandstone rises into a ridge bounding that vale on the north and north-west. The oolitic series of formations succeeds those which we have already noticed, and occupies the north-west part of the county. Only two however of the principal formations of this series appear in Buckinghamshire. The Oxford or clunch clay rises from under the Aylesbury limestone, and extends to the town of Buckingham and to the north-west of Stony Stratford and Newport Pagnell. To this formation succeeds that containing the cornbrash, forest marble, great oolite, and other strata.

Climate, Soil, Agriculture.—The climate of Buckinghamshire is mild and healthy. The chalk-hills, which traverse it through its whole breadth from south-west to north-east, are neither very high nor bleak, and the general temperature is favourable to the ripening of most of the crops usually raised in Great Britain. The hills which are a portion of the Chiltern range, divide the county into two distinct parts, varying in soil and fertility. To the west lies the fertile Vale of Aylesbury, which contains some of the richest pasture in England, and is a part of the valley of the Thame. Towards the north of this rich tract are some inferior soils; and still farther north are some very poor wet clays and gravels. Towards Bedfordshire there are some light sands partaking of the nature of the sandy belt which crosses that county. On the south-east of the county the surface is more varied, there being several depressions or valleys on the eastern slope of the chalk, in which some good loams occur. The mixture of chalk with the clay forms a soil well suited to wheat and beans, and with the help of moderate manuring and good tillage produces abundant crops. In the valley of the Thames are some very good and well-cultivated soils. The lower lands along the Thames and Colne, which are occasionally flooded, are in permanent meadows and very valuable. The whole of this plain consists of a good loam lying on the blue clay, called the London clay; but with the interposition in many places of a stratum of gravel, which adds much to the soundness of the soil above, by forming a natural drain for the waters. The arable land in this part of the county is carefully cultivated. About half of the land in the county is in meadows and pastures, and the other half under the plough. A great many commons and common fields have been inclosed of late years, and considerable improvements have been made. Much of the land in Buckinghamshire being of a good quality, the farms are not in general very large; few are above 500 acres, and many do not exceed 20 or 30 acres; the average may be taken at about 200 acres. Leases for 7 and 14 years prevail, but most farms are let from year to year; and the tenants are seldom proper, provided they pay their rent and cultivate the land in a proper manner.

Cattle, &c.—It is supposed that Buckinghamshire feeds about 20,000 milch cows, each giving on an average 200 lbs. of butter annually. The cows are chiefly short-horns, Glamorgan, and home-bred. The large Hereford oxen are preferred for grazing where the land is very good. The greater speed and general usefulness of the horse causes him to be preferred for the plough in spite of the pretended economy in the use of oxen. Hay is the chief food of the cattle in winter, but turnips and straw are often substituted notwithstanding the bad taste which turnips impart to the butter. No great quantity of cheese is made in this county, except a few cream cheeses in the neighbourhood of the principal towns. The butter is chiefly sent to London made up in the form of oblong rolls weighing 2 lbs. each. It is sent in baskets, called from their shape 'flats,' which hold from 20 to 40 rolls. Their depth is uniformly 11 inches. In the dairy farms the calves are usually sold when three or four days old to dealers, who sell

them again to those farmers who being within a moderate distance from London or any considerable town, find it more profitable to fatten calves by suckling them than to make butter. Many ewes are kept in this county for the sake of early lambs for the London market. The Dorsetshire ewes, which have lambs very early in the season, are consequently preferred for this purpose. Where mutton is the object, the South Down breed is in greater request. The Gloucestershire and Leicester and a breed crossbred between them have come into favour since long wool has borne a better price in proportion to the quantity than the shorter and finer.

The horses used for the plough and team are generally large and black; some of them are bred in the county, but most of them are brought when young by dealers from Northamptonshire and Lincolnshire. The largest and finest are frequently resold at six years old to London dealers for dray horses at a considerable profit. Hogs are an important appendage to a dairy farm. The favourite breed is the Berkshire, sometimes crossed with foreign breeds, as the Chinese or Neapolitan, or with the Essex or Suffolk breeds. The Neapolitan cross increases the aptitude to fatten, but renders the hog more delicate and susceptible of cold. The Chinese cross gives very delicate small porkers and sucking pigs. There is a peculiar trade in this county, which is the rearing and fattening of ducks early in the season for the London epicures. The eggs are hatched under hens, and the ducklings are reared in the house with great care.

Divisions, Towns, &c.—When the Domesday Survey was made this county was divided into eighteen hundreds. They are now reduced to eight; one of them however still retaining the title of 'the Three Hundreds of Aylesbury.' The modern hundreds are: Nowport on the north-east and Buckingham on the north-west of the county; Ashendon, Cottesloe, and Aylesbury in the centre; Burnham on the south-east; and Stoke and Desborough on the south and south-west. Desborough, Stoke, and Burnham are the three 'Chiltern Hundreds,' the stewardship of which is a well known nominal office bestowed upon a member of Parliament who wishes to vacate his seat. There are about 200 parishes in the county.

Buckinghamshire has no city. The market-towns are fourteen. **AYLESBURY**, as being the assize town, the place where the quarter sessions are always held, and the principal place of county election, may now be regarded as the county town. **BUCKINGHAM**, on the Ouse, in the north-west part of the county, was formerly considered the county town. The other market-towns are—**GREAT MARLOW**, on the Thames; **HIGH WYCOMBE**, or Chipping Wycombe, on a small stream flowing into the Thames; **NEWPORT PAGNELL**, at the junction of the Ouse with the Ouse; **AMERSHAM**, on the road from London to Aylesbury; **OLNEY**, on the Ouse; **CHESHAM**, to the right of the Aylesbury road, not far from Amersham; **PRINCE'S RISBOROUGH**, to the left of the Aylesbury road, not far from Wendover; **WENDOVER**, on the road from London to Aylesbury, beyond Amersham; **BEACONSFIELD**, between Uxbridge and Wycombe; **STONY STRATFORD**, on the Ouse; **WINSLOW**, between Aylesbury and Buckingham; and **IVINGHOE**, between Dunstable and Wendover. These will be found described under their respective heads. We shall subjoin a few particulars of Fenny Stratford and Colnbrook, which formerly had markets (now disused), and are consequently sometimes reckoned among the market-towns; and of a few other places which have some claims to notice.

Fenny Stratford, on an eminence on the great Holyhead road, 14 miles N. by E. from Aylesbury: population of the township 1142 in 1851. The chapel, dedicated to St. Martin, was rebuilt in 1724-30, chiefly through the exertions of the antiquary Browne Willis, who is buried within the rails of the communion-table. There are chapels for Baptists and Wesleyan Methodists, and a National school. There are four fairs—April 19th, July 18th, October 10th or 11th, and November 28th. Fenny Stratford is on the Watling Street. There is a stone bridge over the Ouse, which flows by the town. Fenny Stratford gets its name from the nature of the surrounding country. The *Magiovinium* of Antoninus was at or near Fenny Stratford.

Colnbrook is on the high western road, $3\frac{1}{2}$ miles from the Slough station of the Great Western railway: the population of the chapelry of Colnbrook in 1841 was 1050; in the Census returns of 1851 the population is returned with that of the three parishes in which it is situated. The town consists of one long street of neat respectable-looking houses. The Colne flows here in four channels, each of which is crossed by a bridge. An ancient chantry chapel at Colnbrook, which continued to be used after the Reformation, was endowed by private benefaction in 1682. A Baptist meeting-house, a Free school, and a British school are in the town. There are two fairs on the 5th of April and 3rd of May. The town was incorporated in 1543 by the style of the bailiff and burgesses of Colnbrook.

About seventeen places in the county had charters for markets, which have been long ago disused. The following are the only villages which appear to call for description.—

Bierton, a long straggling village about a mile N.N.E. from Aylesbury: the population of the parish of Bierton-with-Broughton was 688 in 1851. The church, which is of the decorated and perpendicular styles, has been repaired, and open oak seats have been substituted for the old pews. The Baptists and Methodists have places of worship, and there is a National school. The Aylesbury railway passes

through the parish. **Blotchley**, about 15 miles N. from Aylesbury: population of the township 433 in 1851. The church is a rather superior example of a village church; it is chiefly of the perpendicular style, but some small portions are decorated. In the interior is a splendid tomb to Lord Grey de Wilton; there are also some incised brasses. **Borstall** or **Borstall**, about 14 miles W. from Aylesbury, population of the parish 243 in 1851, is chiefly noteworthy for its castle, originally erected in the reign of Edward II. Borstall House endured three or four attacks during the contest between Charles I. and the Parliament. Only the embattled gatehouse now remains. It is a good example of that portion of the early castellated mansion: a bay window and some other insertions are of the Elizabethan age. **Brickhill, Great**, 15 miles N.E. from Aylesbury, population of the parish 730 in 1851, is a good-sized straggling village, with a church chiefly of the perpendicular style, a large Baptist chapel, and almshouses for 22 persons, together with several parochial charities. **Brill**, population of the parish 1311 in 1851, stands on an eminence on the border of Oxfordshire, about 10 miles W. from Aylesbury. It is said that the Saxon kings had here a palace, which was a favourite residence of King Edward the Confessor. King Henry II. kept his court here in 1160, attended by Thomas à Becket as his chancellor; he was here again with his court in 1162. Henry III. kept his court at Brill in 1224. (Lysons's 'Magna Britannia.') In the war between Charles I. and his Parliament Brill was garrisoned by the Royal party. The church is ancient; some portions are early English. The Wesleyan Methodists and Independents have places of worship. Near Brill is a mineral spring. **Burnham**, population of the parish 2301 in 1851, between Colnbrook and Maidenhead, a little to the right of the high western road, had formerly a monastery of Augustine nuns of which considerable remains still exist. There was in the 13th century a palace at Chippenhain in Burnham parish in which Henry III. occasionally resided. Burnham church is spacious and interesting; portions of it are of early English date, the remainder is chiefly decorated. There are here a Dissenting chapel and a National school. **Chalfont St. Giles**, on the road to Amersham, 22 miles W.N.W. from London, population 1169 in 1851, contains the house in which Milton finished his 'Paradise Lost,' and where he is said to have commenced his 'Paradise Regained.' The church is of the decorated and perpendicular styles. The Independents and Primitive Methodists have places of worship. Here is a school endowed by Sir Hugh Palliser, who is buried in the parish church; also a British school; and at Chalfont St. Peter, close by, is a school supported by the Portland family. The population has decreased in consequence of the trade being drawn away to other places more accessible by railways. The population of Chalfont St. Peter was 1482 in 1851. **Chenies** or **Cheneys**, on the Chess, a feeder of the Colne, 17 miles S.E. from Aylesbury: the population in 1851 was 565. Here was formerly a seat of the dukes of Buckingham. The old Tudor Manor-house, which belonged to the Chenies, a picturesque brick mansion, stands near the church. The church, which is of the decorated and perpendicular styles, has been recently restored. A mortuary chapel built in 1556 serves as the mausoleum of the Bedford family. There are here a chapel for Baptists, a school of industry, an infant school, almshouses for 10 poor persons, and some parochial charities. On the Chess are extensive paper-mills. In the vicinity, the scenery of which is very beautiful, are several mansions. **Crawley, North**, 17 miles N.E. from Buckingham: population 914 in 1851. The church is a very fine building, chiefly of perpendicular date and style, but some portions are earlier. In the interior is a rood screen of unusually beautiful carved work of the decorated period. In the panels are painted figures of kings and bishops, very curious on account of the costumes. The Independents and Baptists have chapels here. There are National and British schools. **Crendon, Long**, 8 miles S.W. from Aylesbury: population 1700 in 1851. The village consists of a number of houses irregularly arranged, and chiefly constructed of rough stone. In the vicinity traces of a Roman cemetery have been discovered: many urns, &c., have been exhumed. **Notley Abbey**, in the parish of Long Crendon, was founded about 1162 by Walter Giffard, the second earl of Buckingham, for Augustinian monks. A portion of the abbey has been converted into a residence; the chapel is used as a cow-house; the remainder is a ruin. Close by is a curious old water-mill which belonged to the abbey. Long Crendon church is a cruciform edifice of early English and subsequent styles. The Wesleyan Methodists and Baptists have places of worship. **Cuddington**, $5\frac{1}{2}$ miles S.W. from Aylesbury: population 623 in 1851. The church is of the Norman and early English styles, with some inserted windows of the decorated style. The Wesleyan Methodists and Baptists have chapels. There is a charity for apprenticing poor boys and distributing money to needy inhabitants. **Datchet**, on the Thames opposite Windsor, had a population in 1851 of 898. It is a quiet village, chiefly dependent on the neighbouring gentry. It is resorted to in summer by anglers and holiday visitors. The church is a small ancient structure; parts of it are of the early English style. There is a Baptist chapel. **Edlesborough**, about 8 miles E.N.E. from Aylesbury: the population of the parish in 1851 was 1838. The church, a very fine building in a commanding position, is perpendicular in style. It contains many interesting monuments of stone and brass. The Wesleyan Methodists

have a place of worship. Many of the inhabitants are dependent on the plaiting of straw; there are several plaiting schools in the parish. *Haddenham*, 7 miles S.S.W. from Aylesbury: population 1703 in 1851. The church is a spacious and very fine building. The Wesleyan Methodists and Baptists have places of worship. In the parish are some mineral springs. *Hambledon*, near Marlow: population 1305 in 1851. Greenland House, near this village, the seat of the Doyleys, was a severely contested post in the war between Charles I. and the Parliament. The church has been modernised. There is an Independent chapel. *Hampden*, near Prince's Risborough, about 9 miles S. from Aylesbury: population 308 in 1851. The manor was for centuries in the Hampden family, the male line of which became extinct in 1754. The celebrated John Hampden lies buried in the churchyard; and there is a representation of the battle of Chalgrove Field, in which he received his death-wound in 1643, on the monument of John Hampden, Esq., the last heir male of the family. Hampden House, the former seat of the Hampdens, contains several family pictures. There is a whole-length portrait of Oliver Cromwell. The church is mostly perpendicular, with parts of earlier date. The Independents have a chapel at Hampden. *Horton*, near Colnbrook, at the south-eastern extremity of the county is chiefly remarkable as having been the residence of Milton in his early manhood. No vestige of the house remains. The population of the entire parish, which is partly in the county of Middlesex, was 842 in 1851. The ancient church with its ivy-mantled tower is a rather picturesque object. In it is an inscription in memory of the mother of Milton. There is a Free school. On the Colne is a large water-mill. *Iwer*, on the Colne near Uxbridge, 17 miles from London, was once a market-town; it has still two fairs: the population in 1851 was 1985. The church is partly Norman and early English. The Wesleyan Methodists have a place of worship. There is a National school. On the Colne are extensive paper and oil mills. The Great Western railway and the Grand Junction Canal pass through this parish. *Langley Marish* is a good sized village near Colnbrook, part of which town is in this parish: the population of the entire parish in 1851 was 1874. The church is ancient, and contains some good monuments. In the churchyard is a noble yew-tree. The Wesleyan Methodists, Independents, and Baptists have places of worship. There are almshouses for 10 poor persons. *Medmenham*, on the left bank of the Thames, 4 miles W. from Great Marlow: population 401 in 1851. Here was a cell belonging to the Cistercian monastery at Woburn, founded in 1200. What remains of it is now converted into a private residence. The church, which is ancient, has been lately repaired. There are two Free schools. *Great Missenden*, between Amersham and Wendover, 9 miles S. by E. from Aylesbury, was the seat of a rich abbey of the canons of St. Augustine. Some small portions of the conventual buildings remain. The population of the parish in 1851 was 2097. The parish church is a handsome cruciform building, of the decorated and perpendicular styles; it was thoroughly repaired in 1828. The Wesleyan Methodists and Baptists have places of worship. There are National, British, and Infant schools. In the neighbourhood are several good mansions. *Penn* is situated on an elevated site, commanding extensive prospects, 16 miles S.S.E. from Aylesbury: population 1251 in 1851. The original part of the church is of the early English style, but it has been spoiled by tasteless modern additions and alterations. There are chapels for Wesleyan Methodists and Baptists, and National and Infant schools. *Pitstone*, anciently *Pightelsthorpe*, about 10 miles W. from Aylesbury: the population of the entire parish in 1851 was 545. In this parish was the rich abbey of Ashridge. The abbey, for some time after the dissolution of the community, was a royal palace; and Queen Elizabeth, before her accession, frequently resided here. The conventual buildings were nearly all pulled down by the late Duke of Bridgewater. Edward I. spent his Christmas at Ashridge, either in the monastery or the neighbouring castle of his cousin, Edmund, earl of Cornwall, son of Richard, king of the Romans, A.D. 1200. He held a parliament there at the same time. There are here a small church, of decorated and perpendicular styles, a chapel for Wesleyan Methodists, and a National school. *Quainton*, or *Quainton Mallet*, 7 miles N.W. from Aylesbury: the population of Quainton township in 1851 was 854. The church is partly decorated and partly perpendicular. In the chancel is a very showy altar-tomb in memory of R. Winwood, Esq., 1689; there are also some brasses in excellent preservation. The Baptists have a chapel here. There are almshouses for six poor widows. *Slough*, one mile and a half from Eton; the town is situated partly in the parishes of Stoke Poges and Upton: the population of Slough in 1841 was 1189; and in the Census returns for 1851 an increase of 1277 since 1841 in Upton parish is attributed to the erection of new buildings in the town of Slough and the neighbourhood. Since Slough has been made a first-class station of the Great Western railway, the town has considerably increased. A new church has been built; and the railway station and large railway hotel have added much to the appearance of the place. Slough was for many years the residence of Sir William Herschel; it was here he constructed his large reflecting telescope, and made most of his important discoveries. He died here in 1822. Salt Hill, near Slough, was the scene of the celebrated 'Eton Montem.' *Sterple Claydon*, 12 miles N.W. from Aylesbury, was at the Domesday Survey one of the most populous

places in Buckinghamshire: in 1851 the population was 869. The church is of the decorated and perpendicular periods, with modern transepts. It contains a monument to General Sir Harry Calvert, by Chantrey. In the village is a Free school built and supported by Sir Harry Verney. *Claydon House* is a handsome mansion, standing in a fine park. *Stoke Poges* lies to the right of the road, between Colnbrook and Maidenhead: the population in 1851 was 1501. The manor was in the reign of Queen Elizabeth seized by the crown for a debt. It was the residence for a time of 'the grave Lord Keeper,' Sir Christopher Hatton; and subsequently of Sir Edward Coke, who in 1601 entertained Queen Elizabeth here, and presented her with jewels to a considerable amount. The park is adorned with a colossal statue of Sir Edward Coke; and adjoining the park is a large monument, erected to the memory of the poet Gray. The old manor-house, now pulled down, is the scene of Gray's 'Long Story,' and the churchyard of his well-known 'Elegy.' The poet spent much of his youth in this village; and his remains lie in the churchyard, under a tomb which he had erected over the remains of his mother and aunt. *Stoke church* and churchyard well answer to the description in Gray's 'Elegy.' At *Stowe*, near Buckingham, is the mansion which until recently was the seat of the Duke of Buckingham. The grounds were originally laid out in straight paths and avenues, and adorned with canals and fountains. Subsequent improvements were made under the direction of Bridgman, Kent, and other artists and amateurs; and the beauties of Stowe were commemorated by Pope and West, who spent many festive hours with the then owner, Lord Cobham. The grounds when viewed from a distance appear like a vast grove, interspersed with columns, obelisks, and towers. They are adorned with arches, pavilions, temples, a rotunda, a hermitage, a grotto, a lake, and a bridge. The temples are adorned with busts, under which are suitable inscriptions. The house was originally built by Peter Temple, Esq., in the reign of Elizabeth; it was rebuilt by Sir Richard Temple, who died in 1697, and has been enlarged and improved since. The whole front extends 916 feet, the central part 454 feet. The costly and splendid contents of this mansion were two or three years ago sold by auction; the mansion itself is now unoccupied. *Taplow*, on the banks of the Thames, nearly opposite to Maidenhead, population 704 in 1851, may just be mentioned on account of Taplow Court, the seat of the Earl of Orkney; and the former mansion of Cliefden House, destroyed by fire in 1795, and again about three years since: a new mansion has been built by Mr. Barry. This magnificent house was begun by the witty and profligate Duke of Buckingham, and was for some time the residence of Frederick Prince of Wales, father of George III. Cliefden is now the property of the Duke of Sutherland. The church is a modern brick edifice. On the Thames at Taplow is a large paper-mill. *Waddesdon*, 5½ miles W.N.W. from Aylesbury on the road to Bicester: parish population 1439 in 1851. The church is very interesting; it contains examples of every style of architecture from Norman to perpendicular. There are chapels for Wesleyan Methodists and Baptists, and a British school. Among other parochial charities are almshouses for six poor widows, and a fund for distribution among needy parishioners. *Wotton Underwood*, near Olney, was for some years the residence of the poet Cowper; and some of his descriptions of rural scenery were drawn from nature in his walks round this place. The church is of early English and perpendicular styles. There are a Roman Catholic chapel and schools in the parish: the population in 1851 was 405. *Whitchurch*, 11 miles from Aylesbury: population 915 in 1851. The church is chiefly early English. The Wesleyan and Primitive Methodists have places of worship. *Creslow* manor-house in this parish is a picturesque example of a manorial residence of the 16th century. *Wolverton*, 4 miles from Stony Stratford, has grown into importance from having been made the central station of the North-Western railway. The population of Wolverton in 1851 was 2070, being an increase of 1658 since 1831. In the village or town are a church, a Wesleyan chapel, a school-room, a lecture and news-room; besides extensive gas-works, and workshops for the repairing of the locomotives and carriages belonging to the railway company. Most of the inhabitants are dependent on the North-Western Railway Company. The houses though small are generally convenient, and there are several plots of ground let out at a very low rent by the company for workmen's gardens. The new church is in 'the railway town,' as it is sometimes called, close by the station. The old church is at some little distance from it, by the old hamlet of Wolverton. *Wyrardisbury*, or *Wraybury*, on the Thames, 8 miles N.W. from Staines: population 701 in 1851. In this parish was a Benedictine nunnery founded in the reign of Henry II. In the grounds of Ankerwyke House is a celebrated yew-tree which over-shadows a circle of 207 feet in circumference. It is believed to be older than the time when King John signed the Magna Charta on Runnymede, on the opposite side of the river. Magna Charta Island lies just off Wyrardisbury to which parish it belongs. Wyrardisbury church is a very handsome village church; it has recently been well restored. There is a station here of the Windsor and Staines railway.

Decisions for Ecclesiastical and Legal purposes.—Of the 201 parishes 79 are vicarages, and 29 curacies or donatives. The county is for the most part in the diocese of Oxford, and in the archdeaconry of Buckingham. The several parishes of the county are divided among the seven rural deaneries of Buckingham, Burnham, Mureshby, Newport,

Waddesdon, Wendover, and Wycombe. The county is divided by the Poor-Law Commissioners into seven Unions: Amersham, Aylesbury, Buckingham, Eton, Newport-Pagnell, Winalow, and Wycombe. These Poor-Law Unions include 192 parishes and townships, with an area of 386,093 acres, and a population in 1851 of 143,647; but the boundaries of the Unions are not strictly coequal with those of the county. Buckinghamshire is in the Norfolk circuit. The Lent and summer assizes and the quarter sessions for the county are held at Aylesbury, where also is the county jail. County courts are held at Aylesbury, Buckingham, Newport-Pagnell, and High Wycombe. The county returns three members to the Imperial Parliament, one having been added by the Reform Bill. Aylesbury is the chief place of the county election. Two members are returned for the hundred of Aylesbury (the right of voting for the borough of Aylesbury having been thrown open to the freeholders of the hundred), and two each for the boroughs of Buckingham, High Wycombe, and Marlow.

Civil History and Antiquities.—Camden and most other antiquaries have included Buckinghamshire, and probably with good reason, in the territory of the Catyuechiani or Catuellani. [BRITANNIA.] When the Romans, under the command of Aulus Plautius, in the time of the emperor Claudius, seriously undertook the conquest of Britain, it has been considered by some that Buckinghamshire was the seat of conflict, and that in a battle within its borders, Togodumnus, one of the British chieftains, was slain. It is more likely however that the death of Togodumnus occurred in the marshes of Essex, near the mouth of the Thames. When South Britain was subdued by the Romans and divided into provinces, Buckinghamshire was included in Flavia Caesariensis. Several of the ancient British and Roman roads crossed this county. The Watling Street coincides with the parliamentary and mail-coach road to Holyhead in that part of it which runs from Brickhill to Stony Stratford through this county. The Ikening, Ikeneld, or Icknield Street runs along the edge of the Chiltern Hills, and a road runs nearly parallel to it under the hills, called by the country people 'the Lower Ackneld Way.' The Akeman Street crossed this county also, but its direction is uncertain. Of Roman stations some notice has been already taken. The Magiovinium of Antoninus was probably at Fenny Stratford; Lactodorum, which Camden fixes at Stony Stratford, and Pontes, which he fixes at Colnbrook, are placed by more modern antiquaries at stations beyond the limits of Buckinghamshire; namely, Lactodorum, at Towcester in Northamptonshire, and Pontes, at Staines in Middlesex. There are several ancient camps or earth-works in the county, chiefly near the edge of the Chilterns or the course of the Thames. There is an earth-work at Ellesborough, on the ridge of the Chilterns, in one corner of which is a high circular mound or keep 80 paces in circumference, called Castle Hill, or Kimble Castle. The name of the adjacent villages of Kimble (Great and Little) was written in ancient records Kynebel or Cynobel.

In the civil wars in the reigns of Stephen and John, Buckinghamshire was the scene of contest, but not of any marked event. Hanslope Castle, near Stony Stratford, held for the barons against John by its owner, was taken by the king's favourite, Fulk de Breut, A.D. 1216 or 1217. In the great civil war between Charles I. and his Parliament, the village of Brill was garrisoned by the king. Upon this garrison the parliamentary forces under Hampden made some unsuccessful attempts. Aylesbury seems at this time to have been held by the Parliament. In 1643 the Parliamentarians under the Earl of Essex were quartered at different places in the county. Prince Rupert attacked by surprise their quarters at Wycombe and another place, and took several prisoners. The opposite party pursued him in his retreat at Oxford; and it was in a skirmish which took place on this occasion that Hampden received his death-wound. In 1644 the king had his head-quarters at Buckingham. In the same year Burstall House in this county, "reputed a strong place," says Lord Clarendon, was abandoned by the Royalist party, who thought it right to withdraw those garrisons which were too far distant from Oxford.

Buckingham is not by any means rich in antiquities. Of the baronial castles of the feudal age there are scarcely any remains; some earth-works alone serve to mark the sites of those at Lavendon, near Olney, and Whitechurch, between Aylesbury and Buckingham, and of Hanslope Castle, Castlethorpe, near Stony Stratford. The remains of the buildings belonging to the various religious establishments are but scanty. There are some very small remains of Burnham Abbey, and Medmenham Abbey. Of Missenden Abbey, part of the cloisters remain, having groined arches resting on pillars, with enriched capitals in the Norman style. There are more considerable remains of Notley Abbey, which is now converted into a farm-house. The buildings occupy three sides of a quadrangle. On the south side is the hall, 68 feet long by 24 feet (nearly) wide, now used as a barn: the style of this building appears to be the early English. On the west side are the buildings of the farm-house, in the later English style; some part was probably built after the dissolution. Part of the monastery of Mursley (or St. Margaret), in the parish of Ivinghoe, is yet standing.

Of the churches of early date, Stewkley, between Winslow and Leighton Buzzard (Bedfordshire), is a good Norman structure, with much of the characteristic Norman carving. The porch on the south side, and the pinnacles of the short square tower, which is between

the nave and chancel, have been added since its erection. Other examples of the Norman period occur at Hanslope; Leckhampstead; Wing; High Wycombe; Stantonbury near Stony Stratford; the deserted church of Upton, near Colnbrook; Water Stratford, near Buckingham; and Dinton, near Aylesbury; a few other churches have some portions of Norman architecture. Of the early English style the examples are more abundant. Chetwode church, near Buckingham, formerly the church of the priory of Austin Canons, may be considered as coeval with the foundation of the priory, A.D. 1244. This church contains some of the most ancient and elegant specimens of stained glass to be found in the kingdom. Lillingstone Dayrell, and Codd Bradfield are also excellent examples of this style. Many of the churches have portions of early English work. In examples of the decorated style the upper part of the county is very rich. Clifton Reynes, Emberton, Olney, and Great Horwood are excellent specimens of the style; in the lower part Chesham Bois, and the south aisle of North Marston, are the best examples. Of perpendicular churches remaining the best are Maids Morton and Willemsdon, portions of North Crawley, and the chancel of North Marston; the tower of Maids Morton has interesting features; the chapel of Eton College also has some very good portions.

In 1851 there were four savings banks in the county, at Aylesbury, Buckingham, Newport Pagnell, and High Wycombe. The amount owing to depositors on November 20th 1851 was 133,689*l.* 3*s.*

BUCKLAND. [DEVONSHIRE.]

BUCKOWINE. [BUKOWINA.]

BUDA, BUDIN, or OFEN, a city on the right bank of the Danube, in the Hungarian county of Pesth, is united with the city of Pesth, which lies on the left bank of that river, by a bridge of boats about 3800 feet in length, and by a chain bridge recently erected by an English engineer. The two towns (called conjointly Buda-Pesth) constitute the metropolis of Hungary and seat of government. Buda is 130 miles in a straight line but above 150 miles by railway through Presburg and Waitzen S.E. from Vienna. It is built round the Schlossberg in the midst of a mountainous and picturesque country. It is about nine miles in circuit, and contains about 33,000 inhabitants. The central part of Buda is called the Fortress; it rises on all sides round the acclivities of the Schlossberg, and is inclosed at its foot by walls and bastions; thence it spreads out into five suburbs. To the south of the town there is a lofty eminence called the Blocksberg, on the summit of which an observatory is built. The Fortress, which occupies about a twelfth part of the entire area of Buda, is laid out on a regular plan, and contains handsome buildings and spacious squares. The most remarkable buildings are the royal palace, a vast structure fronting the river in which the Palatine, or viceroy, of Hungary resided; the Church of the Assumption; the garrison church; the house of assembly for the states; the arsenal; the town-hall; and the several buildings for the various departments of the business of the state. Buda contains altogether twelve Roman Catholic churches, several monasteries, one Greek church, and a synagogue. It possesses a royal gymnasium, a Roman Catholic high school, several libraries, a school of design, several other educational establishments, a theatre, and many charitable institutions. The observatory, which stands in 47° 29' 12" N. lat., 19° 2' 45" E. long., is supplied with the finest instruments and apparatus. The island of Marguerite which is laid out as a garden, and the sulphurous warm-baths in various parts of the suburbs, are particularly deserving of mention. From one of the hot sulphur springs, which marks 117½° on Fahrenheit's thermometer, the German name Ofen (oven) is derived. Buda is the Hungarian and Budin the Slavonic name of the town.

Buda manufactures a little silk and velvet, leather, some cottons, and woollens. It possesses also a cannon-foundry, copper-foundries, a gunpowder-manufactory, a silk spinning-mill, an extensive type-foundry, and a tobacco-manufactory. The trade of the town principally consists in the wines produced by the vineyards in the environs, to the annual amount of about 4,500,000 gallons. This wine, which resembles Burgundy and is well known under the name of 'Ofener-Wein,' comes from the extensive vineyards belonging to the town itself, which are said to cover an area of seventy square miles.

From some remains of ancient buildings found at Alt-Ofen (a large market-town of 8000 inhabitants close to Buda), it has been inferred that a Roman town once occupied the spot, the name of which is given as Aquincum or Sicambrium. The site is probably ancient, but the first beginning of the town of Buda was the erection of a fortress on the Schlossberg in A.D. 1240. King Stephen and some others of the Hungarian kings occasionally resided in Buda. It was taken in 1526 by Solymán the Magnificent, and retaken the following year by Ferdinand of Bohemia. Solymán again took it in 1529, and it remained in the hands of the Turks till 1686 when it was taken by the Duke of Lorraine who blew up the castle. This was subsequently rebuilt by Maria Theresa. During the insurrection which followed the murder of the Imperial Commissioner Count Lamberg on the bridge of Buda-Pesth (Sept. 28, 1848), Buda as well as Pesth suffered much from the violence of civil war. The palace of the Palatine, the Vienna gate of the town, with the bastions and parapets of the fortress, were all but demolished during the bombardment of the city by Görgey on the 17th, 18th, and 20th of May 1849. On the 20th the city was stormed in consequence of the treachery of an Italian

regiment in the garrison. General Henzi, whose heroic defence of the city is supposed to have saved Vienna from being attacked by the Hungarians, died of his wounds on the night of the 21st. A cast-iron monument 66 feet high and 90 feet in circumference, erected in honour of the general and his companions in arms, was uncovered in the presence of the emperor Francis Joseph in July 1852. The monument represents a dying warrior crowned with laurel by an angel; above him is a dome round which on delicate columns are figures of Faith, Truth, Religion, Magnanimity, and Devotion. The tablets on the sides contain the names of those who fell in defence of the city. The fortifications of Buda have been recently all thoroughly repaired.

BUDAYOON. [DAREILLY.]

BUDISSIN. [BAUTZEN.]

BUDLEIGH, EAST. [DEVONSHIRE.]

BUDWEIS, the capital of the circle of Budweis in the south of Bohemia, is situated on the Moldau, 75 miles S. from Prague, 100 miles N.W. from Vienna, in 48° 59' N. lat., 14° 28' E. long., and has about 9000 inhabitants. It is a well and regularly built town, and is partially fortified. Budweis includes three suburbs; is the seat of a bishopric; and has a handsome rathaus, or town-hall, cathedral, seven churches, one monastery, a gymnasium, a philosophical academy, and diocesan and theological seminary. The markets for horses and grain are important: the manufactures consist of broadcloth, damasks, muslin, sulphate, &c. By means of the Moldau, which is navigable down to Prague, and the Elbe, and by the horse-railway that connects the town with Linz on the Danube and Gmunden on the Trauen-see, in the archduchy of Austria, Budweis is a place of considerable transit for salt from the Salz Kammergut, and for other merchandise. The district around Budweis up to the source of the Moldau belongs chiefly to the princely house of Schwarzenburg, one of whose ancient seats, the Schloss Frauenberg, a feudal fortress, stands in the neighbourhood of a magnificent gothic castle lately erected; around the Schloss is a vast park well stocked with wild boars.

BUDWORTH, GREAT. [CHESHIRE.]

BUENOS AYRES, the largest, most populous, and southernmost of the federal provinces of the Argentine Confederation, South America, extends from the Rio Negro on the south, about 41° S. lat., to a line which, about 33° S. lat., divides it on the north from the provinces of Santa Fé, San Luis, and Mendoza. On the west it nominally extends to the Rio Diamante, or even to the Andes, but this western part of the province is still only occupied by the native Indians. On the east and south-east it has a coast-line along the Rio La Plata and the Atlantic of upwards of 800 miles. The surface is roughly estimated at 200,000 square miles: the population probably does not exceed 250,000.

The coast-line, surface, and geology of this province have been sufficiently described under ARGENTINE CONFEDERATION. The only harbours along the extensive line of coast suitable for large vessels.

those of Buenos Ayres city, which is a very bad one, and Port Belgrano in Bahía Blanca, near the southern extremity of the province, which is an excellent one. Almost the entire province is a level plain; the only exceptions being the unoccupied western districts, which are hilly, and the Sierras del Vulcan and Ventana, and connected ranges, which traverse the southern districts. A large portion of the province is fit for agriculture; but though a good deal of corn is raised, the attention of the inhabitants is chiefly given to the rearing of cattle. The peasantry are generally averse to the cultivation of the soil, to mechanical work, to fishing and navigation, or, indeed, any settled labour. Their employments are mostly confined to the tending of cattle and horses, or such callings as can be pursued on horseback. They live in ranchos, or huts, which are built of stakes, filled in with mud and covered with thatch, and consist of a sleeping apartment and a 'cook-house.' Their food consists of beef and an infusion of maté. The cattle farms, 'Estancias', are many of them of large size; some of the most extensive and complete of these establishments are the property of British subjects, a good proportion of the labourers being natives of Ireland. It is estimated that there are 12,000,000 head of cattle in the province. Great attention has been paid within the last few years to the breeding of sheep, which thrive remarkably in this climate. The old breeds were very inferior animals, but they have been greatly improved, mainly through the skill and enterprise of three or four English sheep-farmers. The number of sheep now in the province is estimated at 8,000,000, of which a third are of the improved breed. There are in the province several 'Saladeros,' or vast establishments at which the cattle are slaughtered, the flesh salted and dried, or boiled down for tallow, and the skins prepared for exportation; some of the vats at these 'Saladeros' will contain the carcasses of 250 oxen. Very large quantities of horses are kept on the plains in a semi-wild state. In 1851 the exports from Buenos Ayres amounted in value to 2,126,705*l.*; the value of the hides exported being 1,300,570*l.*, of tallow, 240,800*l.*, of wool, 219,200*l.* The imports in 1851 amounted to 2,110,000*l.*; of which the imports from Great Britain, chiefly of cotton and woollen goods, silks, hardware, iron, cutlery, and glass, amounted to about 900,000*l.*; from France, chiefly of wines, fine cloths, silks, laces, gloves, and fancy articles, to about 500,000*l.*; and from the United States, chiefly of spirits, provisions, coarse cloths, soap, and candles, to about 200,000*l.* There is also a

very large coasting trade in fruits, &c., brought down to the market at Buenos Ayres, in vessels constructed for the service, and chiefly the property of Italians and Frenchmen. As Buenos Ayres alone of the provinces of the Argentine Confederation has a coast-line, and consequently was thus brought into connection with foreign nations, the provincial government, though not by express arrangement, from the first carried on the business of the Confederation with foreign powers. It also sought to assume to itself the monopoly of the external commerce, by strictly closing the navigation of the Paraná to foreign vessels. The endeavour to maintain this political and commercial supremacy has led to protracted wars with foreign powers, as well as with the other provinces, as has been already noticed in our account of the ARGENTINE CONFEDERATION. It is therefore only necessary to add here that the state of siege, which in that article Buenos Ayres was said to be enduring, has since been raised, and commercial relations have been resumed; that a treaty has been agreed upon between General Urquiza, as president of the Argentine Confederation, and the governments of Great Britain, France, and the United States, for the opening of the Paraná and Uruguay, and establishing a protectorate over the island of Martín García, which commands the entrances of these rivers; and that Buenos Ayres has published a formal protest addressed to "all European governments," against that or any such treaty. The differences between Buenos Ayres and the other provinces remain of course still unsettled. The tenacity with which Buenos Ayres clings to its commercial policy is easy to be understood, when it is stated that nearly the whole of the revenue required for carrying on its government, and meeting the demands of its creditors, is obtained from its custom-duties; and that while the Paraná remained closed to foreign vessels, the entire import and export trade of the riverine provinces, as well as the interior, had to be supplied through the port of Buenos Ayres. According to the constitution, the executive consists of a governor, or captain-general, as he is styled, aided by a council of ministers appointed by himself. He is responsible to the junta, or legislative assembly, by whom he is elected. The junta itself consists of 44 deputies, one-half of whom are annually renewed by the people.

There are few towns of any importance in this province except the capital BUENOS AYRES. The next largest city is that of *San Nicolás de los Arroyos*, which is well situated on high ground on the Paraná, about 190 miles from Buenos Ayres, and has about 8000 inhabitants. The town covers a considerable space, in consequence of the better houses having large fruit gardens attached. The streets, which are built at right angles, have brick foot-ways. The church in the great square has a large wooden cross opposite to its entrance. Near it are the barracks. There are schools for boys and girls. The town has a good deal of trade; and has been steadily improving for some years. *San Pedro*, population about 1000, is another of the towns on the Paraná, which appears capable of carrying on a considerable trade. *Tandil* is a small place, situated at the foot of a range of rocky hills, about 210 miles S. by W. from Buenos Ayres, which serves as a fort against the Indians, and to supply the wants of the surrounding country. *Chacabuco*, about 90 miles S.E. from Buenos Ayres, adjoining the largest lake of the same name, was once a place of some trade, and contained upwards of 4000 inhabitants, but became greatly reduced during the late civil wars. It has a large but now partly ruinous church, and several stores and shops kept by Europeans.

(Sir Woodbine Parish, *Buenos Ayres*, new edition; MacCann; Gerstaecker, &c.)

BUENOS AYRES, the capital of the province of Buenos Ayres, and the chief city of the Argentine Confederation, in South America, is situated in 34° 36' 29" S. lat., 58° 10' 11" W. long., on the south bank of the upper part of the wide estuary of the La Plata River, about 150 miles from the place where it enters the sea. The population of the city in 1825 was 81,136, it is now estimated at about 120,000.

The La Plata at Buenos Ayres is about 30 miles wide, so that Colonia, a small place on the opposite bank, is only visible from the more elevated places in the town, and then only in very clear weather. Though the estuary has a considerable depth in the middle, it grows so shallow towards its south bank, that large vessels are obliged to remain in the outer roads, about seven miles from the shore; small vessels enter the inner roads, called 'belizas,' where they are still two miles from the town. The beach itself is extremely shallow; even boats cannot approach nearer than from 50 yards to a quarter of a mile, according to the state of the tide, and persons as well as goods are landed in rudely constructed carts drawn by oxen. When it blows fresh the surf on the beach is very heavy, and often causes loss of life.

The city stands on a high bank for about two miles along the river, and has a handsome appearance at a distance. Between the city and the water's edge is a space of considerable width, rarely covered by the tides, on which General Rosas, in 1847, commenced the construction of a great sea-wall, which was intended to stretch northward from the fort the whole length of the city, and to be planted with trees, so as to form a grand esplanade. Though it remains at present unfinished, it still forms a favourite promenade. On the beach, about the centre of the line of houses, is the fort or castle, the walls of which extend to the water's edge, and are mounted with cannon. Its buildings are appropriated to public offices, and the residence of the

president of the republic. About a mile lower down the high bank suddenly turns inland, leaving a vast level plain along the shore, traversed by a little stream, which makes a good harbour for small craft, its mouth forming a kind of circular basin.

Behind the castle is the Plaza de la Victoria, a great square, which occupies a considerable space; it is divided into two parts by a long and low edifice, which serves as a kind of bazaar, and has a corridor along the whole length of each side, which is used as a shelter for the market people. One side is occupied as a market. The opposite side, which is much larger, is a kind of 'place d'armes,' and contains a very fine edifice, called the 'cabildo,' or town-house, in which the courts of justice hold their sessions, and the city council, or cabildo, meets. Near the centre of the square is a neat pyramid, with an emblematic figure at each corner, erected in commemoration of the Revolution, by which the country was freed from the dominion of Spain.

There are in the city fifteen churches, of which the principal is the cathedral, which of itself covers almost a whole square. The front is a modern portion of 12 Corinthian columns. It is surmounted with a large and lofty dome. The interior is very splendid. San Domingo, San Merced, San Francisco, and the Recoleta are all large and handsome buildings, but of a somewhat gloomy and neglected aspect. In the time of the Spaniards these churches were ornamented with a profusion of gold and silver, but the revolutionary wars have drained them of their wealth. For the use of British subjects, who are very numerous, a church was erected some years back, at a cost of about 4000*l.*, half of which was contributed by the British government; it is capable of holding about 600 persons, and the service is conducted according to the rites of the Church of England. The Scotch, who number in the city and suburbs about 1000, have a Presbyterian chapel which holds about 400 persons. A Methodist chapel was erected in 1842, at a cost of 2250*l.*, which is used by all sections of British Dissenters. The Germans number about 800; the Protestant portion of them have a chapel in connection with the Evangelical Church of Prussia. In connection with all these Protestant places of worship are schools for the children of both sexes. For a long time these were flourishing establishments, but by a series of measures, commencing in 1844, the government has placed them under such severe restrictions, including a very oppressive degree of police surveillance, that their efficiency has been seriously impaired, and their existence continually imperilled. A Protestant cemetery has a neat gothic chapel. There are general hospitals for the sick, and numerous benevolent institutions, supported by both Roman Catholics and Protestants.

The streets of the city are at regular intervals, and are open at right angles to the river, with a rather steep ascent from the shore. They are straight and regular; a few of them near the piazza are paved, but the greater part are unpaved and very dirty. Besides the Alameda, or public walk on the beach, there are also public pleasure-grounds, lately opened at a short distance from the city.

In the neighbourhood of the plaza there are many houses of two stories, but towards the outskirts the houses have only one story. The most noticeable of the commercial buildings are the 'barracas,' or ware-houses, which are very extensive establishments, well provided with hydraulic presses, &c., but the buildings themselves are little better than long sheds. Though the trade of the city is very considerable, the streets have a dull and listless appearance, especially to one accustomed to the bustle and activity of an English commercial town. The extent of the commerce and its character are sufficiently indicated under ARGENTINE CONFEDERATION and BUENOS AYRES, (Province of). Hotels, boarding-houses, and stores are numerous; several of them are kept by English and Americans.

In the vicinity of the city are many extensive sheep farms and Saladeros, and a large establishment for the preparation of preserved meats.

No other town of South America has so many institutions for the promotion of science. The university is attended by about 450 students, and possesses a library of about 20,000 volumes. There are also a collection of objects of natural history, an observatory, a separate school of mathematics; a public school, a school for painting and drawing; a literary society for the promotion of natural philosophy and mathematics, an academy of medicine, and another of jurisprudence, a normal school for mutual instruction, a patriotic union for the promotion of agriculture, besides some charitable societies. Several newspapers are published in the town.

The majority of the inhabitants are the descendants of Spaniards, who have settled in the country during the last three centuries. The number of free negroes or slaves is small; that of native Indians is greater; they compose the larger part of the lower classes, and speak only Spanish, having entirely forgotten the language of their ancestors.

The town was founded by the Spaniards in 1535, but in 1539, being obliged by the neighbouring Indians to abandon it, they retired to Assumption, on the Paraguay. When the Spaniards were firmly settled in the country they rebuilt the town in 1580, and since that time it always has been increasing, though slowly. The climate is healthy, as its name Buenos Ayres (good air) implies, an appellation which was bestowed on it by its founder Mendoza.

BUFFALO, United States, the chief town of Erie County, State of New York, is situated at the head of Niagara River, near its right bank, in 42° 53' N. lat., 78° 55' W. long., distant 328 miles W. from Albany by railway, and 364 miles by canal. The population of the city of Buffalo in 1810 was 1508; in 1825 it was 5140; in 1830 it was 8653; in 1840 the number of inhabitants was 18,213; in 1850 it was 42,260. The rapid increase of the town may be ascribed to the circumstance of the Erie Canal connecting the Hudson River at Albany with Lake Erie having its termination at this port.

The estuary of Buffalo Creek, on the right bank of which the town is situated, and which here falls into Lake Erie, constitutes the commodious and safe harbour of Buffalo. Niagara River is the channel of communication between Lakes Erie and Ontario. Buffalo stands on elevated ground, commanding varied and picturesque views of land and lake scenery. The town is surrounded on three sides by a fine alluvial plain. The houses are well built, and are arranged numerous broad and regularly laid-out streets and three handsome public squares. The streets are lighted with gas. There is a good supply of water. The churches, which belong to about twelve different denominations, are about forty in number. The Roman Catholic cathedral is the most striking of the ecclesiastical edifices. Besides a full supply of common schools, which are open to all children, there are numerous educational seminaries of a higher class. Buffalo possesses a university, chartered in 1846, connected with which is a Medical school. The Young Men's Association is a kind of literary institute, possessing a library of about 7000 volumes, a small mineralogical and zoological museum, and a good reading-room. The German Young Men's Association is a similar institution with a library, chiefly consisting of works in the German language. Fifteen newspapers are published in Buffalo, including four daily papers. There are numerous benevolent institutions in the city, of which may be named the Orphan Asylum, the City Hospital, the Female Orphan Asylum, the Hospital of the Sisters of Charity, and the Association for the Relief of the Poor. A considerable trade is carried on at Buffalo. Large quantities of wheat, Indian corn, flour, butter, &c., are imported.

The number of travellers passing through Buffalo is at all times very great; it forms the port whence persons going to the northern part of the western states first embark upon the lakes. Buffalo was attacked by the British in 1813, and so entirely destroyed by fire, that of about 200 houses of which the place then consisted only one escaped. The lapse of forty years has made a vast change in the aspect of the town, which is now an important commercial port, and the twelfth in amount of population of the cities of the United States. The railway communication possessed by the town is abundant, reaching to Albany, to New York, to Canada, and in various directions to the interior of the country. The Grand Erie Canal, the main source of the prosperity of Buffalo, was commenced in 1817 and finished in 1825; it is 363 miles long, with a surface width of 40 feet, and has 84 locks. The cost of its construction was about ten millions of dollars: large tolls are received from the traffic carried along its waters. In 1850 there were entered at the port 719 vessels of 101,992 tons burden, and there cleared 748 vessels of 103,593 tons. The arrivals in the coasting-trade were 3558 vessels of 1,255,480 tons, and the clearances 3599 vessels of 1,263,907 tons. The value of the merchandise carried along the Erie Canal amounted to between eight and nine millions of pounds sterling; the goods from Albany by railway amounted to about a million and a quarter.

BUGEY RIVER. [Don.]

BUGEY, a district of France, formerly included in Burgogne, is bounded S.E., S., and S.W. by the Rhone, which here makes a considerable bend. Belley was its capital. It now forms the arrondissement of Belley and Nantua in the department of Ais, under which head the nature and products of the country are noticed. The towns of Gex, Nantua, and Seyssel were also in Bugey. Bugey formerly was subject to the counts of Savoy, by whom it was ceded to France by the treaty of Lyon, A.D. 1601.

BUILTH, Brecknockshire, a market-town and the seat of a Poor-Law Union in the parish and hundred of Builth, is situated on the right bank of the river Wye, in 52° 9' N. lat., 3° 3' W. long.; distant 14 miles N. from Brecknock, and 173 miles W. by N. from London. The population of the parish of Builth, otherwise Llanvair-yn-Buallt, in 1851 was 1158. The living is a perpetual curacy in the archdeaconry of Brecon and diocese of St. David's. Builth Poor-Law Union contains 31 parishes and townships, with an area of 142,120 acres and a population in 1851 of 8346.

In the 29th of Henry III. the castle of Builth, a fortress of great strength and importance, was in the possession of Roger Mortimer who was dispossessed of it by Llewellyn prince of North Wales. Llewellyn was afterwards betrayed by the garrison of this castle, whence the epithet of 'traitors of Builth' was affixed by the Welsh to the townsmen. In the early part of Henry VI's reign the castle was held by Edmund, the last Mortimer Earl of March, after whom it devolved on his brother-in-law, Richard, earl of Cambridge. It afterwards became vested in the crown, and has since passed through various hands to the Gwynne family. The castle occupied a height overlooking the river Wye. The only portion now existing is a small fragment of the north wall.

The town of Builth consists chiefly of two streets which meet in an acute angle, and thence form one street, extending along the road towards Llandoverly. The streets are narrow; the town is irregularly built, but having many rude old-fashioned houses it has a somewhat picturesque appearance. Across the Wye is a handsome stone bridge of six arches, erected in 1770 at the joint expense of the counties of Radnor and Brecknock. The parish church, dedicated to St. Mary, was with the exception of the tower, which is ancient, rebuilt in 1793. About two miles south from Builth is a new church for the parish of Llandew-yr-Cwm. The Baptists, Independents, and Calvinistic and Wesleyan Methodist have chapels in Builth. There is a Free school for 36 boys and 12 girls. The market-day is Monday. Fairs are held on January 27th, October 2nd, and December 6th, for agricultural produce and general wares. A county court is held in the town. About a mile from the town are mineral springs, called Park Wells, which on account of their medicinal qualities are visited in summer by invalids in considerable numbers. The river Wye and its tributaries contain excellent trout and salmon, and Builth is much resorted to by anglers. The scenery around the town is very beautiful.

(Jones, *History of Brecknockshire*; Cliffe, *Book of South Wales; Land We Live In*, vol. 1, the Wye.)

BUTENZORG. [JAVA.]

BUJEIAH. [ALGERIE.]

BUKOWINA, sometimes written *Buckowine*, formerly a subdivision of Austrian Galicia, has been constituted a crownland of the Austrian empire by the Imperial Patent of December 31, 1851. It is bounded N. and N.W. by Galicia, E. and S. by Moldavia, and S.W. by Transylvania. Its greatest length from the Dniester, which forms the northern boundary to the Moldavian frontier, is about 95 miles; its greatest breadth from the junction of the Rakitna with the Pruth on the eastern border to the Czereמוש on the west near 48° N. lat., 25° E. long., is about 73 miles. The area, according to the imperial cadastral returns of 1850, is 4014 square miles, and the population, according to the census of 1850-1 was 380,826.

The surface is almost entirely covered by high mountain ranges, offsets of the Carpathian chain. It belongs entirely to the basin of the Danube, with the exception of a narrow strip along the Dniester. A great number of rivers take their rise in the Bukowina, the largest of which are the Czereמוש before mentioned, the Sereth, the Suczawa (a feeder of the Sereth), and the Moldawa. The Bistricza, a feeder of the Moldawa, crosses the southern angle of the Bukowina; and the Pruth traverses the northern district. Along most of the rivers there is a good breadth of fertile land; but in many parts they flow through large marshes. The district between the Pruth and the Dniester is almost entirely covered with oak forests. In the rest of the crownland there are extensive forests of pine, fir, beech, and common woods. There is comparatively but a small proportion of the surface adapted for agriculture; but this is not neglected where the soil admits of it. Corn and potatoes are grown; also flax, hemp, and pulse. Horned cattle are reared in considerable numbers. Honey and wax are important products. But a large proportion of the male population is engaged in wood-cutting and mining. The mineral products are silver, lead, salt, copper, and iron. Particles of gold are found in the sands of the Bistricza. The industrial establishments comprise metal foundries and smelting furnaces, salterns, glass-works, potash factories, and brandy distilleries.

The Bukowina formed, until the patent above mentioned was issued, the circle of Czernowicz, in the eastern part of Galicia. Its chief town is *Czernowicz* (pronounced *Tchernowitch*), which is situated on a hill on the right bank of the Pruth, 147 miles S.E. from Lemberg, and has about 7000 inhabitants. The town is the residence of a Greek bishop and a Greek consistory; it has a Greek cathedral and several other churches; a college; manufactures of clocks, silver plate, hardware, and carriages; and an active trade with Germany, Moldavia, and Wallachia. Among the other towns may be mentioned *Suczawa*, situated 43 miles S. from Czernowicz on the river Suczawa, near the eastern frontier, which has four churches, a gymnasium, a synagogue, and about 5000 inhabitants; and *Sereth*, also on the eastern frontier, and about midway between Czernowicz and Suczawa. *Sereth* stands on the river of the same name, and has three churches and about 4000 inhabitants.

The principal roads of the Bukowina diverge from Czernowicz; one north-westward up the valley of the Pruth leading to Lemberg, and another southward near the eastern frontier through Sereth and Suczawa, whence it runs west up the valley of the Moldawa and across the Carpathians by the Borgo Pass to Bistritz, in Transylvania.

The Bukowina was included in Dacia; it fell successively under the Huns, Goths, Sarmatians, and Hungarians. Under the sway of the Hungarian kings it formed a dependency of Transylvania till the 15th century, when it was ceded to Turkey and incorporated with Moldavia. In 1777 it was ceded by Turkey to the empress Maria Theresa, governed for a few years by military regulations, and then annexed to Galicia in 1786.

BULAMA. [BISSAUGA.]

BULGARIA, a country of Turkey in Europe, is bounded N. by the Danube, which separates it from the principalities of Wallachia and Moldavia, and from the Russian province of Bessarabia; E. by

the Black Sea; S. by the crests of the Eminch and Khojah Balkan; and W. by the principality of Servia, from which it is partially divided by the Timok, a feeder of the Danube. The area is above 32,000 square miles, and the population according to the estimate of 1814 was about 3,000,000, the majority of whom are adherents of the Greek Church. The area is thus distributed, as nearly as we can ascertain:—Pashalic of Silistria, including the territory of Varna, 13,000 square miles; pashalic of Nicopoli, 10,000 square miles; pashalic of Widdin, 4500 square miles; and a portion of the pashalic of Sophia, 4500 square miles. These divisions however do not coincide with the present Turkish divisions of Bulgaria, which are Widdin, Nich or Nissa, and Silistré. We retain however the old divisions in our maps.

The Danube runs with many windings, but in the general form of a bow, with the convex side towards Bulgaria, all along the northern boundary to the mouth of the Sereth, whence it turns to the eastward and enters the Black Sea by several mouths. [BESSARABIA; DANUBE.] Reckoning all its windings the river flows along the province for not less than 500 miles, and is navigable for steamers and large vessels all the way. It forms numerous small islands in its course and a delta at its mouth; and on both sides of the river at intervals are extensive marshes, which in the dry season are very unhealthy and infested by mosquitoes.

The Balkan Mountains, the ancient *Hæmus*, rise on the southern frontier to about 6000 feet above the sea. They sink down rapidly on the south side; on the north the slope is more gradual. The chain is traversed by many defiles and passes. [BALKAN.] From its crest numerous ramifications extend northward to the plain of the Danube. These offsets are generally well wooded or covered with rich pasture; and they are separated by valleys or small plains drained by feeders of the Danube. The principal of these rivers, commencing on the Servian frontier and proceeding eastward, are the Timok, the Ogust, the Skitul, and the Isker, which cross the pashalic of Widdin; the Wid, the Oama, the Jautro (which passes the town of Tirnova), and the Lom, which traverse the pashalic of Nikopoli, sometimes called the sanjak of Rustchuk; and the Drista, the Tamar or Jemurlu, and the Kara-Su, which drain that part of the pashalic of Silistria which belongs to the basin of the Danube. The Kaintchik, which rises west of the Selimno Pass of the Balkan, flows eastward through a longitudinal valley between parallel ranges of the Balkan, and enters the Black Sea between Cape Eminch and the port of Varna. In the mountains that screen the valley of the Kaintchik on the north is the town and fortress of Shumla. The most important of the other tributaries of the Black Sea in Silistria is the Parawali, which passes through the marshy lakes of Devio and falls into the port of Varna. The Parawadi River is identified by General Jochims in his 'Notes of a Journey to the Balkan' with the ancient *Lygmos*; and the site of Alexander's battle with the Triballi (B.C. 336) he considers to be the isthmus between the two lakes of Devio, a little west of the village Bnyuk-Aladin. Not far from the same spot, but nearer Varna, is the site of the great battle fought between the sultan Murad and King Vladislav in 1114. The site is easily identified by two large mounds called *Sandshak Tépe* and *Murad Tépe*.

The coast of Bulgaria, or Silistria, from Cape Eminch, the eastern extremity of the Balkan, to Cape Kalakria or Gulgrad Buran, north of Varna, is generally high; to the northward of this last point the shore is for the most part flat, low, and marshy. The most important places along this coast are the city, port, and fortress of Varna, and the little town and roadstead of Kustench, which is only about 30 miles distant from the point where the Danube makes the great bend to northward. It has been lately proposed to cut a navigable canal across the isthmus, in order to avoid the tedious navigation by the mouths of the Danube. Between the base of the Baba-Dagh, an elevated mass in the extreme north of Silistria, and the sea lies the large lake of *Rassan*, or *Razen*, which is 35 miles long from north-west to south-east, and about 15 miles wide where broadest. It is separated by a narrow strip of land from the St-George mouth of the Danube, from which a little arm called *Dunavitz* enters the lake. The lake itself communicates with the Black Sea by two principal channels called the *Jalova* and the *Portitcha* mouths. On the west shore of the lake is the town of *Baba-Dagh*, with 10,000 inhabitants, seven mosques, and extensive salt-works. The fishery of the lake is important. At the northern base of the Baba-Dagh range, and on the right bank of the Danube, is the fortress of *Issutscha*, near which the Russians in 1828, and Darius about 2300 years before them, passed the Danube. In consequence of the Russians having neglected to keep the Sulina mouth of the Danube in a navigable state, attention has been turned to the St-George mouth, which belongs to Silistria, but is by treaty open to all trading vessels, and to the war ships of Austria and Russia. No vessel of any size however can easily enter it, owing to the banks of mud which have accumulated round its embouchure, and to the shallowness of the stream from the deposits of the river. It has however been lately surveyed with the view to make it navigable and to free the trade of countries along the lower Danube from the vexatious regulations of the Russians.

A considerable portion of the sanjak of Sophia, now called by the Turks (we believe) the pashalic of Nich or Nissa, forms part of

Bulgaria. This district of Bulgaria extends southward to the point where the Eminch Balkan, the Despot-Dagh, and the Khojah Balkan meet near the source of the Isker and the Sulu Derbend, or Pass of Trajan. The Isker here traverses a beautiful plain, in which stands the populous and well-built city of Sophia, famous for its hot springs. Into the plain from the north-west a high valley screened by the Khojah Balkan and Mount Tesovitch opens; in its northern part stands the city of Nissa, in a fertile country watered by the Nissava, a feeder of the eastern Morava. Near Nissa is the Tower of Skulls erected as a trophy of victory gained over the Servians by the Turks under Kurnurges.

The plains of Bulgaria are in general well cultivated, and the hill-slopes are covered with vineyards. On the Thracian side of the Balkan (excepting the valley of the Maritza) cultivation is generally confined to the immediate circuit of the villages; but in Bulgaria wide tracts are subdued by the plough, and large quantities of corn are produced by the industrious inhabitants. The largest quantities of corn are grown in Silistria and in the plains near the Danube. A good deal of flax, hemp, and tobacco are grown, large quantities of wine are made, and fruits are abundant. Roses are cultivated very extensively for making perfumes. Timber cut in the mountain forests is floated down the rivers for export to the towns on the Danube. For want of good roads however Bulgaria, like all other parts of the Turkish empire, has comparatively but a limited trade. The Bulgarians however seem to enjoy a rude abundance; it is rare to see a beggar, and their well-built dwellings, and neat fields and gardens present a most favourable contrast to the mud-plastered huts of wattle and the neglected or rudely-cultured steppes on the Wallachian side of the Danube.

The soil of Bulgaria is in general fertile and well watered; the section between the town of Sistova and the Balkan however is deficient in water, although it yields grass abundantly. The best cultivation is seen in the districts extending from the western part of the pashalic of Silistria to the pashalic of Widdin: this region is inhabited chiefly by Bulgarians, a race always remarkable for industry and for their pacific disposition, notwithstanding their long oppression under the Turkish feudal system and the rapacity of the pashas. But the Tanzimat has now put the Bulgarian on a level in point of law with the Turk (in other respects he was always his superior), and the feudal system has been swept away; so that Bulgaria, at all times confessedly the best cultivated part of Turkey, will probably soon reach a high degree of prosperity and improvement.

That part of Silistria which skirts the Black Sea is sometimes called the pashalic of Varna, and is inhabited chiefly by Turks and Tartars, who barely raise enough corn for their own consumption, and are chiefly occupied in rearing cattle. The fine plain south from the Baba-Dagh to the neighbourhood of Kustendjé is inhabited by Bulgarians, and by a goodly number of Russian colonists from Bessarabia, who raise large quantities of hard wheat of very superior quality. In the rest of Silistria the country is well cultivated throughout, and yields an abundant supply of provisions of all kinds. Hard wheat of two kinds, distinguished by the names of 'urnaut' and 'coloss', is grown very abundantly. Barley also of fine quality is extensively grown. The other crops are maize, beans, and hemp, which in years of drought do not succeed so well. Several thousand oxen are slaughtered in the city of Silistria for the tallow, which is sent to Constantinople.

The eastern part of the pashalic of Nicopolis is well wooded as far as the neighbourhood of Rustchuk; it also possesses abundant pasturage, and in ordinary years, when not visited by long droughts, it is very productive in corn. Wood for building and oak planks of superior quality are exported. Between Rustchuk and Sistova the plain of the Danube is occupied densely and solely by Bulgarians, and presents a fertile and pleasing aspect. Besides corn the chief products are hemp, flax, attar of roses, and tallow. Sistova is considered the capital of the Bulgarians; it is one of the most important towns on the right bank of the Danube, and carries on a considerable trade with Wallachia. Westward from Nicopolis, and throughout the greater part of the pashalic of Widdin, the country is more thinly peopled, habitations being met with only where there is water, and agricultural produce is raised merely sufficient for the local consumption. The plain of the Danube here partakes of the nature of a steppe, and cultivation prevails more in the mountainous districts. Indeed the cultivation of corn for export was long effectually checked in this part of Bulgaria by a restrictive system, by which the farmers could not sell their surplus produce without the pasha's permission, and at a price fixed by him. Sometimes the pasha appropriated the surplus to himself, ground it at his own mills, and then forwarded it for sale to Constantinople. These regulations have been very injurious to the trade of Widdin, which however has a considerable commerce in manufactured goods imported from Austria.

The tallow trade causes the rearing of large numbers of cattle in Bulgaria. Large herds of oxen to the number of 40,000 or more are fattened during the summer months, and slaughtered during the autumn, in the neighbourhood of Varna, Silistria, Rustchuk, and other towns, for their hides and fat; for beef is seldom eaten by the Moslems, whose favourite animal food is mutton and goat. There is a depôt at Varna for the tallow and other products of the province.

Owing to the difficulties, tediousness, and expense of the river navigation, and vexatiousness of the Russian quarantine regulations, the corn and other products of Bulgaria are generally brought by land-carriage to Varna for export even from the plain of the Danube. Corn however for export to Constantinople is frequently conveyed in 'kiriaches,' or Turkish lighters of from 30 to 100 tons, which are very numerous on the river, to Matsin, a small port opposite Brailoff, and there embarked in larger vessels. From the roadstead of Kustendjé also large quantities of corn are occasionally exported; but the exposed condition of this port since the destruction of its mole (built by Constantine the Great) is a great obstacle to its trade. Its position however has been at all times considered of great importance, as it is only 30 miles distant from Cernawoda on the Danube. A canal was projected in 1837 to unite the two points, and to give a short and direct route to the Danube trade by avoiding the great northern bend of that river, and the intricate shoals and mud-banks in its mouth. This project has been recently revived, and will probably be one day executed.

Besides horned cattle, including buffaloes, Bulgaria rears a great many horses of inferior breed, sheep and goats in great numbers, and swine for the consumption of the Christian part of the population: pork to the Moslem as to the Jew is an abomination. The manufactures of the country are all of a coarse description, and for home consumption. The imports are manufactured goods, coffee, spices, sugar, salt, &c.

The principal towns of Bulgaria are described in this work under separate heads: WIDDIN, NICOPOLIS, SISTOVA, RUSTCHUK, SILISTRIA, RASSOVA, TIRNOVA, SOPHIA, VARNA, KUSTENDJÉ, SHUMLA, NISSA, &c.

Bulgaria comprises the greater part of ancient Moesia, which was occupied in the time of Darius by the Getae, and in the time of Alexander by the Triballi. It is a very interesting country for its historical associations, to illustrate which there is great need of enlightened exploration. General Jochims, in the work already quoted, has thrown great light upon the history of the expeditions of Darius and Alexander in this country. He supposes Darius to have crossed the Balkan by the pass to the north-west of Mesembria, and to have marched northward to Issatchia by the same route that Marshal Diebitsch led the Russians in an opposite direction in the campaign of 1828. Alexander, he says, fought the action with the Thracians at the foot of the defile of the Balkan to the north of Aidos; thence crossed the defile to the Lyginos, near the town of Parawadi; and after his victory over the Triballi, before mentioned, marched in three days to the Danube, which he is supposed to have crossed at or near Silistria, for the purpose of attacking the Getae. Bulgaria contains some Roman remains: the great Roman road connecting Trajan's Bridge over the Danube with Dyrrachium on the Adriatic crossed the valley of the Timok, the ancient Timachus, above Widdin, and is still in parts entire. On the road from Shumla to Rustchuk numerous ancient mounds covered with forest-trees are passed at a place called Lazgarat, marking no doubt the site of some great ancient battle.

Moesia was originally inhabited by a Scythic or Slavonic people. It was subjected by M. Licinius Crassus about B.C. 29 to the Romans, who built entrenched camps along the Danube; one of these is still visible near Widdin. In the 3rd century it was invaded by the Goths, whose incursions were not thoroughly checked till the time of Aurelian, who planted several Roman colonies in the province. It was next overrun by the Visi-Goths, to whom Theodosius I., after the defeat and death of Valens at the great battle of Adrianople in A.D. 378, ceded the country; and a part of those who settled in the western part of it are known in history as the Mæso-Goths. In the 6th century Slavonian tribes spread over Lower Moesia, and in the 7th century Upper Moesia was given by Heraclius to the Serbs and other Slavonic people, to protect the empire in that direction against the Avars.

The Bulgarians, a Tartar people from the banks of the Volga, subdued the Slaves of Lower Moesia about the middle of the 7th century; but became in a short time so blended with the Slavonic part of the population, that before the commencement of the 9th century they had adopted the Slavonic language and customs, the name of the race which gave its designation to the country alone remaining. They were governed by kings who put themselves under the protection of the Greek emperors. This alliance however they renounced in 1185, their king Asan remarking that the Greek empire needed protection more than Bulgaria. Long wars with Hungary desolated the country between this and the 13th century, when Bulgaria was subjugated by Stephen IV. about the time that the Turks made their first appearance in Europe. In 1392 the Turks made the Bulgarian king Susan prisoner, and the people lost their independence. There are many Bulgarian colonies in Thrace and in the countries along the left bank of the Lower Danube.

In consequence of the Russian occupation of the principalities of Moldavia and Wallachia in 1853, the line of fortresses along the left bank of the Danube and the defiles and fortresses in the Balkan range were occupied by a large Turkish army, divisions of which crossed the Danube opposite Kalafat and Oltenitza, and obtained some advantages over the Russians.

(Arrian, l. 1-5; Herod. iv.; *Dictionary of Greek and Roman Biography*; General Jochims, *Notes of a Journey to the Balkan*, 1853; Macgregor, *Commercial Statistics*; *Frontier Lands of the Christian and Turk*; Ubicini, *Lettres sur la Turquie*, Paris, 1853.)

BUNBURY. [WESTERN AUSTRALIA.]

BUNDELCU'NI, or **BOO'NDELA**, a division of the province of Allahabad, in Hindustan, lies between 24° and 26° N. lat., and 77° and 82° E. long. This territory is bounded N. by the river Jumna, E. by Baghulound, S. by Malwa and Berar, and W. by the possessions of Scindia. In its form Bundelound is an irregular parallelogram: its greatest length is in the direction from south-east to north-west; its area is nearly 24,000 square miles: the population is about 2,400,000. There are three ranges of mountains in Bundelound, which extend in continuous lines parallel to each other. One of these ranges, which forms part of the Vindhyan chain, is less sterile and rugged than the part of the same chain which passes through Bahar. On the summit of this range a considerable extent of table-land occurs, which is 1200 feet above the level of the Gangetic plain. The second mountain range, called the Panna Chauts, runs parallel to the Vindhyan chain at the distance of about 10 miles. The third range, called the Bandair, occurs at about an equal distance beyond the second to the north-west, and comprises the most elevated part of the province. The soil of Bundelound presents a very great variety. The valleys and lowlands consist principally of rich black loam: the hilly country and elevated table-land are in great part composed of poor and sterile soil. The fertile tracts, when assisted by irrigation, produce abundant harvests of every kind of grain and plant that is cultivated in Hindustan: the principal produce of the poorer lands is millet. Iron is found among the hills, where also catechu, or terra Japonica, is produced in abundance. The principal rivers of Bundelound are the Betwah, the Desan, and the Ken or Kane. Neither of them is navigable. There are in different parts of the country some very large reservoirs for purposes of irrigation.

The principal towns are Banila, the capital; Bejour, Jeitpore, Jhansi, Chatterpore, Callinger, and Telree. *Banila* is situated in 25° 30' N. lat., 80° 20' E. long., about 90 miles W. from Allahabad. This town has much increased of late years. The cotton brought for sale to its market is of superior quality. *Bejour* is in 24° 38' N. lat., 79° 27' E. long. *Jeitpore* is in 25° 17' N. lat., 79° 32' E. long. *Jhansi*, the capital of a petty Boondela state under British protection, is situated in 25° 32' N. lat., 78° 34' E. long. This town is the centre of an active trade carried on between the Deccan and the towns of the Doab: it contains a considerable carpet manufactory; and large quantities of the warlike weapons used by the Boondela tribes, such as bows, arrows, and spears, are made here. *Chatterpore*, in 24° 56' N. lat., 79° 35' E. long., is about 135 miles W.S.W. from the city of Allahabad: it has much decayed of late years. The manufacture of coarse cotton cloths, used for wrappers, is carried on. *Callinger*, a fortified town in 25° 6' N. lat., 80° 25' E. long., stands on a lofty mountain, the base of which is 10 miles in circuit. The walls include the whole summit of the hill, and are composed of rough hewn stones. *Three*, or *Teary*, on the north-west frontier of Bundelound, in 24° 45' N. lat., 78° 52' E. long., is the residence of a Boondela chief or raja, who possesses several villages, and has a considerable revenue.

The British connection with the chiefs of Bundelound originated in an arrangement concluded with the late Peishwa on 31st December 1802. The Bundelound states are thirty-three in number: of these states five are protected and tributary, including an area of 4476 square miles, with a population of 399,500: their aggregate annual revenue is about 183,464*l.*; the amount of tribute about 10,388*l.*; the military force maintained by them amounts to about 9500 men. The other states, numbering twenty-eight, have in the aggregate an area of 6450 square miles, a population of 680,300, and a revenue of 316,658*l.* Their military resources include 261 artillery, 2380 cavalry, and 20,975 infantry. The Nawab of Banda, a descendant of the former governors of Bundelound, has no hereditary dominions, but receives an allowance of four lacs of rupees (40,000*l.*) per annum from the British government, and maintains a force of 69 artillery, 167 cavalry, and 207 infantry.

BUNDER ABBAS. [GOMBROON.]

BUNGAY, Suffolk, a market-town in the parishes of Holy Trinity and St. Mary's, Bungay and hundred of Wangford, is situated on the Waveney, which sweeps round the town in the form of a horse-shoe, and here separates Suffolk from Norfolk, in 52° 27' N. lat., 1° 23' E. long.; 40 miles N.N.E. from Ipswich; and 109 miles N.E. from London by road; Diss station of the Eastern Union railway, which is 16½ miles from Bungay, is 111 miles from London. The population of the town in 1851 was 3841. The living of Holy Trinity is a vicarage; that of St. Mary's is a perpetual curacy; they are in the archdeaconry of Suffolk and diocese of Norwich. The two parishes of Bungay are united for poor-law purposes, but are not under the operation of the Poor-Law Amendment Act.

The town of Bungay was in ancient times dependent on Bungay Castle, which is supposed to have been erected by the Bigods, the Norman earls of Norfolk. Some ruins of the castle-walls remain. Of the chancel of the old church of St. Mary some vestiges are still standing; and adjoining thereto are the remains of a Benedictine nunnery. Two crosses formerly stood in the market-place. Of these one was taken down in 1810; the remaining one is crowned with a figure of Justice. The church of the Holy Trinity is an ancient edifice with a round tower, supposed by some to be of the time of

Edward the Confessor. St. Mary's church, though said to have been built about 1696, has a north aisle, with a beautiful exterior and a fine west window, which probably dates from the early part of the 15th century. The Roman Catholics, Wesleyan Methodists, Independents, and Baptists have places of worship. The Endowed Grammar school, founded in 1591 had an income in 1837 of 57*l.* a year. The appointment of the master is in the gift of Emmanuel College, Cambridge. There are National and British schools; a savings bank; almshouses for 15 persons; and several charities. Five of the almshouses were erected and endowed in 1848 by a Mrs. Dwyer, "for the widows of unfortunate tradesmen;" the same lady also bequeathed 500*l.* to each of the two parishes, the interest to be expended annually in warm clothing at the discretion of the minister and parochial authorities. A dispensary and a lying-in charity are supported by voluntary contributions; also two clothing societies. The streets of Bungay are well-paved, and the town is lighted with gas. In consequence of an extensive conflagration by which Bungay was nearly destroyed in 1688, the houses are generally of modern date. A building formerly a theatre is now used as a corn-exchange on week days and a Baptist chapel on Sundays. A considerable trade is carried on in coals, malt, grain, and provisions, the river Waveney being navigable up to Bungay for small barges. The market is held on Thursday; there are annual fairs on May 14th and September 25th. Near the town is a large silk-mill; there are also paper- and flour-mills and malt-houses.

BUNKER'S HILL. [BOSTON.]

BUNTINGFORD, Hertfordshire, a small town, and the seat of a Poor-Law Union, chiefly in the parish of Layston and in the hundred of Edwinstree, is situated in 51° 57' N. lat., 0° 1' W. long.; distant 12 miles N. by E. from Hertford, and 31 miles N. from London by road. Ware station of the Eastern Counties railway, which is 10 miles from Buntingford, is distant 24½ miles from London. The population of the parish of Layston in 1851 was 1220. The living is a vicarage held with the perpetual curacy of Buntingford, in the archdeaconry of St. Albans and diocese of Rochester. Buntingford Poor-Law Union contains 16 parishes and townships, with an area of 29,040 acres, and a population in 1851 of 6590. Buntingford obtained the grant of a weekly market in the reign of Edward III. The market was held on Monday, but has long been discontinued. The chapel at Buntingford is a brick edifice erected in the early part of the 17th century. The Independents have a place of worship. The Grammar school founded in 1633 has an income from endowment of about 50*l.* a year, and had 18 scholars in 1851. It has four exhibitions at Christ's College, Cambridge, of 12*l.* each, tenable for seven years. There are National and British schools, a School of Industry for girls, and a savings bank. An hospital provides for four poor men and four poor widows.

BUNZLAU, JUNG, the capital of the circle of Bunzlau in Bohemia, is situated 30 miles N.E. from Prague, on a hill, the base of which is skirted by the Iser; and contains about 5100 inhabitants. It is well built, and has a handsome town-hall, a castle now used for barracks, six churches, some of them handsome structures, two monasteries, a Pietist gymnasium, a high school, an hospital, and besides an extensive cotton factory, manufactories of woollens, leather, soap, &c. It is said to have been founded by King Boleslaf in 975; at least its Bohemian name of 'Mlada Boleslaf' is derived from that monarch. 50° 23' N. lat., 14° 55' E. long.

BUNZLAU, a town in the government of Liegnitz, in Prussian Silesia, lies on the Bober, 25 miles by railway W. by N. from Liegnitz, and is surrounded by a double line of walls and a deep ditch; it possesses three churches (one Lutheran and two Roman Catholic), an orphan asylum and school, an hospital, a seminary for teachers; and manufactures of woollens, linens, stockings, earthenware, &c., and has well-frequented markets for horses, cattle, and grain. Population 7000. Much earthenware is exported. Topazes, agates, chalcedonies, and other valuable stones are found in the neighbourhood. A cast iron obelisk in memory of the Russian general Kutusoff, who died here in 1813, is erected in the market-place.

BURA. [ACHEN.]

BURBURRA. [BENNEHA.]

BURDWA'N, one of the 17 districts into which the province of Bengal is politically divided, is situated to the west of the river Hoogly, between 22° and 24° N. lat., 87° and 89° E. long. Burdwan is bounded N. by Birbhūm and Rajshahy, W. by Midnapore and Rangpur, S. by Midnapore and Hoogly, and E. by Hoogly and Nuddeah. Its area, which is computed at 2400 square miles, is covered with a dense population, supposed to be about 1,500,000, of whom five-sixths are Hindoos. The district of Burdwan, which forms part of the valley of the Ganges, is a level tract. The principal river flowing through it is the Dummudah, which is navigable only for a short time during the rainy season. The greater part of the soil is very fertile, and produces abundant crops of sugar, indigo, betel, tobacco, and cotton, besides the cereal grains usually cultivated in Bengal. A considerable quantity of silk is likewise produced. Compared with the surrounding districts, Burdwan has the appearance of a garden. The native zemindars are generally wealthy; the more considerable of them usually reside in Calcutta, leaving their properties to the management of resident agents. The Raja of Burdwan is the most considerable zemindar under the Bengal presidency, his

annual jumma, or rent, amounting to 40 lacs of rupees (400,000*l.*), which amount is said to be less than one-half of the sum collected by him from his tenants. These tenants form a numerous class, who, like the middlemen in Ireland, have divided their holdings among sub-tenants, reserving a profit-rent to themselves. Coal-mines have been worked in this district for many years, but the operations have not been extensive. The extent of the coal-field has not been ascertained, but is known to be great; the mines now worked are in the possession of an English company, whose rights extend over 4 miles of surface. The seam is 9 feet thick, and is found 90 feet below the surface. The coal is brought down the Hoogly to Calcutta, but it is of very inferior quality. Iron ore, and stone suitable for building are also obtained. The town of *Burdwan*, the capital of the district and the residence of the British agent, is situated in 23° 15' N. lat., 87° 57' E. long., about 60 miles north-north-west from Calcutta. The Raja of Burdwan resides in the town, in which he has a palace with large gardens.

BURFORD, Oxfordshire, a market-town in the parish of Burford and hundred of Banpton, is situated on an ascent on the right bank of the river Windrush, in 51° 48' N. lat., 1° 39' W. long., distant 18 miles W. by N. from Oxford, and 72 miles W. by N. from London. The population of the township of Burford in 1851 was 1503; of the entire parish 1819. The living is a vicarage held with the perpetual curacy of Fulbrook in the archdeaconry and diocese of Oxford.

Burford was in 752 the scene of conflict between Guthred, king of Wessex, and Ethelbald, king of Mercia: Ethelbald was vanquished, and his standard, a golden dragon, taken. The scene of the engagement is still called Battle Edge. The town had a charter of incorporation from Henry II. A corporate officer retaining the name of alderman has for the most part the management of the affairs of the town. The market chiefly for corn is held on Saturday; and there are three annual fairs. The county magistrates hold petty sessions in the town. Burford possesses a savings bank.

Burford church, dedicated to St. John the Baptist, is a commodious cruciform structure, chiefly perpendicular; it has a central tower of Norman date, surmounted with a spire in the perpendicular style. The roof of the nave, now much mutilated and altered, has been of remarkably fine wood-work. The Baptists and Wesleyan Methodists have places of worship in Burford. There are a National school for girls and a school for young boys. The Free Grammar school founded in 1571 has an income from endowment of 85*l.* a year; the number of scholars in 1851 was 32. There is a parochial library. Many of the houses in Burford are ancient: some of them are interesting to the archaeologist and architectural student. There was formerly a small priory or hospital in Burford parish, dedicated to St. John the Evangelist: its site is now occupied by a mansion called 'the Priory,' interesting as having belonged to Lord Falkland, and to the Speaker Leithal. The present mansion contains some valuable historical portraits by Holbein, Vandyke, and Cornelius Jansen.

BURG, a town in Prussian Saxony, is situated on the Elbe, 64 miles S.W. from Berlin, 16 miles by railway N.E. from Magdeburg, and has about 15,000 inhabitants. It is surrounded by a wall with five gates, contains three squares, three Lutheran churches, one Calvinist church, a civic school, an hospital, and a poor-house. In 1817 the population was 9101. Burg has been famous for many centuries for its extensive woollen manufactories. Many of its factories are worked by steam power. Engineering factories for the fabrication of machinery and millwork have been recently established. Yarns and linens, pottery, &c., are made; it has also some tanneries and dye works, and a brisk wool trade. Agriculture, including the growth of tobacco, hops, and chicory, and the rearing of cattle and sheep, are carried on in the immediate environs.

BURGDORF. [BRUNN.]

BURGH. [LINCOLNSHIRE.]

BURGH CASTLE. [SUFFOLK.]

BURGOS, a city of Spain, capital of the ancient kingdom and province of Castilla la Vieja (Old Castile) and of the modern province of Burgos, is situated on the northern or right bank of the Arlanzon, an affluent of the Pisuerga, in 42° 21' N. lat., 3° 42' W. long., 140 miles N. from Madrid, by the road. It is the see of an archbishop, and is the residence of a captain-general. The population is about 12,000.

Burgos is built partly at the foot and partly on the acclivity of a rugged hill, which is crowned by the keep and other remains of the ancient castle now forming part of the fortifications constructed by the French during the Peninsular War. Three stone bridges cross the river, and connect the city with the Barrio de la Vega (Suburb of the Plain) and the public walks and gardens on the left bank. The Espolón (Esplanade) consists of handsome modern houses, and extends along the right bank from the highest bridge, the Puente do San Pablo, to the central bridge, the Puente do Santa Maria, where the roads from Madrid and Valladolid unite, and crossing the bridge enter the city by the arched gate of Santa Maria. Thence the principal and widest street ascends the hill to the principal square, the Plaza Mayor, in which are the cathedral, the archbishop's palace and the town-hall (Casa de Ayuntamiento). The city forms an irregular semicircle, with considerable portions of the old walls still standing towards the river front. The streets are mostly narrow, crooked, and dark; but the Calle Alta, Calle do San

Lorenzo, and other streets above the Plaza Mayor, are wider, and contain several of the half-fortress mansions of the old nobility, such as that of the Constable of Castile, in the Plazuela do la Libertad, with its towers, arms, and rope over the portal, whence it is called the Casa del Cordón (House of the Rope). A structure called El Salar del Cid marks the site of the house occupied by the Cid Rodrigo Diaz de Vivar, who, as the inscription on it records, was born in 1020, and died in 1099, in the city of Valencia. His remains however were interred in the monastery of San Pedro de Cardena, two or three miles from Burgos, where the statue of the Cid mounted on his charger Babieca surmounts the entrance-gateway. A short distance below the city a branch of the Arlanzon separates itself from the main stream, and sweeping round re-enters it, thus forming La Isla (the Island), which is laid out in public walks and pleasure gardens. The lowest bridge across the Arlanzon is called the Puente do la Merced (Bridge of Mercy), and there are two small bridges cross the branch-stream to La Isla. A stream called La Vena enters the Arlanzon a little above the city, and a small stream, El Pico, divided into watercourses called Esquevas, traverses and cleanses the streets. The fountains are abundantly supplied with good water.

The arched gateway of Santa Maria (El Arco de Santa Maria), massive and battlemented, is crowned by a statue of the Virgin Mary, seated, with a child on her knees. In the centre of the Plaza Mayor is a bronze statue of Carlos III. This square has an arcade running along three of the sides, with small shops beneath and handsome houses above. The Plaza Mayor however is too small to afford a good view of the cathedral, which is besides much encumbered with houses. The cathedral is very large, and one of the finest works of gothic architecture in Spain. It was commenced in 1221, and is of various styles, but mostly florid. The two western towers are surmounted by spires of the most delicate open work in stone, almost transparent, and looking like lace that the wind might blow away. These towers were built about 1100 by Juan de Colonia (Cologne) and his son Simon. The central octagonal tower, which surmounts an interior cupola, rising 180 feet from circular buttresses, was completed in 1567, the original cupola and transept having fallen in 1539. This tower is elaborately ornamented, and has numerous pinnacles. A magnificent rose-window surmounts the western entrance, with a gallery beneath, but the deeply recessed triple doorway has been removed and replaced by modern work in bad taste. The cathedral contains seven or eight large chapels, one of which, the Chapel of the Constable (Capilla del Condestable), is a church of itself, with a tower, choir, and chapels, all of beautiful florid gothic. This chapel was erected as the burial-place of the Velasco family, the hereditary constables of Castile. The interior of the cathedral is much crowded by the lofty choir, with its rojis, or railing, the chapels, organs, archbishop's throne, retablo of the grand altar, carved stalls, and tombs. The chapels, as well as the cathedral, are full of sculpture, much of it in the national painted style, by the Hayas. The cloisters belong to the same period as the two western towers, that of Enrique III. They are perfect in design, in proportion, and in ornament, and contain several monuments adorned with interesting sculptures. There are other churches well worth inspection, among which that of San Esteban is distinguished by its rich façade, and the Dominican church of San Pablo for its fine cloisters.

Burgos contains several hospitals and other charitable establishments; among which may be mentioned the three united hospitals of San Juan, San Julian, and San Quirce, the Hospital del Rey, the Hospital Militar, and the Hospicio y Casa de Epósitos. It contains also a theatre, a museum, and a prison. Among the educational institutions are the Instituto Superior Burgales with 20 professors of sciences, arts, and languages; the Colegio de San Nicolas, in the suburb of the Vega; and four primary schools in the city, which give gratuitous instruction to about 350 scholars.

In 1845 there were 80 looms employed in making woollen goods, and 140 looms in making linen goods; there were 14 shops employed in making articles of leather, such as saddles and bridles, 7 hat manufactories, 14 flour-mills, 3 chocolate-mills, and a large paper-mill in the suburb of the Vega. The chief support of Burgos however arises from its being on the great road to Madrid from France and the northern provinces of Spain.

In the neighbourhood of Burgos are the Carthusian convent of Miraflores, 1441-1488, of very fine florid gothic architecture, and the nunnery of Santa Maria la Real, commonly called Las Huelgas, because built in some 'gardens of recreation' which belonged to Alonso VIII.

Burgos was founded in the year 884 by Diego de Porcelos, who erected the castle as a means of defence against the Moors. The town grew up beneath the castle, the citizens became powerful, and elected judges to govern them, among whom were Lain Calvo and others who are mentioned in the old ballads. It afterwards became a large city with from 40,000 to 50,000 inhabitants, and shared alternately with Toledo the honour of being the residence of the counts, constables, and kings (the condes, condestables, and reyes) of Castilla. When Charles V., in the beginning of the 16th century, removed the court to Madrid, Burgos lost its importance, and its population immediately began to diminish. In 1812 the fortress was besieged by Wellington, who, after four assaults, which all failed, retreated before the advancing French army to the neighbourhood of Ciudad

Rodrigo, where he remained in winter-quarters till the spring of 1813, when he commenced his great campaign against the united French armies of the south and centre, took the fortress of Burgos, fought the battle of Vittoria, and drove the invaders over the Pyrenees.

(Ford, *Hand-book of Spain*; Hoskins, *Spain as it is*, 1851; Widdrington, *Spain and the Spaniards*, 1844; Madoz, *Diccionario de España*.)

BURGUNDY. [BOURGOGNE.]

BURLINGTON, United States, the capital of Chittenden County, State of Vermont, is situated on the left bank of the Winooski, or Onion River, at its entrance into Lake Champlain, in 44° 27' N. lat., 73° 10' W. long., distant 440 miles N.E. from Washington. The population in 1850 was 7505. The streets are regularly laid out, and intersect at right angles: in the centre is a spacious area containing the court-house. Many of the dwelling-houses are substantial and handsome. Besides the county buildings and several churches and schools, the chief building is the University of Vermont. The University was founded in 1791; it has 7 instructors and 107 students, with a library of 13,000 volumes. The amount of tonnage of vessels trading from Burlington was 4530 tons in 1850, of which 3096 tons belonged to steam vessels. In the foreign trade in 1849-50 there cleared from the port 312 vessels of 82,856 tons; the entries for the same time amounted to 404 vessels of 99,435 tons. A railway 43 miles long from Burlington to Rouse's Point affords facilities for communication with Canada. In the vicinity of Burlington are several manufacturing villages.

BURLINGTON, U.S. [NEW JERSEY.]

BURLON. [EGYPT.]

BURMAN EMPIRE. [BURMAN EMPIRE.]

BURNHAM. [BUCKINGHAMSHIRE.]

BURNHAM WESTGATE. [SOMERSET.]

BURNLEY, Lancashire, a manufacturing and market-town and the seat of a Poor-Law Union, in the parish of Whalley and hundred of Blackburn, is situated in 53° 47' N. lat., 2° 14' W. long., 36 miles S.E. from Lancaster, 210 miles N.N.W. from London by road, and 219 miles by the North-Western railway via Trent Valley. The living is a perpetual curacy in the vicarage of Whalley, archdeaconry and diocese of Manchester. Burnley Poor-Law Union contains 26 parishes and townships, with an area of 11,378 acres, and a population in 1851 of 63,570.

The town is pleasantly situated, chiefly in a narrow vale, forming a tongue of land on the banks of the Burn or Barn, from which it derives its name, about a mile and a half above the confluence of that river with the Colner. Many remains of Roman antiquities—coins, pottery, and urns containing ashes and calcined bones—have been discovered about the place. Some Saxon remains have also been found; and at a small distance east of the town is a place called 'Saxifield,' which tradition has marked as the scene of a battle in the times of the heptarchy. Adjoining the town and near the church is an ancient cross.

Though an old town, the greater part of Burnley is of recent erection, and the houses are chiefly built of freestone, which is found in the neighbourhood. The town is well lighted with gas, and has a good supply of water.

The parochial chapel of Burnley, dedicated to St. Peter, has undergone much alteration: the present edifice had originally four chantries, namely, the rood altar, placed upon the roof-loft at the entrance of the choir, now removed; the altar of St. Peter; the altar of St. Mary; and the altar of St. Anthony. It combines various styles of architecture. The chapel of the Virgin Mary contains some shields of arms, and a monument to the memory of Charles Townley, Esq., whose collection of marbles is now in the British Museum. The new church of St. James was consecrated in 1849. The Wesleyan Association and Primitive Methodists, Independents, Baptists, and Roman Catholics have places of worship. The Roman Catholic chapel is a large and handsome building, consecrated in 1849.

The Free Grammar school in North Parade, founded about 1650, has an income from endowment of about 150*l.* per annum, and had about 40 scholars in 1851, under the care of a head and a second master. The school has an interest in 13 scholarships in Brasenose College, Oxford; but from disuse this interest has in effect been forfeited. In a room over the school is a valuable library, left by the Rev. Henry Halsted, rector of Stanfield, for the use of the scholars. The Rev. Dr. Whitaker, the learned master of St. John's College, Cambridge, and the historian of the 'original parish of Whalley,' received his early education in this school. There are several National, British, and other schools, including a Roman Catholic school. Several benevolent institutions are maintained for the benefit of the sick and the indigent. A mechanics institution and reading-room is in St. James's Street, and a Church of England literary institution is in Market Street. There is a savings bank. The chief building in the town for public purposes is the court-house, situated in Keighley Green; it serves for a county constabulary station, a magistrates' room, and a room for public meetings, lectures, and exhibitions. There are two markets; one held on Mondays in the principal streets, and another on Saturdays in the new market-place, which has accommodation for the vendors of meat, fish, fruit, and vegetables. A county court is held in Burnley.

The trade of Burnley was formerly confined to woollens; but the cotton manufacture is now the staple. There are some extensive cotton-spinning and weaving mills, one or two calico-printing establishments, three worsted mills, four corn mills (one of them very large), iron foundries, machine-making works, brass foundries, roperies, tanneries, breweries, and collieries.

The Leeds and Liverpool Canal, which nearly surrounds the town, affords communication for the conveyance of goods across the whole line of country from the German Ocean to the Irish Sea. Besides its manufactures Burnley sends coal, freestone, and slate from the vicinity. The East Lancashire railway passes through Burnley on its way from Bury to Colne. A branch from Burnley to Todmorden connects it with the Lancashire and Yorkshire railway.

BURNTISLAND, Fife-shire, Scotland, a town, royal burgh, and seaport, in the parish of Burntisland, on the north or left side of the Frith of Forth, is situated in 56° 4' N. lat., 3° 13' W. long., about 5½ miles nearly due north from Leith: the population of the royal burgh in 1851 was 2329, of the parliamentary burgh 2724. The burgh is governed by 2 bailies and 10 councillors, of whom one is provost; and unites with Kirkcaldy, Dysart, and Kinghorn in returning one member to the Imperial Parliament.

Burntisland was made a royal burgh in 1568. At the General Assembly which met here in 1601 James VI. took the oath to the Covenant. The town was fortified in the reign of Charles I., and besieged and taken by Cromwell, who repaired and considerably improved the harbour. The town chiefly consists of two parallel streets terminated by the harbour on the west. The harbour is deep and well sheltered. Being now the principal ferry station, the town has much increased of late years. There is a good dry dock; and on the eastern pier is a lighthouse, the light of which may be seen at a distance of seven miles. Burntisland formerly possessed a considerable trade. About 1656 there were twelve ports, including St. Andrew's and the now extensive port of Kirkcaldy, which were subordinate to Burntisland. For many years past its traffic has been confined to that arising from the curing of herrings and from distilleries in the neighbourhood. Ship building is carried on. There is daily steam communication with Granton on the opposite coast, and the Edinburgh and Northern railway opens up a direct communication with the whole north-east of Scotland, the passage across the Frith being effected here by a floating railway.

The parish church was built in 1592. There are also a Free church, and chapels for United Presbyterians and Episcopalians.

North from the town, on the summit of Duncarn Hill, an eminence rising 695 feet above the sea, is a level space surrounded with a number of loose stones, which has been called Agricola's Camp and supposed, very improbably, to mark the site of a Roman encampment. On another eminence overlooking the harbour stands Rosend Castle, erected about the 15th century.

BURRA BURRA. [SOUTH AUSTRALIA.]

BURRAMPOOTER. [BRAMAMPOOTER.]

BURSLEM, Staffordshire, a manufacturing and market-town, and conjointly with Wolstanton the seat of a Poor-Law Union, in the parish of Burslem and hundred of Pirehill, is situated on the sides of the river Trent, in 53° 3' N. lat., 2° 12' W. long., 18 miles N. by W. from Stafford, 151 miles N.W. from London by road, and 118 miles by railway via Trent Valley: the population of the township in 1851 was 15,954, being an increase of upwards of 25 per cent. since 1841. The township forms part of the parliamentary borough of Stoke-upon-Trent. The living is a rectory in the archdeaconry of Stafford and diocese of Lichfield. Burslem and Wolstanton Poor-Law Union contains the two parishes, with an area of 13,192 acres, and a population in 1851 of 41,914.

Burslem is governed chiefly under the provisions of an Act passed in 1826, which appoints trustees for the management of the town-hall and the market, and commissioners for lighting and police, in Burslem and a portion of its neighbourhood; each body having power to levy rates for carrying out the provisions of the Act. The county constabulary force was introduced into Burslem in 1842. In 1847 and 1848 Acts were obtained for supplying with water a large district of the potteries, including Burslem. The surface reservoir of the Staffordshire Potteries Waterworks Company is within this parish, about one mile and a half from the town, and at a sufficient elevation to serve a wide district. The town is on a height, favourably situated for the discharge of surface water; but the character of the soil is such as to retain a large quantity of moisture. The lower part of the town is liable to occasional inundations from the overflow of brooks which inclose the town on the west, south, and east. A Local Board of Health has been recently established.

The principal streets of Burslem are moderately well paved, but the poorer streets very badly. In Burslem town the foot-paths are mostly paved with hard blue bricks, but in some cases with ashes obtained from the burning of argillaceous ironstone. Burslem possesses few public buildings. The tower of the parish church is considered to be the oldest existing structure in the Potteries' district, but the body of the church is comparatively modern. In the parish are several other churches, besides chapels for Dissenters. In the market-place, in the centre of the town, is the market-house, town-hall, and news-room. A mechanics institution and reading-room is in

the town. About a mile from Burslem stands the North Staffordshire Infirmary, a very large establishment, which serves for the whole of the Pottery district, and is mainly supported by the manufacturers. There are barracks at Burslem.

Burslem often receives the name of the 'Mother of Potteries,' having been the first, and for a long period the chief of the pottery towns. From an early period it has been distinguished for the variety and excellence of the clays in its vicinity. All the subsoil of the town is clay, varying from 2 to 10 feet in thickness: it is called in the neighbourhood 'tough Tom,' and is employed in the manufacture of red, brown, and yellow wares. Below the subsoil is a very thick stratum of fire-clay, of which the saggers or baking-vessels for the pottery-kilns are made. Below the fire-clay is coal. Most of the early improvements in the pottery manufacture were made at Burslem, and the town took the lead in this art until Wedgwood removed thence to Etruria. Longport is now so closely united to Burslem that the two form in effect one large town, every part of which is occupied by the pottery works, the houses of the workpeople and employers, or the shopkeepers. No town in England, perhaps, is more dependent on one particular branch of manufacture than Burslem is on that of porcelain and earthenware. There are in the parish about 40 pottery establishments, besides glass-works at Longport. The increase of coal-mines and potteries and an improvement in trade have led to the recent great increase of population. The town is accommodated by the Grand Trunk Canal, and by the North Staffordshire railway, a station of which is at Longport.

(Shaw's *Staffordshire*; *Communication from Burslem*.)

BURTON-IN-KENDAL, Westmoreland, a market-town in the parish of Burton-in-Kendal and ward of Lonsdale, is situated in the southern part of the county, close to the border of Lancashire, in 54° 11' N. lat., 0° 42' W. long.; distant 34 miles S.S.W. from Appleby, 251 miles N.W. by N. from London by road, and 213 miles by railway via Lancaster. The population of the township of Burton-in-Kendal in 1851 was 791. The living is a vicarage in the archdeaconry of Richmond and diocese of Chester, but is to be transferred to the diocese of Carlisle. Burton is a small but neat and regularly built town. The market-place is a spacious area, with good houses and shops. A stone cross stands in the centre of it. The parish church, dedicated to St. James, is an ancient but plain edifice, with side aisles and a square tower. The church has been lately well restored. Burton has an old Grammar school; also a National school, a parochial library, and several charities. The linen and canvass manufacture employs some of the inhabitants. The market is held on Tuesday: at one time it was of considerable importance as a corn-market, but it is now of little consequence. Two fairs are held yearly. The trade of the town is inconsiderable in amount. The scenery in the neighbourhood of Burton is interesting. The climate is healthy. A county court is held in the town.

BURTON-UPON-TRENT, Staffordshire, a market-town and the seat of a Poor-Law Union, in the parish of Burton-upon-Trent and hundred of North Offlow, is situated on the river Trent, in 52° 48' N. lat., 1° 38' W. long.; distant 21 miles E. from Stafford, 124 miles N.W. by N. from London by road, and 133 miles by the North-Western and Midland railways. The population of the town of Burton-upon-Trent in 1851 was 7934. The living is a curacy in the archdeaconry of Stafford and diocese of Lichfield. Burton Poor-Law Union contains 53 parishes and townships, with an area of 86,738 acres, and a population in 1851 of 31,842.

The town is not incorporated, although usually called a borough. The manor, which formerly belonged to the abbey of Burton, was given by Henry VIII. to an ancestor of the Marquis of Anglesey, the present lord of the manor. The government is in the hands of a steward and bailiff, appointed by the lord of the manor. The paving and lighting of the town are in the charge of commissioners under a local Act. The abbey of Burton was founded in the 11th century by an Earl of Mercia, and had privileges granted to it by several kings. Some of the abbots sat in Parliament. The bridge at Burton is constructed of freestone, has thirty-six arches, and measures 1545 feet long. The parish church is dedicated to St. Modwona, the patron saint of the abbey. There are two district churches: Trinity church, erected about 1823; and Christ church, erected in 1843. The Baptists and Independents have chapels. The Free Grammar school, founded in 1520 by the then abbot of Burton, has an income from endowment of nearly 400*l.* a year, and in 1852 had 81 scholars, of whom 65 were free. Considerable estates, bequeathed for charitable and other purposes for the benefit of the town, are vested in trustees. There is a savings bank. Of the two principal streets in Burton, one runs parallel to the river, the other cutting it at right angles. In the market-place is the town-hall. The market-day is Thursday; there are four annual fairs, one of which (in October) continues for five days. According to Leland, Burton was in his time noted for its alabaster works. In more recent times it has become more extensively known by the ale which bears the name of the town. The Grand Trunk Canal, which is called also the Trent and Mersey Canal, passes Burton, and communicates with the Trent about a mile below the town. The Trent, which falls into the Humber, is navigable for barges up to Burton-upon-Trent. The Midland railway, and the North Staffordshire and Leicester and

Swanington lines, place Burton in railway communication with all parts of England.

BURTSCHIED. [*AIX-LA-CHAPELLE*.]

BURY, Lancashire, a manufacturing town, parliamentary borough, and the seat of a Poor-Law Union, in the parish of Bury and hundreds of Blackburn and Salford, is situated on the banks of the Irwell, in 53° 36' N. lat., 2° 19' W. long.; 9 miles N. by W. from Manchester; 48 miles S.S.E. from Lancaster; 195 miles N.N.W. from London by road, and 198 miles by the North-Western railway via Trent Valley. The population of the parliamentary borough in 1851 was 31,262; that of the entire parish was 70,143; in 1801 it was 22,300. Bury returns one member to the Imperial Parliament. It is governed by the county magistrates and a board of commissioners. The living is a rectory in the archdeaconry and diocese of Manchester. Bury Poor-Law Union contains 12 parishes and townships, with an area of 33,208 acres, and a population in 1851 of 88,797.

The town of Bury, though it stands on rising ground, appears as if it occupied a low position in consequence of being placed among hills which surround it on the north and east. The river Irwell, which first takes this name at Bury, flows through the west end of the town, and is joined by the Roche about two miles to the south. In ancient times, one of the 12 baronial castles of the county stood close to this town, not far from the parish church, on the banks of what was then the course of the Irwell; but the river now takes a more north-westerly course, and leaves a fertile tract of land in the valley between its present and its ancient bed. The castle was destroyed by the parliamentary forces in 1644. Fragments of stone are occasionally dug out of its ancient foundations. The place where it stood is still called Castle Croft, from which may be seen Castle Stada, in the adjoining township of Walmsley, where the besiegers threw up an intrenchment which enabled them to batter down the walls of the castle. The manor of Bury was in the reign of Henry II. in the possession of John de Lacy. It passed to the families of the De Burys and Pilkingtons. The town of Bury has been very much enlarged and improved within the last few years. It is well lighted with gas and supplied with water. New sewers have been constructed. Many of the streets have been paved by the commissioners; and a series of improvements is being carried out under the powers conferred by an Improvement Act obtained in 1846.

The parish church is dedicated to St. Mary; in 1776 it was rebuilt, all but the steeple, which was not rebuilt till 1844. St. John's chapel, in Stanley Street, erected in 1770, is a neat building. There is another church just erected, dedicated to St. Paul. The oldest of the Dissenting chapels in Bury is the Presbyterian chapel in Silver Street, belonging to the Unitarians. There are places of worship for Wesleyan, Primitive, Association, and New Connexion Methodists; three for Independents; a new Unitarian chapel; and a Roman Catholic chapel of some elegance, built in 1840.

The Free Grammar school, founded in 1726 by the Rev. Roger Kay, has an income from endowment of about 430*l.* a year, and had 70 scholars in 1852. A Charity school for 80 boys and 30 girls, founded in 1748, has been converted into a National school. Two other schools, the Bell school and the Irwell school, are connected with the Established Church. There are also schools connected with the Dissenting chapels, and Infant schools; a public subscription library, a news-room, a mechanics library, a medical library, and a billiard-room. An atheneum has been recently opened in very encouraging circumstances.

Bury has a moderately large subscription library, established upwards of 80 years ago. There is a dispensary in the town. A new market-place was erected in 1840 by the Earl of Derby. There is a savings bank. A county court is held at Bury.

The manufacture of woollen cloth became a staple article of trade in this place in the 14th century, and flourished to such an extent that in the reign of Elizabeth one of her almoners was stationed in the town to stamp the cloth. On the introduction of the cotton-trade into the county many of the inhabitants of Bury became weavers of cotton fabrics, and the woollen trade has been gradually retiring into Yorkshire and other parts of the country where the cotton manufacture is less paramount. The different branches of the cotton manufacture are carried on to a considerable extent. Several important improvements in the cotton manufactory took their rise in this place. A new method of throwing the shuttle by means of the picking-peg instead of the hand, and thence called the fly-shuttle, was invented by John Kay, a native of the town: and in 1760 his son, Robert Kay, invented the drop-box, by means of which the weaver can at will use any one of three shuttles—an invention which led to the introduction of various colours into the same fabric, and made it almost as easy to produce a fabric consisting of different colours as a common cloth of only one. Bury is indebted for one branch of its present trade to the father of the late Sir Robert Peel, who established his extensive print works on the banks of the Irwell, near this town. He resided at Chamber Hall, in the immediate vicinity, where, or at a smaller house close by it, the late Sir Robert Peel was born.

There are in Bury more than a dozen large factories for spinning and manufacturing cotton, several large woollen manufactories, calico-printing and bleaching establishments, dye-works, three large foundries,

several smaller ones, and manufactories of hats and other articles. The market-day according to the charter is Thursday, but Saturday has been adopted in practice. The market is well attended. Three or four fairs are held in the course of the year. A branch of the Manchester, Bolton, and Bury Canal accommodates Bury. The East Lancashire railway and the Lancashire and Yorkshire railway both pass through Bury.

BURY ST. EDMUNDS, the chief town of West Suffolk, a borough and market-town in the hundred of Thingoe, stands on the banks of the river Lark, in 52° 16' N. lat., 0° 43' E. long.; distant 26 miles N.W. by W. from Ipswich, 71 miles N.E. by N. from London by road, and 94½ miles by the Eastern Counties and Eastern Union railways. The parishes of St. James and St. Mary, which compose the borough, are also united for poor-law purposes under a board of guardians, but are not under the operation of the Poor-law Amendment Act. The town is governed by 6 aldermen, one of whom is mayor, and 18 councillors; and returns two members to the Imperial Parliament. The population of the municipal and the parliamentary borough, which are co-extensive, was 13,900 in 1851. The livings are perpetual curacies in the archdeaconry of Sudbury and diocese of Ely.

The origin of Bury St. Edmunds, or St. Edmunds Bury, as it is called by old writers, has been a subject of much discussion. Some suppose it to be the Villa Faustina of the 'Itinerary of Antoninus.' Numerous Roman antiquities have been dug up in the neighbourhood. At the time of the dissolution of the Heptarchy the manor belonged to Beodric, and was hence called Beodric's-worthe, or Beoderici-cortis, the 'villa or mansion of Beodric.' Beodric bequeathed it to Edmund the King and Martyr, after whom it was called St. Edmunds Bury—bury, like burh, burg, burgh, &c., being the Saxon word for a castle or strong town. Edmund, having succeeded to the throne of East Anglia, was crowned at Bury on Christmas-day, 856. In 870 he was taken prisoner and put to death by the Danes. Soon after the death and canonisation of King Edmund, six priests devoted themselves to a monastic life under the patronage of the royal saint, and founded a monastery, which, in after ages, by its magnificence and splendour, and its valuable immunities and privileges, surpassed every other ecclesiastical establishment in Great Britain, (Glastonbury alone excepted). In 1020 Adwun ejected all the secular clergy from Bury, and established twelve Benedictine monks from the monastery of Hildesheim in the abbey, exempted them from all episcopal authority, and laid the foundation of a church, which was consecrated in 1032. The first three churches were built of wood, but in the year 1065 another was erected of hewn stone, under the auspices of Abbot Baldwin. It took twelve years building, and was embellished with numerous ornaments brought from Caen in Normandy. It was 505 feet in length; the transepts were 212 feet, and the western front was 240 feet in breadth; altogether it contained 12 chapels. Portions of the ruins of the western front still remain. The circular rubble wall of the southern tower which seems to baffle defiance to time and weather, is now used as a shop; and the three arches, which once formed the entrance to the three aisles of the church, have been filled up with modern brickwork, and now form convenient dwelling-houses.

There appear to have been four grand gates to the abbey, and its lofty embattled walls inclosed within their vast circumference the body of the monastery, the abbot's palace, garden, &c., chapter-house, towers, cloisters, infirmaries, the magnificent monastical church, an extensive churchyard, three smaller churches, and several chapels. The abbey contained 80 monks, 16 chaplains, and 111 servants. The abbot, who was a spiritual parliamentary baron, held a synod in his own chapter-house, and appointed the parochial clergy of the place. He inflicted capital punishment, and had the power to try by his steward all causes within the liberty of Bury. Beyond the circuit of the abbey-walls were several hospitals and chapels under the patronage and protection of the monks. Edward the Confessor granted to the abbot the liberty of coining; and Edward I. and Edward II. both had mints here. It was at Bury that John was first met by the refractory barons, before he was compelled to sign Magna Charta. In 1272 Henry III. held a parliament here. A parliament was also held at Bury by Edward I. in 1296, when all the goods and chattels and all the revenues of the monastery were forfeited to the king, upon the monks refusing to pay a subsidy that was demanded from them; but on their afterwards complying, their goods were restored. In 1446 another parliament was convened at Bury. Henry VII. and Elizabeth both visited Bury, and were entertained with considerable pomp and magnificence. This celebrated monastery was 519 years in the possession of the Benedictine monks, and during that time had 33 abbots. At the dissolution of monasteries it was valued by the commissioners at 2366*l.* 16*s.*, but that must have been considerably under its real value, for the commissioners, in their report, say, "We have taken in the scyd monastery in golde and sylver 5000 marks, besides as well a rich cross with emeralds as also dyvers stones of great value, and yet we have left the church, abbot, and convent, very well furnished with plate of sylver necessary for the same." Almost the only relic of the magnificence of this monastic establishment is the western, now called the abbey, gate. It was

erected in 1327, after the old gate was pulled down by the mob. It is a specimen of the decorated style of gothic architecture. It has been roofed over by Lord Bristol, whose property it now is, and is generally in a state of good preservation. Its height is 62 feet, its length 50 feet, and breadth 41 feet. The 'terrepleine' of the wall forms a terrace all round, and over each angle there formerly was a tower. The eastern side of this gate, although not so splendid as the west side, is the more elegant. The internal walls are beautifully decorated, and amongst other carved work are the arms of King Edward the Confessor. In digging up an old foundation there were found, with various other antiquities, four antique heads, cut out of blocks of freestone of gigantic dimensions, and probably representing some heathen deities.

Fragments of the ruins of various religious and charitable institutions connected with the abbey are still visible. The following are mentioned in Dugdale's 'Monasticon':—The Hospital of St. John or God's-house without the south gate, probably the chapel, or as it is sometimes called the Hospital of St. Petronilla, was connected with this house; St. Nicholas' Hospital without the east gate, now a farm-house; St. Peter's Hospital and Chapel, founded by Abbot Anselm in the time of Henry I., now belonging to the trustees of the Free Grammar school; St. Saviour's Hospital, founded by Abbot Sampson in the reign of King John; St. Stephen's Hospital, Jesus College and Guild, erected by King Edward VI. in 1481, now occupied as a workhouse; and the convent of Gray Friars at Babwell or North Gate, established in 1256.

The Norman Tower, or Church Gate, was the grand portal into the churchyard opposite to the western entrance of the abbey church. At the dissolution it was converted into a belfry for St. James's church, "and to this circumstance," says Mr. Yates, "most probably the antiquarian is indebted for the gratification of now surveying this venerable relic of ancient piety and taste." It is considered one of the finest specimens of its class in existence of Norman architecture. It is a quadrangular building 80 feet high, and is remarkable for its strength and simplicity. The date of its erection is unknown. The stone of which it is built abounds with small shells. The interior of the arch presents some grotesque figures. The tower has been thoroughly restored of late years under the direction of Mr. Cottingham. The structure has been strengthened by three parallel series of iron braces, and the ashlar-work has been repaired and reset.

St. Mary's church, erected about 1430, is 130 feet long (exclusive of the chancel) and 67½ feet wide. The chancel is 74 feet by 68 feet. There are three aisles, which are divided by two rows of elegant columns. The height of the middle aisle is 60 feet. The roof, which is elaborately and beautifully carved, is supposed to have been brought from Caen in Normandy. On the north side of the communion-table is a marble slab erected to the memory of Mary Tudor, third daughter of King Henry VII. of England, who first married Louis XII. of France, and subsequently Charles Brandon, duke of Suffolk. On each side of the chancel is a handsome altar-tomb: one to Sir W. Carew, who died in 1501, and his wife who died in 1525; and the other to Sir Robert Drury. The tower is of an earlier date than the church itself. The edifice was thoroughly repaired and restored a few years back under the direction of the late Mr. Cottingham.

St. James's church, like St. Mary's, is built of freestone, and is a very handsome building. It was not completed till the Reformation, when Edward VI. gave 200*l.* towards its completion. It is 137 feet long by 69 feet broad, and contains some handsome monuments. The churchyard is of considerable dimensions, and has a beautiful avenue of lofty lime-trees. It contains the two churches (St. Mary's and St. James's), the Saxon tower, abbey ruins, Clopton's hospital, the shrine-house, and the mausoleum; the latter was formerly 'the Chapel of the Chancel,' where it is said Lydgate the poet resided. Not many years since it formed the residence and workshop of a blacksmith. St. John's church, erected in 1841 at a cost of 6000*l.*, has 850 sittings, of which half are free. The Independents and Baptists have each two chapels in Bury: there are also places of worship for Methodists, Quakers, Unitarians, and Roman Catholics. The Free Grammar school, founded by Edward VI., has an income from endowment of upwards of 600*l.* a year; it is under the care of a head master and five other teachers: the number of scholars in 1852 was 80. The school possesses 13 exhibitions for Oxford or Cambridge. Under a decree of the Court of Chancery there have been recently established out of the rents of the Guildhall Feoffment a Commercial school for 150 boys, who pay 5*s.* a quarter; a Poor Boys' school for 300 boys, who pay 1*s.* a quarter; and a Poor Girl's school for 150 girls, who pay 1*s.* a quarter. There are in Bury National schools for boys and girls, Infant schools, and a Female School of Industry.

Bury is a borough by prescription, and its prescriptive rights were first confirmed by James I. in the fourth year of his reign. A sessions court is now held quarterly under the recorder; the assizes are held in Bury in March; the summer assizes being held in Ipswich. A county court is held in Bury. Bury first sent representatives to Parliament in the 30th year of the reign of Edward I., but made no subsequent return till the 4th of James I., since which time it has continued to return two members.

A great part of the town was burnt down in 1608, but was shortly

after rebuilt in its present regular manner. The houses are well built; the streets are paved and kept clean. The town is well lighted with gas, and has a good supply of water. A subscription library contains a valuable collection of books. Bury possesses handsome subscription-rooms, a subscription coffee-room and billiard-room, a mechanics institute, and a savings bank. A new theatre was built in 1819, and the old one converted into a concert-room. There is a good collection of plants in the Botanic Gardens, which are a part of the old abbey grounds, and contain some picturesque bits of the ruins. The shire-hall, a neat modern building, is situated on the ancient site of St. Margaret's church, and contains two good-sized courts. The Guildhall, where the borough courts are held, is a handsome structure, built of flint and freestone.

The county jail, erected in 1803 at a cost of 30,000*l.*, about half a mile from the south end of the town, is built on the radiating principle, and is surrounded by a wall 20 feet high, inclosing an octagonal area, the diameter of which is 292 feet. The house of correction for female prisoners is near the jail.

Among the parochial charities of Bury are 98 almshouses, funded by different persons. They are under the superintendence of trustees, and their funds altogether amount to about 2000*l.* per annum. Clopton Hospital, founded by Boley Clopton, M.D. for the support of six aged widowers and widows, is a neat brick building, with the arms of the founder over the principal entrance. A large building intended by the government for an ordnance dépôt, was purchased and converted into an hospital, which is supported by voluntary contributions; it has been since enlarged by the addition of two wings.

About a mile from Bury the river Larko becomes navigable to Lyun, whence coals and other commodities are brought in small barges. The Eastern Union railway has diverted a good deal of this traffic to itself. The market-days are Wednesday for corn, &c., and Saturday for meat and poultry. Fairs are held on the Tuesday in Easter week, and on the 1st of October and 1st of December for horses, cattle, cheese, &c. The great fair, which is justly celebrated, generally commences about the 10th of October, and lasts about three weeks. About three miles from Bury is Ickworth, the magnificent seat of the Marquis of Bristol. The house is circular, 140 feet in height and 90 feet in diameter, and stands in the centre of a park which has a circuit of 11 miles.

(Gage's *Suffolk; Communication from Bury.*)

BUSA'CO, the name of a convent situated on the summit of a mountain-ridge in the province of Beira in Portugal, called the Serra de Busaco, which is an offset from the great Serra de Aleoba. In September 1810 the united English and Portuguese army under Wellington, about 40,000 strong, took post on the Serra do Busaco, and successfully resisted the French army under Massena, 68,000 strong. Massena being unable to force the position, turned it by a mountain-pass over a neighbouring mountain-ridge, and then Wellington continued his retreat to the lines of Torres Vedras.

BUSHIRE. [ARCT-SHERR.]

BUSHMILLS. [ANTRIM.]

BUSSAHER, or BUSSAHER, a principality in Northern Hindustan, occupying a mountainous tract on both sides of the Himalaya range. Bussaher lies between 30° and 32° N. lat., 77° and 79° E. long.; it is bounded on the N.W. by the Sutlej, S. and S.E. by the Jamma, S.W. by Sirmor, and N. and E. it extends to the empire of China. Over a considerable part of this territory, the boundaries of which are but imperfectly known, the Raja of Bussaher exercises only a kind of feudal superiority, the rulers of the petty states into which it is divided paying an annual tribute to him as their head. The area of the territory is stated at 3000 square miles, and the population at 150,000, with an annual revenue of about 15,000*l.* The subsidy or tribute paid to the British government is about 1500*l.*

Bussaher is divided into the districts of Kunawur; the tract containing Rampoor, the capital, and Seran; the valley of the river Paber; and Dasau, which contains the Tartar pergunnah of Hanganrang. Kunawur is a rugged district, extending on the east to Shipko, the frontier town of Chinese Tartary, and on the west to Hanganrang. The Keubhrang Pass in the Himalaya Mountains, which is 18,130 feet above the level of the sea, forms the boundary between Kunawur and Chinese Tartary. The climate of Kunawur district is cold, and a great part of the soil is composed of eminences covered with snow. Little grain is raised, and the chief employment is breeding and rearing sheep, goats, ponies, asses, and mules. The inhabitants enjoy a good reputation for honesty and punctuality in their dealings. The largest villages do not contain more than 100 inhabitants; several exhibit the appearance of wealth and civilisation. The majority of the inhabitants are Hindoos, but in some of the villages the people are adherents of the grand or Dulai Lama of Lassa. Rampoor, the capital of the principality, is situated in 31° 27' N. lat., 77° 38' E. long., on the left bank of the Sutlej, where that river is little more than 200 feet wide, and confined by lofty precipices, between which the water foams and dashes furiously. The stream is crossed by a ledge of ropes, traversed by a block of wood, upon which the traveller sits and is drawn across. Rampoor is considered a place of much sanctity, and is much frequented by religious mendicants: it contains several temples. The town now contains only about 150 stone and slated dwellings: it is the usual place of residence of the raja, who has also a summer palace at Seran, about 22 miles higher up the river.

This residence of the raja is on a hill 3 miles from the banks of the Sutlej, and 4500 feet above its level.

The third district, that which contains the valley of the river Paber, is the most productive part of the principality, but some portion even of this is wild and barren. Iron ore is found in this district, and is worked, when the iron forms an article of export to the Sikh countries. Dasau produces wheat and barley, but not rice. Near the villages, and in sheltered spots, apricots, gooseberries, and currants are found, but the trees and bushes are stunted. The inhabitants possess considerable numbers of ponies and mules. Manufactures of coarse blanketing are carried on. In other parts of Bussaher woollen cloths of a superior texture are made, the wool being of excellent quality; a few shawls are likewise made of goats' and sheep's wool mixed. Bussaher receives from Hindustan sugar, cotton, hardwares, and indigo, and returns iron, opium, tobacco, turmeric, and blankets. From Tibet and the Chinese territories are brought shawl-wool, salt, tea, silk goods, musk, and borax: the returns are grain, iron, and opium, cotton cloths, indigo, and other articles received from the lower parts of Hindustan. The principality was conquered in 1810 by the Gorkas, and remained subject to them until 1814, when it was regained by the British for the raja, who with the other hill chiefs was confirmed in his possessions at the close of the Nepal war in 1815.

(*Parliamentary Papers.*)

BUTE, one of the islands which compose the county of But-, Scotland, is situated in the Frith of Clyde, between 55° 42' and 55° 56' N. lat., 4° 58' and 5° 10' W. long., distant about six miles from the opposite mainland of Ayrshire, and about half a mile from Argyleshire, from which county it is separated by a narrow and crooked but picturesque channel called the Kyles of Bute. The population of the island in 1851 was 10,661. The island is about 16 miles long, and varies from three miles to four miles in breadth. To the north it is elevated, rocky, and barren; the central part is diversified by hills, valleys, and fertile tracts; and the south end is hilly and divided from the rest of the island by a low and sandy plain called Langul-chorid. The coast is rocky and indented by bays. The soil of the island consists of clay, loam, and sand, with moss lying on gravel. The greater part of the arable land is inclosed and cultivated; barley, oats, potatoes, turnips, and the artificial grasses are all cultivated with success. About the middle of the island are three small lakes—Loch Fad, Loch Ascog, and Loch Quein. The climate, though damp, is mild and temperate, and the island is much resorted to by invalids, Burns being one of the favourite watering places of the Clyde. The minerals are limestone, freestone, slate, and some indifferent coal. Beds of coral and shells, of considerable thickness, are found in several places half a mile from the sea-coast.

Bute island contains many remains of antiquity. Duncuigoil, a vitrified fort, attributed to the Danes or Norwegians, and situated on a lofty crag in the south-west part of the island, is an object of interest and curiosity. In the southern extremity of the island are the ruins of an ancient chapel. Not far from the ruins are the remains of a circular erection about 30 feet in diameter and 10 feet high, known as the 'Devil's Cauldron'; the object for which it was erected has not been ascertained. Bute, and the adjacent islands, were long subject to the Norwegians. Haaco of Norway in 1263 took possession of Bute, but after his defeat it returned to the allegiance of the King of Scotland. Edward of England held it till 1312, when it fell into the possession of Bruce. Robert III. and James III. made the island their occasional residence. It was garrisoned by Cromwell, and was the scene of the Earl of Argyll's unfortunate landing in 1685.

(*New Statistical Account of Scotland.*)

BUTESHIRE, a county in Scotland which comprises the islands of BUTE, ARRAN, the CUMBRAGES, and INCHMARNOCK; with the small islands of Lamash and Pladda, which belong to Arran. The area of the county is given in the population returns of 1841 at 103,040 acres, which is equivalent to 161 square miles; the returns of the Census of 1851 state the area at 171 square miles; other accounts make it 257 square miles. The population of the county in 1851 was 16,603; in 1791 it was 10,563. Buteshire returns one member to the Imperial Parliament; previous to the passing of the Reform Act the county returned a member to Parliament alternately with the county of Caithness. The constituency of the county in 1853 was 483, including the electors of the royal burgh of Rothesay, the county town, who by the Reform Act were united to those of the county for parliamentary purposes. The islands of which the county is composed, as well as Rothesay the county town, are noticed in distinct articles. Lamash and Pladda are noticed under ARRAN.

BUTRINTO (Butrintum), an ancient town, now ruined, on the coast of Epirus, on the northern or narrow part of the channel which divides the island of Corfu from the mainland. It stood on a hill surrounded by marshy ground, and forming a sort of peninsula at the entrance of the harbour or lake Pelodes, and nearly opposite the promontory of Leucimæ in the island of Corfu. (Strabo, vii.) The lake, which is connected with a bay of the sea by a river (now called Paula) three miles long, is now called 'Vutzindro.' Virgil calls it 'Lofty Butiratum' ('Æneid,' iii.), where he makes Æneas meet Helenus the son of Priam, who ruled over the country of the Chaonians after the death

of Pyrrhus the son of Achilles. (Justin, xvii.) After the conquest of Epirus by the Romans, Butthrotum became a Roman colony. Pomponius Atticus had an estate near Butthrotum, where he spent great part of his time; and both he and Cicero interested themselves in favour of the Butthrotians, whose lands had been confiscated and given away to fresh colonists during the civil war. Under the Byzantine empire, Butthrotum was a bishop's see suffragan to the archbishop of Lepanto. It was afterwards ruined, probably at the Turkish invasion. The Venetians, in their wars with the Turks, settled on this coast, and built a square fort at the foot of the hill on the sea-side, where they kept a garrison to protect their fisheries. Butrinto and Parga were dependencies of the Venetian government of Corfu. The walls of the Roman colony still exist, as well as remains of Hellenic and later works; statues, pillars, medals, and cameos have been found on the site. In 1797, after the fall of the Venetian republic, the French put a garrison in the fort of Butrinto, but in the following year Ali Pasha drove them out of it.

BUTTERMERE. [CUMBERLAND.]

BUTTEVANT. [CONK.]

BUXAR, a fortified town in the district of Shahabad, province of Bahar, situated on the right bank of the Ganges, in 25° 33' N. lat., 83° 57' E. long., about 50 miles below the city of Benares. The fort is built on an eminence which projects into the river; the works are kept in good repair, and there is constantly an English garrison in it. A signal victory was gained at this place on the 23rd of October 1764, by Major (afterward Sir Hector) Munro, who opposed and conquered a Mogul force of 10,000 men with an army of 854 European and 6215 native troops. (Mill, *History of British India*.)

BUXTON, Derbyshire, a market-town and chapelry in the parish of Bakewell and hundred of High Peak, is situated on the high road from Derby to Manchester, in 53° 15' N. lat., 1° 52' W. long., distant 33 miles N.W. by N. from Derby, and 160 miles N.W. by N. from London. The population of the chapelry of Buxton in 1851 was 1235. The living of Buxton is a perpetual curacy in the archdeaconry of Derby and diocese of Lichfield.

Buxton is situated in a deep valley or basin, surrounded by bleak hills and extensive tracts of moorland. It would be entirely environed with mountains but for the narrow ravine down which the river Wye flows on its way to the Derwent, parallel to the high road which leads to Bakewell. Chee Tor, a perpendicular and stupendous rock of limestone, 360 feet high, is situated near the village of Wormhill, and about five miles from Buxton. A little east, the lofty peaks of Winhill and Lasehill may be distinguished by their form from all the mountains in the county. Extensive woods and plantations now clothe the sides and summits of many of the neighbouring hills.

The mineral springs at this place appear to have been known to the Romans. Buxton was a watering place in the 16th century. The baths were connected with a shrine, on which visitors for health presented their offerings. After the suppression of religious houses, these offerings were removed, and the baths locked and sealed up for a time. In Queen Elizabeth's time however they had more than regained their former reputation. Mr. Macanlay in his notice of Buxton (*History of England*, vol. i. p. 346) states that in the 17th century, visitors to Buxton were crowded into 'low wooden sheds,' but this is a mistake, as is shown in the 'Land We Live In,' vol. iii. pp. 215-221. There were in fact excellent and commodious buildings provided for visitors even in the 16th century. From Camden's time till now Buxton seems to have maintained and even increased its popularity. Additions and improvements have been made at different times; but the most important have been those carried into effect by the late and the present Duke of Devonshire. Buxton old town stands upon much higher ground than the new, and has still the remains of a cross in the centre of the market-place. The main street is wide, and contains a few good inns and lodging-houses, but the buildings in general are old and mean. The new part of the town may be said to begin at the Crescent and to stretch along the Bakewell road, the buildings of which form a handsome entrance to the town on that side.

The Crescent at Buxton is in the form of the segment of a circle. The basement story is a rustic arcade forming a piazza 7 feet wide within. Over the arches a balustrade runs along the whole building. Above the piers are Doric pilasters that support an ornamental architrave and cornice, which is terminated by another balustrade, in the centre of which are placed the arms of the Cavendish family. This extensive and elegant structure is three stories high; the span of the Crescent is 200 feet; and each wing measures 58 feet, making the whole extent of the front 316 feet; it contains 378 windows. In it are comprised two hotels, a library, an assembly-room 75 feet long, and a news-room, besides the baths and a few private residences.

At the west end of the Crescent and nearly adjoining it is the old hall, erected in the reign of Elizabeth by the Earl of Shrewsbury, in whose custody Mary, queen of Scots, was placed. In one of her visits to Buxton Mary occupied apartments in this building, which are still shown as hers. The house was considerably enlarged in 1670. The public baths at Buxton are very numerous, and are fitted up with every attention to the convenience of the visitors. The well from which the water is supplied to those who resort to Buxton is in a small building in the style of a Grecian temple, in front of the west

wing of the Crescent. In the centre of this building, called St. Ann's Well, is a white marble basin, into which the water issues from the spring. By the side of this basin is a double pump, from which either hot or cold water may be procured within a few inches of each other. The water flows at the rate of 60 gallons a minute. Besides what is properly called the Buxton water there is a chalybeate spring of a rough strong taste issuing from a chalky stratum on the north side of the river Wye, over which a neat stone structure has been erected by the Duke of Devonshire. Mixed with the other this water proves purgative. A conduit for supplying the inhabitants with pure water for domestic purposes was constructed at the expense of the Duke of Devonshire in 1840.

The public walks at Buxton, of which there is great variety, are laid out with much taste, and ornamented with shrubs and plantations. Around Buxton there are many fine walks and drives. Shirbrook Dell, Ashwood Dale, the Lover's Leap, and other spots in the valley of the Wye are all interesting, and the neighbouring eminences afford very extensive and beautiful prospects. The environs of Buxton abound with natural curiosities and romantic scenery. The high perpendicular crags on the Bakewell road bordering the valley of the Wye make that road the most interesting, as it is the most accessible of all the scenery in the immediate vicinity of Buxton. At the distance of about half a mile in a different direction are the limestone quarries and Pool's Hole. The latter is a cavern of considerable dimensions in a limestone rock contracted in its entrance, but spacious in the interior. Its roof and sides are covered with stalactites, one of which more remarkable than the rest about the middle of the cave is called the 'Fitch of Racon.' Here the cave again contracts, but beyond it becomes wide and lofty, as far as a large massy column of stalagmite denominated the 'Queen of Scots' Pillar,' from a tradition that she stopped at this point. The further end of the cavern, comprising about 100 yards, is not very accessible. The whole length is 560 yards. The sides of the mountain are partly occupied with dwellings excavated out of the ashes which have been thrown here from the lime-kilns. A considerable quantity of lime is burnt, and sent into distant parts by the Peak Forest railway. The rocks about Buxton consist of beds of limestone and of lava or tuff-stone, which lie alternately one upon the other. There are many shops in Buxton for the sale of the mineral productions of the Peak, manufactured into various articles of ornament and use, besides fossils and specimens of natural curiosities. Among these is a beautiful spar denominated 'Blue John,' formerly used in repairing the roads, but now worked into the most elegant vases. This spar is found in the neighbourhood of Castleton.

Buxton church is a large and graceful edifice of the Tuscan order, built in 1812 by the Duke of Devonshire. An old building which originally served as the church was for a time used as a school after the opening of the new church; but it has been restored to its original purpose. A new school-room has been fitted up by the Duke of Devonshire. This school has endowments which amount to 917. per annum. There are places of worship in Buxton for Presbyterians, Independents, and Wesleyan Methodists. An excellent institution at this place called the Buxton Bath Charity is for the benefit of persons in humble circumstances whose state of health may require the use of the Buxton waters. Every visitor to Buxton is requested to give a donation of one shilling to this charity the first time of dining in the town, whether at an hotel or a lodging-house. The number of visitors at Buxton varies from 12,000 to 14,000 annually. There are accommodations for nearly 2000 at one time. The season commences in June and ends in October. The market is held on Saturday; fairs are held on February 3rd, April 1st, and May 2nd, besides a cattle fair on September 8th.

(Rhodes, *Peak Scenery*; Adams, *Gem of the Peak*; *Land We Live In*, vol. iii.; *Communication from Buxton*.)

BYBLUS, a town of Phœnicia, now called Jubail, situated nearly half way between Tripoli and Beirut near the sea-coast, and at the foot of the lower range of Libanus. The town of Jubail is inclosed by a wall, some parts of which appear to be of the time of the Crusaders. Within the circuit, which is about a mile and a half, there is an ancient Roman theatre in a nearly perfect state; fragments of granitic columns are lying about. The celebrated Jewish writer Philo was a native of Byblus. Byblus was the fabled birth-place of

Coin of Byblus. Copper. 150 grs.

Thammuz, or Adonis, to whom it had a famous temple. The Hebrew name of the town seems to have been Gibleah, and its territory is assigned (Josh. xiii. 5) to the Israelites, but they never got possession of it. The Gibleites are mentioned in the Old Testament as stone-

squarers and caulkers of ships. Alexander took Byblus, whose king joined the Macedonian fleet with his ships. The city gave title to a bishop before it fell under the Moslems. The coins of Byblus have the type of Astarte, or of Isis, who came to Byblus in quest of the body of Osiris.

BYTOWN, Canada West, the chief town of Carleton County, is situated in a very beautiful part of the country on the Ottawa, near the junction of the Rideau Canal with that river, in 45° 20' N. lat., 75° 42' W. long.; distant 126 miles N.N.E. from Kingston, and 284 miles N.E. by E. from Toronto: the population of the town in 1851 was 7760. The lower town, which is the older part, is that in which business is generally carried on: the upper town is of more recent erection; it is situated about half a mile distant on a more elevated site, and consists chiefly of private residences. Considerable improvement has taken place in the appearance of Bytown of late years. Several handsome stone buildings have been erected. The town contains places of worship for Episcopalians, Presbyterians, Wesleyan Methodists, Baptists, and Roman Catholics; several schools, a commercial reading-room, a mercantile library association, a court-house, barracks, and a jail. Bytown is supported chiefly by the lumber trade, a term applied to the system of floating large rafts of rough timber down the rivers of America to the depôts and ports in the lower parts of their course. Timber cut on crown-lands and brought down the Ottawa River is measured at Bytown, and the owner gives land to pay the duties at Quebec. The value of timber brought down the river in one year, 1844, was estimated at 341,756/. About three-fifths of the whole being cut on crown-lands was liable to duty, amounting to about 24,000/. Fairs are held at Bytown in April and September. Steamers ply between Bytown and Grenville on the Ottawa, and between Bytown and Kingston on the Rideau Canal.

BYZANTIUM (*Βυζάντιον*, on the coins sometimes *Βυζαντιον*), an ancient Greek city, which occupied part of the site of modern Constantinople. It was founded by a Dorian colony from Megara in B.C. 667. The city was washed on the east by the Bosphorus, on the south by the Propontis, and on the north by the Golden Horn. Strabo, Pliny, and other ancient writers, speak of the abundance of fish in the sea of Byzantium, especially of the Pelamys kind, which coming down in shoals from the Pindus Mæotis, and round by the eastern and southern coast of the Euxine, entered the Bosphorus; and the harbour of Byzantium was called 'the Golden Horn,' in consequence of the riches derived from the fishery. (Plin. 'Hist. Nat.' ix. 15.) The Byzantines salted the fish, which was an article of considerable trade. The harbour of Byzantium became a place of resort for vessels trading with the Euxine, the northern coasts of which already in the time of Herodotus supplied with corn, as they do now, Greece and other countries of the Mediterranean.

In the reign of Darius Hystaspes, the Persian satrap Otanes took Byzantium and Chalcedon, an earlier Megarensian colony on the opposite coast of the Bosphorus. After the battle of Platæa, Pausanias at the head of the united Greek forces took Byzantium, and a fresh colony of mixed Athenians and Lacedæmonians was sent to it. This second colony has given occasion to Justinus and other writers to say that Byzantium was founded by Pausanias. The Lacedæmonians kept possession of Byzantium till Pericles took it from them, but they retaken it shortly after. Alcibiades again got possession of it by a stratagem and by holding communication with some persons within the place. (Plutarch, 'Alcib.') Lynceus recovered it soon after, and it was under the Lacedæmonians when Xenophon, with the remnant of the 10,000 passed through it on his way home, and his men had a serious affray with the Lacedæmonian governor, which was with difficulty settled by the prudence of Xenophon. Thrasylmus drove the Lacedæmonians away, B.C. 390, and changed the form of government, which was before oligarchical, into a democracy. The native Bithynian inhabitants were treated as Helots. After the recovery of its liberty, Byzantium seems to have prospered for a time, and it became, in B.C. 356, the head of a confederacy of the neighbouring maritime towns. It also joined Rhodes, Cos, and Chios in the league with King Mausolus against the Athenians, who sent an expedition against Byzantium, which however failed. Some time after, Philip of Macedon having extended his conquests into Thrace, laid siege to Byzantium. The Byzantines made a bold defence, and Philip's army became distressed for want of provisions and money. Philip relieved his wants by seizing 170 ships and confiscating their cargoes. On a dark night Philip's soldiers were near surprising the town, when a "light shone suddenly from the north," and revealed to the inhabitants their danger. In gratitude for this the Byzantines built an altar to Diana, and assumed the crescent as the emblem of their city. The crescent is found on several medals of Byzantium, and the Turks, on their conquest of Constantinople, adopted it for their own device. Under Alexander the Great and Lysimachus, who after Alexander's death succeeded to the government of Thrace, Byzantium was obliged to submit to the Macedonians, but it afterwards recovered its municipal independence, which it retained till the time of the Roman emperors. Its maritime commerce was prosperous, but it was exposed on the land side to continual incursions of Thracians, Scythians, and other barbarians, who ravaged its territory, cut down the harvest, and reduced it to great distress. The most troublesome of these incursions was that of the Gauls, who overran Macedonia

and Northern Greece about B.C. 279. The Byzantines, in order to have some respite from them, were obliged to pay heavy sums, from 3000 to 10,000 pieces of gold a year, and at last as much as 80 talents, to save their lands from being ravaged in harvest-time. These and

Coin of Byzantium. Brit. Mus. Copper. 123 grs.

Brit. Mus. Silver. 206 grs.

other burdens compelled them to have recourse to extraordinary measures for raising money, one of which was the exacting of a toll from all ships passing through the Bosphorus, which became the cause of the war between Byzantium and Rhodes, about B.C. 221. The Gauls at last went over to Asia, and left Byzantium in peace. The Rhodians, a maritime trading people, refused to pay the toll on their ships passing through the Bosphorus, which led to a war with Byzantium, in which Prusias I., king of Bithynia, sided with the Rhodians, and Attalus I., king of Pergamum, took the part of the Byzantines. The latter had the worst of it, and peace was made by the mediation of Cavalus or Cavarus, king of the Gallo-Greci.

Byzantium allied itself to Rome against Philip II. of Macedonia, as well as against Antiochus and Mithridates. In return for its services it was made a free town confederate with Rome, and its envoys were treated as foreign ambassadors. Some domestic disputes however occasioned an appeal to Rome from the losing party, and Claudius the tribune carried a decree enjoining the Byzantines to readmit the emigrants. Piso was sent to enforce this decree, but his conduct there appears to have been that of a hostile conqueror rather than of an ally and mediator. After Piso's departure the Byzantines resumed their former independence. They were subject to a tribute however, at least under the first emperors, which Claudius remitted for five years, in consideration of their losses during the Thracian war. (Tacitus, 'Ann.' xii. 62.) In consequence of some fresh domestic broils however Vespasian took away their liberties and sent them a governor, and when Apollonius of Tyana remonstrated with the emperor on the subject, Vespasian replied that the Byzantines had forgotten how to be free. In the civil war between Severus and Pescennius Niger, the Byzantines took the part of the latter. After Niger's death Severus besieged the town, which the inhabitants defended for three years with the courage of despair. At last famine obliged them to surrender (A.D. 196), and Severus treated them with his characteristic inhumanity. The armed men and the chief citizens were put to death, the walls were razed, and the remaining inhabitants were placed under the jurisdiction of Perinthus. Severus however relented afterwards, and, visiting Byzantium, took pains to embellish the town; he built magnificent baths, porticoes round the Hippodrome and other buildings, and gave it the name of Augusta Antonina, in honour of his son Antoninus Bassianus. The Byzantines having rebuilt their walls, and recovered their prosperity, had next the misfortune of somehow displeasing Gallienus, a worse man than Severus, who entered the town under a promise of amnesty, and had most of the inhabitants massacred. Trebellius Pollio says that in his time there were no old families in Byzantium, except those who had left the town before Gallienus entered it. The town however was restored, and it repelled an irruption of the Goths, who had entered the Bosphorus under Claudius II. After the defeat of Licinius by Constantine, Byzantium surrendered to the latter; who was so struck with its situation that he determined to build a new city by the side of old Byzantium, which he called *Nea Roma*, and which he chose afterwards for the capital of the empire. In May A.D. 330, the new town, which had been commenced only three years before, was dedicated to the Virgin Mary, and the feasts lasted 40 days. [CONSTANTINOPLE.]

Athenæus, Ælian, and other ancient compilers give rather an unfavourable account of Byzantine morals and manners. Idleness and debauchery prevailed, the citizens spent their time in the marketplace, or in the numerous public houses of the city, and let their houses and wives to strangers. The sound of a flute put them immediately in a merry mood, but they fled from that of a trumpet, and

their general, Leo or Leonidas, in the siege by Philip, had no means of keeping them to watch and defend the walls but by causing the sutlers and carpenters to be established along the ramparts. (Athenæus, x. p. 442; *Ælian*, 'Hist.' iii. 14.) Byzantium was full of foreign and native merchants, sailors, and fishermen, whom the excellent wine sold in the town and supplied by Maroneia and other districts seldom permitted to return sober to their ships. A democracy of such jolly carousers could not be expected to be very strict and orderly in its administration, and it is recorded of a Byzantine demagogue that being asked in some particular case what was the law of the country, he answered, "Whatever I please." Dion says that the walls of Byzantium were built of massive square stones fastened together with iron bolts, and fitting so well together that the whole wall appeared

to be one block. The Byzantines at one time had 500 ships, several of them with rudders at both ends, so as to be able to steer either way without veering or tacking. Tacitus speaks of such vessels being used in the Euxine in his time. ('*Histor.*' iii. 46.) Byzantium occupied the most eastern of the seven hills on which the city of Constantinople is built, and it is supposed to have extended over the three regions of the city that lie behind the present seraglio and gardens of the sultan. Dionysius Byzantinus gives it 40 stadia in circumference. The acropolis or citadel stood on the hill where the seraglio now is.

(Müller, *History of the Dorians*; Büsch, *On the Public Economy of the Athenians*; Sextus Empiricus, *Adversus Rhetores*, 37; Codinus, *Fragment of Hecychius on the Origin of Constantinople*.)

C

CABELLO. [PUERTO CABELLO.]
CABES, GULF OF. [KHABZ.]

CABRA. [CORDOVA.]

CARRERA. [BALEARIC ISLANDS.]

CABUL (pronounced and sometimes spelt Caibool, also Kabool), the capital of the State of Cabul in the north of Afghanistan, is situated on the Cabul River, in a wide plain between 6000 and 7000 feet above the sea, in 34° 30' N. lat., 69° 6' E. long., at a distance of about 60 miles N. from Ghuznee, 200 miles N.E. from Candahar, and 120 miles W. from Peshawur: population about 60,000. The city is flanked on three sides by low hills, and inclosed by a wall. The north-eastern quarter forms the Bala Hissar (Palace of Kings), a fortified inclosure comprising the residence of the Khan of Cabul, the government offices, the palace gardens, and a small town. The outer town is about three miles in circuit, compactly built, chiefly with sun-dried bricks and wood to avoid the consequences of the frequent earthquakes. It is entered by four gates placed at the ends of the two principal streets that cross the city. One of these streets, running northward, led to the once magnificent bazaars destroyed by the British on their evacuation of Cabul, on which occasion also the Bala Hissar was greatly damaged. The city is divided into separate districts, each of which is walled, and may form on occasion a separate fortress. In general the streets are crooked, badly paved, and narrow; so much so, that two horsemen can with difficulty pass in some of them. The houses are two and three stories high, and, as in most parts of the east, they have flat roofs: those of the wealthy are built round courtyards, and surrounded by gardens. The tomb of the emperor Baber who made Cabul his capital is on a hill outside the city; it is surrounded by large beds of flowers, and commands a noble prospect: the tomb of Timur-Shah is a brick octagon surmounted by a cupola. The plain about the city is laid out in orchards and gardens, which in some seasons of the year are very beautiful. The climate of Cabul, owing to its great elevation above the sea, is very cold in winter, which is long and severe. [AFGHANISTAN.] The summer is delightful. Cabul is the centre of a very active transit trade in Russian, Chinese, and other northern products, which are sent by caravans to Hindustan and Persia. The routes by which this trade is conducted and the items of which it consists are given in the article on AFGHANISTAN. Cabul has also important markets for the sale of corn, horses, cattle, and fuel; it is particularly celebrated in the east for the excellence and abundance of its fruits and vegetables.

Cabul occupies probably an ancient site; some think it to be the Cabura of Ptolemy. The Arabic historians mention it as the residence of a Hindoo prince in the 7th century. It was taken by Tamerlane about 1394, and again in 1739 by Nadir-Shah, who plundered it. On the death of Nadir-Shah, Ahmed Khan, the founder of the Duranee monarchy, took possession of Cabul, and his son Timur made it in 1774 the capital of Afghanistan. The events that occurred in the city during the late Afghan war are noticed under AFGHANISTAN.

CACERES. [ESTREMADURA, SPANISH.]

CACHA'R, a province in the north-east quarter of Hindustan, is bounded N. by the Brahmaputra River and Assam, E. by Manipoor and the Burmese territory, S. by Silhet and Tiporah, and W. by the principality of Jyntia. This province is situated between 24° and 27° N. lat., and between 92° and 94° E. long.: its length from north to south is about 140 English miles, and its breadth from east to west about 100 miles.

Cachar, the ancient name of which was Hairumbo, is divided into Cachar Proper and Dharnapore; the first occupying the south and the second the north part of the province. The country in general is mountainous; the greater part of the mountains is covered with forest trees, bamboo, and jungle, which frequently render them inaccessible; the passes are not practicable at all seasons, and few roads have been made in the district.

A great number of small streams have their sources in the high lands of Cachar. Those in the eastern mountains unite and form the

GEOG. DIV. VOL. II.

rivers Capili and Barak, both of which join the Megna or Brahmaputra: the Barak at the point (24° lat., 91° long.) where that river takes the name of the Megna. During certain parts of the year the Barak can be navigated; in the dry season it is fordable, the channel being obstructed by rocks; but soon after the rains have set in the river has a depth of from 30 to 40 feet of water. From June until November considerable tracts are inundated, and the difficulty of travelling is consequently increased.

The jungle fever, often fatal to Europeans, is common in Cachar. It does not however attack the natives with equal violence. The country is thinly inhabited. The entire population has been estimated at about 360,000, but the numbers are liable to constant fluctuation. The best peopled districts are those nearest to the south-west, and a level tract in the north near the Capili River and adjacent to the town of Dharnapore.

Cospore, the modern capital, is 20 miles south from Grobarg, the ancient capital of Hairumbo, in 24° 45' N. lat., 92° 45' E. long., on the banks of a small stream called the Madhura. The Raja of Cachar having in 1811 removed his residence to Doodputtee, a small town about 18 miles further north, Cospore has since considerably fallen off. The town of Dharnapore, in the northern division of the province and about 60 miles from Cospore, was formerly a place of some strength, and enjoyed a considerable trade; but the fort has now fallen into decay, the trade has in a great measure left the place, and its population has decreased.

Cachar was invaded by the Birmese in 1774, but the force first sent was destroyed by the jungle fever. A second expedition reduced the raja to submission, and forced him to become a tributary of the King of Ava. In 1810 the Raja of Cachar placed himself under the protection of the British. Some twenty years later the province became the scene of trouble and confusion. In 1830 the Raja Govind Chandra was murdered by his own guard. By desire of the people, as well as to insure peace on the north-east frontier, it was determined to annex the province to the British empire. The affairs of the province are administered by a native raja under the protection of the Company's government.

CADER IDRIS. [MERIONETHSHIRE.]

CADIZ, PROVINCE OF. [SEVILLA.]

CADIZ, a city and sea-port, is situated on the south-west coast of Spain, in 36° 31' N. lat., 6° 17' W. long., 70 miles S.W. from the city of Sevilla. It is the capital of the modern province of Cadiz, which is included in the ancient province of Sevilla and great division of Andalucia. It is the see of a bishop, suffragan to the archbishop of Sevilla. The population in 1845 was 53,922.

Cadiz is built on the end of a low and narrow isthmus or tongue of land, which extends from the island of Leon (Isla de Leon), about 5 miles in a north-north-west direction. The rocky extremity on which the city is constructed is considerably higher than the isthmus which connects it with the Isla de Leon; it has a circuit of six or seven miles, and is surrounded by the sea on all sides except where it joins the isthmus. The whole of the western sides of the city, the isthmus, and the Isla de Leon, are open to the Atlantic Ocean; to the north and north-east the projections of the mainland form with the isthmus the Bay of Cadiz, which includes a circuit of more than thirty miles. The outer bay, the entrance to which is between the city and the promontory of Rota, distant about five miles, is exposed to the south-west, but the inner bay is well sheltered, and affords in most places good anchorage. Some dangerous rocks called Las Puercas (the Sows) are scattered opposite the city, in the direction of Rota. The Guadalete enters the sea at Puerto de Santa Maria, where the inner bay may be said to commence, and within this portion the harbour is formed by a well-constructed mole, but is not of sufficient depth to allow large vessels to come close up to the city. From Puerto de Santa Maria the coast trends south, and the bay becomes narrower, the mouth being defended by the cross-fires of the forts of Matagorda and Puntales. Here an islet, which contained Fort San Luis, is divided from the mainland by a channel called the Troadero.
